Editorial

More than a century after its establishment, psychology has burgeoned into a vast industry that produces and disseminates knowledge, interventions, and social outcomes. This industry often frames its practices as neutral technologies aimed at helping and improving individuals and society. However, this purported neutrality obscures the political nature of these practices, masking their role in social and societal control. The current issue of the *Annual Review of Critical Psychology* (ARCP) delves into the intricate relationship between psychology and politics, emphasizing that human action and agency are inherently political.

The connection between psychology and politics is multifaceted, encompassing areas such as psychology *and* politics, psychology *in* politics, political psychology, and politics *in* psychology. Despite this breadth, the political character of human action is frequently treated as an optional aspect, dependent on the individual psychologist's ethical orientation. This approach fails to acknowledge that the political dimension of human action resists confinement to a specialized subdiscipline like political psychology. The term 'political psychology' misleadingly implies the existence of an 'a-political psychology,' a notion that is fundamentally flawed.

Human action is inherently political due to its social contextualization. It constitutes and is constituted by the social fabric, extending outwards through activities like planning, organizing, caring, prevention, and foresight. The political nature of human action is a fundamental aspect of every human endeavour, including psychological and academic work. Agency involves not just executing given tasks but also formulating questions and identifying phenomena as problematic, thus demanding corrective action. This anticipative and creative dimension of agency underscores that human action maintains and pioneers alternative social relations, making it perpetually political.

In recognizing the pre-figurative qualities and dimensions of human action, (critical) psychology emerges as inherently political. It becomes clear that (critical) psychology operates as politics by other means. This perspective is central to the current issue, which explores psychology as politics by other

means, challenging the view that the political aspect of human agency is merely an add-on to psychological theories or practices.

This issue engages with the diverse and profound relationship between psychology and politics, examining the political assumptions embedded in our psychological theories and practices, the emergence of distinct subjectivities within psychological theory and practice, and the explicit or tacit interests of these subjects. Through this exploration, we aim to foster a deeper understanding of how psychology can serve as a powerful tool for political action and social change.

The contributions

There are over 50 articles in this issue. They cover a wide range of topics and are grouped into six broad areas: Methodology and Epistemology; Subjectivities and Subject Formation; Social Practices of Psychology; Racism and Nationalism; Gender, Women and Critical Feminisms; and Struggles, Visions and Future Possibilities.

The authors of this issue are from a variety of places on the globe, including Brazil Germany, Greece, Austria, South Africa, Turkey, Denmark, the USA, the UK, Botswana, Chile, Iran, Mexico, and Norway. Additionally, some articles focus on the Russia-Ukraine war or the US-Vietnam war, adding further geographic diversity.

The issue includes articles that are primarily theoretical or conceptual in nature, use empirical or primary data, or are reflective and/or critical commentaries. While all the articles straddle theoretical issues, conceptual critiques, reflective commentaries, and draw upon some data from existing research projects, these broad classifications give us a sense of the methodological slant of this collection. Where empirical studies are reported, critical discourse analysis, qualitative interviews, or ethnographies are the preferred modes.

Overall, all articles speak to the broad failure of mainstream psychologies, critiquing and troubling the status quo, while also offering alternative and nuanced visions and manifestos for future possibilities of a politicised psychology from a wide range of vantage points.

Methodology and Epistemology

Epistemological and methodological problems of qualitative research in psychology and mental health: Gonzalez Rey's contribution¹

Daniel Magalhães Goulart

Abstract

This paper aims to discuss epistemological and methodological problems within qualitative research in the fields of psychology and mental health. It presents González Rey's Qualitative Epistemology and Constructive-Interpretative Methodology as a heuristically valuable alternative in face of such problems. In this sense, it is not a discussion that focuses solely on criticism regarding the dominant perspectives, but one that points to the possibility of generating new models that advance in consistent investigative courses, with multiple implications for practice as well. The chapter begins with the discussion of key epistemological problems that have marked the history of psychology and mental health, with emphasis on instrumentalism, which culminated in the devitalisation of research and the neglect of emerging qualitative aspects in these fields. Subsequently, alternatives in qualitative research in these fields are discussed, in order to highlight how they were proposals that innovated mostly from a methodological standpoint, but were epistemologically conservative and not very reflective. Finally, in the face of the discussed limitations, González Rey's thought platform is presented as a possibility to advance. This framework articulates, as a unit, the theory of subjectivity, Qualitative Epistemology and Constructive-Interpretative Methodology. It is based on the understanding that scientific knowledge is never a final product, but a production of intelligibility that has the researcher's creative thinking at its core.

Keywords

Qualitative research, mental health, subjectivity, epistemology

Epistemological problems in Psychology and Mental Health

The fields of psychology and mental health² have historically been marked by neglect regarding their own epistemological issues and by the eminently instrumental use of quantification, which reveals a dominant a-theoretical orientation that is present to this day. If this condition is based, on the one hand, on the predilection of positivism as the support basis for methodological research proposals, it is, on the other, also based on a lack of knowledge about the critiques and advances made within these fields with respect to instrumentalism and the reification of quantification. This scenario led to the intense neglect of the historical, cultural, political, subjective and philosophical aspects that are inseparable from the very development of these areas (González Rey and Mitjans Martínez, 2017; Goulart, 2019; Goulart and González Rey, 2020).

As González Rey (2013) argues, the dissociation between the individual sciences and the field of philosophy, which began in the second half of the eighteenth century, culminated in a technocratic perspective, which created the foundations for its own legitimacy and success. In regards to psychology, such an approach has led to a utilitarian and instrumentalist orientation in both research and professional practice. This explains, partially, the emphasis on psychological testing, which enhances the illusion of neutral, accurate, predictive knowledge with broad possibilities for generalization (González Rey, 2019a). The author also points to a striking feature that characterizes psychology and ends up intensifying these processes: the concern with the a-critical importation of instruments and models from other sciences to the detriment of the development of theoretical, epistemological and methodological systems that consider the qualitative specificity of psychological issues (González Rey, 2019b). Lacking a clear representation of its own field, psychology has become an allegedly positivist empirical science, ignoring several interesting aspects of A. Comte's and E. Durkheim's philosophy.

In the mental health field, such a technocratic perspective unfolded into a not only rigid but also fragile demarcation between the normal and the abnormal. Based on an individualist and organicist perspective, this process ended up generating practices, institutions and knowledge based upon the objectification of the other, which has as its clearest expression in the proliferation of mental hospitals in the nineteenth century and the first half of the twentieth century (Kangoulham, 2004; Basaglia, 1985; Goffman, 1974).

Even though historically, and still in the first half of the twentieth century, there have been critical contributions in the face of this technocratic perspective, such as Jaspers' phenomenological psychopathology (Jaspers, 2000), it is a fact that the dominant logic was shaped into a symptomatic-descriptive model aimed to identify the "mental illness." This rigid demarcation, as Foucault (1975) argues, is related to the comprehension of mental illness as something of the essence; that is, as a specific entity expressed by the symptoms that manifest it, but somewhat independent of them. On the other hand, alongside this essence

² The use of the term "mental health" in this paper refers rather to a field conventionally named as such, rather than to a concept qualitatively defined as such.

prejudice, there is a naturalistic premise that ends up considering mental illness as a kind of botany. According to the author,

“(...) the supposed unity in each nosographic group behind the symptom’s polymorphism would be like the unity of a species defined by its permanent characteristics and diversified into subgroups: thus, early dementia is a species characterized by the last forms of its natural evolution, and which may have the hebephrenic, catatonic and paranoid variants” (Foucault, 1975, p. 8).

Thus, the so-called “mental illness” comes to be seen as a reality in itself, defined by a set of eminently behavioral criteria and dissociated from the singular vital plot that generates it and upon which it unfolds.

This process is not only a part of the *history* of mental health, but still represents dominant sectors in the field today, notably supported by the biomedical model (Goulart, 2017a). Such a model substantiated the already widely questioned Cartesian ideology, whose certainty of scientific knowledge has unfolded into a mechanistic understanding of organic function (Canguilhem, 2004). Based on this model, prevailing practices across the field are based on the machine metaphor as an explanatory resource for deviations from normality, conceived as diseases. In fact, as Camargo Jr (2007) explains, practice in this perspective focuses on the identification and treatment of diseases, so that everything else, including the individual who holds the disease, is marginalized. Thus, constitutive aspects of human subjectivity, such as social, cultural and historical dynamics, are excluded from this horizon (Goulart and González Rey, 2019; Goulart, 2022).

Scientific knowledge linked to the developments of the biomedical model in mental health, as well as in psychology, is supported by the justification of being “evidence-based.” In this process, the so-called “evidence-based science” is often assumed as a synonym for validity and legitimacy, as if this title exempts it from discussing its assumptions, such as what evidence means and who ultimately decides on it (McMullen, 2012, McMullen and Sigurdson, 2013). A problematic development of this logic in the field of mental health, as Ingleby (2014) argues, is that such evidence-based science seems to mask a research agenda dominated by the pharmaceutical industry, which ultimately overestimates medical treatments. Therefore, one comes to a pernicious paradox that seems to have been the dark side of all large-scale psychiatric interventions in the world, as discussed by Foucault (1977, 2006): The more treatment is offered, the more disease is produced.

Effectively, the dominant perspectives in psychology and mental health coincide, therefore, in the elimination of the quality of the lived experience as a unit of analysis, as well as in the neglect of theoretical constructions to represent and deal with the phenomena with which they deal in a differentiated manner (González Rey, 2017b; Goulart, 2019). From a methodological point of view, these perspectives avoid the challenge of seeking more qualified ways to build courses of dialogue with their correspondents and pay little attention to the craft of interpretative construction inherent to research (González Rey and Mitjans Martínez, 2019). Variations and singularities, when not ignored, are considered

as miscalculations, while the researcher's ideas are seen as unwanted contamination. In short, in the modern pursuit of instrumentalizing the scientific exercise, relations become instrumentalized themselves. As argued by Japiassu (1982), the sciences that emphasize human matters become a paradoxically impossible undertaking, marked by the pursuit of studying human processes, while excluding the human side of them.

The method came to be conceived as a reality in itself and as independent from the qualitative and singular specificities of the studied object. It was severed from the philosophical discussions that support it, promoting a dissociation between method, epistemology and theory (Goulart and Patiño Torres, 2021; Patiño Torres and Goulart, 2016, 2020). Statistics became the basis upon which the claims of knowledge were validated (Japiassu, 1982). In the field of psychology, this process led to instrumentalism, in a scenario that came to be known by its critics as “methodological fetishism” (Koch, 1999) and as “methodolatry” (Danzinger, 1990). It is noteworthy, as González Rey and Mitjáns Martínez (2017) point out, that psychology operated an uncritical importation of the premises of the biological and exact sciences, at a time when, in the face of the problems of this dominant model, these sciences were already advancing epistemological and theoretical alternatives in the first half of the twentieth century, such as quantum mechanics with authors W. Heisenberg and M. Plank.

In this context, González Rey (2005) argues that there is a need for epistemological revitalization in scientific research, positing,

The revitalization of the epistemological is, therefore, a necessity in view of the attempt to monopolize the scientific based upon the relation between data and the validity and reliability of the instruments that produce them. This instrumentalism corrupted the purpose of science and led to the reification of the empirical, causing profound deformations when using theory. For this reason, to speak of qualitative methodology implies a theoretical-epistemological debate, without which it is impossible to overcome the instrumental cult derived from the hypertrophy that considers instruments direct courses of producing results in research (González Rey, 2005, p. 3).

Epistemological problems in the fields of psychology and mental health could thus be synthesized as:

1. A symptomatic-descriptive model aimed to identify “mental illnesses”;
2. A biomedical model, represented by the metaphor of a machine logic in understanding practices within the mental health field;
3. A positivist model in the construction of scientific knowledge, based on so-called “evidences,” which unfolded methodological approaches considered as a reality in itself, independently of the specific qualities of what is studied. This process led to a dissociation between theory, epistemology and method.

Next, I present a reflection on qualitative research, mainly in the field of psychology, emphasizing some epistemological alternatives in the face of the modern hegemonic perspective, as well as limitations historically present in the

field. This discussion gives rise to González Rey's proposal for Qualitative Epistemology and Constructive-Interpretative Methodology (González Rey, 1997, 2005, 2019a) as a possibility for the opening of new epistemological and methodological avenues with heuristic value in the psychology and mental health fields.

Qualitative research in Psychology: Innovations, contradictions and challenges

Throughout the twentieth century, psychology was characterized by a plurality of sources that favored the emergence of different theories and methodologies (González Rey, 2019c). According to González Rey and Mitjáns Martínez (2017), in addition to the innovations undertaken by psychoanalysis and Vygotsky, the work of K. Lewin and his group should be highlighted in the field of qualitative research in psychology. These authors not only explicitly took the first steps in qualitative field research, but also approached the qualitative as a theoretical problem by articulating it to the study of human motivation and personality.

A member of K. Lewin's group, T. Dembo, said: "(...) personal experience is more closely and directly linked not only to the question of research, but also to one's feelings and values; therefore, I believe, it may be more potent in its relation to qualitative questions" (Dembo, 1993, p. 25). In this quote, the author expresses something that will mark her work: the advance in methodological reflections is closely related to the developing theoretical model – something seen rarely in the first half of the twentieth century.

González Rey and Mitjáns Martínez (2017) also explain that, in the 1960s, a potent critique of hegemonic positivism was produced in American psychology, whose protagonist was S. Koch, as well as a group of humanistic authors, whose work represented a rupture with the sacralization of instruments, description and quantification. As part of the latter group, G. Allport said:

Two types of approaches predominate in Anglo-American psychology. We refer to the stimulus-response and statistical methods. The stimulus-response unit considered by psychology is habit, the statistical unit is fact. Both suffer from noteworthy limitations, the most important being their distancing from the structure of human life as ordinarily observed (Allport, 1967, p. 394).

G. Allport points out precisely that favoring rigor *a priori* over the quality of the studied process is a key weakness of instrumentalism. From this point of view, the relationship between research and the everyday "structure of human life" is lost, which, ultimately, is what underpins research on human processes.

However, as González Rey (2019a) explains, during the boom of qualitative research in psychology in the 1980s and 1990s, psychologists such as Bogdan and Biklen (1982) and Glasser and Strauss (1967) again engaged in the relatively a-critical importation of social science references, rather than drawing on the

important antecedents of qualitative research in psychology itself. Despite being an important methodological step, as the process was based on the critique of dominant quantitative research, it was carried out without epistemological discussions and ontological definitions concerning the very phenomena that required new methodologies to be studied.

According to González Rey (2019a), that time was marked by a search for validation criteria in phenomenology. However, unlike the K. Lewin group and other Gestalt authors, many researchers who relied on phenomenology were characterized by a lack of further deepening of this broad and heterogeneous philosophical perspective³, which often led to the arbitrary use of conceptual labels attributed to the alleged “empirical data.” This inability of psychologists to operate with the complexity of philosophical models can be seen as the expression of an educational training characterized by an eminently positivist and naturalistic view of the discipline (Mitjáns Martínez and González Rey, 2019). It is not possible to use philosophy as a finished product, ready to be applied directly to any field of science while imposing itself *a priori* on intellectual creation (González Rey, 2019c). This led to the construction of a qualitatively instrumental and epistemologically positivist hybrid, whose inductive-descriptive orientation became the main resource for the production of knowledge (González Rey and Mitjáns Martínez, 2017). The philosophical basis of this process was Husserl's interest in attaining “things as they are,” which ignored the final moment of his work, as well as alternative standpoints of other phenomenological authors such as Heidegger and Merleau-Ponty. González Rey (2019a) discusses works in the psychology field that go in this direction, such as that of A. Giorgi, who says: “Despite all the apparent difficulties, it is stated that they [phenomena] can be grasped as they are actually experienced. And to capture them in this way is to begin to understand them objectively or scientifically” (Giorgi, 1995, p. 39). From this brief quote, it is possible to see how, in its alleged search to learn the studied phenomenon as it is “actually” experienced by the individual, this line of thought in psychology ends up maintaining the scientific ideal based on objectivity.

For González Rey and Mitjáns Martínez (2017), this phenomenological perspective expresses the following main limitations:

1. To consider that the lived experience comes down to a reality limited to the very events that defined it, which, in turn, are subject to signification by the individual such as they happened;
2. In this case, the researcher is a data collector, in such a way that his/her ideas and conjectures do not appear as a constituent part of his analysis, which ends up being limited to the intentional explicit report of the participants;
3. The validity of the analysis is a process external to the quality of the researcher's own construction;
4. There is a lack of a methodological proposal capable of keeping track of the different forms of dialogue.

³ Merleau-Ponty himself wondered about this: “What is phenomenology? It seems strange that this question still needs to be asked half a century after Husserl's early work. The fact is that this question remains unanswered by any means” (Merleau-Ponty, 1964, p. VII)

From this perspective, although under the title of qualitative research, the emphasis remained on instrumental and technical dimensions, without sufficient problematization and consistent constructions of what a qualitative approach means that is pertinent to the ontological specificity of the studied phenomena (Goulart and Patiño Torres, 2021). An expression of this limitation is the enthusiastic spread of the so-called Quali-Quantitative Research, which is often problematic, since it simplifies the complexity of such an approach to a technical addition of research strategies without due attention to the divergence between the epistemological bases that support them, respectively (Patiño Torres and Goulart, 2016, 2020). In this regard, Turato states:

Note that a mix between quantitative and qualitative methods is not possible when there is a clear question. Let it be clear that while we say that quantity and quality are inseparable and interdependent, we must say that 'quantitative-qualitative' separation exists epistemologically, because they are devoted to *answering different questions*, albeit raised regarding the same object (Turato, p. 2004, p. 23, emphasis added).

Another historically problematic development of qualitative research that prioritizes technique over in-depth epistemological, ontological and theoretical discussions is the dissociation between so-called “data collection” and “data analysis,” as if the researcher were, in fact, a collector of information ready and ripe to be consumed, and not an individual immersed in complex relationships, which are crossed by subjective and cultural processes. This separation is an expression of the infamous separation between theory and method, as if such processes maintain an artificial externality relation to each other. As stated by González Rey (2014a), in this logic, the theory, supposedly “applied” to empirical material, is understood through isolated and descriptive concepts, in order to do without the theoretical construction in itself. The empirical, in turn, is understood at the same time as external to the researcher himself and as *a priori* in relation to the knowledge produced. As I argue in another paper, one loses sight of

(...) the strength of an alternative methodological representation: the recognition of the status of ideas. As an information collector, data systematizer and applier of *a priori* concepts, the qualitative researcher remains averse and fearful of the process that underlies his craft: thinking (Goulart, 2018, pp. 2-3).

Based on the contributions of various authors in the field, such as F. González Rey, S. Koch and K. Danzinger, qualitative research in psychology, eager to distance itself from the hegemonic quantitative perspectives, ended up infiltrated by modern science historical problems, amongst which stand out the hegemony of the empirical, the theoretical apriorism, the emphasis on supposedly atheoretical descriptions and the researcher's neutrality (Patiño Torres and Goulart, 2016). In other words:

From this perspective, the sieves of legitimacy of the dominant modern epistemology, namely objectivity, precision and validity, end up being ghosts of the qualitative proposals, which, by not dealing directly with the epistemological problems they carry, remain supported by what they criticize (Goulart, 2018, p. 3).

From the 1990s onwards, different alternatives in the qualitative research field in psychology and mental health have been developed and gained strength. Some had their origins in previous decades, originally came from other fields, such as action research, cartography, and discourse analysis, and maintained their interdisciplinary traditions. In psychology, González Rey and Mitjáns Martínez (2017) argue that during that decade hermeneutics was the most used perspective to legitimize the use of interpretation in research, although without developing the epistemological consequences for knowledge production specifically in psychology. In fact, hermeneutics, in its critique of epistemology and ontology, was defined as the comprehension “of the way of being of this being that exists only in understanding (Ricoeur, 2008, p. 37).” In general, hermeneutics has set the text as its object in such a way that all human processes are read as text. However, it has avoided studying the individual as the text’s author (González Rey and Mitjáns Martínez, 2017). From these contributions, several critical approaches⁴ began to emphasize, within psychology, mental health and the social sciences, among them discourse, language, communication, the dialogical self, deconstruction, social construction, and dialogical realities. Such approaches gradually separate themselves from psychology itself and from the notion of the psyche as an individual and natural entity (Harré, 1995; Parker, 2014).

Despite the theoretical, epistemological and methodological value that these critical approaches had for promoting the understanding of human processes as inseparable from social symbolic constructions, many of them ended up neglecting the individual as an active dimension of such constructions (González Rey, 2019d). In this process, dimensions that were historically related to the individual were directly associated with metaphysics and romanticism without considering the possibility of approaching them through other theoretical courses. Therefore, all the richness of subjectivity -including emotional processes, imagination and human motivation- was left out of such readings of social life as they were considered as epiphenomena of hegemonic discourses, thus ignoring the individual’s creative capacity and agency (González Rey, 2019d). In the field of mental health, these critical approaches have frequently led to a process of sociologization. On the one hand, this process of sociologization considered social, political, cultural and relational issues related to different expressions of distress; on the other hand, it ended up ignoring how these social, political, cultural and relational issues are singularly configured in an individual experience of suffering and how this individual is not only a victim

⁴ Critical approaches are understood in this paper as approaches that define themselves as such. They have been considered as “(t)heoretical trends that (...) have emerged as politically engaged and as critical investigations of societal processes and institutions, focusing on such topics as discrimination and exclusion in terms of gender, race and class and the exercise of power through ideological means” (Fleer et al., 2020, p. 3).

of a broader process, but may also be an agent or a subject of his/her own experience.

Theory of Subjectivity and critical mental health

From the shortcomings left by different critical approaches that were mainly based on hermeneutics, which is at the same time theoretical, epistemological and methodological, González Rey advances his thought platform by articulating Theory of Subjectivity, Qualitative Epistemology and Constructive-Interpretative Methodology (1997, 2002, 2005, 2017, 2019a, 2019b; González Rey and Mitjans Martínez, 2017, 2019)⁵. The founding work that articulates Theory of Subjectivity, Qualitative Epistemology and Constructive-Interpretative Methodology is *Epistemología Cualitativa y Subjetividad* (González Rey, 1997). In this book, González Rey presents a new definition for subjectivity, as culturally and historically constituted, far from the universal essentialist remnants associated with the Cartesian definition. From this perspective, subjectivity is not reduced to language, speech or text, but articulates symbolic and emotional processes in a new ontology. Only through a symbolic-emotional unit, which defines subjective production, do social productions become motives for human action (González Rey, 2014b). In this perspective, as stated by González Rey and Mitjans Martínez (2017, p. 23): “language does not hang over human beings; it is a human production that carries all the subjective character of its configuration and of the living fabric of relationships with others.” This perspective on subjectivity incorporates the notion that individual and social dimensions, as stances that share a subjective character, can be integrated in a contradictory manner that does not reduce one dimension to another (González Rey and Mitjans Martínez, 2019). In this sense, subjectivity can be understood as a critical theoretical tool as it allows advancing upon an intelligibility path that explains singular individual and social production in a manner inseparable from broader social dynamics.

The symbolic-emotional unit, represented by the concept of subjective sense, surpasses historical intrapsychic and individual reductionism, which has characterized the concept of subjectivity in psychology, philosophy and other social sciences (González Rey, 2017). Furthermore, it transcends the sociologization of human processes, which has prevailed in many critical approaches in both psychology and mental health. In addition to these more elementary symbolic-emotional units, which are named ‘subjective senses,’ subjectivity is constituted by self-regulating and self-generating organizations with relative stability, represented by the concept of subjective configurations.

⁵ This approach emerges in the psychology field, but also expresses its value in different research lines today, such as in the field of education (Mitjans Martínez and González Rey, 2017; Rossato, 2009; Madeira Coelho and Tacca, 2019), psychotherapy (González Rey, 2007, 2012; Mori, 2012; Mori and Goulart, 2019), human health (Costa, 2016; Costa and Goulart, 2015; González Rey, 2011, 2015; Goulart, 2021; Mori, 2009; Silva, 2016) and, more specifically, mental health (Goulart, 2013, 2015, 2017b; 2019a, 2019b; Goulart and González Rey, 2016, 2019, 2020).

These concepts have profound implications for the field of mental health, as they allow a new understanding of its processes.

Critical of the notion of naturalized, universal, and *a priori* taxonomies of “mental illnesses,” González Rey (2011) defined mental disorder as the emergence of a type of subjective configuration that generates distress and “prevents the individual from producing alternative subjective senses that could allow him/her new options for life before the rituals perpetuated by this configuration” (González Rey, 2011, pp. 21-22). This definition refers to the unique life plot in which this subjective configuration emerges. The concept of subjective configuration does not express any pre-determined content, but a representation of the subjective organization that only comes to life as it is used as a tool for theoretical construction in singular cases.

Due to the narrow and individualistic way in which the concept of mental disorder has historically been conceived in a dominant way in other perspectives and considering that subjectivity cannot be reduced to the “mental,” I have opted for the term ‘subjective suffering’ (Goulart, 2023; Goulart and Faria, 2023). Subjective suffering does not refer specifically to everyday tensions, contradictions and conflicts, which, in some way, are experienced by all individuals to some degree, but to a dominant subjective configuration that generates distress for the individual, such as in the definition of mental disorder by González Rey (2011). It culminates in the weakening of the individual’s subjective resources⁶ and reduces their possibilities for action, reflection and positioning in different areas of life. Understanding a specific situation of subjective suffering demands an approach to the singularity of the subjective production of the other – something very different from what has been predominantly practiced in the field of mental health.

Professional practices based on the Theory of Subjectivity are oriented towards understanding subjective suffering as a basis for developing dialogical strategies aimed at overcoming it and favoring subjective development⁷. Therefore, dialogue is central to this perspective (González Rey; Mitjans Martínez, 2019; Goulart, 2023). Dialogue is not reduced to its discursive dimension, nor does it necessarily represent any sort of communication. It implies a subjective mobilization in an interrelational process, which is, simultaneously, the basis for its construction and the main outcome of its process. Dialogue can involve provocations, moments of tension and questions that open up new fields of reflection, unfolding in processes beyond the concrete moment of dialogue. It implies an affective bond that does not nullify the differences between its actors, configuring itself as a powerful resource to simultaneously consider and mobilize others to generate paths of subjective development from their own resources.

⁶ The notion of subjective resources is understood “as a functional dimension of a subjective configuration, expressed in the expansion of possibilities for action, reflection and positioning in different areas of life” (Goulart; Mitjans Martínez, 2023, p. 46).

⁷ “We consider subjective development to be the development of new subjective resources that allow the individual to make qualitative changes in different areas of life and that generate an increasingly deeper personal involvement in the area in which the subjective configuration of development is organized” (Mitjans Martínez; González Rey, 2017, p. 73).

The construction of dialogue and the opening of paths of subjective development require that the individuals involved in these processes emerge as agents and subjects of the social space of which they are part. González Rey and Mitjáns Martínez (2017) explain that the agent would be the individual or social group that takes an active position, being “situated in the course of events in the current field of their experiences.” (p. 73) In turn, the emergence of the subject implies a further step. It represents an individual or social condition, which expresses the opening of “a proper path of subjectivation, which overcomes the normative social space within which an individual’s experiences happen, exerting creative options in the course of them, which may or may not be expressed in the action” (p. 73).

Based on the Theory of Subjectivity, research and practice are theoretical enterprises, closely linked to each other. They imply a dialogical conception, contrary to the objectification of the other and the instrumentalization of relational systems, attributing strong importance to the condition of individuals and groups to position themselves in an active and authentic way in their different life paths (González Rey; Goulart; Bezerra, 2016). Overcoming an ethics of procedure, one is oriented towards the construction of an ethics of the subject. In the field of mental health, this ethics of the subject implies an inversion of the dominant logic: Instead of the relationship built with the other being based on the institutionalized technical procedure, it is placed in a flexible and singular way in the search to favor the condition of the subject and of the subjective development of the other. Instead of control over the other, it operates with a logic of mobilizing possible changes.

Qualitative Epistemology and Constructive-Interpretative Methodology: New foundations and new challenges for qualitative research

To advance the study of subjective processes, the construction of new epistemological principles that would simultaneously open new methodological options, became pressing. In this sense, as González Rey (2014a) explains, Qualitative Epistemology substantiates the knowledge production as a subjectively configured process, both by the theory that underlies it as by the researcher himself/herself. From this perspective, science figures as a constructive-interpretative process, as it refers to a production of intelligibility, not an attempt to apprehend reality representationally. Closely related to Qualitative Epistemology, Constructive-Interpretative Methodology has been advanced as a methodological approach that proposes a different understanding of instruments, participants, and analysis.

From this perspective, general conclusions attained by using inductive criteria from the analyzed information, as presented in many phenomenological approaches in both psychology and mental health, are avoided. Emphasis is given to the researcher’s interpretative constructs, which are based on indicators. Indicators are meanings attributed by the researcher to pieces of information pertaining from the field experience (González Rey, 1997; González Rey and

Mitjans Martínez, 2019). They are not present in the participant's expression, but in the researcher's interpretative construction in the face of such expression (González Rey, 2005). From the convergence between different indicators, it becomes possible to construct broader meanings regarding the studied phenomenon, which, in this perspective, is defined as hypothesis (González Rey and Mitjans Martínez, 2016, 2019 *ibid.*). The recursive relationship between indicators and hypotheses, added to other reflections that the researcher forges during the constructive-interpretative process, forms the theoretical model concerning the studied problem (González Rey, 2005, 2014a).

This theoretical model expresses the researcher's ideas and constructions that arise in field work and by which the researcher is oriented to participate actively in the course of the fieldwork itself and the new constructions that develop in this process. The theoretical model is a living process that demands further development, the use of new research instruments and the implementation of turns in the course of the dialogue within which all fieldwork is organized (González Rey and Mitjans Martínez, 2017, p. 90).

From this perspective, the method abandons its abstraction and universal standardization in order to become a living dimension, which expresses the researcher's condition to elaborate and organize his own ideas and actions in the research field. In this process, the method has the researcher's thinking activity at its core.

Unlike other epistemological and methodological approaches, this proposal rescues the subject as an epistemological category in the process of knowledge construction (González Rey, 2019a, 2019b). The researcher's thinking activity during the course of research is the basis for generating strategies that seek to qualify the relationships established during the research, which unfold into the dialogue processes shared with the participants. For González Rey (1997, 2005), it is essential to build authentic dialogue processes during the course of research in which people are subjectively engaged and motivated to share lived situations. In effect, the research itself is conceived as a process of dialogical communication. This marks not only differences in the researcher-participant relationship, but also in the research representation itself, which is now conceived as a social space, in which different and unpredictable communication processes emerge spontaneously, placing the researcher and participants in a living relational fabric that may become relevant to the researched topic itself (González Rey and Mitjans Martínez, 2016).

The consideration of research as a dialogical communication process is related to the author's notion of research instruments as creatively generated strategies to favor the expression of participants in the fieldwork process. In the use of the instruments, no criterion of legitimacy external to the relation that constitutes the research is required. A shift is operated from a response epistemology, centered on the "data" collection, to a construction epistemology, which transcends what is explicit, in search of theoretical constructs in tune with the quality of the lived processes (González Rey, 2005).

On the one hand, the theoretical model is supported by a broader theory, in this case, the Theory of Subjectivity, which offers system-articulated concepts to more generally represent subjective processes. On the other hand, the form the theoretical model takes in the study of a specific case depends on the quality of the information generated and the researcher's intellectual and creative capacity in light of his/her object of study. In this sense, there is no abstract and *a priori* logic for the theoretical model.

Theory is the generator of a thought model that offers resources for the researcher's theoretical production, but theory does not provide the meanings that emerge in singular research endeavors. From this perspective, "(...) theoretical concepts represent models to be built in the course of research. When this does not happen, theories risk becoming dogmas and being used as meanings that are imposed upon the research process" (González Rey and Mitjáns Martínez, 2017, p. 37). Theory represents a continually developing process that feeds and is fed by new practice domains (González Rey and Mitjáns Martínez, 2019). In this process, interpretive constructions advance hand in hand with dialogue, in such a way that theory is deeply articulated with the field of research/practice, in which relationships and various forms of communication are constituted. The dichotomy between "data collection" and "data analysis," still present in the fields of psychology and mental health, is overcome, since the empirical process itself is considered a theoretical production.

From this perspective, all scientific research is theoretical because it implies transforming something that happens in the world into a set of human meanings. Such a system of meanings does not represent the world, because there is no linear identity relation between world and meaning. Thus, the theoretical character of research is not defined because it is part of an established theory, but because the research process itself is an act of theoretical production, a process of the production of articulated meanings that develop new forms of intelligibility concerning the studied phenomenon. González Rey explains:

In this epistemological proposal and the methodological proposition that derives from it, theory making is the general objective of knowledge production. Developing theory, however, differs from 'applying' theories - a term that only makes sense in a science that defines itself as empirical. The theories in our proposal can never be applied, because a theory's categories take new forms and generate specific meanings in light of the new demands that all research implies. In this sense, the 'use of theories' always implies 'making theory', representing an active process of the researcher, which permanently assumes his or her author status. (González Rey, 2014a, p. 17, emphasis added)

In fact, the knowledge produced is always partial, since it is historically and subjectively configured; it is not possible to reach definitive conclusions for the topic addressed. The production of knowledge seeks to follow, as best as possible, the tension between organization and procedurality of the studied subjective processes, without trying to exhaust the complexity of such processes.

The partiality and procedurality of scientific research are what allows us to comprehend the notion of theoretical generalization adopted in this perspective.

As already argued, one does not seek to reach conclusions through inductive processes, but to advance in new meanings, promoting different articulations between them, expanding intelligibility courses that did not exist before concerning the studied phenomenon. In this regard, a singular case study can contribute new elements that broaden the knowledge concerning the phenomenon in question. In this sense, singularity acquires epistemological status insofar as it represents not only uniqueness, but a differentiated record of information that takes on meaning in a theoretical model that transcends it (González Rey, 2019a). It is a process of theoretical generalization, which is directed towards the construction of theory-practice units that are oriented to constructing resounding, albeit partial, explanations of the problem studied. Thus, theoretical generalization would consist precisely in the value that such articulations and meanings acquire in the understanding of new situations and events that, before such construction, were unintelligible (González Rey, 2014a).

Therefore, from the Qualitative Epistemology and the Constructive-Interpretative Methodology standpoint, research aims to open new spaces of intelligibility concerning the studied object, which can substantiate new ways of thinking and acting in relation to it (González Rey and Mitjáns Martínez, 2017, 2019). Such spaces of intelligibility, supported by the theoretical models that substantiate them, may be the basis for new and broader constructions, so as to culminate in the genesis of new concepts. Broader theoretical constructions, such as the concept and subjectivity as a symbolic-emotional system, makes way for theoretical visibility, which, due to its scope in terms of intelligibility concerning reality, is defined as new zones of sense (González Rey, 2005).

González Rey (1997, 2003) distances himself from the position held by current authors who claim that there is no reality beyond discourse, as he is more in tune with the conception adopted by French historical epistemology, represented, amongst others, by G. Bachelard (1978), in which all scientific construction is perceived as a way of simultaneously approaching reality and creating new human realities. This does not mean that there is a finished and defined reality to be apprehended by knowledge, but that our theoretical production is permanently tensioned by elements of such reality, which go beyond the processes involved in the genesis of this production. Such a position expresses an alternative to both naive realism and the total dilution of reality in culturally produced linguistic practices, which ultimately denies any ontological dimension apart from discourse. In this regard, the author expresses:

The consideration of a distinct approach to the theoretical discourses in which knowledge expresses itself, and in relation to which knowledge will confront itself permanently, is what we consider to be reality. (...) The empirical moment is not the expression of a 'reality in itself', but the result of the confrontation of the theory with what was studied in the meaning creation produced by the theory (González Rey, 2005, p. 32).

In this regard, theory is understood as a process in permanent confrontation and development based on different ways of dialoguing with reality.

This thought platform expresses its value in the fields of psychology and mental health by offering alternatives to instrumentalist proposals, typical of modern science, and to the lack of epistemological reflections that supported some methodological innovations in qualitative research, which cultivated the induction criterion as the only legitimacy parameter for the production of knowledge. Articulated as a tripod, Theory of Subjectivity, Qualitative Epistemology and Constructive-Interpretative Methodology allow a new and complex understanding of human functioning within culture, with several implications for the field of psychology and mental health.

In summary, this perspective allows:

- An articulation of epistemology, methodology and theory, which emphasizes the subjective dimension of human experience as symbolic-emotional processes and organizations, which express the generative and singular character of individuals and social groups. This allows the construction of a critical perspective without falling into linguistic-discursive reductionism.
- Overcoming instrumentalism and the devitalization of research processes and professional practice that have been developed within the scope of psychology and mental health. This perspective generates alternatives to conservative epistemological perspectives, which ended up reproducing many of the typical limitations of dominant modern science, such as the hegemon of the empirical, the theoretical apriorism, and the researcher's neutrality.
- Overcoming both individualization, which emphasizes individual and universal explanations to the detriment of relationships, society, culture and history, and sociologization, which ends up leading to a conception in which individuals and social groups are echoes of broader social processes, without any generative capacity;
- Advancing an articulated proposal for research and professional practice, in which the researcher/professional and the participant/user have a fundamentally active role in the construction of dialogical processes that allow both to understand subjective suffering in a complex and singular way and to orient practice towards subjective development in different social spaces based on an ethics of the subject.

Surely this is not the only possible alternative to the problems presented in this chapter, but advancing this unity between theory, epistemology, and methodology is a consistent way to move forward.

Executive Summary

This paper discussed epistemological and methodological problems within the fields of psychology and mental health and presented González Rey's Qualitative Epistemology and Constructive-Interpretative Methodology as a heuristic valuable alternative in the face of such problems. Emphasis was given to instrumentalism, which ended up devitalising research and neglecting emerging qualitative aspects in these fields. In fact, the dominant perspectives in mental health and psychology coincided in the elimination of both the quality of the

lived experience as a unit of analysis and of theoretical construction to represent the phenomena with which they deal. In short, variations and singularities were either ignored or considered as miscalculations, while the researcher's ideas were conceived of as unwanted contamination.

Alternatives in qualitative research in these fields were discussed, highlighting their methodological innovation along with their epistemological conservatism. In this sense, eager to distance itself from the dominant quantitative perspectives, some approaches within qualitative research ended up infiltrated by modern science historical problems, such as the hegemon of the empirical, the theoretical apriorism, and the researcher's neutrality.

On the other hand, gradually, different critical approaches within psychology began to emphasize mental health and the social sciences, language, discourse, communication, deconstruction, social construction and so on. In spite of the theoretical, epistemological and methodological value that these approaches had, many of them ended up neglecting the individual as an active stance of social constructions. Consequently, the richness of subjectivity, including imagination, emotional processes, and human motivation, was left out such critical readings of social life and considered as epiphenomena of hegemonic discourses.

Finally, González Rey's thought platform was presented and discussed as an approach to advance in the face of the discussed problems.

This framework articulates the Theory of Subjectivity, Qualitative Epistemology and Constructive-Interpretative Methodology as a unit. This unit substantiates the knowledge construction as a subjectively configured process, both by the researcher themselves and by the theory that underlies it. Science figures as a constructive-interpretative process, as it refers to the production of intelligibility, not an attempt to apprehend reality. This perspective allows a different understanding of subjective suffering, considering it as a complex, and singular subjective configuration, which constantly articulates individual and social experiences. As explained, professional practices based on the Theory of Subjectivity are oriented towards understanding subjective suffering as the basis for developing dialogical strategies aimed at overcoming it and favoring subjective development.

From González Rey's perspective, emphasis is given to the researcher's interpretative constructs, which are based on indicators and hypotheses. The recursive relationship between indicators and hypotheses -along with other researcher's reflections during the constructive-interpretative process- forms the theoretical model concerning the studied problem. Therefore, the method has the researcher's thinking activity at its core, by rescuing the subject as an epistemological category in the process of knowledge construction. Research is understood as a process of dialogical communication. This marks an important difference in the researcher-participant relationship, as well as a different representation of research itself. Research turns out to be conceived of as a social space, in which unpredictable communication processes emerge in a fabric of living relation that may become important to the researched topic itself. In this sense, it is not possible to reach definitive conclusions for a specific topic; rather,

this approach opens new spaces of intelligibility related to its topic, which can be the ground for the construction of new ways of thinking and practice.

The first psychology laboratories: An intense traffic of micropolitical relations in a neutral space

Arthur Arruda Leal Ferreira, Hugo Leonardo Silva Rocha da Rosa,
Marcus Vinicius Amaral Gama Santos & César Pimentel Pessoa

Abstract

Since Boring's classic work (*The History of Experimental Psychology*), there has been a strong tendency to consider the establishment of laboratories as historical landmarks, which distinguish the scientific from the pre-scientific past. In this traditional history of psychology the laboratories work as a neutral space for legitimation and demarcation. Few traditional historical studies describe the arising of these laboratories in connection with political aspects. When mentioned, these aspects are correlated with contextual macro-political features, as industrialization or democratization processes. In another perspective, the Studies in Science, Technology and Society (STS) propose a new style of analysis: according to the principle of symmetry, scientific and technological activities are completely intertwined with social practices. We have excellent examples of laboratory studies: the classical researches done by Latour & Woolgar and Knorr-Cetina. If we consider the discussion of laboratories in psychology through different STS perspectives, as Actor-Network Theory (ANT), Political Epistemology (PE) and Strong Program (SP), we can observe different problems and approaches correlating the first laboratories in psychology and micro-political questions. If we take some ANT and PE works we can analyze the political relationship with respondents (participants) via the concepts of Docility and Recalcitrance. We have also the very important concept of Political Ontology proposed by John Law, aiming to understand the political effects of our scientific devices. The PE with Vinciane Despret also points to the history of psychological laboratories with a progressively critical relationship in a political aspect: the history of the naive subject. In the SP perspectives, we have the history of work hierarchies in early psychological laboratories through the work of Martin Kursch. Finally, in some Latin America STS works we have some innovative approaches of these first laboratories in countries as Argentina, Brazil and Chile as Miguel Gallegos' ones. In this article we'll try to explore the connections between traditionally separated practices and historiographies: the first laboratories in these countries were places for school and psychiatric measurements. The objective of this work is not to denounce the laboratory as a simple ideological artifact, but to understand the micro-politically produced world connections there and pay attention to micro-political vectors.

Keywords

Brazilian psychological laboratories, political analysis, STS studies

Since Boring's (1929) classic work, *The History of Experimental Psychology*, there has been a strong tendency to consider the establishment of laboratories as historical landmarks that distinguish scientific psychology from its pre-scientific past. The laboratories work as a neutral space for legitimation and demarcation in this traditional history of psychology. Few traditional historical studies describe how these laboratories arise in connection with contextual politics. When mentioned, these aspects are correlated with contextual macro-political features, such as industrialization or democratization processes. (Cattell, 1928; Kirihaara, 1959; Coon, 1993)

The Studies in Science, Technology, and Society (STS) proposed a new style of analysis based on the principle of symmetry, according to which scientific and technological activities are completely intertwined with social practices. If we consider the discussion of laboratories in psychology through different STS perspectives, such as Actor-Network Theory (ANT), Political Epistemology (PE), and the Strong Program (SP), we can observe different problems and approaches that link the first laboratories in psychology with micro-political questions. If we take some ANT and PE works, we can analyze the political relationship with respondents (participants) via the concepts of Docility and Recalcitrance. Central to our analysis is the concept of Political Ontology, as proposed by John Law (2005), which aims to understand the political effects of our scientific devices. The PE with Vinciane Despret (2004) also points to the micro-political history of psychological laboratories with a progressively critical lens that highlights the history of the naive subject. From the SP perspective, the history of work hierarchies in early psychological laboratories is explored through the work of Martin Kusch (2005).

Finally, some Latin America STS efforts offer some innovative approaches to these first laboratories in countries such as Argentina, Brazil, and Chile. For example, Miguel Gallegos and Hugo Leonardo Silva do such work and the latter additionally explores the connections between traditionally separated practices and historiographies to show how the first laboratories in these countries were places for school and psychiatric measurements. The objective of our work is not to denounce the laboratory as a simple ideological artifact, but to understand the micro-politically produced world connections there and pay attention to micro-political vectors. Highlighting ideological aspects of a laboratory's performance presupposes a separation between the sphere of value and knowledge. In contrast, we assert an inseparable and productive link between the two spheres. Exploring its geographic and historical variation calls into question traditional historiographies that overlap the emergence of psychology with the foundation of laboratories.

The laboratory as a place of scientific demarcation

Why were laboratories used as a historical landmark, able to separate scientific and pre-scientific moments? Perhaps this criterion was offered in the face of the difficulty of establishing a scientific criterion such as those proposed by neo-positivism (ultimate empirical tests); by applied rationalism (projects marked by an ultimate rationality), and by the paradigm thesis (the presence of a normal science).

Within this line, the traditional inquiry among historians, often leading to a kind of Grand Prix history, has been: which was the first laboratory? The local characteristics and modes of operation of these laboratories are of little importance, as there is a general history that is colonially replicated from the metropolis to the most distant corners. In contrast, we can seek to establish the uniqueness of the local production of these laboratories around the world through questions such as: How did these spaces work? Who were the users of these laboratories? How do the hierarchy and the leadership styles work? How important is its functioning? What were its periods of activity? What kind of world and society do they produce? We argue that these questions introduce micro-political dimensions that displace laboratories from their status as epistemological landmarks (with a neutral function) to political entities embedded with social relationships.

These discussions are in connection with the current Laboratory Studies as part of the STS. In this domain, especially inspired by the ANT (Latour and Wooglar, 1979), PE (Despret, 1999, 2004 and 2011), and the SP (Kusch, 2005) we will propose a politically dynamic and symmetric description of the laboratories, considering the actors in connection, the establishment of the winners or the losers, happenings supposedly internal to the laboratories, and supposedly broad social or event external to the laboratories. Let's move on to a brief examination of current STS Laboratory Studies with their main contribution to the subject.

Putting the study of psychological laboratories into perspective: Political Epistemology and Actor-Network Theory

As we proposed in the introduction, this collection of analyses of the first laboratories brings about a space for reflecting on the research methods of these laboratories in terms of their historiographical practices. Drawing on STS, ANT, SP, and PE allows us a microanalysis of the psychology laboratories that discuss the politics of these places and propose alternative ways of describing the history of psychology.

Certain works that try to perform a historical overview of the creation of the STS field focus on laboratory studies as one of the constitutive elements of the field (Lynch, 1993; Law, 2004; Latour, 2008). Classic works by Knorr-Cetina (1981) and Latour and Wooglar (1979) delimited the current STS domain, together with the Edinburgh School's position in favor of the SP in the Sociology

of Scientific Knowledge (Bloor, 1976/1991). The main attribute of these works is the principle of symmetry, according to which the ways in which both the recognized sciences and those knowledges considered doubtful or outdated are studied in the same way, without any privileges given to the first group or any special explanatory entities such as scientific rationality, evidence, revolution or normal science. For the SP, this symmetry operated in the common attribution of social causes (beliefs) present in successful and unsuccessful versions of the great market of knowledge.

Latour and Wooglar's (1979) work is an ethnographic study of laboratory practices that stands out for proposing a series of issues to be analyzed. These issues include the enunciative modalities of scientific formulations, the modes of inscription of empirical proofs, and the production of the world from the operations undertaken in laboratories. A more didactic explanation of the conclusions of this book can be found in texts such as *Science in Action* by Latour (1987) or *After Method* by Law (2004). Another important aspect is the increase in the number of actors during this process: the scientific community, public representation, the interests of allies (the pharmaceutical industry, the army, or research funding institutions), the modes of mobilizing the world (or modes of inscription), and a series of nonhuman agents (Latour, 1999). These works focus on the controversial, uncertain, and oscillating aspect of science in its "procedurality", before any stabilization of the statements and supporting efforts take place (a process called the closing of the black box).

Good sources for examining the history of psychology are the studies of Political Epistemology (EP) promoted by authors such as Stengers (1989, 1992) and Despret (1999, 2004 e 2011), among others. In *How to talk about the body?* Latour (2004) enumerates 08 principles of PE that delimit the positions of these authors in regards to knowledge. For these authors, scientific knowledge is never the result of purification of data, where the only role of the researcher is to represent the objects using well-constructed sentences. It is rather produced as an articulation and coaffectation among entities along with the unexpected production of results. As an articulation, scientific knowledge can no longer be distinguished by a good or bad representation, but by a good or bad articulation. In the first case, we have a situation where the articulation is extorted or conditioned to a punctual response, leading the researched entities to a place of "docility". In the second case, we have an articulation where the testimony goes beyond a mere response, opening up to the risk of invalidating the questions and propositions of the researcher and to the proposal of new questions by the researched entities. Here we have a recalcitrant relationship.

These assumptions influence how these authors approach laboratory studies. These subjects of analysis are present, for example, as a mixture of recalcitrance and extortion in a series of evaluations of psychoanalytic practices conducted by Stengers (1989). In this sense, psychoanalysis was able to create a device for the free discourse of its subjects that differed from psychiatry while also creating a type of laboratory in the controlled production of transference (Stengers, 1992). In other instances, however, it went into the opposite direction by protecting itself from risk, both in the search for a transcendental grounding

associated with the concept of the unconscious (Stengers, 1989) and in shifting the problem of influence beyond its boundaries (Stengers, 1992). Stengers thereby argued that psychoanalysis again submitted itself to the risk of recalcitrance when it reconsidered what it had removed in delineating its scientific boundaries: hypnosis and influence (Stengers, 1992).

Despret, moreover, undertakes a more detailed analysis of the political practices of what we call psychological laboratories (1999, 2004, 2011). In her studies of the laboratory versions of the studies of emotion (1999) and in her studies of the Hans case, she offers an interpretation of the political meanings of laboratory practices in psychology (Despret, 2004). In the latter work, she analyzed the introduction of a new character in the field of introspective-experimental devices (based on the training of observer-subjects) that were present in psychological laboratories at the turn of the 20th century: the naïve subject. This character makes an entrance at a time when there was a need to introduce a collaborator into the laboratory who would not know what was being proposed as an object of study. Thereby, over the course of the 20th century, the subject framed in this way is considered to validate the experimental method. Despret thoroughly studied how the Austrian psychologist Oskar Pfungst, in the first decade of the 20th century, introduced this character, aiming at controlling any influence that a human agent who knew the answer to the given questions could have on Hans' answers, through simple indirect clues or emotional responses. This minor character took an ever more defined form in the laboratory studies of approaches such as gestaltism through the critique of the biases acquired by training and in behaviorism through the challenge of the introspective method itself, which was considered subjective and inaccurate (see Ferreira, 2012).

The ascension of the experimental method including the naïve subject first seems like the triumph of a more objective psychology that is without any prior influence of the researcher or of any theoretical referential regarding the authentic actions of its witnesses. Despret (2004) established that the possibility of recalcitrance of the psychological witnesses became even more problematic in the presence of devices that work with the participants in a position of "naïveté". Here we have a reversion of the majority of the manuals of the history of psychology, such as Boring's (1950): the transition of the trained subject to the naïve subject is not a step forward of psychological knowledge in the direction of objectivity and control, but a step backward in the possibility of recalcitrance, generating docile, asymmetrical, and limiting articulations regarding its witnesses: "Subjects without the excellence of expertise do not pose a risk of taking up a position in investigations" (Despret, 2004, p. 97). A considerable amount of psychological research is based on this pact, and thus other possibilities of interchange between researchers and research subjects are inhibited.

The Strong Program and the first laboratories in Western Europe

Different from the EP, the SP authors work with different questions concerning the different kinds of hierarchies present in the psychological laboratories. In 1995, Martin Kusch published the paper “Recluse, interlocutor, interrogator: natural and social order in turn-of-the-century psychological research schools”, which advocates an integration between the “research school” approach of historians of science and the “leadership styles” approach of sociologists of science. This integration resulted in a fruitful framework of analysis that allows for the inclusion of both “natural” and “social” factors in the study of scientific knowledge. This project was later continued in the first part of his book, *Psychological Knowledge: A Social History and Philosophy* (1999), where Kusch includes other “social” factors, such as religious and political affiliation. In order to propose and show the advantages of his framework of analysis, Kusch develops a case study about one of the main scientific controversies that took place from the end of the 19th century to the beginning of the 20th century in the field of psychology: the Imageless-Thought controversy.

The Imageless-Thought controversy involves psychologists’ dispute about whether or not it is possible (or not) to have processes in consciousness that are not reducible to basic elements such as sensations, representations, and affects. These processes would be “imageless” precisely because there was no “image” as an element in their foundation, thus being recognized by their advocates as a new and different class of phenomena, irreducible to more basic processes. The controversy had two main parties in Germany. One party, led by Wilhelm Wundt, insisted that *all* psychological processes that could be studied by experimental methods – only sensation and perception – were reducible to sensations, representations, and affects. The other party, represented by the Würzburg School, announced that they were registering processes of consciousness that their experimental subjects were not able to reduce to the traditional basic elements.

So much is well known from textbooks on the history of psychology, but Kusch’s (1999) treatment turned this debate into a rich case for understanding some of the main features of psychological science of the time. First, he examined the Würzburg School’s theories, procedures, and social organization using primary sources. Second, he added new factors to the traditional analyses of the controversy, mainly the “leadership styles” of each party and the “place of knowledge” that each party defended. Third, Kusch introduced a new thesis: although one cannot suggest a causal relationship between social aspects and natural aspects, one can see that the social order defended by a school is reflected in other aspects of the same school, such as its theory of mind or its view of psychology as a field. In this regard, Wundt established a hierarchical social order and a hierarchical theory of consciousness, while the Würzburg School established an egalitarian hierarchical social order and an egalitarian theory of consciousness¹.

¹ Kusch’s view on the relationship between the social order and the natural order is formulated in a few different ways in his paper. Sometimes he finds that the social order is “reflected in” the natural order

Kusch (1995, p. 421) develops his analysis through five main discussion frames:

1. *The scientific theories*, that is, the theories of mind defended, considering how each party conceives the way consciousness is structured, which elements are the fundamental ones, and which processes are open to experimental investigation;

2. *The “place of knowledge”*, that is, how each party understands which social conditions are necessary to the production of knowledge and whether knowledge demands solitude or interaction, mutual contribution, and conversation;

3. *Experimental designs*, that is, how each party organizes the introspective experiments, how the relationship and the authority function between the experimental subject and the experimenter;

4. *Conceptions of the interrelations between subdisciplines*, that is, how each party conceives the divisions within the field of psychological knowledge and their relationships;

5. *The social order, mainly the director’s style of leadership*, that is, how the social order is more or less hierarchical, more or less egalitarian, and what the relations are between the director of the research school and its researchers.

Natural and social order in Wundt’s Leipzig Laboratory

Wundt advocated for a theory of consciousness that separated lower mental processes and higher mental products. The former, encompassing sensation and perception, were subject to investigation through the experimental method of 'inward perception [*innere Wahrnehmung*]. The higher mental processes were products such as thought, imagination, memory, myth, and religion, all of which Wundt considered too complex for experimental manipulation in the laboratory. For Wundt, the latter were *products* precisely because they were the result of the action of the “apperception” which is an active process which transformed the elements upon which it operates into phenomena that are not just the sum total of its components, but a ‘whole bigger than its parts’. For this reason, the investigation of these products of consciousness requires a different method, which Wundt named ‘psychology of the folks’ [*Völkerpsychologie*], what we would nowadays consider to be a sort of historical or ethnological analysis. Thus, in Wundt we have a *hierarchical theory of consciousness* where there are two

(Kusch, 1995, p. 427); in another formulation, he shows that there are “parallels” (*ibid.*, p. 428) between the social and natural orders; in another formulation, he finds that “the social order [...] repeated the natural order” (*ibid.*, p. 428); in yet another formulation, he shows that the social order goes “hand in hand” with the natural order (*ibid.*, p. 432); in still another formulation, he explains that the natural order “can be read as a justification for” the social order (*ibid.*, p. 428, 438); finally, in still another formulation, he claims that defenders of a certain social order “will be tempted to develop or defend” certain conceptions about the natural order. However, Kusch makes it clear that he is not defending a “static and deterministic” (*ibid.*, p. 421) interpretative model nor “a causal link running from the social structure of research schools to their scientific theories” (*ibid.*, p. 438).

layers – one of lower and the other of the higher mental processes – and each layer requires its specific method.

For Wundt, the proper “place of knowledge” was solitude. Wundt, on the one hand, directed the experimental-laboratory research of the lower processes for his students and, on the other hand, occupied himself *alone* with the research on *Völkerpsychologie*, which he considered the main part of psychology dealing with more complex phenomena. Despite this separation, even in the laboratory research, there was a *solitude ideal*, as in the research in *Völkerpsychologie*. In experimental research, the mechanization of the experiments using instruments increasingly diminished the need for an experimenter to help or interact with the experimental subject during the experiments. Wundt further conceived that it was best for the experimental subject to be left alone as he recorded and reported his inward perception because the presence of another person was considered to interfere with the experimental subject’s reporting. Concerning *Völkerpsychologie*, Wundt was the only one authorized to develop a theory in this area. He did all his research in this area alone and the students only had access to his results through his lectures and books long after the research had already been conducted.

We noted how Wundt’s experimental design was mechanized so that, in the *ideal* situation, there would be no need for the experimental setting of a second person besides the experimental subject and the mechanical instruments for stimulus application and the recording of results. In experiments where there was an experimenter, the experimental setting was designed to exclude any interference that could occur on the experimenter’s part. Thus, the use of questions, dialogs, suggestions, or any type of interaction beyond stimulus application was considered by Wundt to ruin the validity of the results, because such were variables incapable of control.

Wundt’s division of psychology was also *hierarchical* due to his division of lower and higher mental processes. The lower processes such as the tasks assigned to students were simpler and could be studied experimentally, but the higher processes could not be studied experimentally because they were too complex, demanding another method which was the *Völkerpsychologie* that Wundt exercised himself. Thus, psychology was divided into a lower part, experimental psychology, and a higher part, *Völkerpsychologie*. This distinction entailed a *value* distinction whereby the experimental research was held as a *Vorschule* for psychology, while *Völkerpsychologie* investigated the most important part of psychology. Until its theoretical foundations were already well established, Wundt was a strict defender of the idea that psychology as a *Wissenschaft* should not be involved with practical areas such as pedagogy, medicine, law, etc.

Finally, the social order in Wundt’s laboratory was also *hierarchical* where Wundt was the leader of the laboratory, selecting according to his own interests what each researcher would research in his experiments. He did not react in a supportive way to his students’ independent work and ideas, and some of his students were aware that Wundt could not conceive that they could ever do or develop any task that the master had not already set. Moreover, his students saw

Wundt as strictly inaccessible, for they pretty much only saw him when he left his solitude to give his lectures, where he preached what his students must know about psychology.

Kusch's analysis shows some relationships between the natural and social orders that are reminiscent of Wundt:

The two-tier hierarchy of the mind could be used as a justification for the two-tier hierarchy within psychology as a field of knowledge, and both in turn could be used to lend plausibility to the hierarchical 'division of labor' in Wundt's institute. (Kusch, 1995, p. 428).

Thus, the division between higher and lower mental processes was the base and justification for the division between experimental psychology and *Völkerpsychologie* and also for the division between the work the students were supposed to do – experimental psychology – and the work the master was supposed to do – *Völkerpsychologie*. Moreover, “the social order of the experiment had the same hierarchical structure” (*ibid.*, p. 428), since the experiments were based on a *solitude ideal* and the authority was located in the experimental subject, who should not be disturbed or influenced by the experimenter (if even present).

Natural and Social Order at Würzburg School

The Würzburg School had quite different “natural” and “social” orders in opposition to Wundt. First, concerning the *theory of mind*, the Würzburg psychologists opposed the view that the study of higher mental processes and products – thought, imagination, memory, etc. – could not be conducted experimentally. By proposing a method of “systematic experimental introspection” which was in several ways different from Wundt's *innere Wahrnehmung*, the Würzburg psychologists considered themselves able to study higher processes by experimental means. There was no need to adopt a complementary method, as Wundt did with *Völkerpsychologie* because, for the Würzburg School, *all* psychological phenomena could be studied experimentally. One of the reasons for this view was that those higher processes, such as thought, were not as complicated or complex as Wundt believed. Thus, the Würzburg School's theory of mind was *non-hierarchical* or *egalitarian*.

The place of knowledge is in interchange and communication for the Würzburg School. The production of knowledge depends on a social organization in which researchers can develop their own research projects but are in constant dialogue with others' theories, methods, and results. Although the Würzburg psychologists are considered as constituting a “school”, they did not agree on everything. Theories created by one member were later used or reviewed by other researchers, and researchers usually took part in the experiments of others.

This appreciation of cooperation can also be seen in the *experimental design*. In opposition to Wundt, Würzburg psychologists did not consider the presence and action of another person in the experimental setting to be a problem. Not only was it not a problem, but the realization of any experiment was conceived as necessarily including two persons: the experimenter and the experimental subject. The relationship between the experimenter and the experimental subject in the experiments should be *egalitarian* and *reciprocal* where the experimenter should allow the experimental subject to use the words that the subject prefers and the experimenter should choose tasks for the experiments taking into account the experimental subject's tastes and predilections. The use of questions after the introspection was not seen as a bad intervention or as biased suggestions, but as useful tools to help the experimental subject remember or focus on some aspects he ignored in his initial report. Moreover, some Würzburg psychologists claimed that some sort of interpersonal empathy was necessary, that intimacy and trust between the experimenter and the experimental subject would help the experiment to proceed in a useful way.

Concerning the view of psychology as a discipline, the Würzburg psychologists did not see any need for a strict division between experimental psychology of the lower processes and a *Völkerpsychologie* of the higher products. Experimental psychology could use "systematic experimental introspection" to investigate all psychological processes. The Würzburg psychologists were much more open than Wundt in reference to the relationship between psychology and applied areas because they were in constant contact with those areas, sometimes even using untrained experimental subjects in their experiments. Külpe, for example, accepted laboratory researchers who had already studied or still worked in applied areas such as pedagogy, medicine, law, etc.

Concerning the social order, mainly the leadership style, it is possible to see the contrasts between the place of Külpe as the director of the Würzburg School and Wundt as the director of the Leipzig laboratory. First, Külpe preferred not to choose what each researcher studied; for him, each researcher should be free to choose what he wanted to investigate. In opposition to Wundt, who would leave the experimental work to his students so that he could concentrate on his *Völkerpsychologie*, Külpe would take part in his researchers' experiments and considered it a duty of *every* member of the laboratory to participate. The main discoveries and theoretical statements of the Würzburg School, moreover, were not usually made by Külpe, but by Marbe, Ach, and Bühler. Thus, against Wundt's *hierarchical* social order, Külpe and the Würzburgers developed a much more *egalitarian* social order.

In the same way as the Wundt case, we can establish some relations between Kusch's five factors: "The egalitarian spirit of the Würzburg laboratory and its emphasis on the equality of experimenter and experimental subject went hand in hand with an egalitarian model of the human mind" (Kusch, 1995, p. 432). In opposition to Wundt, however, it is not *hierarchy* but *equality* that is at play in both "social" and "natural" orders. The Würzburg laboratory politics context enabled a social order in the laboratory that encourages interchange

among researchers and a social order in the experimental setting that emphasizes empathy, communication, and trust; and a natural order that does not divide consciousness between lower and higher processes and thus does not divide psychology strictly into two subdisciplines or into two methodologies.

Historiographic issues relating to psychology laboratories in Brazil

We related some cases such as the naive subject and the hierarchy in the laboratories connected to EP and SP, but we now turn to the implications entailed in the examination of psychological laboratories in Brazil. This turn involves examining the connections of these laboratories to their functions in the broader context of institutions. We propose inquiries that establish the politics of the laboratories according to the STS frame. But more than proposing STS questions, we understand the political aspect of these laboratories through their ontologies, or political ontology (Law, 2004). As Latour (1983) suggested, laboratories are places that produce natures and societies. It is in this wide sense that Brazilian laboratories will be examined here: how they create political features that shape Brazilian society.

In Brazil, the starting point of a supposed scientific psychology is usually marked by very superficial knowledge of the first laboratory practices. As far as is known, there were few laboratory practices that existed between the dawn and the middle of the First Republic, which is consistent with the little documentation found to date that can better elucidate them. Document collections, on the assumption that they exist, are yet to be found, studied, and analyzed. On the other hand, it is possible, and this hypothesis should not be discarded, that some of these few practices did not even produce records of their existence or, if they did, this material was not perpetuated over generations or was not adequately preserved.

The curious fact is that the number of mentions and references to Brazilian psychology laboratories that appear in our narratives are not accompanied by a more detailed, descriptive work of their practices. The laboratories were monumentalized and their significance in the history of psychology was overestimated, without at least their activities being properly elucidated. When the question is asked: "What was produced in the laboratories that were under the leadership of Manoel Bomfim and Maurício de Medeiros?" a more satisfactory answer to the activities of institutions such as these is yet to be written. If a supposed meaning of laboratories in the process of making psychology autonomous seems to be a matter that has already been clarified among some historians, on the other hand, the question raised undoubtedly transports us from an illuminated point to a region of twilight and almost complete darkness.

The present text is not an attempt to answer these problems, nor is it an exhaustive exercise in describing experimental practices in psychology in Brazil. We will seek to analyze certain issues related to the psychology laboratory regarding a perception of its relevance by the so-called Brazilian intelligentsia

and its function, based on two examples of laboratories whose practices were linked to the field of education.

Consider the preliminary question that informs our following inquiry: What was the use of psychological experimentation, whether in educational or psychiatric institutions? In the field of psychiatry, psychology was used as (1) a framework that supported the theoretical foundation for understanding the normal and pathological manifestations of the faculties of the soul, (2) a diagnostic and prognostic aid, and (3) the incorporation of means and techniques for the prophylaxis and cure of mental illnesses. The role of the laboratory was mainly as a diagnostic and prognostic aid because its devices served to measure variations in pathological manifestations. The psychological examination was a complementary tool in the attribution of a medical diagnosis.

In education, the laboratory had an equivalent function where, if a teacher observed that a particular student offered resistance "to the influences of education" (Bomfim, 1928, p. 360), the laboratory entered the scene as a scientific device that would help in the examination with the purpose of verifying the degree of abnormality of that student. According to Bomfim, "school abnormals" ranged from cases that were considered mild (the "mentally weak") to the most serious, such as "imbeciles" or "deep idiots" (ibid. p. 355-358). Once the examination had been carried out and the diagnosis of the school abnormality had been established, the next step is well articulated by Basilio de Magalhães:

Now, one of two things: - either this child is literarily educable, and, in such a case, it is necessary that special schools are provided, where they will be entrusted to the care of a suitable teacher, after being examined by an Academic, who shall not leave them unattended; or this child is literally uneducable, but capable of receiving, with benefit, a treatment befitting their condition, and, in such a hypothesis, it is necessary to take them to suitable establishments, where they are to be entrusted to the care of specialist physicians. (1913, p. 47).

The laboratory is a mediator in deciding the child's future as either destined to a special class or school, or they would be taken to a special institution (e.g. an asylum) for serious cases unable to go through the educational process in schools. In this latter case, children would be put under the care of a doctor and would suffer all the infamy that characterizes this group of abnormal individuals. They would be stigmatized as failures of the adaptive process and possibly permanently useless to themselves, their family, and their country.

The idea of transferring the child to another class or institution included the possibility of their return to ordinary classes where students were constructed as physically and psychologically healthy beings. In this sense, the role of the laboratory was situated in the wake of calls for pedagogical transformations and reforms in public education. It was time for the teacher to know not only the content to be taught but the students themselves. This knowledge was what Basilio de Magalhães called the "student's psychophysiological curriculum" (p. 145). A curriculum that was certainly not written by the parents or the students themselves, but an enigma to be elucidated by the observation of the teachers and, above all, by the scientific examinations used in the laboratories (or offices).

The practice of mental orthopedics necessarily implied prior knowledge of the physical and psychological aspects that were twisted. From this point of view, it is not surprising that experimental psychology gained ground in the school environment where precisely its methods responded to an interest in the area of public education. Having sketched some lines for this introductory question that will be taken up later, we can now move on to the other proposed subject.

When Claparède describes a brief historical overview of pedology in different countries around the globe, he comments on Brazil as follows:

In Brazil, pedology is under-represented. In São Paulo, Quaglio, author of a Compendium of Pedology (1911), works for its development, having created a Faculty of Pedology in the Capital. In 1897, Mr. Medeiros e Albuquerque created a laboratory of experimental psychology in the *Pedagogium* of Rio de Janeiro, and later a professorship of pedagogical anthropology. It was vigorously opposed; they censured him for these 'fantasy innovations' and none of his creations subsisted. (1940, p. 76, author's emphasis)

Note how the *Pedagogium's* experimental psychology laboratory was created in 1897 and the censorship was suffered by Medeiros and Albuquerque². It also highlights how psychology in Brazil at the end of the 19th century was part of a network of tensions in the discourse among intellectuals. The conflict mentioned by Claparède is an example of this tension, and it was most likely carried out by critics of materialism and positive philosophy. The attack by certain sectors of the Brazilian intelligentsia on Medeiros e Albuquerque, however, is not something that remained in the 19th century, when these philosophical currents began to be discussed. It is worth remembering the tension reported by Centofanti (1982) between Catholic intellectuals and the Institute of Psychology that was founded in 1932, after the conversion of the experimental psychology laboratory at the *Colônia de Psicopatas do Engenho de Dentro* (*The Colony of psychopaths from Engenho de Dentro*). Certain barriers offered resistance to the advancement of these ideas in national territory in the accounts of defenders of new trends in psychology (and natural sciences in general). Barriers were erected by those who judged the transformations in the scenario of philosophy and natural sciences as a harmful excess of materialism that corrupted society. It is in this scenario that we can place Claparède's comment.

The year 1897 as the foundation of the *Pedagogium* laboratory attracts attention for creating a certain historiographical inconsistency. This is the year that Centofanti attributes to the creation of this laboratory in the aforementioned study, with Claparède as a reference. It so happens that some works mention the year 1906 as the founding date of this experimental psychology laboratory (Antunes, 2012, p. 68; Massimi, 1990, p. 72; Pinheiral, 2011, p. 376). However, a reading of Article 2 of Decree number. 100, published in the collection of municipal laws and vetoes of 1898, provides us with a clue on this issue:

² The reflections about the date here do not seek to discuss what would have been the first psychology laboratory in Brazil, but its period of operation.

It is incumbent upon him to organize and maintain the pedagogical museum, a laboratory of experimental psychology especially intended for pedagogical research, offices for the practical study of physical and natural sciences, and pedagogical exhibitions. (1898, p. 253).

Following the reading of the Decree, Article 41 states that:

The editor of *Revista Pedagógica* [*Pedagogic Review*] will be in charge of the direction of the psychology laboratory, whose installation can already be commissioned by the School Board, on account of the funds - School supplies - and- School activities- for the future accounting period. (p. 260).

The passages of the decree suggest that the laboratory was conceived and proposed at the end of the 19th century, but as the installation was still to be commissioned and so its inauguration could only effectively take place sometime later. The first references found about the *Pedagogium's* experimental psychology laboratory date from 1902 and 1903. In fact, the 1902 article contains the regulations and decrees concerning the *Pedagogium*, that is, the laboratory was still only on paper, it was something planned with the aim of a future implementation (*Correio da Manhã*, November 25, 1902, p. 2)³. However, the 1903 text already suggests the concrete presence of a laboratory in the institution, commenting that the *Pedagogium* has the "resources of the laboratory of experimental psychology" (*A Notícia*, December 31, 1903, p. 2). Although it is not possible to conclude that its inauguration was, in fact, in 1903, a text from 1904 affirms the fact that Bomfim was the director of the psychology laboratory (*O Paiz*, August 13, 1904, p. 3). Thus, with these records, we can assume that the laboratory was installed between 1898 and 1904. This interval could be understood as the time required for the importation of the devices and, given the lack of competent Brazilian professionals in this new psychology who could teach courses of experimental psychology, Bomfim's training with Alfred Binet in France.

What would this laboratory have produced? Regarding the subject of laboratories in the history of psychology in Brazil, the activities of the *Pedagogium* laboratory are perhaps the most enveloped by questions. The few sources found on this issue reveal that Bomfim at least carried out teaching activities in the laboratory. The press release of the experimental psychology courses coordinated by Bomfim shows that the laboratory space was used for practical classes. In the course program, as shown in an article published in the newspaper *A Notícia*, on May 2, 1916 (p. 1), it is stated that the classes taught methods and techniques of psychological experimentation with the use of devices. The program explicitly mentions the ergograph, but the themes of the classes suggest that instruments such as a dynamometer and esthesiometer were also used in practical classes.

³ The direction of the experimental psychology laboratory at *Pedagogium* was discussed in this article published in *Correio da Manhã*. The author of the comments points to the need for the laboratory to be run by a person "who has publicly demonstrated high competence; otherwise, the aforementioned laboratory will become a sorcery shop".

The article comments that Bomfim's courses, which provided knowledge of experimental psychology, could be of great use to the teaching profession since it would help in the teachers' observations in the case of abnormal children, but the course mostly attracted the attention of physicians. To train doctors and professors interested in the new methods and techniques of experimental psychology, Bomfim taught contents that were present in the main manuals of physiological and experimental psychology of his time: reaction time, fatigue, memory, attention, threshold awareness, and the association of ideas, among other topics. In addition to the practical classes in the laboratory, the space was available for students to carry out autonomous investigations under the guidance or not of Bomfim.

It is worth remembering, by way of contextualization, that the proposal of the experimental psychology laboratory in the field of education was aligned with the purposes of the *Pedagogium* itself. Remember Kuhlmann Jr. (2013), who in referring to the institution's regulations, stated that the purpose of the *Pedagogium* would be:

To become a driving force for the reforms and improvements that national education needs, offering public and private teachers the means of professional instruction they may need, exposure to the best methods and the most improved teaching material. (p. 37).

By offering new methods and techniques for the psychological examination of schoolchildren, experimental psychology would help in teacher training and ultimately contribute to public education. Bomfim's course could be understood in the light of the proposals for the reform of public education that were much discussed among intellectuals of his time, and whose resonances can be found in the Brazilian media.

In terms of the assumption that the *Pedagogium* laboratory was used in the training of doctors and teachers, Bomfim's (1928[1917]) *Noções de Psychologia* [*Outlines of Psychology*] verified that Bomfim had published research from activities in the laboratory there. We emphasize, however, that the book was intended to assist in the teaching of psychology, especially in normal schools, and was therefore not intended to be a means of disseminating laboratory research. The evidence is scant, but at the end of the second edition of the book Bomfim included an appendix composed of two texts: "a characterization of school abnormalities" and "an analysis of fatigue". The first appendix is a more theoretical exposition and aims to incorporate diagnostic categories into the understanding of childhood abnormality and the second approaches psychological examination in practice. Therein Bomfim describes experiments regarding fatigue and the use of devices such as the esthesiometer, the ergograph, and the dynamometer for this purpose. Devices that evaluate, respectively, the consciousness threshold, fatigue, and muscle strength, themes present in the course program. The problem is that Bomfim does not offer clear indications that the experiments described in this chapter are the product of research carried out in the laboratory, but at certain moments it ends up leaving the reader in doubt. For example, the chapter is divided into the topics "verifications carried out",

"surveys in schools" and "verified results". Although he never mentions the *Escola Normal do Rio de Janeiro* (Normal School of Rio de Janeiro) or even the *Pedagogium*, he uses passages such as "however, it was not possible to establish a precise relationship (.)" or even "the exercises made especially with the research of the classes (.)" (1928, p.369), generating some confusion as to whom exactly he was referring to. In describing the research and its results, Bomfim certainly referred to authors such as Binet and Ebbinghaus to enter into dialogue with the literature of his time and expose the state of the art of research on the subjects he dealt with. At other times, however, his descriptions lack direct references to the authors.

The work *Pensar e Dizer* (*To Think and to Say*), from 1923, is somewhat curious regarding this subject. Here Manoel Bomfim suggests that he carried out research and accumulated data, but assumes that he did not obtain satisfactory results so that he could organize and publish them. On the other hand, this is a text in which Bomfim criticizes the experimental method. Portugal (2010) comments that it is also possible to find "severe criticism of the experimental procedure" in the text *O Método dos Testes* (*The Tests Method*), published by Bomfim in 1928.

In any case, comments on the activities of this laboratory or even on experimental psychology in Brazil make a more accurate historical analysis even more complex. A brief mention by Moncorvo Filho (1926) of the laboratory can be found in the passage "this laboratory actually set up there seems to never have started its work, which without a doubt could have been of the greatest use." (p. 187). Which works, precisely, would Moncorvo Filho be referring to? Expanding on the issue and moving on to a more general comment on experimental psychology in Brazil, Farias Brito (1912) wrote a short essay in which he denounced the delays that psychology had been suffering. The intellectual atmosphere, in his view, was not prepared for the new trends in psychology, nor was the Brazilian soil conducive to fertilizing the seed of this new science. Referring precisely to experimental psychology, Farias Brito asserts:

In our country, unfortunately, we have nothing that can be mentioned here. If you ask yourself: what is there among us on this very important subject that has so greatly aroused the interest of the most eminent men in all the educated countries of the world? The answer should be this: nothing, absolutely nothing. (p. 277).

This text is quite suggestive concerning the obstacles faced by Brazilian intellectuals who intended to germinate the new practices of this science of the soul that emerged in Europe and the United States some decades ago. The tensions produced in Brazil around the possibility of an experimental science of the soul are found in different sources, and in Farias Brito such tensions acquire dramatic contours:

And whoever intends to cultivate it there, risks suffering the disappointment of those who sow in the rough rock, on boulders, where the plant cannot take root, or among thorns that will not let it grow. What is certain is that no one wished to react against our overwhelming sterility with regard to the study of the human

spirit, that is, with regard to the study of our own nature in its deepest significance. (p. 278).

The chapter in question is part of the book *A base física do espírito (The physical basis of the spirit)*, which was published in Rio de Janeiro in 1912, in the same city and almost a decade after the inauguration of the *Pedagogium* laboratory. So, a question remains: if the laboratory headed by Bomfim has really existed and carried out teaching and research activities, why did Farias Brito write those passages so decisively? With the information we have analyzed so far, even though the number of primary sources has not been satisfactory, we can at least raise the hypothesis that the experimental psychology laboratory installed at the *Pedagogium* was not a large center for teaching and research like the well-known European laboratories so present in the general historiography of psychology. Its activities seem to have been more discreet, possibly more focused on teaching, and did not produce a legacy to be perpetuated by later generations of doctors and educators, to acquire notoriety and mark its presence in historiography as an expressive center of teaching and production of psychology.

In contrast, the same cannot be said about the laboratory created at the *Escola Normal Secundária de São Paulo (Normal School from São Paulo)*. Centofanti's works (2006, 2014) are an important contribution to the historiography of this institution. Consider works published by Clemente Quaglio⁴ that are based on his experiences with students from the *Escola Modelo Caetano de Campos (São José dos Campos Normal School)*, which was attached to the aforementioned *Escola Normal (Normal School)*. It is not clear whether Quaglio used the laboratory's facilities for these studies, but the names of the instruments suggest that they were part of the laboratory's collection. These works were compiled in the book *Estudos de Psicologia Experimental e Pedagógica (Studies of Experimental and Pedagogic Psychology)*, published in 1921. The richness of Quaglio's articles, even though they are relatively short, is not only related to the descriptions of the experiments but also to his considerations regarding childhood and education in Brazil.

The ideal of the adult as a rational being that is shaped by a childhood transformation, with the educator having an important role in this process, is a notable discourse in the text *O raciocínio na criança (On reasoning in children)*. The child is represented as a typical being that has not yet learned to perceive the world with good clarity because it is unable to properly judge and reason about the elements of which it is composed. This doesn't happen because the child lacks a nervous apparatus underlying the corresponding mental faculties or because of any type of organic or psychic pathology. The child, although it does not belong to the group of school abnormalities, is represented as being endowed with sentimental impulses, and these tend to select elements from the environment, coloring some and neglecting others. Emotions in children are characterized as an obstacle to an accurate understanding of objects in the world.

⁴ For a biography and professional trajectory of Clemente Quaglio, see Monarcha (2007). The author comments on a Pedagogical Anthropology and Experimental Psychology laboratory that Quaglio created in 1909, in a school in the city of Amparo. In the collection of General Works of the National Library there are several texts by Quaglio, but we did not verify evidence or productions from this laboratory.

According to Quaglio, to possess reasoning, "it is indispensable: to observe well and to clearly perceive; and the school can have a great influence on the student to guide them well in these two forms of psychic activity." (1921, p. 101).

In terms of measurement and evaluation, Quaglio describes the results of his experiment in which he used the "Logorthoscopio Pizzoli". Briefly, the students observed some boards and were asked what happened in the illustrated situation⁵. Through reports on the boards, the experimenter could assess logical reasoning, the presence of feelings in the stories, the degree of concreteness and reality, among other aspects that orbit around reasoning and what could blunt it. Not only did Quaglio study reasoning in these texts, but he also devoted himself to the experimental examination of attention in one hundred children, as suggested by the title of his work "Study on the attention of one hundred Brazilian children". The principle was this: blood flows in abundance into an organ when it works (1921, p. 9). In the case of attention, when an individual directs it to an object or when solving a mathematical calculation, the volume of blood would increase in the brain as it was undergoing intense activity. One way of examining this blood flow was through the scale experiment: the child (or the individual being examined) was immobilized on a scale and, in the exercise of any activity, such as those mentioned above, the scale tended to lean towards the side of the head.

However, the experiment engineered by Quaglio involves the use of the "Myokinesiscopio". It was not intended to assess the child's attention exactly, but their motor coordination in terms of fine movements and gross movements that were recorded as errors in the device⁶. The relationship between motor coordination and psychic faculties is indicated by Quaglio in the following terms:

For the execution of all these various muscular acts, a complex intellectual operation is indispensable, to which many psychic faculties and very delicate parts of the nervous centers contribute. Thus, when measuring dexterity in movements, we sought to examine the child's psychological aspects. (1921, p. 18).

In what terms did Quaglio express the usefulness of these results of psychological experimentation for education? Quaglio's thinking agrees with the conceptions about the nature of the child, the role of the educator, and the school institution present in the literature of the time. As far as the role of experimental psychology is concerned, it resides in its power to enunciate a truth, not through metaphysical abstractions, but through scientific abstractions, about the functioning of the child. This truth is shown by the discovery of the physical and

⁵ An interesting image that Quaglio attached to the text illustrates a moment of application of this instrument. In it, the presence of some women (possibly teachers or students of the Normal School) is verified manipulating the instrument while a man takes note of the child's reports about the boards. Finding photos in which people are seen next to laboratory instruments, at the time of application or even in the laboratory with other collaborators, are relatively rare findings).

⁶ The Quaglio's descriptions of the "Myocynescopio" is similar to what is called the "Tremometer". We believe that the principle and the experimental situation were very similar. It is possible that it is not exactly the same device, since there were some variations in the models, not only in manufacturing, but also an adaptation that the experimenter often needed to make.

psychic limits of the child, without which education, within the framework of modern and scientific pedagogy, would not take place. According to the author:

It is time for us to follow a new and good path. It is necessary that the prejudice of wanting to worry about what the child should do, without ever knowing what they can do, disappears once and for all. There is a prominent need to carry out long and complex investigations of the psychophysiological organism, by examining and studying children individually. It is necessary to find a happy middle ground between the practice of bodily hygiene and the hygiene of the mind, between physical and intellectual education. It is from these investigations, from these examinations, from these studies that the practice of the educational process must emerge. (1921, p. 27)

Quaglio's conclusion in the passage is revealing. Psychological examination using experimental methods could, to a greater or lesser extent, reveal defects in children. He and other educators of his lineage promoted the need to know more about the child, about their organic and psychic deficiencies that, once identified, led to the necessary interventions without which the educational process would be compromised. If a child had a hearing impairment, for example, the hearing organ should be exercised, so that he or she could learn to read. This was the starting point for teaching reading, which in turn implied the education of this particular body (p. 5). All the child's learning and its consequent psychic development depended on their physiological condition. It is here that we could place Quaglio's texts within the framework of intuitive teaching and education through the senses, which is aimed at the production of healthy bodies and minds.

We can see that the so-called experimental psychology operated in institutions during the period of the First Republic. Psychology was constructed via rhetoric of education and medicine for the good of children and patients, but it also makes possible the political production of material based on examinations. These are documents such as a biographical sheet, a school biographical portfolio, or a history of anthropometrics (e.g., physiological and psychological records of the student) produced from the information (the "facts") collected from experiments. Such productions are, in the words of Basilio de Magalhães (1913, p. 145), the "psychophysiological" curriculum of children. Here, "biographical" overrides more common-sense frames such as the student's name, age, affiliation, etc. They are "bio-graphic" insofar as they include the organic and psychic aspects that constitute the child. The biographical portfolio was a medical and pedagogical tool that was used to record deficiencies diagnosed in (laboratory) exams and also to accompany children throughout the educational process. Consider the school biographical portfolio, a model proposed by Viera de Mello (1917). In Viera de Mello's portfolio proposal (1917, p. 29-37), the document was divided into different sections according to the type of information. Initially, it contained personal data of the examinee ("general notes"), and then it proceeded to the different sections of the exam. The anthropometric section gathered information such as height, arm span, weight, muscle strength, lung capacity, etc. The physical and physiological section was

related to the organic conditions of the eyes, ears, nose, head, neck, etc. And, finally, and of greater interest here, there were the psychophysiological and psychological exams. The first one refers mainly to the child's acuity of the different sense organs, including also language, motility, and internal sensitivity. The psychological examination, on the other hand, was composed of the categories that were very present in the psychology manuals of the time: perception, attention, memory, intelligence, affectivity, will, etc. Interestingly, under the rubric of the psychological examination, the examiner was also supposed to include information about the student's aptitude and vocation. Such forms function to identify and separate the school abnormals from the healthy ones which framed how they were used as tools in the construction of pedagogical interventions according to the deficiencies of this or that student.

Factors ranging from the anthropometric to the psychological were monitored according to a conception of the relationship they maintained with each other. The student's lung capacity, for example, could be indicative of weakness or good physical health which, in turn, indicated the direction of their psychological development. In this sense, an expected height for a given age, good muscle strength, and adequate lung capacity tended to distance the student from the boundaries circumscribe the group of those that were considered "weak" or "abnormal" at that time, with average attention and expected intelligence (or above average), among other psychological factors favorable to a good development. Inattention, for example, could be motivated, in the words of Alfredo de Magalhães, by a state of "general weakness of the organism", or even by "disorders of breathing" (1927, p. 96).

In practice, through the form, the teacher would have basic information about the student at hand that would help a teacher in the pedagogical practice. With better knowledge of the physical characteristics of each student, the teacher would know how to conduct a physical exercise, for example. Knowing students' visual and auditory abilities, a teacher decided which students would need to sit near the front to better follow the class. Aware of the attention and intelligence capabilities of the class, a teacher would know how long to lead a class and how far they could supposedly advance in the content. Here we see the function of the laboratory as an examination center for its visitors. Moreover, Viera de Mello's school biographical portfolio cataloged the aptitude and vocation categories that structured the knowledge of what represented good indicators of an adaptation to work. The physical characteristics were also reported here, since, for example, a "brachisquelo" would be more adapted to work in the workshops, while a "macrosquelo" was more suitable for farming (Magalhães, 1927, p. 56). The school biographical portfolio, in this sense, could be understood as a device linked to the aspirations to produce bodies focused on the world of work, an interpretation that resonates with works such as Gondra's (2000).

Although psychology laboratories are narrated as important institutions in the production of scientific psychology, whether in general history (Boring, 1950; Goodwin, 2010; Schultz & Schultz, 2014) or in Brazil (Antunes, 2012; Massimi, 2013), it is important to remember that psychological examinations were not exclusive to these institutions. Claparède (1940) recalls that:

The processes used to collect the facts differ according to whether patients are studied individually or collectively. The individual experiment is carried out at home, in the laboratory or in an isolated part of the school; the collective experiment can be carried out in the classroom itself. (p.235).

Moving the laboratory experience to other spaces, such as the classroom, allows us to think about the possibility of *training* teachers to use the methods and techniques of psychological experimentation without the need to seek out a laboratory that authorizes the exercise of these practices. A laboratory equipped with experimental physiology and psychology equipment was costly and impractical. Claparède himself pays attention to this issue of high costs when it comes to appliances and their maintenance, even though for him they represent a *sine qua non* condition for investigations conducted on children (p. 263-265). It became important thereby to look for cheaper and more practical options for carrying out observations and exams in schools. Cheaper instruments such as boxes of weights and esthesiometers, in addition to those that only needed pencil and paper, could be cheaply employed by teachers and doctors. The exams which only used paper and pencil were often referred to as the "test" method or one of the types of "test", in the broadest sense of the word, alongside the experimental apparatus that constituted the laboratory's collection (Piéron, 1966). [1951], p. 423; Warren, 1948[1934], p. 358). It is this displacement of the environment and the adaptation of instruments that allows us to understand the collective application of experimental methods outside the limits of the legitimate scientific space that initially characterized their practice.

On this point, Alfred Binet, who since the 1890s was already the target of the typical complimentary mentions that characterized the Brazilian media discourse referred to him as an experimentalist, an illustrious psychologist, or even as the most notable disciple of Charcot. He suggested exercises to be administered in the classroom. In Basilio de Magalhães' manual (1913), the author talks about some methods and exercises to be applied in the classroom, with Binet as the main reference. Consider the example of the dynamometer which was a device whose purpose was to measure muscle strength, and was recommended as an exercise in the classroom. Weekly, the students would press the device so that their strength indicators were monitored over time by the teacher. Not only was an increase in muscle tone the aim, but also the exercise of the will itself, since the collective application favored emulation among the students. By generating some competition, the obligation to tighten the dynamometer gave way to an exercise that was important in the physical and psychological evaluation of children. In addition, another exercise involves the teacher asking the students to remain in the statue position for some time, constraining their movements as best they can. The teacher believes this to be a way for the student to acquire self-control in the face of discomfort and unpleasant stimuli. The student was responsible for becoming master of themselves, a process that took place in the educational context. The theoretical models given by psychology (and also by experimental psychology) are carried out through an exercise that influences the direction of the will through constant

training. The dynamometer and this exercise were not used as part of an experimental examination in psychology but acquired a direct function in the education of the body and the will.

The advent of experimental examinations in psychology in institutions such as educational establishments is part of a real framework of interventions that converged to achieve an objective: subjecting the child's body and mind to harmonize with social order. Faced with a disorganized nature that expressed countless inertia in the course of the educational process, practices of all kinds were added to spark a transformation in the child. Experimental psychology adds to such efforts that were emerging since the 19th century: from hygiene to anthropometry, through pedagogy and pedology. A set of sciences - which often had the appearance of movements - forming a network whose fibers overlap in such a way that an exercise of separating them is not only arduous from a historical point of view but liable to incur a probable artificiality.

Conclusion: The different historiographical colors in political hues

As we proposed in the introduction, this set of analyses of the first laboratories opens up a space for reflection on the research modes of the historical modes of knowledge production in these first laboratories. So far, we have analyzed some historiographical issues related to psychology laboratories in Brazil in the early period of the First Republic, although our contribution has been somewhat discreet, presenting preliminary results and enabling discussion about how these laboratories work in Brazil and who the participants were that worked there. Although discreet, we can understand how these laboratories worked, politically shaping Brazilian society through Psychiatric and Psychological categories.

These questions lead us to a unique description of the configurations of the first laboratories in Brazil. We can thereby begin to account for the politics of their emergence and understand the networks where human and non-human actors are the most diverse. Obviously, the instruments, concepts, specialties, literature, and their ways of implementation were imported from the epistemic metropolises of the moment. But as Gallegos (2018) points out, there is a singularity in how these and other laboratories in Latin American territories were created: they owe nothing to the colonizing lineages of the Wundtian laboratories, who were invested in making a detailed description of the components of the immediate experience that bordered on sensory physiology. Our laboratories operate on the borders of normality and abnormality in schools and asylums, generating reports that allow the social ordering of individuals who circulate in these spaces. In other words, they produce politically new sociabilities. If these laboratories can break with the colonality of a lineage of notorious spaces for the production of psychological knowledge, they would be able to train psychologists as scientists to decolonize a series of pedagogical and daily experiences of infamous men and children under the sign of normality. Perhaps this constitutes a more complex colonality that lacks new historiographies.

Arthur Arruda Leal Ferreira is a Postdoctoral Researcher in the History of Psychology from the UNED (Spain) and Janveriana University (Colombia), and is a Full Professor at the Institute of Psychology at the Federal University of Rio de Janeiro (UFRJ). He has recently edited the following books: *Governamentalidade e práticas psicológicas: a gestão pela liberdade*, *Para além da psicofísica: Fechner e as visões diurna e noturna*, *Psicologia, Tecnologia e Sociedade*, *A pluralidade do campo psicológico*, *Teoria Ator-Rede e a Psicologia* and *História da Psicologia: Rumos e Percursos*. He has also contributed to the books: *Explicaciones en Psicología*, *Neoliberalism and Technoscience* and *ANT Companion*.

Hugo Leonardo Rocha Silva da Rosa is a Clinical Psychologist (CRP/RJ/BR), Clinical Counsellor (RCC/BC/CA) and Historian (BR). He received his PhD from the Federal University of Rio de Janeiro (UFRJ) and was also a postdoctoral fellow at UFRJ. He was an Assistant Professor at Federal Fluminense University (UFF) and a Lecturer at UFRJ. His research interest includes History and Historiography of Psychology, Psychological instruments, Psychological assessment, and Psychological Museums. He recently published *Dicionário de Avaliação Psicológica e Para além da psicofísica: Fechner e as visões diurna e noturna*.

Marcus Vinícius do Amaral Gama Santos has a bachelor's and master's degree in Psychology from the Federal University of Rio de Janeiro. He is currently a temporary professor in the Department of Social Psychology at UFRJ. Among his publications, he has articles on the history of psychology, on the STS field and on the introspective method in psychological laboratories at the beginning of the 20th century. He was co-editor and co-author of the book “*Para além da psicofísica: Fechner e as visões diurna e noturna*”.

César Pessoa is a post-doctoral student in psychology at the Federal University of Rio de Janeiro, researching the history of psychedelics and the role of scientific atlases in the constitution of psychological thought. His publications include the article “Aron Gurwitsch” and the *History of Psychology*, with his supervisor, Arthur Leal and Marcus Gama.

The Stanford Prison Experiment: Still failing the political test

Serdar M. Değirmencioğlu

Abstract

The Stanford Prison Experiment is one of the most famous studies in social psychology and psychology in general. It has been told and retold in classrooms across the world to illustrate the power of social psychology (and psychology in general) in explaining human behavior. Fifty years later, the Stanford Prison Experiment continues to attract considerable scholarly attention. While mainstream psychology still prides itself in the main findings, various scholars claim to have “debunked” them. There has also been discussion regarding the ethical issues involved. This paper offers a critical assessment of the Stanford Prison Experiment with a focus on the historical and political context. When placed in its historical and political context, the Stanford Prison Experiment exemplifies the persistent political shortcomings of mainstream psychology; its critical assessment thus offers lessons for those who are seeking alternatives to mainstream psychology.

Keywords

militarism, colonialism, veterans, Vietnam, Ukraine, War on Terror

The Stanford Prison Experiment [TSPE] is one of the most famous studies in social psychology and psychology in general. It has been cited again and again as evidence for the power of social settings on social behavior. The study has been told and retold in classrooms across the world to illustrate the power of social psychology (and psychology in general) in explaining human behavior. The study was conducted by Philip G. Zimbardo at Stanford University in August 1971 and funded by the U.S. Office of Naval Research. TSPE simulated a prison environment, where university students were assigned the role of either a prisoner or a prison guard. It was intended to assess the power of a prison environment on behavior over a period of two weeks. However, mistreatment of prisoners escalated and Zimbardo terminated the experiment in one week.¹

Fifty years later, Philip G. Zimbardo continues to be treated as a scientific genius and is sought-after as a speaker. He has been invited to deliver keynote speeches at international conferences and congresses again and again. Following

¹ Further information can be found on a website dedicated to the study.

the invasion of Iraq in 2003 and the revelations in 2004 about human rights violations and war crimes against detainees in the Abu Ghraib prison near Baghdad, Zimbardo became popular once again. His opinion was sought out to explain the war crimes in Iraq, particularly in Abu Ghraib. Today, TSPE continues to attract considerable scholarly attention: While mainstream psychology still prides itself in SPE's main findings (Griggs, & Bartels, 2019), some scholars are interested in "debunking" them (e.g., Le Texier, 2019), while others are busy finding ways to resolve the ethical issues (e.g., Perlstadt, 2018).

The goal of this paper is to offer a critical assessment of TSPE with a focus on the historical and political context. Mainstream psychology, with its diversity of branches and shades, is decidedly ahistorical and claims to be a politically neutral discipline. The goal here is to place TSPE in its historical and political context to demonstrate how it exemplifies the persistent political shortcomings of mainstream psychology. Putting TSPE in its socio-historical context requires an examination of how it related to the war on Vietnam, a defining event in the history of the United States of America. Finally, this paper aims to draw lessons for those who are seeking alternatives to mainstream approaches.

The war on Vietnam

The war on Vietnam was a very prolonged campaign and proved to be a very brutal one. The war started in the second half of the 1950s and officially ended in 1975. Many scholars and observers (e.g. Hess, 1994) have characterized the war as a defining event in U.S. history. The number of publications on the war on Vietnam grew in the decades following the war and continues to expand today, almost 50 years after the war officially ended. The number of publications dedicated to the war on Vietnam indicates that this particular war has occupied a central place in the intellectual domain. No other war since World War II has received so much attention. Today, there are thousands of books on the war on Vietnam. They are so numerous that one can find websites offering rankings under titles like "*The best 20 books*," "*Top 30 books*" and so on. What is perhaps even more interesting is that the trend continues year after year. Most of these books about the war on Vietnam are non-fiction, many produced by journalists. More personal books were written by soldiers who wanted to tell their own stories and experiences during the war (Rollins, 1984). Many of these books are hardly known because they were published by small publishers or by the authors themselves and not distributed widely. There are also numerous works of fiction. The earliest is a novel by Graham Greene, titled *The Quiet American*. As early as 1955, Greene was able to expect the consequences of a war on Vietnam: failure, defeat, and withdrawal (Whitfield, 1996).

Silence in psychology

Almost 50 years later after the end of the war, new books on the war on Vietnam are still being published. The fact that some of these books are 400 pages long and very detailed (e.g., Appy, 2016) indicates a rather strange and yet persistent preoccupation with this particular war. It would be hard not to conclude that there is an obsession in the U.S. with the war on Vietnam. This obsession appears to be a consequence of an imperial mentality and a belief in militarism: The U.S. is a modern superpower and therefore it must be invincible. The defeat in Vietnam can only be a result of a major miscalculation somewhere, a strategic failure by the military or a lack of political will. The defeat must be explained away and the belief in the invincibility of the superpower must be restored.

In contrast, there are surprisingly few publications in psychology focusing on the war on Vietnam. Scholarly books and articles are very rare. Even though the war on Vietnam was clearly a burning public issue in the U.S. in the 70s (Rollins, 1984), very few psychologists in the U.S. focused their scholarship on the ongoing war and its consequences. The vast majority of psychologists in the U.S. remained silent as the U.S. government continued a horrific war of attrition (Değirmencioglu, 2010).

The historical context

In 1971, the war on Vietnam was clearly a salient issue in the U.S. The war was on the front pages. In April, U.S. Army First Lieutenant William L. Calley, Jr. was found guilty of murdering 22 civilians in the My Lai massacre and sentenced to life in prison.² In May, thousands of anti-war activists were arrested in Washington, D.C. by the police and military. In June, the New York Times began to publish the Report of the Office of the Secretary of Defense Vietnam Task Force, which came to be known as the “Pentagon Papers.” The Pentagon Papers showed that the U.S. government lied systematically to the public and to the U.S. Congress about the war on Vietnam. Philip Zimbardo conducted TSPE in the same year, in August 1971; yet, the experiment was rarely discussed in relation to the war on Vietnam. Even today, students rarely, if ever, hear a discussion of TSPE in its socio-historical context. Consequently, five decades later, a serious political analysis of TSPE is still sorely needed.

The militarism problem

A rarely discussed problem with TSPE is that the study was funded by the Naval Research Office, or the Navy. The fact that the US military was interested in the

² Convicted of murdering twenty-two villagers at My Lai on 16 March 1968, Calley was sentenced in March 1971 to life imprisonment. That sentence was quickly reduced to 20, then to 10 years. In November 1974, Calley became eligible for parole and was set free. In 1976, he married and took over the management of his father-in-law's business in Columbus, Georgia (Oliver, 2003).

behaviors that TSPE reported has rarely attracted attention from TSPE's critics. This is not surprising given the long-standing alliance of US mainstream psychology with the military. For many mainstream psychologists, an alliance with the military is not a political or an ethical problem (Değirmencioğlu, 2010; 2021). The long-standing alliance with the military is not a matter of individual psychologists working for the military. The alliance is institutionalized and has been promoted as "public service" by the American Psychological Association (APA). As the largest professional organization representing psychology in the U.S. and with a membership above one hundred and fifty thousand, APA plays a central role in mainstream psychology. APA openly and continuously lobbies on behalf of the Department of Veterans Affairs (formerly Veterans Administration), which provides medical care, benefits, and other services to veterans. The Department of Veterans Affairs is the largest employer of psychologists in the U.S.: it employs about 6000 psychologists. It is followed by the U.S. Army, which employs about 800 to 900 psychologists.

Following the September 11 attacks in the U.S., the Bush administration sought to employ psychologists in its "War on Terror." It did not take a long time for the APA administration to cooperate with the U.S. Department of Defense to provide ethical cover for an "interrogation" program and for psychologists working in the program. About a decade later, an independent review was conducted by attorney David Hoffman. Hoffman was hired by APA in November 2014 to investigate whether APA engaged in activity that would constitute collusion with the Bush administration to promote, support or facilitate the use of "enhanced" interrogation techniques by the U.S. in the war on terror (Değirmencioğlu, 2021). The Hoffman Report, which was released in July 2015, provided clear evidence of collusion. The report shook APA and mainstream psychology like an earthquake. Some characterized the collusion as one of the greatest ethical breaches in the history of psychology. The APA administration quickly apologized for "deeply disturbing findings and organizational failures," and announced "policy and procedural actions to correct shortcomings." (Değirmencioğlu, 2021).

The earthquake following the Hoffman Report was but a glitch for the long-standing alliance. It did not take long for the APA administration to engage in damage control. In 2017, APA President Antonio E. Puente released a statement in honor of Veterans Day that confirmed APA's commitment to serving the military and the veterans it produces:

Veterans Day is an opportunity to honor those individuals who have selflessly served to protect our country. APA works throughout the year to acknowledge that spirit, supporting military personnel and veterans, their families and their communities and the psychologists who conduct research for and provide direct services to these military-connected populations. APA strongly advocates for funding and support for veterans' health research and clinical services, including therapies to address post-traumatic stress disorder and depression and more effective suicide prevention efforts in military and veteran populations.

One of the best ways for psychologists to serve our veterans is to better understand their psychological needs. I encourage our members to visit the VA

community provider toolkit, which provides free training modules to better understand military culture and how psychologists can help serve military personnel, veterans, families and communities. I also encourage members of the public to honor our military today in whatever way they can, whether by attending a local Veterans Day celebration or just reaching out to a nearby member of the military and expressing gratitude for his or her service.³

The statement illustrates the problem. Only two years after the Hoffman Report, Puente emphasizes how dedicated APA is to the military personnel, past and present, and how deserving the military personnel was. He also underscores APA's continuing lobbying efforts. What follows is particularly interesting. In the second paragraph, Puente changes his audience and starts speaking as if he were a military spokesperson: He encourages psychologists to learn about the military culture and how they can serve military personnel and veterans, and people around them. Finally, he invites APA members to express their gratitude to members of the military.

A number of prominent psychologists, whose names were associated with the collusion, disputed the findings of the Hoffman Report and some openly attacked those involved in the independent review process. Martin Seligman, for instance, portrayed the criticisms as attempts to "discourage young psychologists from working with the Department of Defense" and he urged APA "not to waver in its long-standing commitment to serve the nation," (Seligman, 2018). Prominent supporters of militarism in psychology continue to equate serving the military with serving the nation (Değirmencioğlu, 2022).

It is clear that mainstream psychology is yet to distance itself from militarism. It is also clear that the move away from militarism toward a focus on preventing injustice will not originate from APA's corporate apparatus or mainstream psychology. APA has not abandoned its long-standing alliance with the military establishment even after the Hoffman Report. The Association continues to promote military psychology, to highlight psychologists working in the military, to present itself as the advocate for the well-being of veterans, and so on (Değirmencioğlu, 2022).

The complicity problem

A second problem with TSPE and the studies following it is that they were disconnected from contemporary wars and from glaring examples of the social-psychological madness these wars created. In typical mainstream fashion, TSPE and other "ground-breaking" work remained politically silent or complicit as far as addressing ongoing wars and imperial, colonial, and racist policies of their times.

A case in point is the slur "gook." Anyone who has some familiarity with the war on Vietnam knows about the wide-spread use of this slur. It is an ethnic

³ The statement was distributed via email on Thursday, 9 November 2017 with the title APA News: "APA Honors Military for Their Service: Association works to support veterans."

slur for a person of Southeast Asian descent, especially a Vietnamese, Filipino, Chinese, Japanese or Korean person. The term is similar to the N-word used in the U.S. for African-American people. In this paper, it will be referred to as the “G-word.” The exact origin of the G-word is not clear. However, it is clear that it is a derogatory term used primarily, but not exclusively, for people who live in South Asian lands. The G-word owes its staying power to the U.S. military: It was primarily and consistently used by the U.S. forces in various wars across time. U.S. military personnel used the G-word to refer to indigenous peoples in the Philippines and in Korea, but the G-word became well-known only during the war on Vietnam as a racial slur.

There has been very little interest in mainstream psychology in the G-word and how this term was employed consistently across decades. A notable exception can be found in a chapter by Leventman and Camacho (1980). They noted the use of the G-word for the Vietnamese as a racial slur. Next, they noted that race, racism and race consciousness were critical in understanding the dynamics of war. Today the G-word rarely, if ever, appears in mainstream psychology. Its staying power is not mentioned or explored in social psychology textbooks. The war on Vietnam, the great suffering that was inflicted on the local population, the intentional environmental destruction, the use of Napalm or Agent Orange are all missing from psychology textbooks. Mainstream psychology rarely disturbs militarism.

The G-word was not unknown to Zimbardo. He did write about it some 25 years after TSPE, in “The Lucifer Effect” (Zimbardo, 2007). The section titled “Dehumanization: The Other as Nothing Worthwhile” opens with a quote: “*Kill a Gook for God* – Penned on helmet of a U.S. soldier in Vietnam” (p.222). In another section of book, Zimbardo examines the G-word to discuss dehumanization and moral disengagement:

Behind the My Lai massacre of hundreds of innocent Vietnamese civilians by American soldiers was the dehumanizing “gooks” label that GIs had for all of those different-looking Asian people. Yesterday's “gooks” have become today's “hajjis” and “towel heads” in the Iraq War as a new corps of soldiers derogates these different-looking citizens and soldiers. “You just sort of try to block out the fact that they're human beings and see them as enemies,” said Sergeant Mejia, who refused to return to action in what he considered an abominable war. “You call them ‘hajjis’, you know? You do all the things that make it easier to deal with killing them and mistreating them.” (pp. 307-308)

Zimbardo himself recognizes part of the problem. In a talk titled “The Lucifer Effect: Understanding How Good People Turn Evil,” at the 18th APS Annual Convention, he offered this striking assessment, “Psychologists rarely ask the big questions.” As usual, Zimbardo was addressing a roomful of psychologists and students eager to hear him talk (Wargo, 2006). He concluded, “*We have all kinds of great techniques for answering small questions. We've never bothered to ask the big questions. It's time we asked the big questions like the nature of evil.*”

The import-export problem

Another glaring problem with the criticisms of TSPE and similar studies is the fact that most of the critics refrained from addressing the political biases exported to the Global South as part of mainstream psychology (Değirmencioğlu, 2021). The way mainstream psychology has been operating across the world can best be described as an “import-export” business (Değirmencioğlu, 2021). The vast number of psychology publications are produced in the Global North. Psychology was born and then institutionalized as a profession in the Global North. The products of mainstream psychology are distributed around the world as knowledge, practice, or models. Journals, books, instruments, software, workshops, and speakers are all marketed globally and often aggressively. Exports always need local importers; they bring the products in and distribute them to the local market. In the past, importers were predominantly academic psychologists. Today, many professional organizations and private firms are also engaged in the import business. The import-export business continues to flourish with diverse products.

Academic psychology is well-organized particularly in the US and in the UK; university degrees have also become big business. Students from the Global South often receive their advanced degrees in the Global North and unknowingly facilitate the import-export business. Graduate students are often exposed to a narrative that sounds a lot like a fairy tale: Objective and hard-working psychologists in the Global North produce theoretical and methodological tools for psychologists around the world. These products are made available to psychologists in the Global South, who adopt them for the benefit of society. Little is mentioned regarding the import-export process and the biases that go along with the imports. When TSPE and other studies in the literature are imported, biases and silences are also imported. Imported textbooks, instructional materials, including videos on popular video platforms such as TED Talks on psychology all bring in persistent biases and silences. The import-export business, thus, serves the spread of persistent biases, such as militarism.

What about critical psychology?

Critical psychology is not necessarily immune to problems and biases that plague mainstream psychology. One such bias appears to be a lack of focus on militarism. Given the centrality of militarism for understanding injustice and suffering across the world (Değirmencioğlu, 2020b), one would expect a strong and sustained critical focus on militarism. One would also expect at least a sizable body of literature in critical psychology focusing on major imperial wars, such as the war on Vietnam and the war on Iraq. For decades, these two wars were, without a doubt, defining influences for millions of people.

In order to make a quick assessment regarding a discipline (or a sub-discipline or a school of thought), one can carry out an analysis of major handbooks that are considered milestones in this discipline’s literature. The

Handbook of Environmental Psychology (Bechtel & Churchman, 2002), for instance, was considered an important milestone in environmental psychology. If this 736-page handbook does not contain any mention of militarism and the devastating environmental impact of military activities, it is fair to make a general statement about the state of environmental psychology at that time (Değirmencioğlu, 2022).

A similar assessment can be carried out for critical psychology on the basis of a recent handbook. The Handbook of Critical Psychology (Parker, 2015) is an important contribution to critical psychology. The 477-page long handbook contains many well-written and informative contributions from a long list of critical psychologists. When examined carefully, however, this volume has little to offer regarding the relationship between mainstream psychology and wars across the world. The handbook does not contain a single analysis of how mainstream psychology responded to the war on Vietnam. There is also no analysis of how mainstream psychology contributed to the war on Iraq, before and after 2003.

Thus, it is fair to conclude that critical psychologists paid very little attention to the war on Vietnam and the prevalence of militarism in mainstream psychology. Perhaps because of this negligent attitude, critical psychologists failed to pay attention to the war on Iraq, a politically decisive imperial campaign that clearly led to very serious consequences for Iraq, for the Middle East and the entire world. This general assessment holds even though there have been a few notable exceptions (e.g., Duckett, 2005).

Conclusion

The never-ending debate in the USA about the war on Vietnam seems to have had very little influence on mainstream psychology. The horrific and prolonged mass suffering inflicted on the people of Vietnam and in neighboring countries seems to have had very little significance for mainstream psychologists. In contrast, TSPE has had enormous recognition in social psychology and mainstream psychology across the world. Philip Zimbardo continues to be treated as a scientific genius in mainstream psychology and enjoys the status of a guru in human behavior some fifty years later. He continues to receive awards from professional organizations for his distinguished contributions to psychology.

This paper places TSPE in its historical context and casts a new and critical light on the study. TSPE was conducted in August 1971, at a time when the war on Vietnam was raging. By August 1971, the atrocities in Vietnam – including the My Lai massacre – were no secret. The Pentagon Papers had already been published. By August 1971, the king was very much naked. TSPE should be assessed in this context. First, it was funded by an institution that was clearly associated with wars and in particular with the ongoing horrific war in Vietnam. Second, Zimbardo seems to have made no effort at that time to link his scholarship and his work on the power of social settings to the atrocities

committed in Vietnam. Just as with many other exports, TSPE and its biases were exported as sound psychology to the Global South.

As a seasoned scholar, Zimbardo himself is aware of some of the lingering problems in mainstream psychology. He has pointed out the discrepancy between the greatness of common methodological tools and the smallness of the questions they are able to answer (Wargo, 2006). He has also urged psychologists to ask big questions, which is in line with the points laid out in this paper. It might indeed be appropriate to pose a few big questions that critical psychologists may hopefully follow up in the near future. Why is mainstream psychology still very silent about wars that lasted for decades, such as the war on Vietnam? Why has mainstream psychology been extremely negligent with regard to the immense suffering associated with the atomic massacres in Japan, or Napalm and Agent Orange? Why do psychologists in the Global South remain silent, when mainstream psychology in the Global North promotes militarism?

It might be appropriate to end this paper with a set of big questions brought up by the invasion of Ukraine. The invasion officially began on 24 February 2022 and has turned into a war with bitter consequences. Professional psychology organizations in the Global North, the very organizations that kept silent about the invasion of Afghanistan and Iraq, rushed to condemn the invasion of Ukraine. The British Psychological Society (BPS), for instance, released the following statement:

The developing conflict in Ukraine is deeply concerning for all, not least for those directly affected and who will feel the brunt of the psychological impact of the crisis and potential human rights violations.

We stand shoulder to shoulder with our colleagues in Ukraine in the face of aggression, and we are ready to draw on the collective expertise of our membership to provide any necessary psychological aid and human rights support during the crisis.

We believe in the values of freedom and democracy, and the role of psychology and psychologists in uniting and finding shared beliefs, over those that try to divide us.⁴

European Federation of Psychologists' Associations (EFPA), the body that represents the national organization of psychologists in Europe, also condemned the invasion and released a longer statement, which deserves quoting in full:

EFPA and its member associations strongly condemn the war started by the Russian government on the Ukrainian people. As the days pass the evidence mounts that this war causes unspeakable and intolerable human suffering.

EFPA views the war as a blatant violation of international law and human rights. It is against our core mission as enshrined in our statutes of shaping a humane society, building a European identity based on common values and goals, mutual respect and collaboration. It flies in the face of EFPA's goals to contribute to the quality of life of people living in Europe and to a democratic and prosperous

⁴ BPS responds to current conflict in Ukraine, <https://www.bps.org.uk/news/bps-responds-current-conflict-ukraine>, 25 February 2022. BPS also voted to support the rapid expulsion of the Russian Psychological Society from EFPA.

society. It contravenes the ethical principles in our meta code of respecting the fundamental rights, dignity and worth of all people; professional and scientific responsibilities to society; and maintaining the integrity that is the basis of psychology as a science and a helping profession. Peaceful collaboration on this basis is at the heart of the mission and vision of EFPA, and in turn the basis of membership of EFPA.⁵

The statement specifically described war as a blatant violation of international law and human rights, and also announced concrete action. The Russian Psychological Society was quickly expelled from EFPA on 3 March:

In the last few days, we have received many letters and statements from our member associations. This included a request from the National Psychological Association of Ukraine for the Russian Psychological Society to be excluded from EFPA. We have also received communications to EFPA from the Russian Psychological Society. As a result, an extra-ordinary Presidents' Council Meeting was held on Thursday, March 3, 2022.

Statements condemning the invasion were also released by various national organizations (e.g., Psychological Society of Ireland, Belgian Association of Psychological Science), international organizations (e.g., International Council of Psychologists) and various groups of mainstream psychologists. Most of these statements correctly identified war as a cause of immense suffering and also as a context where human rights were bound to be systematically violated. It is particularly noteworthy that these statements were released almost immediately: The BPS statement was released only a day after the invasion. The Belgian Association of Psychological Science released a statement on 28 February. The Psychological Society of Ireland followed on 4 March. Action was also very swift: The EFPA decision of expulsion was taken on 3 March.

Not surprisingly, APA also released a statement, immediately after the start of the invasion, and expressed solidarity with Ukraine. Even state associations, which are expected to remain silent on important issues, such as the Ohio Psychological Association, released statements.⁶ Just as with many of the statements mentioned above, these statements praised human rights, well-being, dignity and freedom. The short statement by APA also specifically mentioned that the military invasion of Ukraine threatened the people in surrounding nations.

None of these statements mentioned militarism as a threat to peace across the world. Nor did any of these statements mention other invasions, such as the invasion of Afghanistan. The statements by BPS and APA did not explain why the invasion of Ukraine deserved attention and concern, while the invasion of Iraq never did. In fact, none of the other statements contained a single hint

⁵ Statement from EFPA concerning the war in Ukraine and action in relation to the EFPA membership of the Russian Psychological Society, <https://www.efpa.eu/statement-efpa-concerning-war-ukraine-and-action-relation-efpa-membership-russian-psychological>, 3 March 2022.

⁶ OPA statement on the conflict in Ukraine, <https://ohpsych.org/news/597529/OPA-Statement-on-the-Conflict-in-Ukraine.htm>, 2 March 2022.

regarding concern with the invasion of Iraq or any hint of an explanation why other ongoing invasions around the world did not matter.

Only a few statements cared to distinguish between Putin's dictatorship and the people of the Russian Federation. Only a few statements mentioned the fact that war was detrimental for the millions living in the Russian Federation or expressed concern about their welfare. None of these statements included demands regarding the elimination of militarism and the structures that make wars inevitable. None included a demand for peace at all costs. It was very clear that organizations representing mainstream psychology had little understanding of politics and of peace-building.

Thus, mainstream psychology in the Global North missed a historic opportunity in 2022 to change course. Once again, it proved itself to be ahistorical. One after another, mainstream psychology organizations acted as if the invasion of Afghanistan had never happened, or as if the invasion had taken place in distant history. The truth is that the invasion of Afghanistan had officially ended only very recently, on 30 August 2021, less than six months before the invasion of Ukraine. The U.S. Armed Forces completed their withdrawal from Afghanistan and the withdrawal was in the media all across the world. The invasion was not a brief affair either: The occupation had lasted for 20 years.

Just like TSPE, mainstream psychology in the Global North has failed the political test. It appears important, at this juncture, for critical psychologists to press with a set of big questions: Why is the invasion of Ukraine more important than the invasions of Afghanistan and Iraq? Why is human suffering in Ukraine unacceptable, but suffering in Afghanistan or Iraq is perfectly negligible? If the Russian Psychological Society is complicit and therefore should be expelled from EFPA, why was BPS not expelled in 2003 after the invasion of Iraq? Why were other member organizations not expelled, when they did not object to their governments' decisions to send military personnel to join the occupation of Iraq?

This paper is a modest attempt to highlight an important and persistent political shortcoming of mainstream psychology. It has placed TSPE in its historical and political context, and provided a critical assessment of TSPE. However, TSPE is only one example of a persistent problem. The problem is obviously not unique to a single person's work or career, or to a single country or continent. The point is that mainstream psychology has a militarism problem.

This paper is also an invitation to psychologists, both mainstream and critical, to seriously consider wars and militarism in their work. In this vein, it might be a good idea to end this paper with a provocative question. Why did EFPA hold its 16th European Congress of Psychology in Moscow in July 2019 in collaboration with the Russian Psychological Society? At the time, the Russian Federation was under full control of the Putin regime, just as it was in 2022 and still is today. Why was this congress not boycotted by member organizations? If professional psychology organizations in the Global North and mainstream psychology as a whole want to be credible, they need to be able to offer credible explanations to their political failures in 1975, in 2015, in 2019, or in 2022.

A reassessment of Tajfel's Social Identity Approach from a critical psychological perspective

Daniel Schnur

Abstract

Henri Tajfel's Social Identity Theory (SIT) grew out of criticism of the social psychological mainstream that emerged in the wake of the crisis of social psychology in the 60s' and 70s'. In contrast to prevailing assumptions at the time that the causes of social action were to be found intra- or interpersonally - i.e., the social only as a relationship between individuals - Tajfel stressed the importance of theorizing the social itself and individual action within it independently. He accused other approaches of individualistic reductionism. His theory grasps the action-guiding social identity in the dynamics between in- and out-groups. For many of the researchers referring to it, SIT represents a "critical" social psychology in the broadest sense, with which it should also be possible to grasp the psychological dynamics in the context of social change. From the perspective of German Critical psychology, the present text formulates central points of criticism of the social identity approach: (1) the untouched dichotomy between the social and the individual, which manifests a subdisciplinary split between a social-psychological and a general-psychological subject, (2) the model-like version of the social as an in-group/out-group constellation, (3) and, finally, inherent in the latter arguments, the different epistemological interests of the various works relying on Tajfel's legacy.

Keywords

social psychology, Critical Psychology, Social Identity Theory

Social Identity Theory (SIT) gained influence from the 1970s onwards and is now considered one of the "great theories" (Ellemers & Haslam, 2012) in social psychology. SIT originated as an attempt to explain the so-called "minimal group experiments" at the University of Bristol in the department of Henri Tajfel (Turner, 1996). It is also an answer to questions about the social context of individual action that were raised in the course of the "crisis of social psychology" in the 1960s and 1970s (Marvakis & Mentinis, 2014). At the same time, Critical Psychology (sometimes referred to as Berlin school or German critical psychology; in German: *Kritische Psychologie*), initiated largely by

Klaus Holzkamp, emerged at the *Freie Universität* in Berlin. Holzkamp criticized the dominant psychology of the time and started from similar premises as Tajfel. However, his scientific development was significantly different from Tajfel's and he arrived at fundamentally different categorical conclusions. In the discussion with Tajfel and the authors of SIT, it is striking that they do not arrive at a common conception with regard to the connection between the social and the individual, although it was precisely in the early days of SIT that the aim was to create clarity here on a paradigmatic level. As will be shown, this was already the case with Tajfel himself: In my opinion, a comparison of SIT with the perspective of critical psychology can illustrate this well. First, I will discuss the basic concepts, the context in which SIT emerged, and Tajfel's epistemological position. I then discuss central points of Tajfel's understanding of the connection between the social and the individual from a critical psychological perspective.

1. Basic Concepts of Social Identity Theory

Henri Tajfel formulated the SIT for the first time as part of his "minimal group studies." Tajfel, born in Poland, experienced the Second World War as a member of the French army and concealed his Jewish identity while a prisoner of war of the Germans. After the end of the war, through contacts with the British military administration in West Germany, he made his way to Great Britain, where he studied psychology and later became a professor. Early on, Tajfel took issue with US-style social psychology, accusing it of mechanistic modeling of individual behavior that could only inadequately explain the phenomena he researched, such as discrimination. He was of the opinion that the aim should be to explain collective similarities, not individual deviations. In debates about the "crisis of social psychology," he engaged in sometimes harsh polemics against the mainstream of (social) psychology at the time and called for the rethinking in the scientific community.

Tajfel noticed that social psychological laboratory studies revealed certain similarities in the behavior of test subjects, which, according to him, required their own theoretical concepts to explain. Tajfel's questions were as follows: How is the relationship of the individual to the social context to be understood? How do people form an image of their social environment and how do they search for meaning in it? And: What are the interactions between individual behavior and social context?

Tajfel formulated his concepts for the first time in concrete terms as an interpretative framework for his "minimal group studies" (Tajfel et al., 1971). The key question of the experiments was under what minimal conditions conflicts or intergroup discrimination occur between two experimental groups, i.e. different behavior towards members of an out-group and members of the in-group (Tajfel & Turner, 1979). Tajfel & Turner modeled a baseline condition under which it was expected that no intergroup behavior would occur: Subjects were randomly assigned to a group with no real meaning (e.g., group "X" and group "Y") and were then presented with a list of out-group and in-group

members (e.g., labeled member "4" in group "Y"). The task of the test subjects was now to attribute small fictitious amounts of money to the various individuals on the list. Tajfel and Turner expected that the money would be distributed relatively fairly between the fictitious individuals on the list, regardless of their group membership. However, they observed that even in this arrangement (where this was only indicated by a letter), there was discriminatory behavior towards the other group and preference for one's in-group. In contrast to the vacation camp study by Sherif et al. (1961), there was no conflict of interest between the groups in Tajfel and Turner's (1979) study; nevertheless, the experiment resulted in discriminatory behavior in their decisions by the subjects towards the other group. The mere social categorization - the perception of belonging to one group and not another - was sufficient to give rise to discriminatory behavior. Tajfel called this "in-group bias" or "in-group favoritism": the in-group is preferred, even if "fairness" would not mean a disadvantage. According to Tajfel and Turner, the in-group is concerned with maximizing the difference to the out-group.

On this basis, the authors formulate the theory of social identity: According to this theory, social groups represent a social way of understanding oneself. In this sense, Tajfel and Turner speak of social identity as those aspects of the individual's self-image that result from the social categories to which the individual feels he or she belongs (Tajfel & Turner, 1979). In the concept of social identity, they link the process of social categorization with the motivational basis of individual action: Individuals strive to maintain or improve their self-esteem. Social categories and membership in social groups are associated with positive or negative evaluations depending on the comparison with certain other groups. Consequently, social identity is negative or positive, depending on the evaluation of one's in-group. If the social identity is unsatisfactory, individuals may leave the group and look for a group that is more conducive to self-esteem. Alternatively, individuals can try to collectively improve the status of the group in relation to the relevant out-group.

Tajfel and Turner go on to ask themselves when individuals tend to orient their actions towards the social and when they tend not to do so. They postulate that social behavior can be mapped on a continuum between interpersonal and intergroup behavior. On the one end, one encounters an individual with his or her individual characteristics, i.e. only on the basis of an interindividual relationship. On the other end, one encounters a person only as a member of a foreign group, i.e. the relationship is primarily characterized by the fact that two group members interact with each other on the basis of (assumed/perceived) group characteristics. In reality, according to Tajfel and Turner, it rarely happens that social behavior is characterized by only one of the two extremes; rather, it is usually a position on a continuum. Their interest, however, is the question of the conditions under which social behavior approaches one of the two extremes. For Tajfel and Turner, the *conflict* between two groups is essential: The more intense it is, the more likely another person is to be regarded as a member of a group or social category and the more likely social behavior will approach the "intergroup extreme."

Tajfel and Turner claim to explain "ideological" conceptions of society by linking the continuum between interpersonal and intergroup extremes with a thesis on "belief systems": Accordingly, in the case of "social mobility," individuals believe that a change of their group membership is possible if their own group membership is experienced as unsatisfactory. If individuals have no experience of social mobility, they perceive the social system as so hierarchical or confrontational that the possibility of changing an unsatisfactory group membership is considered unlikely. Social change, i.e. a change in the group constellation, is considered desirable or even necessary in this case. Tajfel and Turner assume that the more widespread inequality in a society is, the more widespread the conviction of the need for social change is.

According to Tajfel and Turner, certain group constellations can lead to social identity being experienced as negative or threatened, but social mobility is not possible due to conflict of interests. They discuss three ways of dealing with belonging to a disadvantaged group. Firstly, one could try to leave the disadvantaged group through "individual mobility" and take off the identity, i.e. the feeling of belonging to the group. A second possibility is "social creativity," through which one tries to change the dimension of comparison with the privileged group in order to upgrade the disadvantaged group. And thirdly, there is the possibility of "social competition," i.e. the in-group tries to outperform the dominant out-group with regard to the relevant dimension of comparison, e.g. the fulfillment of social norms.

The basic concepts of SIT presented here already reveal Tajfel's fundamental criticism of the prevailing social psychological mainstream at the time. In contrast to the mainstream, Tajfel wants to understand the genuine social nature of the individual without assuming that behavior is unilaterally determined by circumstances. In addition, Tajfel attempts to explain how belief systems or ideological convictions can be linked to directly experienced social behavior.

2. Tajfel's Epistemological Position

The development of SIT took place against the backdrop of Tajfel's confrontation with the Allportian mainstream of social psychology at the time. This was particularly evident in his demand that social psychology should do more than examine the relationship between individuals. In particular, Tajfel accused the mainstream of his time of clinging to abstract individualism. According to Tajfel, social psychologists narrowed their perspective when they attributed ideas of individuals only to relationships between individuals (cf. Billig, 1996, 343). The complexity of the social behavioral context is not done justice if it is understood as a mere stimulus. One must begin by conceptualizing the context differently.

For Tajfel, the function of theories is to formulate guidelines for the interpretation of experimentally obtained data. Ultimately, these guidelines are assumptions about the behavior of people in relation to groups and to society as a whole ("society at large").

Turner says that Tajfel occupies an intermediate position between philosophy and atheoretical empiricism, from which he reflects on the social background of the behavior (Turner, 1996, 10). He does not place his own research in a historical-social context, which would probably also run counter to his understanding of science (Tajfel, 1979, 188). On the other hand, SIT is obviously not the result of a random idea in the ivory tower: Tajfel refers several times to the struggle of black Americans in his time to prove the social relevance of his ideas. Only by considering the possibility of social change can one arrive at a social psychology that is appropriate to reality. For him, the choice of research questions is also not random, but rather linked to social conditions and needs and to the relevant ideas and norms of the researchers. This is a central difference to the previously prevailing attitude that research questions and methods are neutral in relation to the social world. This difference has consequences for epistemology: "Instead of proceeding from the individual to the social, which produced reductionist explanations, we needed to start from an analysis of social functions to reach the individual ones." (Tajfel, cited in Turner, 1996, 14).

A key concept is that of the "social context" of behavior. For Tajfel, the "social" are group relationships; from the point of view of the individual, society appears as a group arrangement. Individuals are categorized by societal processes, the significance of which is reflected in individual actions aimed at maintaining or improving self-esteem. To investigate these processes, Tajfel, on the one hand, calls on social psychology to be interdisciplinary, while, on the other hand, he sharply distinguishes psychology from other disciplines:

'Social reality' can be described or analyzed in terms of socio-economic, historical or political structures. Such descriptions or analyses are not within the competence of the social psychologist. But he can ascertain that, for whatever reasons, the system of the relations between social groups is perceived by the individuals located in the various parts of the system as being capable or incapable of change, as being based on legitimate or illegitimate principles of social organization. (Tajfel, 1979, 187).

According to Tajfel, a special quality of individual behavior develops in social contexts, which can be seen, for example, in culturally learned norms: "Society, social structure are the natural environment of human behavior and social psychology's task was to relate psychological processes to that context" (ibid., 19). Tajfel's suggestion that society is more than the totality of social groups raises conceptual questions about the relationship between individual, group, and society. Tajfel merely argues that the intergroup relationships studied by social psychologists must somehow be placed in relation to the "macrosocial" context and can be examined in their "relatively autonomous" consequences by social psychology.

Tajfel sharply distinguishes himself from pure empiricism when he emphasizes the independent significance of theory; however, unlike critical psychology, for example, he does not consider the development of concepts as such empirically. The concepts of SIT merely have to be experimentally

falsifiable. However - and in my opinion this is a central epistemological problem of SIT - he argues that there are certain aspects of the relationship between the individual, group and society that cannot be investigated experimentally. These include numerous SIT assumptions, e.g. the link between self-esteem and group membership, which are based on theoretical assumptions. The same applies to Tajfel's equation of the social with intergroup relationships, the deduction of which is not empirically based.

Ultimately, Tajfel's epistemological position remains committed to experimentation as a method. He argues that the value of experiments depends on the "quality of the ideas tested"; the experiment itself is neither good nor bad, rather it depends on the quality of the hypotheses. One arrives at "trivial findings when guided by trivial ideas" (Tajfel, 1981a, 20). For him, the task of research remains the experimental acquisition of data, although these should be analyzed in the light of theories that do not necessarily have to come from psychology. "I do not believe that 'explanations' of social conflicts and social injustice can be mainly or primarily psychological" (Tajfel, 1981, 7).

Tajfel does not offer a broad methodological and conceptual critique of the Allportian type social psychology, but rather turns the then dominant individual-centered social psychology into a group-centered one. He does not claim to investigate how individuals behave in groups, but rather wants to show how group memberships are reflected in the individual and how group norms and beliefs influence the group behavior of individuals. In other words, his subject is the "group individual" or its behavior. However, he concedes that individuals also have a life outside the group; but this should be dealt with - for example - by general psychology or sociology (cf. Tajfel, 1979). Tajfel has no equivalent to the view of critical psychology, according to which the individual is a genuinely societal being, whose actions relate to sections of a society based on the division of labor: For him, there are only groups and the individual.

3. The "Double Tajfel": Critical Concepts and Methodological Conventions

It is noticeable in the literature that SIT and its further developments (e.g. Turner et al., 1987, Reicher et al., 2010) emphasize Tajfel's critical concern, but simultaneously use his concepts more as state-of-the-art experimental design and as an interpretation template. However, this contradiction was already inherent in Tajfel himself. Stroebe, a companion of Tajfel, writes about critical psychology:

Holzkamp's criticism seems to be quite similar to the objections raised against its individualistic approach by Moscovici, Steiner or Tajfel. [...] However, this similarity is only superficial. While we merely argued for more consideration of the social context in social psychological theorizing, the critical psychology arrives at a much more radical conclusion (Stroebe, 1980, 109f.).

In the face of critical psychology, one must self-critically admit that the context of the discussion of SIT has created a "homo socio-psychologicus" that is more reminiscent of "Frankenstein than the result of evolution" (Stroebe, 1980, 110). The fact that this concession did not lead to a change in the research program is due to the fact that Tajfel and the social psychology he criticizes have similar ideas about the object of research and method. Additionally, Tajfel is concerned with an experimentally based prediction of group behavior. Tajfel's critical stance therefore remains external to the method.

In contrast, Holzkamp does not want to apply critical standards to psychology "in retrospect," but rather starts his critique at the conceptualization stage. For critical psychology, the cognitive interest and goal is the (self-)enlightenment of people about the societal mediatedness of their action, combined with the question of whether and how the societal conditions can be changed.

Tajfel's approach was different: He saw the central problem of social psychology of his time primarily in theoretical individualism, which he no longer considered plausible against the background of the experience of fascism and his own biography. For Tajfel, there was never any question of leaving the methodological framework of the psychological mainstream. Laucken (1997, 247ff.) classifies three types of dealing with the "crisis of social psychology" in the 1970s: These are, firstly, immanent "improving" (e.g. better condition control in experiments); secondly, immanent "expanding" to include new concepts; thirdly, "transcending." Tajfel's approach can ideally be categorized as "expanding," i.e. he introduces new concepts without leaving the methodological framework. This can be seen, among other things, in the reception of his work, which is characterized by diverse debates on the question of what Tajfel "really meant" (cf. Condor, 1996, 286). Michael Billig, an early companion of Tajfel, criticizes the reception that separates Tajfel's empirical works such as the minimal group studies from his texts critical of empiricism - to Billig, both belong together (Billig, 1996). However, Billig does not discuss the question of why Tajfel, himself, never brought together his epistemological position and his research practice. He ultimately remained an experimental social psychologist who reflected on and criticized the restrictions of experimental social psychology along the way.

In this respect, it is understandable that two interpretations of SIT emerged from the debates about Tajfel's "true concern": On the one hand, the one that does not take note of Tajfel's numerous references to the relevance of interdisciplinarity and to the limitations of purely psychological explanations; on the other hand, the one that explicitly refers to the possibility of social change conceptualized in SIT and thus attempts to grasp the historicity of the social (Reicher, 2004, Drury & Reicher, 2009; for an overview, see Schnur, 2021). Many of those who refer to the second reading have accused others committed to the minimal group studies of having turned Tajfel's ideas into an individualistic social psychology (cf. Reicher et al., 2010; Wetherell, 1996). In particular, concepts such as collective empowerment and collective self-objectification (Drury & Reicher, 2009) offer starting points for critical-psychological questions.

However, this group of authors is not so much a scientific community in its own right; for example, it does not run its own journals or institutes. They merely insist on Tajfel's "critical" claims within the framework and community of SIT.

However, Reicher and Drury do not draw any methodological conclusions from the claim to a "more social social psychology" either: As for Tajfel, it is easy for them to criticize the relatively theory-poor formulations of others without focusing on their methodology. Here, too, theory in a way 'hovers' over the empirical data. Interpreting study results in terms of SIT is ultimately left to the individual decision of the researchers. Reicher and Drury's appeal to take Tajfel's entire work seriously repeats his "double track": A real connection between "criticism" and research practice does not succeed. Here, too, a methodologically grounded "outside view" of the subjects ultimately prevails. When, for example, climate activists are studied in Reicher and Drury's research context, their a field experiment has the police act in a certain way in order to then examine how the dynamics among the climate activists change (cf. Vestergren et al., 2018). The conditions under which the groups are formed, which groups there are, who is part of the experiment, etc. - all of this is set by the researchers. Thus, the actions of the group members are not interpreted as a special case of possible reference to the world, but as a reaction to conditions that were set from outside and cannot be influenced. The level of intersubjectivity between researchers and research subjects is excluded (for methodological reasons) and only brought in retrospectively through the interpretative framework of SIT.

4. A Critical-Psychological Perspective

While in critical psychology society is understood as the sum of the mediated relationships between individuals, i.e. society is based on collective and "average" activities (cf. Holzkamp, 1983, 233ff.), in SIT, despite Tajfel's claim, there is a dualism between the individual and the social. The groups exist before the individual joins them and is faced with the task of dealing with the consequences of belonging to the group. It remains unclear where the "social context" comes from.

In the phylogenetic deduction of the psychic, which Holzkamp (1983) executes in his *Foundation of Psychology*, groups only play a decisive role in the maintenance of life before the emergence of humans - for mutual communication, e.g. for food intake or warnings against predators (cf. Holzkamp, 1983, 114f.). With the production of tools and the division of labor, the societal process becomes increasingly autonomous, which, in turn, means that the existence of the individual or the reproduction of society is no longer directly dependent on individual activities or "contributions" (Holzkamp, 1986, 396f.). Social groups can be understood here as arrangements of meaning; For the acting individual, they represent possibilities and impediments to action mediated by society as a whole. Groups and the norms, ideas, etc. associated with them can therefore serve as a subjective orientation for action.

The "social identity" in Tajfel's sense could thus be understood as an experience that mediates between the significance of the group and the social position and situation of the subject - the contradictory nature of which is not taken into account in SIT. An example of the one-sidedness of SIT is its modeling of the motivational aspect of human action: SIT assumes that the pressure to evaluate one's in-group positively and thus increase one's own self-esteem leads to comparisons with the out-group. Critical psychology understands motivation as an aspect of agency and thus links it to the goal of (collectively) expanding the possessing of societal conditions (Holzkamp, 1983, 402ff.). It is therefore not necessarily about a comparison with a foreign group in which one must "come away" well, but about intervening in and participating in the social process. The idea of the world from the perspective of comparing one's own group is only one possible approach to the world.

In SIT, however, the "social context" (defined by groups) and society itself is one thing. It is only possible to describe action in the group because it remains open how the mediation between group and society is to be understood. The direct and purely situational (present) confrontation between two groups, which is necessary for SIT, makes the model abstract because groups, especially in the ideal-typical constellation of self and other groups, do not act in a vacuum. Due to its model-like character, the SIT interprets all possible subjective action orientations from the outset as part of social identity. Other possibilities are left out. Reicher and Drury (2009) supplement SIT with a perspective on "empowerment," which is to be achieved through social change, but, in my opinion, the basic problem remains: The direct confrontation between two groups is an example of a special situation, even if the representatives* of SIT declare it to be the normal case. Consequently, Reicher et al. (2010) speak of the group-based perception of the world corresponding to their reality.

The following studies cited as examples with reference to SIT take place in contexts in which a dichotomous group arrangement is given: For example, when Trump's supporters are examined during the US presidential election (Reicher & Haslam, 2017). The same applies to a study on the escalation of nationalism in the course of the Bosnian war (Elcheroth & Reicher, 2017, 183ff.), where the fact of the war created a friend-foe scheme, as well as to a study on the Scottish independence referendum, where the vote has only two options to choose from (ibid., 215ff.). However, the principle that one belongs either to one's own group or to a foreign group quickly reaches its limits: The emerging nationalisms that Reicher examines in connection with the disintegration of Yugoslavia cannot be understood exclusively on their own terms without, for example, understanding the function of the nation as a specific form of socialization. The concrete groups must ultimately be able to be placed in relation to society, otherwise there are only (manageable) groups, on the one hand, and an unmanageable and not conceptually comprehensible society, on the other. It remains unclear how the connection between group formation and social processes is to be understood.

However, the fact that groups must be mediated by society as a whole does not, conversely, mean that they are derived from the analysis of social conditions. What is essential is the question of the relationship between social structure,

individual group membership and subjective action. With Marvakis, society can be understood as a system "in which the individual subjects act with 'limited' insights due to the social division of labor" (1996, 126f.). From the subject's perspective, the social structure represents the totality of the framework conditions that enable and hinder certain actions (cf. *ibid.*, 128f.), e.g. through certain norms, institutions, but also social groups. Certain compromises between conflicting particular interests of collective subjects are solidified here. This is where concrete subjective action takes place - and even if it does not directly determine the overall social process, the social process is accelerated, delayed, and influenced by subjective action mediated by the meanings. In the examples cited above from SIT research, the conflict between identities -or even the assertion of one social identity at the expense of another- has no conceptual relationship to the overall social process. Ultimately, the concept of social identity in the sense of SIT limits subjective action to the respective group situation.

On the omission of researchers' working conditions in the critique of science

Critique of neuroscience and the position of neuroscientists in economized academia

Eileen Wengemuth

Abstract

Neuroscience as a discipline of high relevance to psychology has been faced with a critique from various fields, including (critical) psychology, sociology, philosophy and neuroscience itself. Points of critique range from pointing out methodological flaws to the questioning of implicitly underlying philosophical or socio-theoretical assumptions. While the politicality of the debate around neuroscience as well as the potential political and societal implications of some neuroscientists' claims were often exposed as 'politics in neuroscience,' most of the critique omits another political aspect – that is, the dynamics and working conditions of researchers in economized academia. This article gives a brief overview of the different points of critique and then focuses on how neuroscientists position themselves in relation to these. It concludes that both the working and research conditions as well as different understandings of science need to be taken into account to understand the phenomenon of critique of neuroscience and neuroscientists' situatedness in it.

Keywords

Critique of neuroscience, interdisciplinary critique, neoliberal academia, economized academia, working and research conditions, science as practice

Introduction

When telling people that I was investigating the topic of the critique of neuroscience for my doctoral research project, I received a wide range of mixed reactions, which already gave a first hint at the political and academic dynamics around this subject matter. While some people were immediately overjoyed,

encouraged me as to the relevance of my topic and gave me suggestions on what literature to include, others were mildly taken aback and expressed puzzlement over whether this was a sufficiently relevant and specific phenomenon to investigate¹. Having majored in cognitive neuroscience, but at the same time being skeptical of some of the implicit assumptions made in neuroscientific research myself, it was exactly these dynamics that originally drew me to this topic and that I wanted to understand better.

In my doctoral research, I first conducted a literature analysis of the critique of neuroscience to give a systematic overview. To find out how neuroscientists position themselves towards these critiques, I then conducted qualitative expert interviews with neuroscientists. In the interviews, they were also asked what they *themselves* criticize about their discipline, thus offering them the opportunity to contribute further points of critique. In this article, I will mostly focus on the results of the expert interviews, but first give some examples of the critique of neuroscience found in the literature. It is important to point out that I conducted my interviews in Germany and in the UK and that in my literature analysis I included only texts available in English and German. It would thus need to be investigated whether similar results can be found in other contexts.

I would like to add another caveat before giving a brief overview of different points of critique. Neuroscience is a very broad and varied field with research topics and focuses ranging from physiological research on the opening and closing of ion channels to fMRI-studies investigating differences in activity patterns between different groups of people. In their analysis, many critics of neuroscience focus on selected, often popular scientific works, but then nevertheless formulate a general critique of the field of neuroscience. It would be an important task to investigate whether this is a problem or not and which points of critique apply only to specific subfields and which can be generalized. This was, however, beyond the scope of my thesis. I started with the finding that there is a remarkable amount of literature in which neuroscience is criticized, that 'critique of neuroscience' is thus a phenomenon worth investigating; consequently, I pragmatically included into my analysis any literature that calls itself 'critique of neuroscience.'

Literature analysis on critique of neuroscience

To give a systematic overview of different points of critique of neuroscience, I used a four-level-conceptualization from German-Nordic critical psychology (Holzkamp, 1983, p. 27-31). This conceptualization was introduced in early critical psychology to explain on which levels critical psychology criticizes mainstream academic psychology and to differentiate between different kinds and targets of critique. According to this conceptualization, points of critique are situated on different levels. The most basic one is the philosophical level, which deals with basic epistemological and ontological assumptions. At this level, fundamental questions are addressed, such as 'how I can know something with

¹ Needless to say that these reactions are the extremes and most were somewhere in between.

certainty' or 'what distinguishes scientific from non-scientific knowledge.' Here, critical psychology criticizes bourgeois psychology's understanding of science, which has no method for deriving and developing concepts, but often simply sets a definition.

Holzkamp considers the next level to be the socio-theoretical level, i.e. the level of an implicit or explicit understanding of society and of the relationship between individual and society. Ideology critique, for example, can be situated on this level. Specifically, critical psychology criticizes the "reduction of societal relations to direct social interaction" (Holzkamp, 1983 p.27, translation EW) as well as "the blind intellectual-methodical reproduction of the prevailing conditions" (ibid.). This means that the current form of society is seen as the only possible one due to a lack of reflection on societal relations. As a result, psychological scientific findings about human actions are not presented as findings about actions in specific societal conditions, but as general findings about human behaviour.

The categorical level - sometimes called paradigmatic - deals with the basic categories or concepts of a discipline, which determine its subject matter, i.e. with what this discipline is concerned. In critical psychology, basic concepts are called categories, which is where the name of this level comes from. One of the reasons why a critical examination of categories and basic concepts is important is that they often contain methodological assumptions as to how the subject matter can and should be researched scientifically.

On the basis of these basic concepts, assumptions about empirical data and their relationships are then explicated as theories on the next, single-theory level. The individual theories are not determined by the categorical definitions; rather, there can be different individual theories on the basis of the same basic categories, even to address the same empirical facts. For example, against the background of a shared understanding of scientific knowledge, society and the psyche, different theories about how mental health problems arise could be discussed. Which theory best describes a particular situation can then be empirically demonstrated.

Needless to say, this conceptualization is a bit oversimplifying and is not meant to be a description of different academic disciplines' scientific practice. Also, making use of this conceptualization does not posit the existence of ontologically distinct levels.

While keeping these restrictions in mind, I found it a helpful heuristic for systematizing different points of critique of neuroscience according to these levels. I will give a brief overview of these now. On a philosophical level, critique is, for example, directed at the psychophysical problem, which is a basic problem concerning the relationship between mental and physical – and in the case of neuroscience, usually neuronal – processes. Critics point out that while explicitly rejecting dualist mind-body-conceptualizations, neuroscientists implicitly fall back into Cartesian dualism by conceiving of the mind as an entity (e.g. Bennett & Hacker, 2003; Maier, 2015). Other philosophical critiques address epistemological problems, e.g. explanatory gaps or inconsistent conceptualizations of causality in neuroscientific research (e.g. Falkenburg,

2012).

On a socio-theoretical level, critical analyses address the ideological content (e.g. Malabou, 2003; Rose, 2012) of neuroscientific research, for example, that findings on neuronal plasticity can be interpreted as evidence that humans are able to -and can thus be asked to- flexibly adapt to any circumstances, which gives neoliberal capitalism its biological basis and justification. Critics also point out that neuroscience has a tendency towards naturalizing inequalities with respect to, for example, gender and race (Martinez Matteo, Cabaniz, Loebell & Krach, 2012; Schmitz & Höppner, 2014). Not surprisingly, the critique on this level addresses the potential political implications of the criticized neuroscientific research most explicitly. Critique directed at a lack of conceptual clarity, for instance, posits that terms such as 'consciousness' or 'representation,' which are vaguely and incoherently conceptualized, can be situated on a categorical level. Other critical analyses on this level address the attribution of human properties to the brain, such as 'brains making decisions,' which, as critics point out, can logically only be said of persons and thus constitutes a mereological fallacy (e.g. Gallagher, 2012; Crawford, 2008; Bennett & Hacker, 2003).

There are also many examples of a critique of methods, which address problems regarding statistical analysis, for example α -error-inflation due to multiple comparisons both in fMRI- as well as EEG-research (e.g. Vul, Harris, Winkielman & Pashler, 2009; Luck & Gaspelin, 2017). Critique of methods is – as is true for other academic disciplines – the most common form of intradisciplinary critique. Consequently, in this case, the critics are usually themselves neuroscientists.

Neuroscientists' positioning in relation to critique

The fact that neuroscience has been criticized a lot has led me to the question of how neuroscientists see these different points of critique, with which ones they agree or find relevant and what points they themselves would raise. I would argue that this is important for different reasons: In much of the critical literature, neuroscientists seem to be addressed as potential readers of the critique, presumably also because the authors assume they could change something about the criticized issues. Many critics aim to raise awareness of potential negative societal consequences of neuroscientific research, and it is thus relevant to reach and even convince people who could potentially change the way research is conducted. As I said above, much of the critique focuses on the writings of a few well-known neuroscientists, who have been very active in the media, and it is not clear -and thus worth investigating- how other neuroscientists see both the writings of these well-known representatives and the critiques of them. Finally, I believe it can be of general academic interest to better understand the reception of interdisciplinary critique or analyses of academic fields by other academic fields.

In order to investigate these questions, I conducted qualitative interviews

with 13 neuroscientists working in Germany and in the UK. To ensure my sample group is varied, I approached scientists from different neuroscientific subdisciplines, such as cognitive neuroscience, social neuroscience and computational neuroscience. Furthermore, the interview partners were at different stages of their academic careers, ranging from postdoctoral researchers to full professors. The interviews were conducted in German or English depending on the interviewees' preferences and took place either in their offices or – after the onset of the COVID-19-pandemic – in online meetings. To make sure that the interviewees were able to bring their own points of view into the interviews, I started each interview with the open question about which points of critique the interviewees have come across and how they thought about these. I kept this question that broad to allow the interviewees to bring up whatever their own understanding of the topic ‘critique of neuroscience’ was, be it critique of the whole field or of their own work. As I will describe later, it turned out that they brought forward issues under the headline ‘critique of neuroscience’ that were very different from what can be found in much of the interdisciplinary critique of neuroscience.

To ensure that the points of critique found in the literature were also addressed in the interviews, I used thematic cards with different points of critique as topics written on them. The interviews were audio-recorded and transcribed. For the analyses, I used a combination of Grounded Theory Methodology (e.g. Corbin & Strauss, 2008) and critical-psychological praxis research (e.g. Markard & Holzkamp, 1989). For the individual analysis steps, I followed Grounded Theory Methodology and used critical psychological methodological considerations as a reference frame throughout the process. A more detailed account of my methodology can be found in my thesis; here, I will illustrate my approach with the following example: In Grounded Theory Methodology, one technique for deriving concepts is asking questions about the data. This is well in line with what German critical psychologist Morus Markard suggests doing when analyzing interview data in absence of the interviewee, but still trying to maintain a level of intersubjective understanding. Namely, one should engage in a “simulated dialogue” (Markard, 2019, p.38) with the interviewee and ask what they could have meant by phrasing something a certain way and then build hypotheses about their reasons.²

First, I will show based on some examples of interview clips, how my interviewees positioned themselves in relation to different points of interdisciplinary critique that can be found in the literature. Some interviewees raised these points themselves; however, in most cases these topics were not discussed until after I had presented the cards. I selected the clips presented here to show as wide a spectrum of answers as possible.

On the topic of the *psychophysical problem* and critique of *implicit dualism*, one interviewee, a lecturer in cognitive neuroscience, states

² Following the critical-psychological principle of co-research, interviewees should be included in all steps of the research process as co-researchers. However, like many other critical-psychological researchers, aside from offering them to authorize the transcripts, I did not include the interviewees in the analysis. (See Wengemuth & Waleng, in press, for a discussion of problems in research practice when it comes to co-research.)

NW12: “we still don't understand how molecules contribute to consciousness or the mind.”
(NW12, 49)

Apparently, he assumes there is an explanatory or knowledge gap between physiological and mental processes, which neuroscientific research has not (yet) been able to close and thus agrees with critics pointing out this explanatory gap.

In contrast, another interviewee -who works both a researcher in affective neuroscience and as a psychotherapist-, when asked how her being a neuroscientist impacts upon her therapeutic work with depressed clients, is sure that

NW7: „negative thoughts (are) in principle only a specific constellation of neurotransmitters.”
(NW7, 48; translation EW)

She seems to understand negative thoughts as equivalent to -and potentially reducible to- neuronal processes. In other parts of the interview, she states that she sees mental and neuronal states as identical and that she uses this knowledge to explain to her clients why both psychotherapy as well as antidepressant medication are effective. She thus apparently does not assume there is an explanatory gap and does not agree with this point of critique.

The following two interview clips refer to critique on a socio-theoretical level. Addressing the point of critique of *naturalization of inequality*, with which he is familiar, one interviewee, a junior professor in cognitive neuroscience, describes his view as follows:

NW13: “Especially a lot of social scientists don't want to face the fact that there are also biological foundations of differences. Which doesn't mean that that can't change. But something like different educational success certainly also has biological foundations which we can't discuss away.”
(NW13, 39; translation EW)

The interviewee points out that just because something is biological, it is not necessarily unchangeable, possibly in response to oversimplified accounts of *nature vs. nurture*, which he has come across and which identify something being natural with it being unchangeable. Assuming that this point of critique is mostly raised by social scientists, he turns the critique back at them, stating that they refuse to admit the existence of biological foundations. By stating that social scientists – maybe due to their field's focus – refuse to admit the existence of biological foundations, I would argue he quickly wards off the critique without touching upon the potential societal consequences of naturalizing inequality.

In contrast, another interviewee, a professor in social neuroscience, brings up this topic as very important to him, even before the thematic cards were introduced into the interview. He speaks about how he, along with some colleagues, was concerned especially about implicit assumptions in the

subdiscipline of cultural neuroscience.

NW11: “We tried to find out, what are the questions and how are they addressed, in these cultural neurosciences? (...) And we thought, that has very problematic implications going in the direction of old race concepts even though the studies speak of culture. (...) And partly, we did assume that the authors were implicitly racist.”

(NW11, 6, 51; translation EW)

I hope these few interview clips give a first idea that there was a wide variety in how the interviewees positioned themselves towards critique of their field. There was no consensus among them on which points of critique are justified. Some strongly criticized (aspects of) neuroscientific research, whereas others found it unwarranted that neuroscience had been the object of much interdisciplinary critique. Apart from critique directed at statistical analysis, with which all interviewees were acquainted, there was a vast variety in their knowledge of other points of critique. Some interviewees had never come across many of the topics, whereas others had extensive knowledge. Several interviewees, irrespective of their individual stance towards the critique, stated that critique on a philosophical or socio-theoretical level -but also epistemological foundations- are not discussed in their daily research practice and that these critical analyses are not practically relevant for their work.³ I would argue that this practical irrelevance is corroborated by the fact that there was no consensus among the interviewees and that their familiarity with these topics varied greatly. If the discussion of basic philosophical and socio-theoretical assumptions played a role in the daily research, both a minimum consensus and a shared knowledge level would be needed.

How neuroscientists' understanding of science and their working and research conditions impact their position towards different points of critique

Over the course of the interviews, it turned out that the interviewees had different *individual understandings of science* and that these help to understand how the different interviewees think about different points of critique. By ‘individual understanding of science,’ a concept sometimes referred to as *personal epistemology* (e.g. Hofer, 2000) or *view on the nature of science* (e.g. Deng et al., 2011), I mean their implicit or explicit understanding of how one arrives at scientific knowledge. For instance, some interviewees expressed strong trust in the progress of science and saw science as independent from societal influences, whereas others emphasized the social embeddedness of scientific knowledge generation and questioned the primacy of knowledge from the natural sciences in relation to other disciplines.

One interviewee who generally sees a lot of problems in the way science is

³This does not mean that these points of critique are also theoretically irrelevant.

organized, expresses her strong trust that these problems will be remedied because neuroscience as a field will mature.

NW2: Consciousness science is a very young science. We've really just started. (...) I don't know what the way out is, but this is not a dead-end. We will get better. (**I:** Ok, so you have faith in the progress of science?) Absolutely, yeah. (...) We're babies playing in the mud. But we will grow. As babies do. (Both laugh) The criticism is true, it's valid. But we'll get over it. NW2, 109-112

She seems to be very sure that, no matter how problematic the conditions are now, there will be scientific progress and current problems will be solved.

Another interviewee, on the other hand, states that many neuroscientists do not question the data they collect. He contrasts this understanding with the understanding in the social sciences, which he described as having a more embedded view on data.

NW11: There is a prevailing trust in data in neuroscience, to say, data don't 'lie', they are just there (...). And this other view, maybe more from the social sciences, is to say, data are somehow embedded... have been collected in a certain context, with a certain research question, embedded in other phenomena of a certain time. (NW11, 12; translation EW)

This interviewee, himself, understands the data he collects as socially embedded and criticizes the predominant understanding of science in neuroscience.

Thus, the interviewees' understandings of science can be situated on a continuum between a more *naturalistic* understanding and a more *social-science-informed* understanding. I would argue that the individual understanding of science serves as a reference frame for *good scientific practice* and thus plays a role in how they see different points of critique.⁴ For example, interview partners with a more naturalistic understanding of science, who understand the scientific process as independent from societal influences, tended to disagree with philosophical and socio-theoretical critiques in particular or to see these critiques as irrelevant.

Irrespective of their individual understanding of science and their stance towards the critique that can be found in the literature, almost all interviewees strongly criticized their *working and research conditions*. For many of them, these were the most important points of critique, and they named this as their primary motivation for taking part in the interview. For example, they criticized the pressure to publish, which -in combination with short-term contracts- means that early-career-researchers, in particular, must generate publishable results in the short term to secure their next job. They also saw the bias towards positive-outcome papers as highly problematic, meaning that studies that have a positive

⁴ However, I am grateful to Morten Nissen for pointing out to me that this argumentation might follow too rationalistic a pattern and focus too much on what is said. While the interviewees probably want to put forward a coherent line of reasoning, it does not automatically follow that their practice is guided by the same logic.

outcome and/or confirm expectations have a higher chance of being published, while null result-studies usually remain unpublished and are not included in meta-analyses. Many also criticized the popularization of scientific knowledge, which has increasingly become a requirement for obtaining funding and often leads to the selection of research topics that can easily be summarized into short, catchy headlines, instead of complicated research endeavors that might or might not be finished successfully. Several interviewees also stated that the way scientific impact is defined in indices does not necessarily represent what they consider high-quality research. However, the number of publications and their impact levels play a crucial role in hiring practices.

I will again exemplify this with some interview clips. One interviewee recounts an incident in which a new colleague pointed out a flaw in an experimental setup, which limited the validity of the conclusions drawn from the experiment. However, since she needed to have a publication soon, the interviewee describes that it seemed not possible to change the experimental setup and to repeat the experiment.

NW2: (...) She had a very good point and we never thought about it in two years of doing this experiment. We have a problem. (Both laugh) And nevertheless, we have to publish, because... you know, it's two years of work! So we will discuss this, we will account for it, we will try our best, but we probably don't want to rerun the whole experiment saying "Oh, what happens if we change this other thing." Once we've reached our conclusions... (...)

I: You said: "But we still have to publish." Did you mean, for example, that you got some grants and now you have to show, ok, we did something with that money?

NW2: Not so much based on grant money, but in terms of career. (...) I need papers to get my next job.

(NW2, 34, 44)

In this interview clip, it becomes clear that the interviewee perceives her working and research conditions as not allowing her to work in a way that would meet her own standards of good science.

When speaking about the topic that neuroscience has sometimes been criticized for its broad claims, another interviewee draws a link to fixed-term contracts and the way scientific impact is defined.

NW9: We are working in a structure in which an increasing number of people are on third-party-funded positions, which are temporary. And one important criterion that decides who stays and who doesn't, is: who has published where? So journal impact factors. And publishing high impact often means: generalizing as much as possible in the interpretations and throwing as many limitations as possible overboard.

(NW9, 8; translation EW)

He argues here that the broad claims for which neuroscientists have been criticized also have to be understood as a way of getting one's article published in

a high impact journal and thus increasing one's chances for a next job.

The phenomena criticized by the interviewees are aspects of societal developments that are being characterized by sociologists as *economization of science* (e.g. Schimank, 2011), *neoliberal academia* (Smyth, 2017) or the *entrepreneurial university* (Etzkovitz, 2013). As such, they are by no means specific to neuroscience. However, as the German sociologist of science Torsten Voigt (formerly Torsten Heinemann) points out, neuroscience as an academic discipline is very well adapted to economized academia, both in the project-based way it is organized and with regard to the readily popularizable knowledge it produces (Heinemann, 2012). Consequently, neuroscience is very publicly visible and quite successful in the interdisciplinary competition for research funds. I would argue that for *individual neuroscientists*, their *discipline's* advantageous position might lead to even more competition.

More generally, I would like to make the case that the working and research conditions in economized academia are, on the one hand, an object of critique – as shown, for example, by the problems the interviewees report. On the other hand, the way academia is organized also provides (at least part of) an explanation of how neuroscientists position themselves towards different points of critique, especially for the relatively low reception and the low level of knowledge of many points of critique. Because of the pressure to generate a publishable result within a certain time, neuroscientists have little time to acquaint themselves with critiques of their discipline. As mentioned above, my interviews showed that many points of critique are not considered to be relevant to everyday research, so that dealing with these does not offer any advantages for a scientific career, let alone being a requirement. Their personal interest would therefore have to be strong for interviewees to give this discussion priority over other tasks or to devote their free time to it. A large part of the critique from the humanities and social sciences is published in the form of monographs, a form of publication that is unusual in the neurosciences and which many neuroscientists do not have time to read in their daily work.

To better understand the relatively low reception of many critiques, it is helpful to consider the two concepts – different understandings of science and the working and research conditions – combined and in relation to one another. In their analyses, many critics presuppose an understanding of science that is not prevalent among neuroscientists and was not even known to many interviewees. Theoretically and conceptually, these critics thus presuppose knowledge that neuroscientists often do not have. Neuroscientists would first have to acquire the basic assumptions and concepts used by the critics, before they can understand the critique. This is often unrealistic – although not impossible – due to the time and performance pressures they face.

Gaps and entanglements as characteristics of the phenomenon of critique of neuroscience

More broadly, I would argue that the phenomenon of the interdisciplinary

critique of neuroscience can be more adequately understood when taking into account the overall working and research conditions in economized academia as well as different understandings of science. Scholars who criticize neuroscientific research -and are not neuroscientists themselves- *also* work within an economized academic system characterized by competition for research funds between universities, disciplines and individual scientists, to which neuroscience is well adapted and thus comparatively successful. If, for example, the popularization of scientific knowledge in the neurosciences were less common, critics from other disciplines would probably not have taken note of these statements and would not have criticized them.

The success of neuroscience as a discipline can, on the one hand, motivate scholars from other fields to want to participate in it and to conduct neuroscientific research themselves, which can be seen in the many emerging neuro-hyphenated disciplines (Hasler, 2012 p.14 & Heinemann, 2012, p.119). On the other hand, this success may also make it subjectively functional for scientists from other disciplines to scrutinize neuroscience particularly critically and, through their critique, show the public, potential funders, and neuroscientists that the success of neuroscience, in terms of the quality of its findings, is not justified. I would assume that this is a particularly strong interest of humanities scholars and social scientists, who see themselves threatened by neuroscience in the competition for research funding, which is -at least partly- justified. In addition, criticizing a successful discipline – intentionally or not – may also let the critics partake in the attention that has been and is given to neuroscience. On the other hand, I would also assume that by seriously critiquing the attention-seeking statements of some neuroscientists, neuroscience as a field has received even more media attention, and critics may thus have unintentionally reinforced the "neuro-hype" (e.g. Grübler, 2017) they originally wanted to criticize.

In their critique, many – though not all – critics disregard the working and research conditions of neuroscientists and focus exclusively on neuroscientific – often popularized – knowledge.⁵

Many of my interviewees, on the other hand, focused their critique exclusively on the working and research conditions and were not familiar with the critique directed at neuroscientific research content and knowledge. Thus, there is a *mediation gap* in both directions. As a result of this gap, it remains unconsidered that many aspects criticized about neuroscientific knowledge are not independent of the working and research conditions in economized academia, in which this knowledge is generated. If we understand human agency as always social and political, we -as critical researchers- need to make sure to not only critically analyze knowledge and ideology, but also the economic-political structures in which this knowledge is produced -in the case of academic knowledge, the way universities and funding are organized- and to fight for better working conditions for researchers.

⁵ The insight that, to investigate and to critique science, it is not sufficient to look only at the generated scientific knowledge, but also to understand science as practice and labour, is by no means new (see for example Pickering, 1992 and Callard, 2022). However, a substantial part of the critical literature on neuroscience does not include this insight, often because they do not see it as relevant to talk to or engage with neuroscientists to understand neuroscience.

Disclosure of prior publication: This paper summarizes key findings of my doctoral research project. The entire thesis has been published in German as “Wengemuth, E. (2023) Neurowissenschaften in der Kritik. Positionierungen im ökonomisierten Wissenschaftssystem.” Courtesy of transcript Verlag, Bielefeld, Germany.

Funding acknowledgments: This research was funded by a 3-year doctoral scholarship by Hans-Böckler-Foundation provided by the German Ministry of Education and Research.

Declaration of conflicting interests: The author declares no conflict of interest.

Fostering democratic deficiency with climate action research

A tale of epistocracy, despotic truth tellers and useless laypeople in a time of climate change

Lise Isabella Meistrup¹

Abstract

Researchers hold a certain position in society, which enables us to competently hypothesize on the most favorable paths to pursue in specific matters. However, because of this privileged position, researchers also have a greater responsibility to exercise caution and acknowledge their limitations, when/if they make such suggestions. In this article, I argue that psychological researchers sometimes overstep this balance of caution with somewhat less finesse than what would be appropriate. More specifically, I argue that psychologists are at risk of contributing to a path that excludes the wider public from participating in matters of climate action – matters that require the participation of the public. I argue that this risk is particularly problematic for psychologists who work from a theory of human conduct, in which people are ontologically understood as competent participants in society, and I argue that while all research may be political, this is a point for caution and that researchers should be wary of intertwining scientific and political assessments.

Keywords

Climate action, democracy, theory of human conduct, laypeople

¹ I have no conflict of interest to disclose. The paper features data from a PhD project that is financially supported by Aarhus University.

Introduction

The customary complaints about democracy's ungovernability in the last instance come down to this: democracy is neither a society to be governed, nor a government of society, it is specifically this ungovernable on which every government must ultimately find out it is based. (Rancière, 2006, p. 49)

My aim in this article is to highlight why and how psychological researchers should resist their urge to propose too concrete solutions for political problems such as climate change mitigation.

I begin by arguing that climate change is a special kind of problem, a wicked problem that needs to be handled democratically. I argue that psychologists working from a theory of human conduct in which people are seen as competent participants in society will agree with this, because of said ontological assumption. However, drawing on Rancière and others, I argue that typical Western, democratic societies are sometimes rather leaning towards epistocracies, meaning that politicians and experts are effectively excluding the public from the decision-making processes of otherwise political matters. I give examples of this from psychological research on climate action.

I further argue that psychologists with a theory of human conduct where people are seen as competent participants in society should be particularly wary of this tendency to exclude laypeople from decision-making processes. I argue that a point for caution is when said researchers shift their aim from describing and revealing an existing reality to arguing what this reality needs in the future, as this is a political assessment rather than a scientific assessment.

Climate change requires democratic action – this is a known fact for those who believe it

In this first section, I argue, that climate change must be dealt with democratically. That is, with the inclusion of the public. I also argue, that this suggestion inevitably follows from a specific ontological onset that lays the ground for the researchers who make it.

Climate change is described as a *wicked problem* (Levin et al., 2012; Meistrup & Klitmøller, 2020; Sun & Yang, 2016), meaning a societal problem that cannot be solved with scientific knowledge due to the fundamental nature of the problem, which requires solution models that involve prioritizing between a number of intertwined solutions, none of which will ultimately be able to solve the problem due to the recurrent and ever-changing quality of the problem. Wicked problems are thus contrasted with *tame problems* with linear solution models (Rittel & Webber, 1973).

Similarly, Willis et al. (2022, p. 5) argue that it is useful to distinguish between technical and non-technical problems, with climate change being the latter: “In short, scientific and technical evidence can describe the problem, and offer options on how to respond, but it cannot make decisions on behalf of society”.

This is not to say that solving the problem of climate change does not require technical knowledge – on the contrary, Willis et al (2022, p. 5) continue:

Of course, scientific and technical input is an essential ingredient in any response to climate change. We cannot understand climate change without techniques of scientific observation, synthesis, modeling, and forecasting. Responses to the climate crisis, too, require understanding of different technical and technological options, such as the potential for uptake of renewable energy, or the feasibility of capturing and storing carbon dioxide. However, as has long been argued by scholars of science and technology studies, it is not simply a case of “translating” such evidence into action.

Willis et al., 2022 (p. 11) go on to argue that this process of translating technical knowledge into action is a political issue, and thus *more democracy* is the way forward (see also Willis (2020)):

As countries grapple with increasingly severe climate impacts and far-reaching cuts in greenhouse gas emissions, the climate crisis will come to dominate political thinking and action. Strengthening and enhancing democracy is an essential ingredient in rising to this challenge.

So, climate change is a democratic problem, or a political problem, either way, solving it requires the active involvement of the public, according to the above researchers. And their arguments may be sound, but I would argue that this solution is given by these researchers’ ontological understanding of human conduct. That is, for a critical psychologist, a pragmatist, a cultural-historical, activity theoretical psychologist, and the like², human conduct is based on participation. Therefore, participation must be the answer. This ontological premise is what Arendt (1998, p. 7) calls the *human condition of plurality*, meaning:

While all aspects of the human condition are somehow related to politics, this plurality is specifically the condition - not only the *conditio sine qua non*, [the condition absolutely necessary] but the *conditio per quam* [the condition that, if fulfilled, causes is] – of all political life

Thus, according to Arendt (1998), action in general, is the kind of human conduct concerned with our common lives, and this premise of shared participation is the basis for all political life, i.e. the life concerned with our

² I am not saying these theories are *the same*, however, they do share certain assumptions of conduct, which specifically distinguish them from so-called *mainstream psychological theories* and for this particular paper, I find them to be sufficiently alike for it to be more functional to treat them as one.

wishes for our future, our ideological beliefs about how to reach that future and the practical actions we partake in to get there. Being political and participating in *polis* is therefore, a constitutive part of human conduct – an argument with which Dewey agrees: “Regarded as an idea, democracy is not an alternative to other principles of associated life. It is the idea of community life itself” (Dewey, 2016, p. 175).

So, when we try to solve a problem like climate change, it is obviously a matter of political (and democratic) action because it revolves around the future we want for our common existence. For Arendt and Dewey, this is an ontological premise, not an ideological question.

Additionally, and more specifically in relation to climate change mitigation, critical psychologists, Rätzl and Uzzell (2019, pp. 1406-1407) also write how:

We are obviously not the first people to argue that change can only happen as a process from below in which people take control over their living conditions and thereby begin a process of changing their circumstances and changing themselves [...] Our argument is only that without recognizing and engaging the capacities of individuals for cooperation and a collective control of their living conditions a socially and environmentally sustainable world will not be possible.

Therefore, for many psychological subgroups of researchers, the statement that climate change should be handled democratically, meaning with the active involvement of the public, is little more than a reference to a fundamental aspect of human conduct concerning common problems of the future.

This point is not to say, however, that the statement ‘that climate change is a democratic problem’ is not valid or necessary. On the contrary, in the following section, I will argue that public participation is not something to be taken for granted.

Epistocracy disguised as democracy equals democratic deficiency

In the previous section, I argued that climate change (at least according to some researchers) requires democratic action. In this section I refer to a group of researchers who argue, that although most, Western societies, typically think of themselves as democracies they tend to be epistocracies, effectively excluding the public, while pretending to include them.

In their book, debating whether we need more or less democracy, Brennan and Landmore write that “Most people regard democracy as the best and most legitimate form of government” (Brennan & Landmore, 2021, p. 1). However, Brennan and Landmore (2021, pp. 1-2) continue, and write how “Even dictators claim to speak for and derive their authority from the people [...]”, and therefore, the statement that almost everyone seems to be in favor of democracy is no guarantee of actual public involvement.

The conundrum with people arguing for democracy while effectively repressing or suppressing or undermining it in practice illustrates a societal problem: Democracy is often taken for granted while the very constituting

elements of said democracy are undermining it from within. At least, this is the point in several papers and books, for example in Jacques Rancière's *Hatred of democracy* (Rancère, 2006), and with a particular focus on the use of merits in this pursuit in Michael Sandel's *The Tyranny of Merit* (Sandel, 2021). I find that Danish journalist, Rune Lykkeberg (2012), describes this twisted process the best in his book on the subject *Everyone is right. Democracy as principle and problem*:

It turns out that the very people, who use democracy as a slogan, are often the ones who work against it in practice. They assume that the majority is too immature and irresponsible to rule for themselves, and consequently the productive and enlightened must rule them. (Lykkeberg, 2012, p. 8, my translation)

Additionally, sociologist Ulrich Beck (2010) describes the phenomena specifically in relation to climate action: "The discourse on climate politics so far is an expert and elitist discourse in which peoples, societies, citizens, workers, voters and their interests, views and voices are very much neglected" (Beck, 2010, p. 254).

Thus, the theory is, that a small elite of scientists and politicians are forming an unholy unity, a kind of epistocracy, that subtly but firmly excludes the wider public from the decision-making processes. The elitist unity is formed and defended outwardly with reference to the before-mentioned merits:

[A]s the members of the government parties have done their studies in the same schools as those who are experts in managing the public interest, they tend to adopt the same solutions, giving precedence to the science of experts over the passions of the multitude (Rancère, 2006, p. 75).

In addition, Sandel (2021) argues, this constitution is often supported by those excluded from it:

They [elites] may denounce racism and sexism but are unapologetic about their negative attitudes toward the less-educated [...] this adverse judgment of the less-educated is not unique to elites; it is shared by the less-educated respondents themselves. This shows how deeply the meritocratic view of achievements has penetrated social life and how demoralizing it can be for those who do not go to college (Sandel, 2021, p. 96).

The exclusion of the public from the decision-making processes is problematic for several reasons, apart from the fact that it does not correspond with the ontological assumptions of people being competent participants in society. One of these reasons is that the merits are not transparent for those who do not hold them, i.e. "For most men, save the scientific workers, science is a mystery in the hands of initiates, who have become adepts in virtue of following ritualistic ceremonies from which the profane herd is excluded" (Dewey, 2016, p. 188). Thus, when decision-making power is delegated to a limited elite with reference

to merits, and these merits are not constituted in a transparent system for the wider public, that public is not only excluded from the decision-making processes, but is also effectively excluded from a position in which it could reasonably consider and question whether this delegation is preferable – therefore, the democratic constitution is weakened by a double exclusion of the public.

In the next section, I will show examples of how psychological research specifically on climate action can be seen as advocating the very same exclusion of the public in matters of climate action – thus fulfilling the diagnosis of democratic deficit caused by such research.

Examples of psychological research on climate action that supports the exclusion of the public

In the following section, I give examples of psychological researchers advocating for the exclusion of laypeople in public decision-making. However, my aim is not to point the finger at anyone in particular, because the problem I am trying to highlight is not specific to one or two researchers, but, I will argue via Lyotard and Dewey, inert to our position as researchers, where we are often asked: “then what” when presenting our findings as if such suggestions for future paths follow unproblematically from our research when this is usually not the case (e.g. Lyotard, 1984). Thus, my aim is not to empirically prove that psychologists endorse an exclusion of the public through their research, but rather to give examples of what it might look like when it happens because these examples will work as my point of departure for a future-oriented discussion about how this potential downfall can be overcome.

Generally speaking, my colleague, Jacob Klitmøller, and I have argued that mainstream research on individuals’ climate action often ignores the person’s perspective, i.e. the person’s history, motives and conflicting agendas in taking climate action (Meistrup & Klitmøller, in review). This means that, on a very basic level, people are not studied as people, but as instruments for a task that the researchers have decided on a priori (i.e. turning off the lights). Instead, the mainstream field of environmental psychology focuses on so-called *psychological barriers* as assumed reasons for the finding that people are often not acting according to the normative expectation – that is, reasons for why they are being such poor instruments for turning off the lights (Adams, 2021). For example, a commonly referred to ‘barrier’ to climate action is *lack of knowledge*. However, much research has shown that interventions aimed at informing people (canceling the barrier) often do not work and therefore, interventions are instead designed to surpass said barrier (e.g. Gifford, 2011).

One of the most transparent and radical uses of the public’s *lack of knowledge* comes from Jason Brennan who argues that “Citizens are ignorant, misinformed, and tribalistic despite lacking firm beliefs. As a result, the more power we give them, the more we suffer the consequences” (Brennan in Brennan & Landemore, 2021, p. 10), which is why he argues for overriding the public as a

constitutional right altogether (only letting those who pass some kind of test participate).

Often, though, the surpassing of the public happens more subtle, as in the case of *paternalism* which refers to nudging and behavioral design (Thaler & Sunstein, 2021). Either way, though, these strategies are designed to bypass the public's decision-making processes, i.e. Goodwin (2012, p. 85) writes that "the use of 'nudge' tactics in UK policymaking ought to be rejected. Nudge contravenes the coalition government's aspirations to promote ideas such as empowerment, freedom and fairness".

However, not all psychologists will agree with the aforementioned ontological assumptions, about people being competent participants in society, and therefore, these theoretical positions may fully and transparently *not* endorse democracy as a solution model. For instance, Brennan and Freiman (2022) argue how theories in favor of paternalism essentially must also be in favor of epistocracy, because the internal logic is parallel in the two belief systems – people are incapable of deciding what is best for themselves and therefore someone else must decide for them. This means that the argument that psychological theories may exclude laypeople's perspectives on public climate action is not a critique to these theories – at least not an internal critique, since there is internal consistency between the ontological assumptions of human conduct in these theories and their proposed solution models, which advocate the exclusion of laypeople. An external critique is of course valid, but not the aim of this article (see Meistrup & Klitmøller, 2020).

What is more problematic is if psychologists who believe in their research subjects as competent participants also lean towards the less democratic solution models. The problem is that such bypassing of the public is fundamentally incompatible with these theories' perspective on human conduct, and therefore these theories would show a lack of internal validity if participating in excluding the public (in addition to excluding the public). Therefore, such psychologists have a greater responsibility to avoid this.

Personally, I research people's climate actions, and I often find myself *driven* to research and understand the most effective actions, speaking from an environmental perspective, rather than the mundane and ineffective actions that seem to absorb my research subjects (like switching to bamboo toothbrushes). However, deciding what are the most effective actions for mitigating climate change is not a factual, neutral, or *certain* matter. As noted above, climate change is not a technical problem. Thus, some would argue that individuals' climate actions should be studied whenever they act as participants in democracy, and some would argue that individuals' role in climate change is primarily as consumers, so I should study specific pro-environmental (consumption) behaviors. Choosing which solution to focus on is as much an ideological judgement as a scientific one and therefore this is the exact time to be especially cautious as a researcher, not to exclude one's subjects (the laypeople of society). I will unfold this argument in the following.

The importance of our perception of ‘the other’

In the previous section, I argued that a time for caution is whenever researchers move from describing what is, to hypothesizing about what should be. Dewey describes this same shift as a historical change in our perception of what counts as scientific knowledge:

In short, there is a change from knowing as an esthetic enjoyment of the properties of nature regarded as a work of divine art, to knowing as a means of secular control – that is, a method of purposefully introducing changes which will alter the direction of the course of events (Dewey, 2008, p. 81).

Thus, following this change, rather than aiming at understanding, research becomes the process of gaining control. Dewey writes the above in his book *The quest for certainty*, where he argues that in response to living in an uncertain world, people behave in a counter-manner, constantly seeking for certainty as a way of escaping “the peril of evils” (Dewey, 2008, p. 7). However, working from an ontology of constant change, such certainty is simply not a possible endeavor, hence:

We are unable to show that the ideals, values and meanings which the philosophy we nominally hold places in another world, are capable of characterizing in a concrete form, with some measure of security, the world in which we live, that of our actual experience (Dewey, 2008, p. 63).

Thus, the research as an art of control is not descriptive of the life we live. Instead, as in the example of my own research subjects who are more concerned with their bamboo toothbrushes than with revolutionizing the system, Dewey describes how people are, indeed “frenetically absorbed in mundane affairs in ways which, if they were formulated for intellectual acceptance, would be repudiated as low and unworthy” (Dewey, 2008, p. 62).

Therefore, if people are not already mitigating climate change in the *certain* way that we, as researchers, believe the problem should be solved, and we in turn prescribe a *certain* path forward, recommending it with the authority our positions grant us, maybe even on a legislative level, we run the risk of overlooking the “mundane affairs” that absorb them, in order to gain control with a process that should be uncontrollable, and thus, we risk excluding the laypeople and their lived experience from the process altogether.

Additionally, Løgstrup argued that a fundamental aspect of human conduct was our interdependence – our mutual and undeniable dependence on others (Løgstrup, 2014). Where I have argued that excluding the public is a democratic problem, and perhaps a problem of internal, theoretical validity, Løgstrup rather argues that the problem with excluding the other is that even if we reach the future we set ourselves up to reach, that future would only be a perversion of what it should have been (Løgstrup, 2014). Staying with the example, we can imagine a world where people might consume plant-based foods, but only do so because these products were the most accessible to them – placed right in eyes

sight in the supermarket, not because they understood the environmental benefits of doing so. They would be headless soldiers, not educated adults and to some of us, that matters.

Thus, we are a group of psychological researchers, who believe that our research subjects are competent participants in society, and we who share these ontological assumptions, face a potential struggle, when trying to endorse (certain) solutions while remaining true to our ontological assumptions, including *the human condition of plurality and interdependence*. This is somewhat old news for most of us, but it is still a tricky endeavor and one that we should be constantly aware of. Therefore, in the next section, I will suggest a concrete focus for researchers concerned with this potential problem.

Beware of subtle intertwinement of research and politics – using Arendt for guidance

Following on the previous sections, I will use Arendt to argue, that it is wise, as a researcher, to be cautious about the intertwining of research and politics – that is when researchers move from describing society to suggesting ways of changing and controlling it because this particular event marks the point where researchers risk excluding the public from their agenda.

According to Arendt, when researchers advocate a particular course of action (even if that course is chosen with reference to facts), they overstep their role as researchers because, according to Arendt, the role of researchers is to establish facts – essentially to tell truths. Politicians, on the other hand, tell people what to make of these facts, i.e. what they should mean, based not only on the facts but also on the ideological convictions about what kind of world they want and how they think we, as a society, will achieve it (Arendt, 2005).

An introductory, disclaiming note on Arendt is probably in order, as Arendt's theory of scientific knowledge is sometimes a little unclear (see also Burdman, 2018). Following the above distinction in which researchers are positioned as society's truth-tellers, it would seem like Arendt has a positivistic view of science – however, similar to Lyotard (1984) in *The postmodern condition*, Arendt describes what she think science is legitimized by, i.e. stating facts and telling truths, as opposed to prescribing what she think science should be. So Arendt is not telling us that this is how she thinks it *should* be; she is merely describing how most science in practice is legitimized.

Moving on, what happens in the above-mentioned examples is that instead of stating facts such as *all psychological research is political*, the researchers act as politicians themselves, arguing for a particular future being the most favorable. In this shift, they overstep their role as scientists and this is problematic because researchers as society's truth-tellers, do not engage in debates on the same premises as politicians (or other political members of polis, the public). Burdman (2018, p. 491) on Arendt, describes this incompatibility between scientific and political communication as follows:

Arendt (2006) defines truth as a "mode of asserting validity" [...], which is distinguished from opinion. Independently of its specific content, this mode of assertion is inherently in conflict with the public realm. The reason is that it is coercive rather than persuasive, in the sense that it is beyond agreement and dispute.

Therefore, Arendt (2005, p. 302) even goes on to say that "a commitment even to factual truth is felt to be an anti-political attitude", and that "the scientist qua scientist does not even care about the survival of the human race on earth or, for that matter, about the survival of the planet itself" (Arendt in Burdman, 2018, p. 488), thus meaning that being a scientist is in every way detrimental to being political.

In order to understand why the political sphere and the scientific spheres, according to Arendt, are so detrimental, I will explain these two spheres in more detail. The sphere of political life is different from the sphere of scientific life, because science, as already stated, is about establishing facts, and facts can only be factual in retrospect – facts concern the *past*. Whereas political life is about ideas, ideologies, and actions to achieve a specific, desired *future*. Additionally, political life is concerned with *opinions*, and opinions are asserted through words and discussions – persuasion rather than facts and coercion (Arendt, 2005).

Therefore, according to Arendt, researchers who transgress their role as truth-tellers become as dubious as the politician who argues that his ideology is a matter of facts. Because researchers have this special role as society's truth-tellers, their transgression becomes particularly problematic, because their typical mode of asserting validity effectively impedes debate. For example, even though researchers might agree that neither green growth nor technological fixes are likely to be a sustainable solution to climate change (e.g. Stuart et al., 2020), some people may still *want* to focus on them – despite being aware of the risk of failure. Because we do not yet know the future, no one can say with certainty that their focus is wrong or invalid, because this is a matter of opinion and ideology, a matter of taking action rather than stating facts. What can be said is that on current assumptions, green technology is unlikely to make enough of a difference to avoid certain consequences. However, judging whether these consequences should be avoided and at which cost is a matter of ethical, not factual, arguments, and therefore such matters must be dealt with as a political issue, not with quiet coercion as in the cases where the public is excluded altogether.

I will argue that the division between science and politics is not watertight. Burdman argues that Arendt did not either (Burdman, 2018) and that the distinction is primarily, as I will use it here, a call for caution. Furthermore, Walsh writes:

Arendt has always resisted classification within any particular discipline. She resolutely refused the title of 'philosopher' throughout her life, preferring the label of 'political theorist' (Arendt, 1994: 2), and is regarded primarily this way today, as a theorist whose main contributions feed into contemporary debates (Walsh, 2011, p. 121).

Thus, Arendt did not let herself be reduced to a mere truth-teller, and I suspect that neither should we. In fact, for researchers who believe people to be competent participants in society, science and politics must inevitably be intertwined, as this assumption implies for themselves as well.

So, my aim is not to separate research and politics, describing past and arguing for a different future. Rather, I hope that those researchers who do overstep the scientific sphere and enter the political will be even more aware of their own role when doing so – so that they do not (inadvertently) exclude the public along the way. If they are not careful, they risk bringing a despotic mode of asserting validity into a realm that must remain open to debate. They risk undermining the public's opinion and ability to participate democratically, and at least some of us find that very worrying.

Summary

In this article, I have argued that climate change is a wicked problem and that such problems must be handled democratically. I have argued that this is an ontological premise for all psychologists who hold the assumption that people are competent participants in society. I referred to Rancière and others who argues that typical, Western democracies are showing democratic deficiencies, tending towards epistocracies, in particular by excluding the public from decision-making processes; and I showed that psychological researchers sometimes contribute to this exclusion. With these examples, I hope to have elicited the phenomenological nod from researchers who, like me, sometimes feel the urge to solve the problem and to suggest concrete ways forward, while at the same time holding the conviction that the problem is not for me alone to solve. Acknowledging that the public and the other, as Rancière, Dewey, and Løgstrup say, are just that, because they are not me and they are not mine to control. Finally, I suggest, via Arendt, that researchers who wish to avoid this potential exclusion, can focus on the times when they move from being researchers stating facts, i.e. describing what is, to sharing (qualified) hypotheses for future paths, because, with this event should follow a shift in these researchers' mode of asserting validity and if this does not happen, these researchers risk bringing a despotic mode into a democratic one.

Thus, researchers in climate action must 1) avoid the exclusion of laypeople from decision-making processes in general, i.e. focus on illuminating their perspectives (motives, experiences, etc.) and communicate findings to the public to enable them to participate even more qualified; and 2) avoid the potentially despotic character of researchers who argue for specific solutions as if these were the only ones – i.e. be aware of the limitations that follow from going from stating facts and describing the past to making hypotheses about the future based on selected facts.

Although the path to a sustainable future in which we are able to keep the wicked problem of climate change in check may seem immensely distant if we are to follow the democratic path, at least for some of us, due to ontological

assumptions about our own and others actions, we have no other choice. Not because democracy is a certain solution for climate change mitigation, but because democracy *is* being in a world that includes others.

In her PhD, Lise explores everyday experiences of climate change. Her primary research interests are climate action, complex decision making and research philosophy.

Participatory Research with the Margins: Learnings with youth and children about the importance of inventiveness in peripheral contexts in Northeast Brazil

James Ferreira Moura Jr, Érica Atem Gonçalves de Araújo Costa & João Paulo Pereira Barros

Abstract

We aim to analyze the importance of the inventiveness of participatory research with children and adolescents in marginal peripheral contexts in two cities in the Northeast of Brazil. First, we present the differences between center-periphery-margin conceptions in knowledge production. We understand that the coloniality of power spatially situates people who live through historical processes of dehumanization, such as women, children, youth, poor, black, and indigenous people. Thus, we understand that knowledge production is developed by these centers of power that reproduce these hierarchies. Participatory Action Research can be a strategy to displace this knowledge production to the margins. We understand that ethnography, radical solidarity, and following the inventive processes of resistance developed by children and adolescents in the peripheries can be good strategies to displace this knowledge production. We exemplify our understanding of Participatory Action Research with an inventive focus on children and adolescents through our experiences in our research groups: Research Network on Poverty, Discrimination and Resistance (REAPODERE) and Research and Intervention Group on Violence, Social Exclusion and Subjectivation (VIESES).

Keywords

participatory research, margin, children, youth, Global South

Introduction

We understand the matrices of domination responsible for the erasure of specific subjects - black people, women, the poor, children, young people, and homosexuals (Moura, Sonn, Serrano Garcia, & Ortiz-Torres, 2022). They have

systematically removed from them the possibility of having their voices heard and their knowledge recognized (epistemicide and colonial practice) (Mignolo, 2017). There are populations living, in their majority, in urban and/or rural regions marked by high rates of violence (Borges & Cano, 2017), poverty, and discrimination (Almeida, 2019). There is a line that separates the majority of the population that is located on the margins from a small group of privileged people. This line is the same line that divided the colony from the metropolis during colonization. Souza (2019) calls the abyssal line the one that separates the world into Global South and Global North. Below this line is the predominance of the dehumanization of human beings and the intensification of violence against women (Ballestrin, 2021), people of color (Almeida, 2019), children and youth, and groups with dissident sexuality, among others. We realize that this line does not separate only countries that were maintainers of the hierarchies of colonialism. We understand that this abyssal line is present in any center-periphery relationship. The center can mean the location of economic, political, and cultural power in any institution, city, country, or region, structurally maintaining coloniality (Castro-Gómez, 2005). Thus, we understand that in the center, the coloniality of power can reign more hegemonic since there is a white, masculine, elitist, capacist, and cisgender normative structure configuring a concrete space of coloniality of being. This coloniality of power and being is totally intertwined with the coloniality of knowledge (Quijano, 2005). In this way, the center reproduces and employs stigmatizing understandings of the people present in the peripheries.

In Brazil, the outskirts of cities are predominantly made up of poor people, black and indigenous people, women (Carneiro, 2011), groups with dissident sexuality (Adaïd, 2016), and people with disabilities. Milton Santos (1997) states that the reproduction of inequalities present in society's very structure permeates a city's geographic and population structure. In this way, the concept of periphery should be understood as a geographical and social concept situated on the margins of the urban centers of power. Most people of the world are situated outside the centers of economic, political, and cultural power (Bulhan, 2015). They are positioned on these margins. According to Goffman (1982), groups situated on these margins are stigmatized. Stereotypes and stigmas can be differentiated through the groups that individuals make up. However, we note that there is the same stigma for women, black people, children, and the poor: people are recognized as less intelligent from this intersection of the coloniality of power-being-knowledge. Despite these stigmas, we have historically researched these groups situated in the margins. We have found people with inventive resistance strategies to deal with violence, death, prejudice, and stigma daily. Community-based Participatory Action Research is the primary strategy for strengthening resistance practices developed at the margins (Dutta, Sonn, & Lykes, 2016). In this sense, we aimed to analyze the importance of the inventiveness of participatory research with children and adolescents in marginal peripheral contexts in two cities in Northeast Brazil. In the first topic, we perform a brief genealogy of the modes of production of Western scientific knowledge, explaining how it rose as a hegemonic discourse that occurred in line with the

delegitimization of certain groups capable of producing knowledge. In the second section, we show how the problematization of these matrices of domination is materialized in the design of ethnographies with young people in the peripheral context, moving researchers and research participants through inventive and procedural paths. In the final considerations, we reaffirm the ethical-aesthetic and political character of research in Psychology.

The place of the peripheries and the margins in knowledge production

In its hegemonic rationality, science's process of "development" has historically positioned certain social groups on the margins. The production of scientific knowledge was created from colonial bases. Before colonization, knowledge had an organic relationship with the world (Castro-Gomez, 2007). However, to René Descartes, in "Discourse of Method" and "Metaphysical Meditations" (2005), knowledge only becomes valid with the distancing of the subject of knowledge from the object to be known. In this way, the Ego Cogito, "I think, therefore I am", becomes central in Science and Western Societies. However, from a critical perspective of coloniality, we understand that scientific rationality based on solipsism and ontological dualism is an epistemicide (Grosfoguel, 2016).

The mind-body separation is based on erasing the location of individuals in their territories, prioritizing the idea of the superiority of the mind. Thus, knowledge creation would come from a solipsistic perspective as an inner monologue in which the producer of knowledge inquires himself and finds his answer (Grosfoguel, 2016). As bound to rationality, the mind functions as the idea of a Christian "eye of God", omniscient and omnipresent, which is not located anywhere but has the power of observation, domination, and control of one's body nature (Castro-Gomez, 2007).

Without these ideas of mind-body separation and solipsism, there could be no conception of the production of universal knowledge because it is territorialized, embodied, genderized, and racialized (Haraway, 1988). This definition of scientific knowledge as universal aims to invisibilize the ideological construction of modern Western knowledge by white men with a Eurocentric bias, referencing an epistemic superiority to certain territories and identity markers (Grosfoguel, 2016).

Spivak (2010) denotes that identity markers are ideologically recognized as incapable of producing knowledge, located in the body of women, the black population, third-world countries, individuals in the peripheries, young people, and other social groups. In an intersectional way, this process of subalternization of knowledge and dehumanization would be concretized in the body of black peripheral third-world women (Brah, 2006). Intersectionality functions as a prism for understanding the articulated matrices of domination (Crenshaw, 2002). The origin of the dehumanization of these identity markers lies in constructing the centrality of the Ego-Cogito in Western Science and society. According to Quijano (2005), with colonization and the creation of the idea of America, the world underwent a global transformation with the cognitive structuring of society

into a modern colonial world with a valorative base of the heterosexual European white man. This structure emerged from creating the idea of race and racism that, before colonization, was non-existent globally.

The legitimization of the genocide and enslavement of the black population of the African continent and indigenous people of the Americas was necessary to create the idea of the superiority of the white European race (Grosfoguel, 2016). The indigenous and black races were positioned as inferior and underdeveloped that needed to be colonized. Thus, for the emergence of the "I think; therefore I am," there had to be the "I conquer; therefore I am". However, this conquest was only possible with the "Extermination; therefore I am" which was the basis of colonization with the idea that people without the religion of the colonizers, such as the black African population and the indigenous people, came to be seen as people without soul that could be enslaved, catechized and murdered (Grosfoguel, 2016).

However, this conquest and extermination are still constitutive of Western societies based on coloniality. Quijano (2005) conceives a colonial-based pattern configuring a cognitive system of societies, situating whiteness, masculinity, the North, heteronormativity, wealth, and adultism as superior. Since science is a constituent of society, according to Spivak (2010), there is a delegitimization of knowledge produced by young people, women, black people, the periphery, and the third world. The structures of universities are also based on this process of hierarchization of expertise, not recognizing knowledge in the margins (Castro-Gomez, 2010).

Santos (2010) understands that science has a sexist, classist, and racist structure, which has used the fallacy of neutrality to legitimize historical inequalities. Thus, it is necessary to foster guidelines in knowledge production and investigations based on the plurality of cosmovision. According to Grosfoguel (2016), rational scientific knowledge is hugely provincial, situated from the ideas of a few men from countries in the Global North. Alcoff (2016) points out that we must have a normative horizon based on social justice and against these colonial premises. Thus, Santos (2011) points out that the sociology of emergences and absences should guide knowledge production. These refer to the invisibilities present in the production of knowledge.

According to Dantas, Oliveira, and Yamamoto (2010), the scientific productions of Psychology in Brazil have denied the context of poverty as central in developing their investigations. Moreover, the conditions of poverty and vulnerability can also be seen as an emergent phenomenon because, in third-world territories, such as Brazilian, the structure of society is based on the death of marginalized bodies not seen as human (Mbembe, 2017). In this case, the poor, black people, young children, women, homosexuals, and trans people are not recognized as human beings. Therefore, they are not centrally present in knowledge production but have historically been discriminated against, violated, and murdered. Dussel (1977) brings up the need for the displays of knowledge to be made with these people in the margins in a radical sense from the otherness.

Marginalizing the research: Learnings with experiences with children and youth in Ceara

In this article, we analyze the specificities of research in peripheral contexts under the inspiration of studies in thematic fields that intersect: poverty, peripheral childhood, youth, violence, and resistance. From this encounter, we understand there is a way to do participatory research with these mostly black youth and children in poverty in the Global South in the Northeast of Brazil. We, the authors of this article, also come from peripheral contexts in our youth and childhoods. We know in our way the power of monetary deprivation, class prejudice, and the significant presence of violence in our communities. However, we understand that we also have privileges because we are white. Thus, we have not suffered racism in our trajectories. I, Erica, suffered sexist discrimination for being a woman, feeling the weight of patriarchy in my trajectory to become a university professor. When we reached these positions as professors, we started intervention projects and participant action research in the peripheries located in the cities of our universities. The Federal University of Ceara is located in Fortaleza, the capital of the state of Ceara, in Northeast Brazil. The Universidade da Integração Internacional da Lusofonia Afro-Brasileira is located in the cities of Redenção and Acarape in the interior of the same state. Both universities are public and free of charge, supporting intervention projects that we call university extension and participant action research projects. However, despite this institutional support, few professors decide to carry out activities on the outskirts of our cities.

Thus, we materialized this article through exchanges within the two research and extension groups that we coordinate: Group of Research and Interventions on Violence, Social Exclusion and Subjectivation (VIESES) and Network of Studies and Confrontations of Poverty, Discriminations, and Resistances (reaPODERE). Currently, VIESES is carrying out Participatory Action Research on articulating social practices related to the problem of urban violence involving segments of children and youth in areas of the city with high homicide rates. The Rede de Estudos e Afrontamentos das Pobrezas, Discriminações e resistências works with black children in poverty to develop processes of empowering these children to confront racism, classism, and adultism in a rural town called Acarape. We will share our experiences with this participatory research with children and youth situated in these city margins. Participatory Action Research is a way to produce knowledge with people in their territories from their concrete demands (Fals Borda, 2013).

The basis of our participatory action research is ethnography. We understand that ethnography allows us to be in the peripheral territories of children and adolescents in a more integral way. To act communally, we must be presentially with people in their territories, experiencing the local dynamics (Gois, 2005, 2008). In this sense, we (professors, undergraduate, and graduate students) leave our universities to be face-to-face with the children and young people who live on the margins of our cities. The VIESES team goes by bus to the city of Fortaleza's poor areas to conduct the action research activities with

young people. The REAPODERE team works in a small town in a rural context. So they walk to the community of Estrada Velha where the children live. It takes them 30 minutes to walk to reach this peripheral territory. So the ethnographic approach starts when we leave the university to do the activities with the youth and the children. Other teachers and students sometimes ask us where we are going. We answer that we will carry out the action research activities in the peripheral communities of the youth and children. They usually respond that we are crazy to go to these territories and will be robbed. The coloniality of power, knowledge, and being operates in the format of prejudiced talk from colleagues and students in our universities because our universities are still structured as hierarchical knowledge-producing centers (Bell, 2018). Thus, with Ethnography, we move away from these centers to build knowledge with youth and children situated on the margins. This perspective requires the inscription of the researcher in an existential territory, accompanied by an exercise of attention to lurking throughout the fieldwork.

The ethnography is based on the creation of devices with a function of reference, explicitness, and subjectivities through which the researcher moves and seeks to establish relationships of trust and draw the plane of the ordinary (Kastrup, Passos & Tedesco, 2014; Passos, Kastrup & Escóssia, 2009). We aim to create relationships of radical solidarity, avoiding a salvationist idea of action (Moura et al, 2022). In order to build a bond that strengthens children and young people in their communities autonomously, we must be willing to relate to them in an open, joyful, and loving way. In this sense, we have to play their games, understand their slang, and discuss the issues they are interested in. We must be available to participate in the activities they invite us to. Thus, we can attend parties, weddings, baptisms, and community events. With time and our presence in the communities, we build a relationship of trust. When we arrive in the peripheral territories, we are welcomed with hugs, kisses, and talks filled with longing. They tell us the news that happens during the week because we are usually present in the communities of the children and young people once a week. However, if it is necessary to go more often during the week, we must be flexible and open to the paths jointly drawn with the youth and children. Thus, the community action of the research must be based on a procedural perspective of construction from the interest of the local agents (Montero, 2004). Passos, Kastrup, and Escóssia (2009) only conceive ethnography as a method because they work with a reversal of its traditional meaning (*meta-hodos*), which would be the previous delimitation of rules, steps and goals. They propose, thus, a *hodos-metá*, i.e., a method "to be experienced and assumed as an attitude (Passos, Kastrup & Escóssia, 2009, p. 11)", and not to be applied in a technicist way.

We have experienced the perspective of ethnography as a posture intrinsic to the research, a set of clues that help build its path. This has led us to consider segments of children and young people, professionals, and family members with whom we are subjects and not objects of the study - therefore, research partners. In the limit, we seek to research with them, and not about them, from various methodological devices and generally defined from the encounters with the field, refusing to stereotype and potentiate the insurrection of subjected knowledge. In

these contexts, we have also focused on listening to life trajectories marked by various expressions of violence, discourses on relationships between youth and violence, meanings produced by the subjects about the conditions of production, and effects of the intensification of homicide in their daily lives. These listening practices aim to address and prevent violence and micro-politics of youth resistance to violence.

We have experienced the perspective of ethnography as a posture intrinsic to the research, a set of clues that help build its path. This has led us to consider segments of children and young people, professionals, and family members with whom we are subjects and not objects of the study - therefore, research partners. In the limit, we seek to research with them, and not about them, from various methodological devices and generally defined from the encounters with the field, refusing to stereotype and potentiate the insurrection of subjected knowledge. In these contexts, we have also focused on listening to life trajectories marked by various expressions of violence, discourses on relationships between youth and violence, and effects of the intensification of homicide in their daily lives. These listening practices aim to address and prevent violence and micro-politics of youth resistance to violence. Barros, Lima, Bessa Filho, Martins, Benicio, and Pinheiro (2017) point out the following characteristic displacements of this mode of research in Social Psychology and Community Psychology: interest in the singular and concrete forms of the problems investigated, preference for clues instead of a static method; production of fissures in assumptions in the process of creating a problematic field; articulation between research and micropolitical transformations; the refusal of specialisms; collectivization of practices and affirmation of multiplicities.

When a situation of violence occurs in the peripheral territories, we analyze with the kids and young people why the episode occurred. For example, when we were holding a painting workshop with children from Estrada Velha (Old Road), a police car suddenly entered the community. The police officers got out of the car and held the man. At that moment, they started beating him. The children started to cry and scream at that situation. We were also scared by that violent situation. After the police car left, we stayed with the children and talked about what had happened. They commented that the police usually act violently toward the people in the community. The children said they feared that someone in their families would suffer violence. During the following months, we started to do playful activities using songs, movies, and images more systematically about violence, racism, and classism. With these activities, the children created a play to question the police violence in the community. We were surprised by the children's ability to create an artistic expression in an autonomous way that questioned police violence. They created a musical genre called funk in Brazil and a dramatization to express that they only want to "walk happily in the favela where I was born".

We want to emphasize the inventive character of Participatory Action Research. This invention has allowed the rejection of perspectives that conceive vulnerability as an intrinsic and inescapable characteristic of marginalized populations. After all, one of the most dangerous theoretical traps is disregarding

these segments' political agency since it would corroborate, directly or indirectly, tutelary practices (Demetre, 2018). Judith Butler (2015, 2018) undoubtedly helps us put the question back in more politically potent terms. There is an unequal distribution of this vulnerability by operations of domination that maximize the induced precariousness of individual lives (Pelbart, 2019). We start here from the understanding that betting on a type of participatory research in the margins should imply the production of marginal research - done and inserted in the margins and at the margins of hegemonic forms of research. In this way, reflexivity is central to opening these creative and participatory possibilities in doing research (Denzin & Lincoln, 2006), having the researcher to daily decentre himself/herself and try to question his place of privilege in the production of knowledge and in the conditions that circumscribe the act of research. Critical reflexivity must align questioning involving the personal and social dimensions (Lykes, 2013).

We understand the invention as a bet that the investigative path is permeated by acts of creation that reinvent the form of research. Traditionally, this form is a linear and progressive continuum of successive steps and previously established data collection procedures (Kastrup, 2009). Experimenting with the invention on the margins has implied attempts to radicalize the participatory character of research. More is needed to participate in the daily study (Rocha, & Aguiar, 2003). Still, it is necessary to seek strategies and spaces so that segments of children and young people also experience the weaving of our research within the conditions made possible by each context in which we are inserted and each moment of investigation. The invention concerns the power of research to perform worlds and ways of moving, problematizing, widening, and, perhaps, undoing margins.

We understand that invention can be present in a new drawing created by a child that questions the unequal structure of society, in a song that a youth presents to us that talks about the situations of racism experienced in the periphery, in a game proposed by another child that brings a more significant community involvement; in an event proposed by the youth that we help to organize. In this way, we understand that the symbolic invention of new possibilities of life in the face of the oppression experienced on the margins is a powerful tool for transformation. Thus, we have also tried to make visible the practices of resistance. As Lacaz, Heckert, and Lima (2015) propose, we focus on experiences engendered by young people who contest social practices (discursive and non-discursive) that disqualify the ways of life in the peripheral territories. Thus, resistance practices are taken here as synonymous with (re) existence (Achinte, 2017) and persistence practices of those who "combine not to die" amidst the upsurge of death and mortification policies.

According to Lacaz, Heckert, and Lima (2015), when researching youth inserted in peripheral contexts, we do not take the peripheral dimension to crystallize Centre and periphery nor reinforce the exclusionary way in which so-called peripheral juveniles have been treated. On the contrary, when we think of peripheral movements activated by young people inserted in contexts marked by the intensification of lethal violence, we want to highlight the possibility of the

invention of ways of existing distinct from the dominant and colonial patterns of life in the margins. This text minimally goes through the socio-historical and political conditions in charge of designing "the" margins through negative views and conceptions. We bet, on the contrary, on the images of the peripheries as a complex composition of personal belonging that intends stigmatizing categorizations, whose understanding includes understanding it from a global and local perspective. Spivak (2010) indicates that the periphery is linked to subalternation, delegitimizing the production of the child's knowledge, poor, black, and female populations. However, researching with young people and children from the periphery can decentralize the hegemonic structure of knowledge, making it a territorialized, embodied, and marginalized science. This way of doing science must focus on these young people and children who have historically already faced violence, prejudice, and dehumanization. Thus, we should recognize ourselves in acts of radical solidarity with these young people and children in their peripheral territories, learning from them and co-constructing new inventive ways of producing knowledge.

Final Considerations

Researching with children and adolescents on the margins of cities in Northeast Brazil is based on an act of displacement from the center of power. We leave the city centers and universities that reproduce colonial hierarchies of knowledge production. In this movement towards the margins, we seek to build relationships of trust, horizontality, and love with these youth and children, questioning the legacy of extermination and epistemicide that the production of scientific knowledge has developed. In these relationships built on the margins, we learn from these children and adolescents that survival is necessary to invent new worlds in which violence, discrimination, and death are questioned. In this sense, we should cultivate the importance of the inventiveness developed by these children and adolescents in participant action research. In this sense, we have greater possibilities of creating territorialized knowledge, embodied and with a genuine social commitment to creating new worlds in which the coloniality of power, being, and knowledge are dismantled.

James Ferreira Moura Jr is Professor in Community Psychology at the University for International Integration of the Afro-Brazilian Lusophony, Ceara, Brazil. He undertakes participatory and decolonial research with people living in poverty, indigenous peoples and quilombolas, with a focus on intersectional processes of resistance. He also studies authoritarianism, whiteness and elites as a strategy for questioning privileges and dismantling colonial violence. Email: james.mourajr@unilab.edu.br

Érica Atem Gonçalves de Araújo Costa is Professor in Social Psychology at Federal University of Ceara, Ceara, Brazil. Her research interests are resistance practices, institutions and group and artistic devices, modes of subjectivation and childhood in peripheral contexts, formative and inventive processes, and public policies at the intersection of Psychology, Education and Human Rights. Email: erica.atem@ufc.br

João Paulo Pereira Barros is Professor in Social Psychology at Federal University of Ceara, Ceara, Brazil. His research interests are based on post-structuralist, counter-colonial and critical criminology references. He studies psychosocial aspects of violence in contemporary times, neoliberalism and its processes of subjectification, territorialities and collective (re)existences, participatory research, and the production of knowledge in Psychology. Email: joaopaulobarros@ufc.br

Cultural psychology in a subject-scientific perspective¹

Wolfgang Maiers & Katrin Reimer-Gordinskaya

Abstract

Constitutive for the subject-scientific perspective of Critical Psychology, on the one hand, are historically-empirically obtained determinations of the object of knowledge – such as its reconstruction of human nature as societal nature, its materialistic concept of human subjects as socially situated bodily actors as well as its determination of the intentionality of human action coming to bear in the practical possibility relation of individuals to societal structures of meaning – and, on the other hand, methodological principles of actual-empirical research that indicate the consistent transition to a generalised standpoint of the subject as the point of knowledge. This is in principle compatible with cultural-psychological programmes that analyse individual action and psychological phenomena in their dependent relationship to social-culturally handed-down artefacts, discourses and forms of life, and that include humans in research on an equal footing: namely as subjects acting on grounds. A Marxist-based subject-oriented cultural psychology focuses on the determinacy of cultural processes and forms through the mode of production of a societal formation and offers differentiated class-theoretical explanations for the structural intersectional relations of inequality, oppression and discrimination in the diversity of socio-cultural constellations. When put into perspective in this way, the concept of culture can in turn enrich the concept of society with a dimension relevant to action by opening up access to the actors' perspective on the diversity and change of socio-cultural codifications of lifeworlds and subjectivities.

¹ The text is based on an original contribution in German to the handbook *Kulturpsychologie. Eine Einführung* [Cultural Psychology. An Introduction], ed. by Wolfradt et al. (2022) which was published there in a heavily abbreviated version: cf. Maiers & Reimer-Gordinskaya (2022). We would like to thank Manfred Renken for his helpful assistance with the translation. Occasionally the conceptuality of Critical Psychology raises problems in that they cannot easily be transferred into common English terms without loss of (nuances of) meaning. This applies, for instance, to the distinction between *sozial* = *social* and *gesellschaftlich* = *societal* and, even more so, to derivations such as *Vergesellschaftung* = *societalisation* (instead of *socialisation*), *Gesellschaftlichkeit* = *societability* (rather than *sociability*). Other telling examples are concepts such as *Gründe/begründetes Handeln/Begründung/Begründetheit*, where *grounds/grounded action/grounding/groundedness* are a better match than the rationalistically biased *reasons, reasonable action*, and *suchlike*. In general, we have decided to expect the Anglophone reader to accept less common translations if they seemed to us to better convey the connotations of the German original terms. (In the interest of clarity, the latter are appended in brackets in each case.)

For a more detailed impression of the sometimes awkward problems that one encounters when translating German Critical Psychological terminology we refer the reader to the notes in Tolman's (1994) pioneering introduction.

In order to illustrate how subject-scientific studies break down culture as the contradictory meaning of the mode of production and life for individuals in such a way that they can understand external and internal impediments to action and open up possibility spaces for their action in an emancipatory perspective, exemplary presentations include: the critical further development of the methodological guiding concepts of the so-called 'developmental' and 'stagnation figure' respectively, the elimination of the blind spots of the constructivist discourse-analytical 'new childhood research' in the Critical-Psychological view of the dialectics of children's development of agency, as well as the investigation of children's re-/construction of societally prefabricated social categories, stereotypes and prejudices in the living environment of day-care centres, which is shaped by intersectional power relations, by the research project *KiWin*.

cross-cultural psychology vs. cultural psychology (- as diverse directions of culture-inclusive psychology), Cultural-historical School, developmental figure (- as a movement form of emancipatory research), German Critical Psychology, grounded action / discourse of groundedness, historical-empirical method, restrictive vs. generalised agency, societal nature (human nature as -), subject science / subject-scientific research and practice, unity of comprehension and change

Critical Psychology - subject science - cultural psychology: Conceptual localisations

In the title of the article, it is assumed that *Critical Psychology*, with its *subject-scientific* orientation, can be classified as a *kind of cultural psychology*. This seems to be beyond question if one considers that in its transformation of radical psychology criticism into the elaboration of a positive psychology conception, it took up the *Cultural-historical School* of Soviet psychology founded by Vygotsky and continued after his death in 1934 by his co-workers Leontiev, Lurija, Galperin and others (cf. Kölbl, 2022). This, in turn, is consistently acknowledged in relevant cultural psychology treatises as a contribution to the "profiling of an advanced cultural psychology" (Straub & Chakkarath, 2010, 195f.) - both directly and by way of explicitly referring to it by various proponents of research into experience- and action-relevant cultural structures of meaning and significance, such as Bruner (1990) or Cole (1996). Critical Psychology is often included in the circle of concepts that are at least partially related to cultural psychology. Billmann-Mahecha (2003), for example, states: "From the 1970s onwards, Klaus Holzkamp's Critical Psychology was added, which, closely following Soviet activity psychology, emphasised the cultural-historical contextuality of human experience and behaviour, without understanding itself in the narrower sense as cultural psychology". Kölbl (op. cit., 18) expresses a similar view.

The positioning of Critical Psychology in the tradition of the *Cultural-historical School* (both in its own and in external perception) must admittedly be relativised in certain respects: Vygotsky's original works (insofar as they were

available at all in German at the time²) were not really constitutive for its emergence. Rather, it was primarily the so-called *activity-theoretical* approach to the study of human consciousness presented in A. N. Leontyev's collection of texts *Development of Mind [Probleme der Entwicklung des Psychischen]*, published in 1963 in the GDR and ten years later in West Germany (Leontjew, 1963/1973), that provided decisive guiding principles for the discussion about the transformation of psychological science on the basis of dialectical historical materialism conducted at the Psychological Institute of the Free University of Berlin.

Differences between Leontyev's and Vygotsky's views will not be explored in detail here (cf. Keiler, 1999), but Keiler's research on the topos *cultural-historical* (cf. Keiler, 2012) should be taken up. According to him, the term "cultural-historical theory" or "school" (this is the name that runs through the original works) was not coined by Vygotsky and the researchers working with him themselves, contrary to the common opinion (also handed down in Critical Psychology: cf. Holzkamp & Schurig, 2015 [1973], 33ff.), but was brought into play by their opponents in the mid-1930s with the intention of bringing the conception of a "[historical] theory of the [development of] higher psychological functions" dangerously close to German *Kulturpsychologie* [cultural psychology] and thus discrediting it as an idealistic, anti-Marxist, pseudo-scientific reactionary theory. In 1956 (the year of the XXth Party Congress of the CPSU), Leontyev and Luria (in their introduction to Vygotsky's *Selected Psychological Research Works*), seizing the bull by the horns, so to speak, appropriated the term *cultural-historical*. In the 1970s, it finally became a valid trademark in international literature for the school of Soviet psychology, which was by then recognised as leading.

Only one problematic aspect of this topos should be mentioned here: On the one hand, the compound term *cultural-historical* fosters a *culturalist* dissolution of the materialist concept of *societal relations/practice* which Vygotsky and his colleagues take as a basis, by means of fuzzier notions of *culture* qua system of linguistic-symbolic meanings, which may even be caught up in linguistic idealism. To speak of a conception of the *cultural* or *cultural-historical* determinacy of development with reference to Vygotsky, as Keiler points out, can only be valid on the proviso that he always emphasised the *sociality* of the human being as an essential (inner) condition of specifically human psychological development and explicitly regarded *culture* as something *derived*, as the "result of the human's social life and communal activity" (Sobr. soč. , 3, 145; as cited in Keiler, 2012, 119). On the other hand, the term *cultural-historical* obscures the fundamental point of Vygotsky's approach, which is to overcome the common dichotomisation between the naturalness and societality of human development of consciousness and to grasp its mediation process theoretically.

² In the 1970s, we mainly had a German-language version of *Denken und Sprechen* [Thinking and Speech] (Russian original: 1934; German: Berlin/DDR: Akademie Verlag 1964; Frankfurt/M. : Fischer 1977) available, which was problematic because it was based on a misleading and erroneous Soviet republication from 1956. It was not until 2002 that a new critical edition based on the original manuscript, previously thought to be lost, appeared by Rückriem & Lompscher (Vygotskij, 2002).

However the relationship to Vygotsky's ideas is to be assessed in detail, his central epistemological concern of approaching the study of the human psyche *from a comprehensively historical perspective* comes to full fruition in Leontyev's book. Scientifically understanding the concrete human being in his or her culturally specific individuality and subjectivity – in a well-understood sense of *cultural history* – means explicating him or her in the unity of his or her *natural, societal and individual historical development* from the objective necessities of the material life process. Following Marx, it is worked out how historical development in its human specificity has developed with objective labour and takes place in the accumulation of societal experience mediated through material, iconic and linguistic-symbolic objectifications. Through the practical process of their individual-historical appropriation, each individual human being participates in this societal process and thus also unfolds his or her personal life. Accordingly, the structures and forms of human consciousness must change with the various stages of objective production and the relations of production entered into in the process. The individual development of consciousness – this is fundamental for Vygotsky's as well as Leontyev's psychological approach – also takes place through the *objective activity of the human being*. The historical-societal forms of consciousness (mediated by psych[olog]ical tools) emerge in each individual person from external activities, which are then gradually transformed into internal, mental activities (*interiorisation*).

This *historical-genetic paradigm* has decisively inspired the methodological maxim of Critical Psychology, which is still valid today, to work out, in a *historical analysis of origin and differentiation* [*Ursprungs- und Differenzierungsanalyse*], the essential inner connections of the psychological phenomena in question together with the mediating processes leading to their manifestations. Through the *categorical determinations* of the *subject matter* [*kategoriale Gegenstandsbestimmungen*] thus obtained, it attempts to arrive at a concrete-historical theory of human-societal subjectivity that overcomes the bourgeois-psychological presupposition of an "abstract - isolated - human individual" (Marx, 1845, MEW 3, 7) along with the associated mystifying construction of a *universal-societal* [*allgemeingesellschaftlich*] human being.

The term *subject science* [*Subjektwissenschaft*] was first used in the context of Critical Psychology at its 1st International Congress in Marburg in 1977³, when the aim was to justify both the possibility (proven by the facticity of Critical Psychology) of a Marxist-based psychological science of the individual and the necessity of such an internal expansion of Marxism. In doing so, it was necessary to refute objections that were unanimously based on its misguided economistic-reductionist interpretation but led to contrary conclusions – such that, for example, the *Projekt Klassenanalyse* (*Project Class Analysis*: see, e.g., Bischoff, 1973) considered the political-economic analysis of capitalism sufficient to derive statements about human subjectivity, while the *Kritische*

³ If we associate the *subject-scientific perspective* with *Critical Psychology* (cf. Holzkamp, 1988), this is by no means to ignore the fact that other critical positions also oppose the denial of the subject by the psychological mainstream with explicit subject orientations.

Theorie des Subjekts (*Critical Theory of the Subject*: see, e.g. Lorenzer, 1974) deemed it necessary to supplement Marxist societal theory with an independent extra-Marxist (namely psychoanalytical) theory of subjectivity.

In contrast, in his opening lecture at the congress Klaus Holzkamp (1977 [2015]) argued that although a Marxist individual science is essentially determined by the analysis of the overarching societal-historical process and is thus secondary, it can nevertheless be distinguished as a special science with a specific object and specific procedures that can be derived from it, since in their life activity the individuals are the permanent result of their individual-historical development, the laws of which do not coincide with those of the historical process, however closely they are interwoven with them.

Holzkamp (op. cit. , 232) described the historical materialist conception as "the *general historical subject science* par excellence" because, as a revolutionary theory, it aims at the empowerment of collective human actors. With regard to the psychology to be developed within this framework, which aims to help release the efficacy of concrete individuals against external and internal resistance, it is then said:

If the general object of Marxist theory is the relationship between objective determinacy and subjective determination of the historical process and its practical goal is the development of the *subjective* factor in history, then (. . .) the *remaining object of Critical-Psychological approaches is the relationship between objective determinacy and subjective determination in the life activity of concrete individuals*. Its character as a '*special subject science*' within scientific socialism would then consist in the fact that it has as its *practical goal the development of the subjective-active component, i. e. self-determination, in individual life activity*. (op. cit. , 232f.)

In the writings of the 1980s, this critical-emancipatory basic concern of the Marxist-subject-scientific knowledge approach, to understand the surrender of individuals to (capitalist) conditions and the subjective necessity of overcoming them, taking into account the developmental interests of the respective others, and in this practical understanding to critically *sublate* views of traditional psychology caught up in bourgeois ideology, is affirmed on various occasions (cf. Holzkamp, 1988). On the other hand, concrete provisions of a subject-scientific psychology were elaborated in that period (especially in Holzkamp's magnum opus of 1983, *Grundlegung der Psychologie* [Foundations of Psychology]), even though terminologically *individual science* is consistently spoken of).

Psychology from the generalised standpoint of the subject

Under the premise of the prevailing *nomological-functionalistic variable psychology*, which in its experimental-statistical conditional analyses seeks to grasp human behaviour and experience as effects, consequences, correlates of situational conditions conceived as causal determinants, subjectivity is

naturalistically failed to recognise in its historical concreteness of respective life situations. If the programmatic critique of this reifying reduction of human subjectivity not only wants to rehabilitate the everyday experience of human intentionality and reflexivity as an inescapable thematic starting point of research, but also to develop a thoroughgoing methodological alternative, it needs other, substantively more sustainable concepts of human subjectivity. In Critical Psychology, the *historical-empirical categorial analysis* – distinguished from *actual-empirical* research methodology – fulfils precisely this function of developing scientific basic concepts of psychological theorising in a methodical, i. e. empirically verifiable way, in which (in a specialisation of dialectical-materialistic developmental knowledge) the essential relations of the psychological object (psyche/consciousness) are derived in their historical determination and concreteness from the developmental logic of its having become. (Holzkamp, 1983, 48ff. , 207ff. , 249ff. ; Maiers, 1999; Markard, 2009, 106ff.).

In particular, this conceptuality must grasp the specific human-world relationship associated with the effective implementation of the societal-historical process, characterised by a *gnostic distance* fundamental to human consciousness: The objective-social meanings refer to historically produced forms of practice that, from the standpoint of the individuals, only represent generalised possibilities of action, to which in principle (within historically set limits) they can behave consciously - and that means: with alternatives. Against the traditional naturalistic reduction of individual subjectivity to its mere conditionality by the circumstances of life, and against the idealistic exaltation of the autonomy of the subjects in this respect, it is a matter of mapping in the psychological categories the two-sidedness of human action in the material intermediary context of individual and society – the relationship between *objective determinacy* and *subjective determination*. The essential quality of human subjectivity, being able to consciously relate to the objective-social world and to oneself, does not entail the abandonment of any idea of determination: individual action, though not simply causally determined by conditions, is nevertheless grounded in them. The circumstances of the material-social context of life, as they are *experienced* in their significance as objective preconditions for action at the respective location of the individuals and according to their current needs and interests, provide the essential *premises* for someone's *grounds* for acting now in this way and not otherwise. For others, such *grounds for action* [*Handlungsgründe*] are in principle comprehensible in that people cannot consciously act contrary to their own experienced life interests. This is the *material apriori* of human self-awareness, of interpersonal understanding – and thus also of subject-scientific knowledge.

Let us summarise: Relevant are, on the one hand, *categorial determinations of the subject matter* [*kategoriale Gegenstandsbestimmungen*], in which human subjectivity is conceived in concretisation of the scientific humanism inherent in Marxism and for the purpose of overcoming both the naturalistic objectivism of the dominant psychology and the abstract opposition of the natural and the societal or cultural found in various subject-oriented critiques of *subjectless*

psychology (cf. Maiers, 1993; 2019a). This essentially includes an empirically anchored human-scientific concept of human nature, which as *societal nature* establishes the "*human potentiality*" (*Menschenmöglichkeit* - Tomberg, 1978, 76) of individual socialisation under concrete-historical societal conditions; furthermore, a *decentred materialist concept of the subject*, which grasps the individual experiencing his or her world and himself or herself in his or her "real, sensuous activity" (Marx, 1845, MEW 3, 5) as an objectively and personal-biographically *situated* subject bound to his or her *corporeality* (cf. Holzkamp, 1983, 336ff). Constitutive of human subjectivity is the characteristic of *intentionality*: action and experience are always directed towards an objective-meaningful reality and, as a *centre of intentionality*, the human being relates to his or her living conditions in a subjectively grounded way (*bewusstes Verhalten zu [conscious behaviour towards]*: Holzkamp, op. cit, 237ff.); this practical *possibility relation* of individuals to the societal structures of meaning is specified in subject-scientific terms as the *double possibility of acting* in the direction of securing *restrictive* or gaining *generalised agency*, (Holzkamp, 1983, 342ff. ; Markard, 2009, 180ff.), etc.

On the other hand, *methodological consequences* for (actual) empirical research arise from these content-related subject-theoretical conceptualisations. It goes without saying that the claim to understand the world- and self-experience of individual subjects psychologically without any reduction in methodical rigour, rather in the perspective of objective explanation and generalisation, is incompatible with any psychology from a third point of view, in which (other) subjects are *researched* from a distanced observer perspective. If subject-scientific psychology specifically aims at the subjective mode of experience of objective societal possibilities and limitations of action, the subjects as the origin of such experience cannot be placed on the object side, but must stand on the side of the researchers. Some of the methodological research principles and objectification criteria mentioned in more detail below also apply to other subject-oriented positions in a similar way, while others represent Critical-Psychological specifics.

Actual-empirical studies from the standpoint of the subject share with *qualitative research* the maxim of not being bound by a fixed canon of methods, but regarding methodical development itself as part of the research situation; likewise the view of data collection and evaluation being continuously linked in a dynamic optimisation process of hypothesis-guided data acquisition and data-based revision of hypothesis formation.

With *action research* in particular, it shares the orientation towards a research setting designed as a *meta-subjective scientific framework of understanding* [*metasubjektiver Verständigungsrahmen*], in which the epistemic interest of professional researchers is to be included in a methodologically reflected way, while those affected, whose challenges of practical life (self-) clarifications are elevated to a more general problem of subjective modes of action and inner states to be grasped scientifically, actively participate and become qualified as *co-researchers* (cf. Holzkamp, 1983, 540ff. ; Markard, 2009, 263ff.). Furthermore, subject-scientific empirical research as *emancipatory*

action research includes a *unity of comprehension and change* [*Einheit von Erkennen und Verändern*] in such a way that the assumptions developed in the joint cognitive process, how an expansion of the disposal of one's own impeding life situation and an improvement of the subjective ability to act and quality of life could be achieved by including the point of view of others, are tested and verified in a *controlled exemplary practice* [*kontrolliert-exemplarische Praxis*] (cf. Holzkamp, op. cit. , 560ff.).

The *specific difference* of subject-scientific actual-empirical methods lies in the methodological foundation of empiricism through object categories that are suitable for opening up the *manifestations of subjective agency/mental situation* [*subjektive Handlungsfähigkeit/Befindlichkeit*] and the *contradictory meaning-grounds nexuses* [*Bedeutungs-Begründungs-Zusammenhänge*] of human action under the historically concrete living conditions of bourgeois society, and guidelines derived from this for the *generalisability of subjective experience data*. From the fact that the grounds for action, in whose medium human life activity is carried out in its specificity, are *first-person* and can only be negotiated from *ever my* point of view, it necessarily follows that epistemologically the subject point of view must be brought to bear as a scientific point of view of knowledge. This means that both in theory formation and in research practice, the corresponding *discourse of groundedness* [*Begründungsdiskurs*] must be maintained as a "discourse form of intersubjective interaction that is centrally specified by the nexus between meanings, grounds and action intentions/actions" – in contrast to the *discourse of conditionality* [*Bedingtheitsdiskurs*], "whose nexus . . . is specified as a 'cause-effect relation'" (Holzkamp, 1996, 64 [2013, 294⁴]).

Conveyed by the research context, the practical development and validation of a subjectively more satisfying everyday way of life also provides an approach to the generalised identification of possibilities for action for others in comparable life situations. The concept of the so-called *structural* or *possibility generalisation* [*strukturelle Verallgemeinerung/Möglichkeitsverallgemeinerung*] (Holzkamp, 1983, 545ff. ; cf. also Markard, 2009, 287ff.) – developed in rejection of average statements and thus in limiting the validity of the model of statistical generalisation, as well as in connection with Lewin's concept of *generalisation* from the *individual case* to the *pure case* – does not refer to dimensions of randomly recorded characteristics of people, but to *premise-ground connexions* and the use or expansion of subjective scopes of disposal of action. The ultimate criterion for confirming such determinations of *typical possibility spaces* [*Möglichkeitsräume*], which are developed in the course of intersubjective understanding between researchers and the co-researchers concerned and are validated as presumably accurate (and applicable) through self-subsumptions, lies in (life) practice.

It should have become clear: *Sensu stricto subject science/subject-scientific* means a subject orientation in the radical way of a consistent transition of

⁴ The translation of the technical terms *Bedingtheits-/Begründungsdiskurs* as *discourse of conditioning* and *reason discourse* respectively in the edition of *Selected Writings of Klaus Holzkamp* by Schraube & Osterkamp (2013) differs from our definition – see in this regard our comment in footnote 1.

research from a supposedly uninvolved external standpoint and its 3rd person observation perspective to the generalised standpoint of the subject and its 1st person perspective - and this *change of epistemic standpoint* forms a distinguishing feature of Critical Psychology.

In the following, we will set out the framework within which its perspective of subject-scientific research can be subsumed under the term cultural psychology.

Linkage to cultural psychology

In the field of *culture-inclusive psychology*, one encounters two basic directions, starting from different (social) ontological or anthropological presuppositions and leading to corresponding epistemological-methodological consequences: The so-called *cross-cultural psychology* – as a sub-discipline of nomological-functionalistic variable psychology – assumes the psychologically interesting phenomena to be universal biopsychic conditions of human nature, whose causal laws are to be uncovered in preferably experimental conditional analyses. Under this premise, it attributes interculturally observable differences to moderating influences of specific socio-cultural environments (cf. e. g. Berry et al. , 1997).

In this kind of *culturally sensitive contextualism*, culture is seen as a separate sphere, independent of natural individuals and their activities. *Cultural psychology* sensu stricto breaks with such naturalistic ontology and the variable-analytic methodology of conceptualising culture as an external condition, a set of antecedent (independent or moderator) variables of behaviour and experience.

Attempting to draw a basic (meta-) theoretical and methodological understanding that connects the various currents of cultural psychology from relevant representations (e. g. Boesch, 1991; Billmann-Mahecha, 2003; Cole, 1996; Shweder, 1990; Straub & Chakkarath, 2010), it can be outlined as an interdisciplinary general perspective that takes a look at psychological phenomena (structures, processes, functions) in their *constitutional relationship* to the meanings handed down in a historically specific social-cultural environment. Cultures are conceptualised as systems of signs, knowledge, rules and symbols that fulfil orientation functions for corporeal, language-enabled, sentient subjects capable of acting by allowing them to give meaning and significance to their world and self. The arrangements of action-guiding discourses, practices, forms of life are perceived from respective individual standpoints in different perspectives. They form dynamic spaces of experience and horizons of expectation that are shared by members of respective cultural collectives, whereby multiple (possibly conflictual) cultural affiliations are not only possible but also to be expected in societies that are complex and, not least, culturally differentiated. Insofar as the relationship of the individual subjects of a cultural group (also) to (their own) culture is not assumed to be an unproblematic appropriation of/adaptation to the cultural meanings/means (*enculturation* in the harmonistic sense of traditional structural functionalism), power and domination relations can be thematised.

This cultural knowledge, which on the one hand opens up and limits people's spaces of experience and action, and on the other hand is (re-)constructed and changed in the course of individual conduct of life and social exchange, can take on different forms: It can be explicit, articulated and reflected or remain implicit, physically embodied and staged performatively, objectified in institutions, materialised in non-linguistic things, spaces and places, embodied in symbolic representations (such as club badges) or present in traces (for example, in "narrative abbreviations" that refer to identity-forming and preserving stories such as 9/11). This is where the cultural-psychological interpretation of action comes in.

In order to understand "how people make personal use of their customary practices, traditional institutions, symbolic and resources, inherited conceptions of things to construct a world that makes sense and to constitute a life-space in which they can feel at home" (Stigler et al. , 1990, vii), the conceptualisation of such mutual constitution of culture and individual requires a concept of subject that emphasises the intentionality of human consciousness:

Sociocultural worlds are understood as intentional worlds that are factual and effective only through people who draw action-guiding meanings from them: 'no sociocultural environment exists or has identity independent of the way human beings seize meanings and resources from it, while every human being has her or his subjectivity and mental life altered through the process of seizing meanings and resources from some sociocultural environment and using them' (Shweder 1990, 2). (Staeuble, 2002, 100)

In their *methodological rationale*, research programmes in cultural psychology are therefore guided by a subject model that assumes the human being as a socially situated, reflexive and intentional actor who pursues goals and broader life orientations in his or her actions and gives meaning and significance to all his or her experiencing and doing as well as to the adversities of life. Cultural knowledge is not seen as a causally effective condition of human action, but as a reservoir of manifold, systematically distinguishable types of *determining reasons* [*Bestimmungsgründe*], to which the always *polyvalent* structure of meaning and significance of actions is owed (cf. Boesch, 1991). Actions (such as the ritual eating of a host) refer to cultural (in this case: religious) representations of the world and practices, through which their occurrence becomes understandable in the first place. Accordingly, they cannot be conceptualised as discrete variables that are logically independent of them and stand in purely empirical-contingent relationships to them; their interrelationships cannot be described as laws of nature according to the causalist model – neither in the strictly deductive-deterministic sense nor in the weakened inductive-statistical sense, in which strict laws of nature are replaced by probabilistic statements. Since constructions of meaning and signification can only be deduced reconstructively and interpretatively, the hermeneutic problem of understanding meaning is at the centre of the methodological reflections of cultural psychology. In general, its empiricism follows the principle of connecting to everyday or lifeworld experience and practices of giving meaning and adapting its methodical

instruments to the respective research topic of interest, if necessary also developing them in the course of the research. This open understanding of methods does not exclude the use of standardised quantitative and experimental methods, but relativises it considerably in favour of a methodical repertoire consisting primarily of qualitative, reconstructive or interpretative procedures.

Finally, it follows from the above that cultural psychology shares the *criticism of the epistemological ethnocentrism* of the dominant (culture-blind and thus all the more culture-bound) psychology, which is pronounced by the so-called *indigenous* psychologies, and accordingly endeavours to include the so-called others and strangers as research partners and subjects who bring in their own cultural (psychological) knowledge. The concept of culture as an intentional world, as a *processed experience* of events, practices and artefacts, includes recognising and acknowledging the plurality of cultures "as their creation, not ours" (Schwartz, 1992, op. cit. , 345).

If one takes the key aspects outlined above as the quintessence of the cultural psychological approach to knowledge, then various affinities with the Critical-Psychological definitions of the subject-scientific perspective are unmistakable, which justify their classification as cultural psychology – provided certain criteria are observed.

This reservation is not without reason, considering that in the course of its social-scientific boom, the concept of culture has tended to displace the concept of society: "As comprehensible as the societal constitution of subjectivity and action once appeared in the concepts of the mode of production and social structure, it sometimes appears as blurred in concepts of cultural lifeworlds and practices". (Staeuble, 2002, 97). However, as stated at the beginning, Marxist individual science is essentially bound to the prior analysis of the societal process overarching the individual life processes in its historical specificity. In this respect, a subject-scientific perspective within cultural psychology can only be maintained under the double precondition that it does not misunderstand culture as an external boundary condition of the actions and experiences of individuals, but rather grasps it as their *medium* (Cole, 1996), which contains both the objects and the means of mental development to which individuals enter into an active relationship of appropriation; and that at the same time it does not idealistically reduce this historical socio-cultural world to a system of linguistic symbolic meanings (whose intersubjective signification is created and secured in communicative processes of negotiation), but materialistically understands it as a totality of objectified meanings created in the historical process of societal labour, which includes the differentiation of the level of the symbolic-linguistic.

In contrast to the theoretical isolation of the cultural from other societal practices and contexts of effects, it is important to recognise that the societal totality forms a complex structure with the inclusion of a dominant factor. The mode of production and relations of production of a societal formation determine cultural processes and forms (while recognising their relative autonomy and their own logics).

Set in relation in this way, culture does not have to be an omnibus concept for everything societal and cultural coinage does not have to be an indeterminate

conceptual substitute for the societal determinacy of human subjectivity. This fact was already shown in the late 1950s by the cultural theory writings of Hoggart, Williams, and Thompson and the subsequent work of the Birmingham Centre for Contemporary Cultural Studies (Hall, Willis et al.) (cf. Ampuja & Koivisto, 2012).

Understood as "the actual, grounded terrain of practices, representations, languages and customs of any specific historical society" (Hall, 1986, cited in Nelson, Treichler & Grossberg 1992, 5), the concept of culture, for its part, can add an action-relevant dimension to the concept of society by opening up access to the perspective of the actors, the world and self-understanding of social groups. The insight of theory of society (eminent in comparison to the naturalism prevailing in psychology) that sustainable constructions of the psychological should reflect societal-historically specific forms of individuality/subjectivity would thus be supplemented by the cultural theoretical idea of a diversity and changeability of *socio-cultural codifications of life worlds and subjectivities* (cf. also Staeuble, 2002, 97).

However, today's social sciences – especially since their postmodern distancing from Marx – are only partially suitable for the foundational reference of psychological theory formation to critical theory of society. In particular, they lack a concept for understanding the class societies of the 21st century. Scientific and political progress in terms of class analysis achieved in the wake of the 1968 movement has in many cases been forgotten and replaced by interpretations of society that merely duplicate in descriptive terms what is happening on a global scale on the societal surface of capitalist relations through the development of productive forces and the permanent restructuring of class contexts: The dissolution of old and the emergence of new social milieus, the mass increase in precarious living conditions with the intensification of class antagonism and horizontal class-specific inequalities, the formation of plural identities that often appear fragmented, the development of altered subjectivities linked to the change in forms of individuality and subjectivation, the consumerist lifestyle stagings of the so-called "high achievers" of high-tech capitalism, but also the public articulation of new emancipatory claims of the subjects, and so on and so forth.

In our conviction, the social-scientific penetration of such rapidly advancing transformation processes of capitalist society requires, in particular the (re)appropriation, critical further development and connection of Marxist, Marxist-feminist and praxeological class theories (cf. for example Candeias, 2021). Only on the basis of their conceptual foundation and material basis do we – Critical Psychology and cultural psychology alike – see ourselves as sufficiently equipped to understand the processes of interpretation and practical appropriation, in which people give meaning to their lives in such changed social-cultural constellations characterised by intersectional structural relations of inequality, oppression and discrimination (with regard to class or gender, categories such as ethnicity, sexuality, age, etc.).

Anchoring a subject-scientific perspective in cultural psychology thus also requires introducing the most advanced class-related theoretical and political concepts into its discourse in order to gain a differentiated, empirically

underpinned theoretical explanation of the diversity of cultural references to life. At the same time, this serves to sharpen the subject-scientific perspective on the active moment of human subjectivity: grounded action, insofar as the *analysis of grounds* [*Begründungsanalyse*] of human action can connect to more concrete *meaning-analytical* [*bedeutungsanalytisch*] findings.

Following a subject-scientific research orientation, a systematic ambiguity and corresponding need for clarification is assumed on the part of affected subjects with regard to the connection, experienced as ambiguous or contradictory, between life interests, circumstances and actions to be grounded on them – an ambiguity through which the subjects are at the mercy of certain dependency situations in their life practice and are thus hindered in exercising control over their life circumstances and in their quality of life. *Analyses of (objective) meaning and (subjective) grounds*, as intertwined systematic tasks of knowledge in the actual empirical research process, aim at understanding the subjective functionality of restrictive coping strategies by first determining the different possibilities and limits of action existing in a historically concrete constellation of economic, political, legal, ideological and cultural conditions, and secondly, by understanding how and on the basis of which premises these objective spaces of possibility are realised individually and how subjective agency and mental states are formed (cf. Holzkamp, 1983, 349ff; Markard, 2009, 160ff, 180ff.).

Application: Actual-empirical subject-scientific research and practice

In its actual-empirical research and practice, Critical Psychology follows the psychological traces of societalisation in capitalist, patriarchal and further historically specific forms from the standpoint of the subject. In view of the (not only) mental costs of living in a society permeated by domination, it emphasises the emancipatory potential of psychological research and practice, which can contribute to the expansion of human possibilities of action in the perspective "to overthrow all relations in which man is a debased, enslaved, abandoned, despicable being ⁵" (Marx, 1843/44, MEW 1, 385). And while *traditional* psychologies with their individualising concepts, passivising research methods and technologies of differentiation and selection stabilise domination, psychologists can also help shape the conditions of the culture of a mode of production and life (Gramsci), in which "the free development of each is the condition for the free development of all" (Marx & Engels, 1848, MEW 4, 482).

⁵ In the English source to which we refer, the translation *essence* is used for the German word *Wesen* in the Marx quote. Outside the context of his critical discussion of Feuerbach, in which Marx speaks of the "essence of man" as "[in] reality [being] the ensemble of the social relations" (Marx 1845, 6), this expression is out of place and has therefore been replaced by *being*. This does not cut off the controversial issue of a "theoretical anti-humanism" (Althusser) in Marx's thought, or, in contrast, of whether and in what way a theory of *human nature* occupies an important place in Marx' critique of capitalism and his materialist conception of history. On this, see e.g. Sève (1972); Rückriem et al. (1978); Geras (1983); from a Critical-psychological perspective: Maiers 1993; 2019a.

The Psyche in a Problematic Culture of the Capitalist Mode of Production and Life

Over a period of more than 40 years, four generations of Critical Psychologists have presented alternatives to existing psychological concepts and practices in almost all fields of psychology.⁶ The fund stretches from the *Projekt Analyse psychologischer Praxis (PAPP)* (project analysis of psychological practice), which showed, among other things, how psychological concepts serve to maintain the power-relation between client and therapist by reinforcing the latter's sovereignty of interpretation without easing the suffering of the former, through the work of Critical Psychologists in *Berliner Weglaufhaus* (Berlin's house for run aways) as a practical alternative to psychiatry and the approach of a psychotherapy of everyday life (Dreier, 2011) to the critique of the concept of psychic/ psychological disorders (Weber & Brensell, 2015) and behavioural therapy of depression (Knebel, 2021); from the exploration of institutional racism in shelters for asylum seekers in the *Projekt Rassismus als Selbstentmächtigung* (project racism as disempowerment) to the clarification of the interplay between psycho-social counselling for victims of right-wing violence and civil society mobilisation against racism (Köbberling, 2018) as well as of potentials for alliances against antisemitism (Reimer-Gordinskaya & Tzschiesche, 2021); from the analysis of the ambivalent meaning of changes of productive forces for employees in the *Projekt Automation und Qualifikation* (project automation and qualification) to the reconstruction of how trade union strategies can enhance collective agency, if they encompass not only the workplace but also the seemingly private context of life (Schmalstieg, 2015); from the *Erinnerungsarbeit* [memory work] on female societalisation in the *Projekt Frauenformen* (project shaping women) through the critique of prevailing sex education (Zirkel, 2008) to the development of feminist trauma work (Brensell et al. 2020); from the foundation and elaboration of a subject-scientific concept of human learning (Holzkamp, 1993; Maiers, 2018, 2019b) and the critique of education and 'teaching-learning' in various pedagogical settings, such as *Umgang mit Kindern* (interacting with children) in the family, adult education (Faulstich & Ludwig, 2004), neoliberal higher education (Thiel, 2010) and extracurricular education (Reimer, 2011), to the debate on the validity of related theoretical assumptions under the conditions of neoliberal subjectification (Kaindl, 2005; Langemeyer, 2005; Markard, 2005).

Regardless of the range of content, the common impetus of subject-scientific research is to reconstruct connections between seemingly purely individual phenomena with social contexts and underlying societal structures. In this context, *culture* is understood as the contradictory meaning of the mode of production and life for societal individuals and is analysed more concretely with respect to external and internal impediments to action and, alternatively, spaces

⁶ Although there is a lack of more or less complete overviews, for reasons of space, older, classical approaches that can be found on the web via the italicised proper names are named below without individual references (cf. also the compilation in Markard, 2020), while more recent contributions are referred to directly.

of possibility for individual and collective action in an emancipatory perspective (Markard, 2009, 64ff u. 92ff). The societal conditions to be taken into account are subject to potentially fundamental transformation, which a psychology that understands the psychic as societally mediated must keep up with by referring to relevant theory of society. In addition, inner-scientific controversies and findings also give rise to criticism or revision and further development of subject-scientific concepts and theories. For instance, the societal and science-political consequences of the historical caesura of 1989 brought challenges with them and initiated efforts and controversies through which Critical Psychology as a Marxist approach was updated and renewed in the sense of the principle of *critique and further development* [*Kritik und Weiterentwicklung*] (Markard, op.cit., 152ff and 209ff).

In view of the wide range of content of subject-scientific research, its concrete, actual-empirical methodology cannot be reduced to a simple denominator. Basically, the spectrum of qualitative research methods is used, so that very different types of data (verbal and observational data, documents, media products, diaries, pictures, etc.) can be included. However, the data-based theorising, takes place on the basis of the above-mentioned methodological regulations and concepts. It is also specific to subject-scientific research that it has concretised concepts of action research in terms of a generalised standpoint of the subject. In the following, essential aspects of this research conception will be illustrated in its emergence, critique and further development.

The developmental figure as a movement form of emancipatory research

In the concept of the *developmental figure* [*Entwicklungsfigur*] the claim to realise research that intervenes in problematic conditions with an emancipatory intention has been methodically concretised. It was developed in the *Projekt Subjektentwicklung in der frühen Kindheit* (SUFKI) (project subject development in early childhood) (cf. Markard, 2009, 279ff). The fact that twelve researchers and parents met at approximately fortnightly intervals between 1977 and 1983 to jointly analyse critical situations in the coexistence of adults and their children indicates three essential characteristics of this type of action research: 1. it is about recognising and changing everyday practical problems, not problems constructed for research settings; 2. Those who in traditional research take the role of *test persons* (here: parents) are *co-researchers* who, as those affected, have a practical interest in the research process that converges with the researchers' scientific interest in a phenomenon that is in general need of clarification (here: early stages of ontogenesis); and finally, 3. it is about de-privatising and publicising seemingly individual problems of life in a capitalist society (here: child-adult coordination in the institution of the family). In SUFKI, the temporal and financial resources as well as habitual similarities of the participants made such a research practice possible. The concept of developmental figure is a critical regulative for subject-scientific research in other settings, and at the same time itself needs modification, expansion and

concretisation (Markard, 2009, 277ff), as will be illustrated in comparison with another example about dilemmas of critically intended extracurricular civic education (ECE - cf. Reimer, 2011, 34ff).

Ideally, a developmental figure passes through four instances.

1. First of all, it is necessary to circumscribe a subjective problem of action that the participants are interested in analysing and overcoming in practice.

In SUFKI, for example, relevant scenes were highlighted from the extensive data material of parents' diaries on the interaction of children and adults – for example, the fact that conflicts between children and parents sparked off because several children wanted to have or do the same thing at the same time, even if this is objectively impossible (e. g. sitting in the middle). The initial problem in ECE, viz.: to often fall short of enabling fundamentally critical debates on the interrelations between individual actions, social contexts and societal structures, resulted from the reflection of the author's professional experiences, but was shared by colleagues who therefore participated as interview partners and to a certain extent as co-researchers.

2. The next step is to generate a problem theory formulated in the discourse of groundedness, based on Critical Psychological categories and anchored in the data material, which captures the premises and reasons for the genesis and reproduction of these problems. In doing so, it is conceptually assumed that those affected are involved in the reproduction of their own problems in the context of gaining restrictive agency.

In the aforementioned context of SUFKI, this was the case, for example, when parents made the concept of equality regulation their own premise for action and believed that this would allow justice to prevail in their relationship with their children and prevent conflicts. In ECE, it was demonstrated how the educational practice – contrary to the intention – stays within the limits of progressive neoliberalism (Fraser) insofar as it conceptually and didactically addresses societal structures selectively, for example by ignoring class relations, and predominantly in their immediate significance for the subjects, instead of making collective experiences the starting point for learning about this specific form of capitalist modes of production and life.

3. Insofar as the co-researchers acknowledge their practice to be a case of the presumed premise-ground nexus, alternative courses of action can be generated, practically tested and reconstructed in so-called solution theories.

In the SUFKI case, it was assumed that the concept of equality regulation was adopted and utilised by the children as a predominant mode of rearticulating their needs, thus hindering interactions between adults and children oriented towards real needs; the alternative – not to be gained without conflict – was to abandon the idea of equality regulation and to learn how to address needs more adequately. In ECE, an alternative course of action lay in developing didactics that correspondingly enable a more comprehensive examination of the reproduction of

domination under neoliberalism. While those involved in the SUFKI project adopted the theory of the problem and tested alternatives accordingly, the views of the colleagues in ECE remained divided regarding the solution theory developed at the time.

4. The changed practice is documented and evaluated and, if it has succeeded in expanding possibilities for action, the developmental figure comes to a provisional end and can serve as a theoretically and empirically sound good practice for others who face similar problems. If the attempts to change a problematic practice fail, the premises and reasons for this failure are examined, passing through all instances (so-called *stagnation figure* [*Stagnationsfigur*]).

The extent to which parents and children in SUFKI succeeded in overriding the validity of the problematic premise-ground-relation – "if we elevate equality regulation to the guiding principle of our relationships with children, we reproduce and exacerbate a problem that should thereby be defused" – was not publicly documented. Due to the much more limited time span of ECE, it was not possible to go through the third and fourth instances of the developmental figure. However, the work represented an intermediate stage in a process that preceded it and continued after it. And while the attempts of the author to restructure her educational work in the following years often failed due to the hegemony of inadequate, but popular concepts in the field of civic education, many professionals have begun to adopt a more critical stance, i.e. towards capitalism and class relations in recent years. This may contribute to a broader adoption of the solution theory presented in ECE.

The comparison of the two *figures of development* and *stagnation* indicates the further development of the concept. The starting point was the self-critical diagnosis (Holzkamp, 1996, 159; Markard, 2000, 238) that although the SUFKI de facto referred to a specific societal-social constellation (the interaction of children and adults within the institution of the family in Fordism, etc.), the original version of the method did not sufficiently reflect the (possible) significance of these circumstances for the problems of action and their transformation. The same applies to the above-mentioned study of the reproduction of institutional racism in shelters for asylum seekers, whose function in institutionalising racism was not sufficiently taken into account (Fried, 2002). Here, the concept of personal agency, which is used to ask about impediments and possibilities of living in the face of the overall societal mediatedness of individual existence, and actual-empirical research methodology diverge, or the methodology falls short of the theoretical concept. More adequate is a methodology in which the genesis of (inter-)individual problems of action and perspectives for change are not merely contextualised, but in which questions are asked about how the social contexts are institutionally integrated and societally structured.

As will be shown below, the object of human development can also be used to illustrate one of the above-mentioned specific features of the Critical-Psychological perspective in cultural psychology.

Contradictions and limits of psychological cultural theories using the example of child development

Contradictions of a certain cultural-theoretical perspective in psychology or on the psychic become apparent from a Critical-Psychological point of view when it comes to subject areas in which natural and societal-historical developmental moments are interconnected. Exemplary for this is human ontogenesis with the fact that human newborns come into the world in a state in need of help, in which they are not able to survive on their own and – in a relatively long time compared to other mammals – must fundamentally acquire individual abilities to use the historically specific societal possibilities for action. The natural (-historical) dimension of this developmental fact has been absolutised in the dominant developmental-psychological paradigm, so that child development and childhood have been understood as quasi-natural conditions and accordingly made the object of research with quasi-scientific methods, which designed age-normalised developmental courses on the basis of observational data and assumed universal regularities (Woodhead, 2009).

This developmental thinking arose from a societal approach to children that subjugated them in the form of education – and at the same time legitimised this practice. In the 1970s, critical voices from psychology and the newly emerging sociology of childhood turned against the inherent naturalisation and universalisation of childhood. Instead of perpetuating it as a quasi-natural phase of life, childhood was understood here as a societal structural moment with its own history. In a materialist reading, modern Western childhood emerged as a structure and as a concept of a moratorium through the separation of children's and adults' worlds in the course of the dissolution of household economies, the exclusion of (first proletarian, then tending to include all) children from gainful employment, and the location of (first bourgeois, later tending to include all) children in the private space of the (generalising bourgeois) family and (increasingly including all children) the public school (Held, 2010, 13ff; Reimer-Gordinskaya, 2019, 117f). Historical discourse analyses also trace how elements of the dominant developmental psychology (techniques of observation, use of statistical measures as a basis for determining age-normalised stages, categorisation, placement and selection of children on the basis of tests, etc.) emerged from the 17th century onwards (Tervooren, 2008). They also show how the dominant developmental thinking combines with an androcentric epistemology as well as colonial racist and social Darwinist constructions (Burman, 2017, 238f, 243f, 246ff). While it is central, and initially sufficient, for a sociology of childhood to address societal reactions to, or ways of dealing with, the so-called developmental fact, it cannot ultimately ignore that development and childhood are not mere discourses (Prout & James, 1990, 25f), but a natural-historical and societally material reality. And in various variants of an alternative developmental psychology, it has been recalled that the criticism of developmental thinking, which is incidentally shared, does not apply to developmental psychology *per se*, but its mainstream (Woodhead, 2009;

Kleeberg-Niepage, 2018). Furthermore, it was shown that developmental thinking is sometimes wrongly identified with Piaget's work (Reimer-Gordinskaya 2018) and that it is rather the selective modes of reception of Piaget's work in the dominant psychology that should be analysed and criticised (Burman, 2017, 235ff).

Even more: from the perspective of alternative developmental psychology, the predominantly constructivist and discourse-analytical orientation of childhood sociology can be problematised in various respects: 1. it uses quantitative methods largely unquestioningly, although these tend to contradict its own premises (Mey, 2018, 234ff); 2. the *abstract* negation of universalist-normative developmental thinking in the emphasis on children as *beings* rather than *becomings* (Qvortrup, 1994; Hungerland, 2008) disperses its own object (namely the difference between children and adults) and makes it difficult to realise the claim to reconstruct children's perspectives and give them a voice (Mey, op.cit., 240ff); 3. the repression of children as developing *becomings* tends to be anti-emancipatory, because development for children (and adults alike) is a prerequisite for overcoming impediments (Markard, 2013); 4. the programmatic emphasis on child *agency* runs the danger of underestimating the real oppression of children in society as well as becoming blind to the danger of fitting harmoniously into the neoliberal mobilisation of subjects that accompanies the development of productive forces (Held, 2010, 27ff).

Materialistic (developmental) psychologies (cultural-historical school, Critical Psychology) open up ways out of contradictions and limits of in this sense *culturalistic* approaches in childhood sciences: 1. with the historical-empirical reconstruction of the psychic, the relationship between bio-physiological and societal-social dimensions of human agency can be determined and the opposition of nature and culture can be overcome (Maiers, 1993; 2019a); 2. with its action- and activity-theoretical foundations, the programmatic heuristic *agency* (Betz & Eßer, 2016) can be conceptually executed in such a way that children are understood as simultaneously being and becoming (*be[com]ings*: Mey, 2018, 241), who 3. carry out their (developmental) activity in social contexts and institutions in the historically specific form of the capitalist mode of production and life.

The implementation of a resulting programme of a materialistic-cultural theoretical research on the relationship between children and society is illustrated below and in conclusion.

On the societal agency of children

From a perspective following the cultural-historical school, it has recently been recalled that children's *understanding of society*, i. e. an extremely relevant subject area in terms of cultural theory, has largely remained a desideratum of (developmental) psychological research (Kölbl & Mey, 2018). While this diagnosis is generally shared from a subject-scientific perspective (Bandt, 2018; Markard, 2018), it should not be overlooked that children develop their

understanding of society within the framework of their social activity, which they carry out in concrete social contexts and institutions and starting from a specific position and situation in societal relations. In this sense, over a period of three years, the subject-scientific research project *KiWin* investigated how children act in intersectional power relations by means of participant observation in several day care centres. On the one hand, condition-meaning analyses were used to determine the way in which class and gender relations as well as racist and generational relations are represented in everyday life at the day care centre; on the other hand, with reference to the position and situation of the children, it was reconstructed to what extent they can (or could) gain the ability to act in restrictive or generalised forms in these relations, whereby cognitive, emotional and motivational dimensions were taken into account and, indeed, could be considered due to the chosen methodology.

Starting from circumscribed spheres such as economy and politics or from specific concepts such as tolerance, traditional research in developmental psychology, which nevertheless sees itself as cultural theory, constructs the understanding of society in the form of age-related developmental phases of their cognitive realisation on the basis of often standardised surveys far removed from the real world and ignoring the actions as well as the emotionality and motivation of the children (Barret & Buchanan-Barrow, 2005; van Deth et al. , 2007). Similar reductions characterise the relevant social psychological research on racial prejudice in early and middle childhood (Quintana & McKown, 2012). Its critique and reinterpretation, however, created partly illuminating guiding questions for *KiWin* (Reimer-Gordinskaya, 2018): Instead of trying to identify age-related cognitive developmental phases of prejudice on the basis of aggregated data from laboratory experiments, it was important to be attentive, on a case-by-case basis, to which social categories, stereotypes and prejudices children (re)construct in their social interactions in the life-world of daycare centres in the course of acquiring forms of restrictive agency in intersectional power relations.

The latter perspective proved fruitful in *KiWin*, for example, when analysing the use of age-related or generational categories (Reimer-Gordinskaya, 2020). Thus, the children's association of the category adult with power was revealed by the fact that some children did not easily classify the observers as adults because, unlike educators, they did not give orders except in dangerous situations, offered themselves as play partners and let the children take the lead in the interactions. And the fact that children tried to take advantage of their older age compared to others or to employ the categories of child and baby in a pejorative way in order to assert their interest in the use of a coveted object against other children can be understood as the realisation of a possibility of action in inter- and intragenerational power relations, through which these are simultaneously reinforced. In this context, generational power relations and their representation in the semantic meaning of social categories are understood as an implication of the above-mentioned enforcement of the structure of modern childhood. In a certain way, the fact that this structure includes the exclusion of children from gainful employment refers them to a non-position in class

relations, in whose conflictual dynamics they are caught nevertheless. For example, children suffered from being excluded from lunch when their parents owed payments (Reimer-Gordinskaya, op. cit.). On the part of the specialist staff, this practice is also justified by the fact that they and/or other parents feel it is unfair if some make the payments despite low income while others do not. From the children's point of view, they become victims of a conflict in which they can hardly intervene effectively from their position and situation in life. And the conflict carried out among adults at their expense, with reference to research on the transformation of class relations in neoliberally regulated capitalism, proves to be a reproduction of the competition between class fractions in the zones of precariousness and inclusion, illustrated there by the example of the competitive relationship between core industrial workforces and those employed in the form of temporary work (Brinkmann et al. 2006). In the context of day care centres, this conflict takes on an educationist flavour towards parents who owe payments – they are supposed to *learn to pay*. In addition to this classist dynamic, racist grounding contexts also come into play, insofar as the children concerned come from families with a migration history, who also (have to) live in precarious circumstances due to institutional discrimination. Starting points for changing this practice, which is directly problematic for the children, lie in the emotional ambivalence of specialist staff who feel sorry for the children. In the sense of the developmental figure and based on the definition of a common problem of action provided for therein, it can be possible to design alternative and solidary possibilities of action, such as the redistribution of leftover food, support in applying for funds from the *education and participation package* [*Bildungs- und Teilhabepaket*], or the medium-term strategy of advocating for a provision for children that is generally free of charge for parents, i. e. organised as a publicly financed common good. Such a practice would be evidence of a solidary workers' culture that counteracts both class factions and racist divisions.

Conclusion

In order to clarify the benefit of a subject-scientific perspective for cultural-psychological research into cultural structures of meaning and significance that are fundamental to experience and action, we have first determined the respective positions in this context in more detail in terms of their relationship to each other and possible connections: Cultural-Historical Theory, the Critical Psychology that builds on it, its understanding of psychology as a particular subject science, and cultural psychology, which sees itself not as subdisciplinary but as an overarching perspective.

Contrary to what culturalist constrictions of the meaning of "cultural-historical" suggest, Vygotsky's approach aimed at explicating human subjectivity in the unity of its natural-, societal- and individual-historical determinants from the objective necessities of the material life process. This historical-materialist paradigm of developmental theory decisively inspired the Critical-Psychological programme of gaining scientific basic concepts for a concrete-historical theory of

societal subjectivity through a "historical-empirical categorial analysis" of the natural and societal history of the human mind. By uncovering the social contexts of seemingly purely individual phenomena and the underlying overall societal conditions, such an analysis is able to critically sublate traditional psychology, which – with its personalising concepts and pacifying social technologies – is trapped in bourgeois ideology, and to contribute in a practical-emancipatory way to empowering a self-determined individual conduct of life.

The subject-scientific determinations of the subject essentially include overcoming the dichotomisation of the natural and the societal or cultural, which can be found both in the naturalistic-subjectless psychologies and in their subject-oriented critiques arguing in terms of cultural theory, by means of a concept of human nature qua societal nature gained in the reconstruction of psychophylogenesis/anthropogenesis – which constitutes the "human potentiality" (Tomberg, 1978) to form societies and to societalise individually in respective historical conditions. Also central is a decentred, materialistic concept of the subject, which is secured against emphatic notions of the omnipotence of the ego over external and internal reality, and which understands the individuals experiencing their world and themselves as bodily actors situated in their objective life circumstances and personal biographies. Such a practice-theoretical concept is eminently important to counteract any kind of objectivism, which is by no means limited to the naturalistic conditionality thinking of traditional mainstream psychology, but may also manifest itself in the form of degrading individuals to passive appendages or mere functions of societal-cultural systems. It is a matter of simultaneously understanding human behaviour in its objective determinacy by (natural and societal) conditions and the subjective determination about the conditions, i. e. the reality of people as practice. Human individuals are not causally determined in their behaviour by existing (historically produced) circumstances, but can consciously relate to them as societal object meanings and possibilities of action. The intentionality of human action comes to the fore in the practical possibility relationship of individuals to the world.

A decidedly subject-scientific, actual-empirical research with its methodological guidelines – discourse of groundedness, meta-subjective scientific framework of understanding, co-researcher principle, unity of comprehension and change, etc. – distinguishes itself through making a consistent switch from a supposedly uninvolved external standpoint to a generalised subject standpoint as the point of knowledge. In principle, this is capable of connecting with cultural-psychological research programmes that take a look at individual action and mental phenomena in their constitutional relationship to the artefacts, discourses and forms of life socially and culturally handed down in a specific societal-historical constellation. i. e. that examines these meanings of human life circumstances as results of and contexts of grounds for human action, thus starting from people as socially situated, reflexive and intentional actors and including the so-called others as producers of knowledge in their research settings.

A subject-scientific orientation of cultural psychology grounded in Marxist societal theory can thus prevent tendencies of certain discourses in the social

sciences and humanities (for example, of post-structuralist provenance) to use culture and socio-cultural imprinting as fuzzy omnibus terms for everything societal and the societal determinacy of human subjectivity by recognising cultural processes and forms as determined by the mode of production – the productive forces and relations of production – of a societal formation. The incorporation of advanced class theoretical and political concepts into the discussion of cultural psychology enables a differentiated theoretical explanation for the diversity of socio-cultural constellations characterised by intersectional structural relations of inequality, oppression and discrimination and the subjectively grounded action in contradictory life situations associated with them. As a product of human practice, and thus changeable on a historical scale, the societal structural relations determine the possibility spaces of personal agency – a fact that is easily glossed over in idealistic-social constructivist conceptions of culture.

In that materialistic way set in relation to each other, the concept of culture can widen the concept of society by a dimension relevant to action in that it opens up access to the perspective of the actors, the world- and self-understanding of social groups and the diversity and changeability of socio-cultural codifications of life worlds and subjectivities. In this respect, cultural theories refer to a level of theory formation and empirical research that is basically laid out in Critical Psychology with its concept of *meaning analysis*, but is not sufficiently differentiated. To achieve this differentiation, of course, systematically requires the further elaboration of a Marxist concept of culture, from which available cultural theories can be reinterpreted. From a subject-scientific point of view, it would be important to comprehend culture as contradictory, everyday practical patterns of meaning of the mode of production and life for societal individuals in such a way that, compared to the objective restrictions on action and self-acting impediments, expanded spaces of possibility for self-determined action open up for them.

Wolfgang Maiers (* 1950) is a Professor emeritus of General Psychology at the Magdeburg-Stendal University of Applied Sciences and a supernumerary Professor [außerplanmäßiger Professor] of Psychology at the Free University of Berlin. The focus of his publications is on philosophical issues, history of science, theoretical psychology, subject-scientific action theory and psychology of learning. He was an editorial member of the *Forum Kritische Psychologie*, is a co-editor of Klaus Holzkamp's collected works (*Klaus Holzkamp Schriften*, Hamburg: Argument), and has taken an active part in the *International Society of Theoretical Psychology* since its foundation. Email: wolfgang.maiers@h2.de

Katrin Reimer-Gordinskaya (*1973) is Professor of Child Development, Education and Socialisation and Chairwoman of the Institute for democratic Culture at the Magdeburg-Stendal University of Applied Sciences. In her research, i.e. on class, gender and race in early childhood, antisemitism in Berlin

and jewish culture in East Germany, she draws on German Critical Psychology both conceptually and methodologically. She is an editor of Forum Kritische Psychologie - Neue Folge. Email: katrin.reimer@h2.de

Placing semiotic formulations to the epistemological ground of psychology

N. Ekrem Düzen & Mete Sefa Uysal

Abstract

The increasing irrelevancy of reported results in psychology to their conjectures has been growingly well-documented. There is also a shift of emphasis from methodological to theoretical shortcomings. Inasmuch as the attention devoted to the replication crisis is justified, the call that methodological drawbacks are hardly addressable unless the theoretical base is fortified is equally warranted. In this paper, we intend to expound on our estimation that epistemological foundations of psychology are in need of dire reinforcement if our discipline should remain a bastion of knowledge production. We assert a twofold argument that (a) psychology has to free itself from verbal ambiguities and linguistic imperfections in order to relate its subject matter to its methodology and (b) for that reason, reinstate its subject matter in such a precision that conjectures and implications produced across subfields could be relatable and translatable to each other. In support of our argument, we attempt to identify epistemic conditions through which both parts of our argument could be sustained. For the first part, we consult semiotics to illustrate a way of discerning robust phenomena and thus establishing the validity of constructs. For the second part, we revisit the beginnings of the science of psychology to highlight the dead end we have currently been stuck in. We search for prerequisites of turning data points over subjective experience into objective information. In addition, the authors are well informed that none of the problems summarized in the literature nor the efforts towards resolving them cannot be considered independently from overarching sociopolitical influences and effective circumstances shaping research environments. Therefore, we take note of the present-day state of affairs corroding the ever-weakening tie between theory and methodology.

Keywords

theoretical ground, psychological constructs, method-methodology connection, semiotic bridge

1. Introduction

History of psychology is nearly equivalent to history of crises in psychology (Wieser, 2020). However, its relatively long history of crises rarely produced consensual improvement strategies elevating the status of the discipline to the

level of basic sciences, nor helped to formulate its main subject matter (Pryiomka & Clegg, 2020). It does not follow, however, that there are good examples or efforts to counter the corrosive flow of “publish or perish” dictum (for discussions on good research practices, open science, and replicability in psychology, see Banks et al., 2016; Nosek et al., 2022; Sassenberg & Dittrich, 2019; Vazire et al., 2022; Youyou et al., 2023). The recent literature on replication crisis is one significant endeavor to address the current link in the chain displaying the ever weakening power of psychology in mastering its *raison d'être* (Morawski, 2019). Despite ameliorative exercises, increasing irrelevancy of reported results to their conjectures continue to mark the major shortcomings of psychology (Scheel, 2022), echoed in a shift of emphasis from methodological to theoretical deficits (Eronen & Bringmann, 2021; Flis & van Eck, 2018). With a close examination of the succession of crises, one could suggest that most of the deep-seated issues in psychology, are indeed symptoms of a fragile intellectual and epistemological base of the discipline rather than methodological problems or technical inadequacies (Muthukrishna & Henrich, 2019; Wiggins & Christopherson, 2019).

Inasmuch as attention devoted to the replication crisis is justified, the argument that methodological drawbacks are hardly addressable without a fortified theoretical base is equally, if not more, warranted (Berkman & Wilson, 2021; Düzen & Uysal, 2022; Flis, 2019). It is evident that dissecting the methodological capability of psychology from its theory-building capacity would lead to a short-circuited understanding of epistemological problems. Doing so would eventually result in amplified procedural routines of singular studies, inevitably reducing methodical applications to mere technical operations. Recent criticisms on how mainstream research activities are conducted despite serious criticisms support the view that psychologists tackle the problem frivolously (see Berkman & Wilson, 2021; Borsboom et al., 2021; Gervais, 2021; Irvine, 2021). It is disconcerting that most psychologists do not engage with methodological problems beyond instrumental approaches specific to the scope of their current studies, worrying only about standardized methods and associated theoretical sketches (Oberauer & Lewandowsky, 2019).

In this paper, we intend to expound on our estimation that epistemological foundations of psychology need dire reinforcement if our discipline should remain a bastion of knowledge production (Düzen & Uysal, 2022). We present a twofold argument that (a) psychology needs to free itself from conceptual ambiguities and linguistic imperfections in order to relate its area of study to its methodology and (b) for that reason, reinstate its subject matter in such a precision that conjectures and associated evidence produced across subfields could be relatable and translatable to each other.

We will attempt to identify epistemic conditions through which both parts of our argument could be sustained. More specifically, we will consult semiotics (Glaz, 2017; Glaz et al., 2013) to illustrate usable ways to describe psychological phenomena, define pertaining concepts, and thus prepare the ground for establishing the validity of constructs. To illustrate our arguments, we will propose to refresh consciousness studies with an elaborated terminology by the

help of linguistics and, more generally, semiotics. We do not mean to put forward a formulation out of our own fancy, rather we will draw attention to the fact that determining the primary subject matter of a scientific discipline, such as consciousness in psychology, calls for collectively coordinated cooperative collaboration in order to achieve a consensual understanding of what it should deal with. We maintain that big questions should be taken care of concertedly as opposed to single-handedly as it is usually the case with private enterprises of individual researchers or insulated research teams.

The idea of collective collaboration is more about creating a synergetic consensus, however provisional that may be at a given moment, out of the combined efforts of heretofore unconnected scholars than about going with a series of slightly modified fragmentary studies even when interdisciplinarity or multidisciplinary is sustained. We argue that if psychology is to claim ownership of a research area investigating mental faculty, it has to define the basic phenomena that supposedly make the mind up such as cognition, emotion, motivation, and consciousness. Furthermore, psychologists must discern a similar understanding when talking with these terms. The dark irony is that it is utterly difficult to find two psychologists who could agree on such basic phenomena, neither separately nor, worse, in combination. Solomon Asch pointed out the problem of subject matter in psychology 70 years ago: "If social psychology is to make a contribution to human knowledge, it must freely look at its phenomena and examine its foundations. [...] Before we inquire into origins and functional relations, it is necessary to know the thing we are trying to explain." (Asch, 1952/1987; p. xv; p. 65). Psychologists long abandoned the due philosophical, linguistic, and semantic work of describing their subject matter and thus building the conceptual framework defining it, despite historically good examples. Consequently, the discipline has become a scattered crowd of dazzled conductors pretending to decipher a deep mystery despite having only superficial, if not defective, decoders.

In such a haze, going back to basics and looking for the point of departure where roads are diverged could be helpful. Semiotics, in this sense, has the potential to provide much needed groundwork to start any inquiry on mental phenomena. As being the science of meaning making (see Chandler, 2022 for a concise account) semiotics provide us with the tools of constructing a metalanguage to link phenomena with concepts through which researchers can build their workable conjectures (Ayer & Elders, 1974; Popper, 1962). To put it plainly, we will search for semantic prerequisites for describing phenomena by reference to linguistic constructs in such a way to arrive at a unified conceptual framework. The goal of this venture is to be able to talk about the same thing: obtain empirical data and translate it into objective (in the sense of replicably testable) information that could be useful in epistemological inquiries and thus knowledge production.

2. The Precarious Science-worker's Conundrum

The authors are well informed that none of the problems summarized in the literature nor the efforts towards resolving them, for that matter, cannot be considered independently from the overarching sociopolitical influences and circumstances shaping the research environment such as funding schemes, publication pressure, and precarity. In this light, one has to consider present-day state of affairs corroding the ever-weakening tie between theory and methodology (Karau, 2019; Nosek et al., 2012; Uysal & Düzen, 2022; Witkowski, 2020).

It seems that the theoretical preparation in most studies in psychology is usually done with compilations from ready-to-use packages that are in demand by the current literature. Existing elements of intellectual background are presented in their widely accepted forms without being questioned or discussed in detail, allowing researchers not to take the risk of (re)addressing the epistemic validity of the variables they work with. Well-known or potential loopholes in the theoretical model are eclipsed in a way that does not pose a threat to the research at hand. Methodological problems are usually associated with the concerns of deciding on the appropriate combination in the matrix of data types (quantitative, qualitative, narrative, etc.) and data evaluation systems (statistics, thematic classification, content analysis, etc.) (Szollosi & Donkin, 2021).

Intellectual preparation is devoted to the selection of variables and estimating the correlations between them, rather than establishing the link between the phenomena and the corresponding by prioritizing simplicity in formulating the research question, validity in measurement, and clarity in reporting. In other words, on average, most of the reported results do not add precision to the description of phenomena or definition of the concept of it. Comparably, studies that emphasize model-building are written with the belief that epistemological and methodological problems are largely eliminated. However, advanced model applications often result in selecting variables based on model assumptions, rather than purifying the definition of variables (Danziger, 1985). As Cronbach lamented on the same disappointment twenty years apart (Cronbach, 1975), model-appropriate hypothesis-forming instead of theory-building became the rule of thumb rather than exception, obviously hindering theoretical progress. Leaning excessively towards correlative techniques strips the method off its position as an integral component feeding the theory and, for that matter, pertinent epistemology. Hence, the opportunity of improving the idea or transforming the hypothesis-testing cycle into a knowledge-generation process decreases substantially (van Rooij & Baggio, 2021).

As research activity takes the shape of an automated procedure, establishing a productive method-theory interaction fails. The dynamic interaction between the methodology, which is the systematic discussion of how to transfer hypothetical reasoning and inferences to the process of generating empirical knowledge, and the method, which is the procedure of applying this discussion to the current study, is often lost amongst sentences of introductory textbooks.

Researchers usually focus on the method of the particular research they carry out at a given time rather than the methodological rationale of the discipline of psychology in its integrality. They are rarely able to get involved in the imminent relationship between method and methodology. This indifference results either in not linking the method to methodology or not being reflected in the study. The methodology is mentioned as if it is a pile of popular methods that do not speak to each other. When this is the case, deriving an increasing number of variables around the same theme and reporting the results of the correlations between these derivatives turn out to be an activity serving only the person doing the study (Flis & van Eck 2018). Thus, the literature loses its quality as a source of cumulative information suitable for the use of others and grows into a gigantic statistical table with no consequential outcomes. Such a literature creates a) disorientation in psychology as to what the discipline is good for b) distrust in scientific community as to what could be expected from psychology, and c) erosion in intra- and inter-disciplinary communication and collaboration.

On the other hand, individual researchers *per se* cannot be blamed for these current and potential problems given the levels and types of precarity, academic culture, financial policies, societal endorsement, and political repression. If a researcher, despite the negative socio-political and academic circumstances, spare some of their effort to address the method-theory problem and cares about the relationship between methodology and method, they have to face two crucial problems, one intellectual and one practical. Intellectually, putting forward something significant about the methodology requires a giant repertoire in its own right. Practically, they would have to struggle with limiting the scope of their research, losing their thematic focus, and falling behind the requisite number of publications. The former asks for shouldering a workload that cannot be taken on alone, and the latter jeopardizes their chances of an 'academic career'. Faced with these intertwined problems, researchers usually declare in their "limitation and future directions" sections that they wait for an imaginary group of researchers, which is impossible to encounter, to come along and solve the methodological and epistemological problems that concern them as well. The development of the conceptual framework is postponed to further work, preferably by others; hence, the dispossession of the theory-method problem deepens. In this twilight where personal concerns and scientific responsibilities are intermingled the method-theory problem is apprehended by an avoidance reflex that the individual researcher refuses to undertake, and the collective effort never arrives.

3. Fault Lines on the Intellectual Plane

It is remarkable that the number of studies dealing with a double contraction in the field of psychology, theoretical deficiency and methodological bottleneck (i.e., method-methodology jamming), is not proportional to the urgency of the problem. Despite the scarcity, it is nevertheless promising to have studies trying to identify the sub-factors, components, or possible reasons (e.g., Eronen &

Bringmann, 2021; Flis & van Flick, 2018; van Rooij & Baggio, 2021). Here we will refer to Eronen and Bringmann's (2021) study to give a short account of reasons of weaknesses in theory building in psychology. Basically, we will summarize their review, as they do, in three headings: 1) Absence of robust phenomena, 2) lack of validity/validation, and 3) difficulty of finding a causal relationship. Indeed, they do not claim that the theoretical problems consist only of these three topics. Instead, they highlight the need for in-depth studies in these directions and draw attention to the ongoing uncertainty about psychology's subject matter.

In this section, we address the main theoretical challenges drawing on the work of these researchers and then discuss possible solutions or enhancement suggestions in the next section.

3.1. Absence of robust phenomena

Robustness is a measure of whether the theories have the power to determine the boundaries of the phenomenon. Accordingly, there is a two-way relationship between the phenomenon and the theory developed to explain the phenomenon: a) the phenomenon should be able to be explained on the basis of theory, and b) there should not be many theories explaining the same phenomenon. In psychology, however, both theories' power to explain the phenomenon is weak and there are many theories related to the same phenomenon. For example, Darwin's theory of evolution can perfectly explain the phenomenon of evolution and natural selection, and there is no other scientific theory that is a candidate to explain evolution and natural selection other than the existing theory. In the field of psychology, we cannot easily think about a theory like that. Instead, the phenomena proposed by theories are often not supported by empirical evidence or, when the phenomena are supported by specific evidence, this evidence provides no clue as to which theory would be more explanatory—and therefore more valid.

Eronen and Bringmann (2021) argue that the theory of ego depletion, which was thought to be well-established in the literature and has remained popular for a long time and has led to many publications, is slowly faded away due to its weak or unreliable empirical supports and existence of many alternative theories. Similarly, psychological theories on stereotype threat, newborn imitation, and priming effects, which are thought to be well-established, either cannot explain their phenomena or these phenomena are explained by different approaches. Thus, the absence of a theory that can explain its phenomenon and that cannot be explained by alternative theories contributes to existing crises and does not help to determine the main research subject of psychology.

3.2. Lack of validity/validation

The reason for the lack of validity/validation, which is not reflected in the studies to the extent that it is emphasized in psychology education, is an ongoing negligence towards developing psychological constructs. Eronen and Bringmann (2021) argue that robustness is ignored despite the abundance of constructs in the literature. Having plenty of repetitive constructs related to the same theme (for example, perceived control) and the continuous production of new ones without attempting to improve the existing ones take the form of common scientific activity. The field of psychology grows into a discipline of unvalidated constructs and provider of measurement tools for those slippery fabrications. Researchers' emphasis on reliability over validity, citing other seemingly related studies as a tool of validity, and the ability to publish derivative constructs make this mediocrity a standard.

It is worth mentioning two more preparatory factors that psychology does not deal with sufficiently, hence, make construct validation difficult: *generative entrenchment* and *epistemic iteration*. Generative entrenchment means that after a construct is introduced, it can be widely used in many fields other than the output field. Psychiatric diagnosis categories, which not only psychology but also other disciplines frequently use, can be given as an example for generative entrenchment. In time, such defective constructs are seen indispensable due to the practical fact that other structures (other constructs, measurement tools, training and intervention programs, etc.) built based on this construct will also be affected. Thus, commonly used constructs are persistently circulated even though they are known to be weak or erroneous.

Epistemic iteration refers to constantly increased epistemic purity of a construct with new definitions that are getting more and more precise over time. Epistemic purity can be understood as the degree of power explaining the phenomenon with the same construct at an increasing rate and without the need for other constructs. For example, atom or electron constructs in physics are constructs with high epistemic purity in terms of explaining the phenomenon, although their initial definitions have undergone significant transformations over time. However, most constructs in psychology remain outside of similar epistemic evolutions.

3.3. Difficulty of establishing causal relationships

It seems that the theoretical and methodological development of psychology contingent upon to the revealing the causal relationships between psychological variables. Aside from the debate about which methodological processes are sufficient to establish causal relationships, there is another big problem that psychology needs to develop a solution. Although it is important to show the causal relationships between external variables and psychological variables, revealing the causal relationships between psychological variables is the main difficulty.

We can understand external variables simply as environmental stimuli, and psychological variables as units of processing these stimuli. Environmental stimuli also involve the internal environment of the organism (biological body, anatomy, brain, nervous system, etc.). Psychological variables, from sensation to perception, memory to attitude, emotion to belief, are all psychological responses and behaviors to the stimulus (responses, reactions, actions, echoes, reflections, representations, etc.). In that sense, external variables and psychological variables are poorly, if not at all, symmetrical. In other words, it is none other than our conjectures that make them related to each other. Such an asymmetry suggests that examining the correlation between a well-validated external variable (e.g., daylight duration) and a poorly validated psychological variable (e.g., ego depletion) would yield more reliable results than examining the correlation between two psychological variables (e.g., risk taking and ego depletion). Hence, we can predict that it will be relatively easy to establish a causal relationship between external variables and psychological variables, and it will be quite difficult to establish a causal relationship between psychological variables. Eronen and Bringmann (2021) suggest that establishing causal relationships between external independent variables and psychological variables can be considered a necessary condition, but not a sufficient condition for our discipline. They emphasize that since Wilhelm Wundt, psychology has not made any progress in overcoming this limit and remind that complex psychological processes such as thinking or feeling cannot be deduced from the correlations between external variables and psychological variables.

The cyclical feeding of the problems identified by researchers is one of the biggest obstacles to overcoming the epistemological and theoretical problems of psychology. In other words, the absence of durable phenomena, lack of validity/validation, and difficulty in finding a causal relationship, each grow from the negativity of the other, making it difficult to determine where to start solving the problem. The absence of durable phenomena paves the way for unvalidated constructs; unvalidated constructs make it difficult to find causal relationship; and the difficulty of finding causal relationship exhausts robust phenomena-explain possibilities.

Following Eronen and Bringmann, we maintain that linking a psychological phenomenon (such as risk taking) to a psychological variable (such as ego depletion) rather than linking an external phenomenon (such as daylight duration) to a psychological variable (such as, again, ego depletion) is of paramount importance. In the following sections, we will expand on this idea when we try to explicate why psychology should be the field of explaining psychological phenomena with reference to psychological variables and why studies explaining psychological variables with reference to external variables are destined to be unproductive – and do not make a science of psychology but something else.

4. Ontological Coordinates of Consciousness

In an attempt to establish a new paradigm for studying emotions, Lisa Feldman Barret (2017) attests that "... progress in science is often not answering old questions but asking better ones" (p. 14). She reviews existing theories of emotion and proposes a new approach endorsing that emotions are constructed in a similar way perception is eventuated against the question "what is this new sensory input most similar to?" (p. 7). When translated to Irvin Rock's language (1983) emotions are propagated answers to environmental questions in the sense of problems to be solved including questions arising from one's own inner milieu. In both perception and emotion, the organism uses past experience to guide itself to deal with the present situation and move forward to update its allostasis (Sterling, 2012) rather than restore homeostasis (Schulkin, 2003). Barret is not naïve to the huge literature on neural correlates of psychological processes, she nevertheless tries to establish a link between two psychological variables: receptivity of environmental events and associated emotions as allostatic responses to them. This way, she locates emotions not in the flesh (neural network) but in the interaction between the organism and its environment; that is, making sense of the sensory input and generating a corresponding response.

Inasmuch as Barret's approach helps to clarify the huge confusion around what emotions are, the discipline is still very far away from studying emotions like perception and cognition, let alone consciousness. Much less acceptable, we see no similar attempt in studies on motivation or, worse, connecting motivation to these basic mental faculties. Whether Barret's approach would be paid by due justice in studies of emotion is yet to be seen. What is certain is that studies in consciousness do not revolve around the interaction of the organism with its environment, but rather inside the individual's physical body and grant it a privileged position among all other mental states. The source of its distinguished status is said to be its inaccessibility to external observation, being both the means and ends of subjective experience in the same moment. Therefore, the attributed prominence of consciousness creates a hard problem. Notable researchers, too agree that introspection should not have a place in studies of consciousness, yet they admit that there is hardly a clear way of making research on consciousness sensible without referring to introspection (e.g., Seth & Bayne, 2022). The alternative term proposed to avoid it, interoception, helps no better as long as consciousness is looked for in the human brain (Nikolova et al., 2022).

This hard problem led psychologists and researchers from other fields to place consciousness into the brain, sometimes along with a little bit of larger neural network. This placement made it handy to work on the connections across external and psychological variables. There it is seen immediately that such are studies linking external variables to psychological ones, neglecting once again linking psychological variables to each other. At the end, we have an abundance of correlations between supposedly conscious experiences with an endless list of brain or nervous system structures, processes, and functions. Most of the time, these correlations are not even translatable to the vocabulary of psychology. The

explanation is nothing psychological but physical so much so that one need not to be a psychologist to do the work or make sense of the outputs.

What, then, blocks psychologists developing an understanding of consciousness that can be sought in interactions of the organism with its environment, as they do when studying perception and cognition? To put it differently, could there be alternative ways of defining consciousness in such a way that it yields itself to investigation without referring to neural correlates, brain parts, or chemical reactions? Could psychology search for consciousness by connecting psychological variables among themselves rather than to external variables?

4.1. From construct to concept

The use of the word consciousness in psychology is so imprecise that it cannot fulfill the function of a concept. Researchers hardly take into account its linguistic characteristics, historical background, or literary, artistic, and metaphorical implications. It seems that consciousness is never thought to be reprocessed to ascribe qualities of a construct. Rather, everyone understood that it is understood by everyone the way they understood. At the end, we neither have a good theory of consciousness nor a testable construct. That is why, in this section, we try to develop a proposal asserting that the transition from construct to concept follows a semiotic process that makes the semiotic work an intrinsic component of identifying robust phenomena. Then, later, we will go back to reflect on what had been lost in studies of consciousness by neglecting the semiotic homework.

We argue that one fruitful approach to take semiotic work into the center would be to consult social representations (see Bauer & Gaskell, 1999 for an outline of the approach). Even though a thorough discussion of the way semiotics is linked to social representations is beyond the scope of this chapter, we nevertheless think that this approach provides useful methods for describing robust psychological phenomena (see Veltri, 2013, 2015 for connections between semiotics and social representations).

It may not be a coincidence that Moscovici (1988) repeatedly invoked the same example given by Eronen and Bringmann (2021) in his efforts to explain social representations: *Atom*. Initially, atom was not a concept corresponding to an observed and identified object/phenomenon, but a construct proposed to correspond to an object that was thought to exist. Natural sciences insisted on calling the smallest unit of matter by the term atom. Physics empirically demonstrated that matter is composed of atoms, more or less in accordance with Democritus' design. In fact, atom as an object was neither indivisible nor the smallest unit, but it was historically convenient to express findings about the qualities of the constituent elements of matter. Physics continued to describe these constituent elements and explained its attributes through empirical evidence while preserving the construct of atom. Although its meaning expanded to other areas of life (art, music, literature, worldviews, etc.), the word atom differentiated

from every other meaning and became a basic term in physics. Thus, atom transcended its meanings in everyday language and settled in the discipline of physics as a concept corresponding to an ontological object.

Constructs are linguistic expressions built with the aim of converting them into concepts corresponding to the described or identified objects, regardless of surrounding nomenclature. In that sense, constructs are made up of words by stripping off their irrelevant connotations and denotations in order to appoint them the quality of a *term*. When supported empirically, *the term* enters into the terminology as a concept corresponding to an ontological object. Otherwise, terminology remains a set of words with high interference frequency – which is the usual case in non-specific use of language. Sporadic nomenclature exerts disproportionate power on the social sciences compared to natural sciences in terms of twisting the object under investigation and bending the information to be gained from this investigation.

Once constructs become concepts, we can give a pause for a while. If the concept can continue to describe and explain the object in a more precise way - as in the case of atom - we do not need to change terminology. But if the concept does not correspond well enough to the object, we need to go back and revise the construct and put forward the conditions under which the reconstructed construct can become a concept. As a matter of course, scientific activity starts from fiction and arrives at a concept; it is an effort to extract the phenomenon from the imagination of the researcher and expose it to empirical access.

4.2. The price of staying away from semiotics

Moscovici (1984) emphasizes that every social representation is embedded in a semiotic triangle and that it should be understood as a dynamic embeddedness. Briefly, the semiotic triangle shows the three components of making sense of the world and thus representing it. These components (see Figure 1.) are a) the signifier (linguistic expression), b) the signified (concept), c) the signifier/signified (object) (see Ogden & Richards, 1989; Kiran, 1990 for basic semiological terms; see Michon et al., 2008 for semiotic views of psychology).

Figure taken from page 11, *The Meaning of Meaning: A Study of the Influence of Language upon Thought and of the Science of Symbolism*, 1923, was co-authored by C. K. Ogden and I. A. Richards, Magdalene College, University of Cambridge, Public Domain, <https://commons.wikimedia.org/w/index.php?curid=672318>

Figure 1

In another study Moscovici (1988) argues that once a representation is endowed with explanatory power, the only thing to do is to study the phenomenon that the representation points out to, and that there is no other way of producing knowledge. Jovchelovitch (2002) proposes to build the social psychology of knowing on the basis of dynamics of social interactions and cultural contexts following Moscovici's footsteps. Hence, she also shows why representations cannot be understood when left in the subject-object binary and not placed in the semiotic triangle. According to this reasoning, giving meaning to the object depends on a) being in relation with others and b) being able to develop a common code of signs that serve communication and social interaction. In other words, the object does not have meaning unless it is part of the common code of social communication and interaction. Reinterpreting these views, Voelklein and Howarth (2005) state that the binary opposition of subject-object is insufficient to fully grasp the social nature of representations and identify three dimensions of representation as 1) the object represented, 2) the subject who assumes the representation, and 3) the social group in which the subject positions itself while assuming the representation.

In line with these evaluations, we are looking for the *semiotic bridge* that connects the construct to the phenomenon in the transition from construct to concept. In this search, we argue that *the term as the specified name of the word* (or *phrase*) is the semiotic element that should be taken into account when claiming that a proposed concept really corresponds to the ontological phenomenon in question. To the best of our knowledge, the conditions of semiotic transition from construct to concept is not sufficiently emphasized in psychology and this lack of emphasis leaves the matter inconclusive as what to call a concept and what to call a construct. Following the example of *ego depletion*, we can argue that the researcher's construct is not subjected to a

semiotic work to establish its status as a communicative concept beyond the researcher's conjecture. Although the social representations approach does not explicitly mention *the term as the specified name of the word* or such is a semiotic component, we find it arguable that there is an abundance of implications within the approach that the function of the term summarizes the representation of a social or psychological object.

4.3. Semiotic geometry of the concept

A research activity based on words expressing schemes that are not objects and ignoring the transitivity from constructs to terms and then to concepts may result in the pursuit of things that are not objects. This risk is the same for words that refer to supernatural beings such as djinn, fairy, and demon as well as for words that express states rather than phenomena such as individualism-collectivism. In other words, a research activity that is initiated without establishing the transitions of construct-term-concept may end up producing meaningful statistical results about either a phenomenon that does not exist or a situation that does not qualify as a phenomenon.

Glaz (2017) argues that the semiotic triangle is insufficient for determining the metonymic and virtual meanings of linguistic expressions used as words or phrases. First, he finds that linguistic units are largely composed of expressions that are used interchangeable (metonymic) or denote the unrealized part of the reality (virtual). As examples of transpositional expressions, he gives the example of marking the object identified with the subject instead of the subject performing the action, as in the expression "Brussels said that" instead of "The European Union said that", or marking the subject who created the music even though the object of love is Mozart's music as in the example "I like Mozart very much". As for virtual expressions, he gives the examples of hurricane and composition. A hurricane is the form of a storm that reaches a certain but different peak each time, while a composition is a piece of music that is performed with a different interpretation each time. Both are critical expressions of more than just one part of reality that appears there and then. Glaz says that this feature of virtual expressions makes all virtual expressions also transitive. A hurricane extends to all storms that reach a peak; a composition extends to all interpretations of a piece of music that is performed differently each time.

The fact that linguistic expressions are transitive and virtual and that all virtual expressions are also transitive, prompts Glaz to reconsider the semiotic triangle. Glaz sees that unless the semiotic triangle is transformed into a tetragon, the semantic content of linguistic expressions cannot be completely determined. He says that we cannot know what we are talking about if we cannot determine which virtual and transitive forms of a linguistic expression we are talking about. He emphasizes that whether or not we define the boundaries of what we are talking about in a way that is clear to ourselves and others will definitely affect the limits of describing the phenomenon that will be the subject of scientific research. Glaz combines Jakendorff's (1983) distinction between "the real world,

the conceived world, the experienced world" and Bartmiński's understanding of "the interpretation of reality embedded in language" to build a fourth corner in the semiotic geometry (Bartmiński & Zinken, 2012; Bartmiński, 2013). This way, he proposes to update the semiotic triangle consisting of linguistic expression-concept-object into a tetragon of linguistic expression-conceptual structure-experienced world-real world.

We maintain that by adapting Glaz's quadrilateral semiotic model to the construct-term-concept transition, we can concretize the view we try to develop in this chapter. According to our version, terms that are names of constructions acquire the quality of concepts insofar as they are shown to correspond to the object in question. During the assembly of the construct, one or more of the transitive and virtual variants of linguistic expressions are selected and distinguished from the others. One of the dissected expressions are coined with a specific name that will indicate the holistic theme appropriate to the purpose of the construct. Hence, the term as the specified name of the linguistic unit is formed after eliminating raw linguistic expressions and before determining the concept corresponding to the object. Empirical studies conducted under this name acquire the function of the term (the linguistic unit in which the concept is to be expressed) when they describe and explain the phenomenon. When it becomes clear that the term can be used as a concept, connections of the term beyond linguistic connotations (e.g., imaginary or kinetic) are also included into the concept. In this respect, the concept is always broader than the term. The term is the cognitive-linguistic alias of the concept, and it is important to take extra care that the concept is not overshadowed by this alias.

In this regard, we have the possibility of reorganizing Glaz's geometry into the tetragon of linguistic expression-terms-concepts-objects. In this reorganization, the terms correspond to the selected and extracted contents of linguistic expressions, and the concepts referred by these terms correspond to the phenomena that the researcher investigates (see Figure 2). More concisely, concepts correspond to objects and terms to linguistic expressions.

Figure 2

In our adaptation, the term is the semiotic bridge between the fact and fiction in the research activity that seeks to move from fiction to concept. When this semiotic bridge is not explicitly intended, the fact-seeking researcher may not know what they are talking about. The interlocutor, who is addressed by the researcher but who is not aware of this semiotic bridge, may not be able to find the meaning of what they hear.

We may imagine that the proposed semiotic bridge is a constant headache for social sciences, though it can also bother natural sciences time to time. Since the research subjects of natural sciences are external objects including laws of nature, historically it has been considered to be unaffected by human imagination. In this respect, living beings in general and the biological equipment of human beings in particular are seen as external objects. Natural sciences may have the comfort of using more direct quotations from existing linguistic expressions and neglecting most of transitive or virtual variations when defining concepts associated with external objects. Although the study of quantum mechanics nowadays is confronted with the possibility that the presence of an observer may affect the phenomenon under study, it may not be a top priority in the natural sciences to observe construction-terms-concept transitivity. From a theoretical point of view, it can be argued that observing this transitivity is a necessity, but from a practical point of view, we can think that the methodology of investigating external objects mitigates the effect of this neglect at least to some extent.

In terms of social sciences, on the other hand, neither the constitution of research subjects nor the methodology are strong enough to bear such a neglect. The phenomena sought by social sciences are not to be found *free* in nature. They are all found in human interaction with the living or non-living elements of the environment, including one's own inner milieu. Social sciences have nothing to say about the non-interactive human being. The non-interacting human being, like all external object-phenomena whose ontology is not changed by human imaginative or linguistic activity, is the subject of research only and exclusively for the natural sciences.

5. Epistemological Coordinates of Consciousness

We can illustrate the necessity of the bridge of term in the semiotic geometry with an exercise that helps to define consciousness in the form of a robust phenomenon. In this exercise, we deliberately avoid saying anything new about consciousness. We traverse the breadth of the literature on consciousness by drawing on Van Gulick's (2014) entry on Consciousness in the Stanford Encyclopedia of Philosophy. In a reductionist way, we try not to go beyond emphasizing the importance of appealing to semiotic geometry.

In the study of consciousness, we may speak of three main approaches that develop independently of the researchers' trained disciplines of origins. The first approach (the materialist view) argues that consciousness must ultimately arise in the course of neural activity. The second approach (the panpsychic view) claims

that consciousness should be considered as one of the basic elements of nature such as matter, mass and energy, and that human consciousness is a share of this basic element of nature. The third approach (empiricism) says that consciousness is an illusion, just like visual illusions, and that in order to understand consciousness we need to study the processes of illusions. All three approaches ultimately look for consciousness under the skin of the individual human being, especially in the brain and its neural activities.

All three approaches, which have produced most of the literature on consciousness, insist that the difficulty of the problem lies in the fact that a) the experience of consciousness is subjective and b) subjective experience cannot be detected in the workings of objective matter. None of these approaches, however, goes back to one of the basic tenets of the organism and its environment: The interaction between the distal and proximal stimuli (Flach & Holden, 1998; Gibson, 1967). In fact, Bartley (1982) gives an exact example of why it is important to agree on terms which are meant to be used in building constructs which would be used in describing the associated phenomenon. More recently, Brosch et al. (2010) reemphasizes the significance of working with the concepts of distal and proximal stimuli in emotion research. They assert that, without a clarified terminology there is no way of studying emotions in the sense that emotions are responses not to external stimuli which are outside of the organism but to distal stimuli which are representation of the external stimuli by the organism.

To put it differently, consciousness is not understood in psychology the way perception, cognition, or emotion is understood. The reason why emotion is entered the picture more recently may hold true for consciousness as well. Finally some researchers (e.g., Barrett, 2017) came to the understanding that emotions, too, are about organism's preparedness to receive external stimuli (work on distal stimuli) and, again, preparedness to react to distal stimuli on the basis of its representation (proximal stimuli) which is made up of a complex repertoire of learned responses. Such an understanding made possible to fine tune the terminology in describing emotional phenomena and thus what we should understand from the term emotion in emotion research (Shaffer et al., 2022). Consciousness, on the other hand, is still a crude word without irrelevant transitive and virtual extensions are eliminated and without the transitivity between constructs-terms-concepts are taken into account. Therefore, we have the word but not the term of consciousness which is taken to be the concept of the phenomenon of consciousness.

Does psychology have to search for consciousness under the human skin? Or could the discipline begin this search by placing the elements that are thought to mark the phenomenon of consciousness in their proper place, such as in a semiotic geometry? This exercise gives us the opportunity to argue the following: If the psychodynamic school had placed self and consciousness in person-environment interactions including interpersonal relations, instead of in the subjective psyche, we would be talking about a completely different psychology today. We could have placed consciousness in semiotic geometry, thus paving the way for describing other related phenomena as well, finally elevating the

concept of the psychological phenomena to a solid position in the history of science.

We should also emphasize the importance of semiotic geometry by reminding us that semiotically unprocessed linguistic expressions often do not correspond to psychological phenomena and may even contain elements that have nothing to do with describing phenomena. It would not be an exaggeration to say that studies in voluminous fields such as emotion or personality mostly rely on factor analyses of word lists and correlations between variables derived from these analyses. The information on emotions or personalities produced by researchers working in what are thought to be the most ambitious fields of psychology are more situational than factual. Moreover, this way of working, in which the robust phenomenon is neglected, is open to the arbitrary shaping of the researcher and closed to independent audits. It is in this light that one should evaluate what went wrong in the personality studies of Hans Eysenck, who died in 1997 as the most cited researcher after Freud and Piaget (O'Grady, 2020).

Concluding Remarks

Perhaps psychology's inability to give up the idea of dispositions (eventually giving rise to essentialist constructs and thus essentialist variables in many sub-fields like clinical, developmental, and social) should be linked to the fact that – in addition to sociopolitical factors – psychology considers itself as obliged or condemned to discover free-roaming objects in nature. That could be the reason why increasing numbers of psychologists are now working in fields derived from biology such as neurology, physiology and endocrinology. In these fields, psychologists have the opportunity to examine the relationships between external variables and psychological variables. Doing so, they believe that they are accepted scientifically to the extent that they can link psychological variables to external variables. Especially if they can assign essentialist qualities to psychological variables, they think that they have raised the scientific status of psychology.

The advantages of submitting essentialist constructs as concepts are many. As soon as one says *disposition* or *trait*, an imaginary ontological field emerges. Once this ontological field is taken as an unquestioned axiom, an unlimited horizon opens before psychology from which countless variables can be derived, from consciousness to the self, identity to personality, individualism to collectivism, emotion to pathology.

However, there is no methodological basis for saying that a study without reference to an external object cannot be scientific. Psychology is the discipline of being able to work with the variables that remain after external variables are removed from the equation – as long as the constructs are built in a way that is suitable for capturing the phenomenon. Attempts to construct psychological variables by resorting to non-essentialist constructs are rare in our discipline. The work of Jack Martin and his colleagues, who draw attention to the productive relationality of the construct of personhood rather than the futile essentialism of

the construct of personality, exemplifies that such constructions are possible (Martin, 2015; Martin & Bickhard, 2012; Martin et al., 2010). Neither should we neglect studies that examine how personhood is constructed in collective relations (see Hammond, 2021 for examples in this direction).

It is necessary to re-position psychology as a discipline able to describes and explains psychological variables in such a way to explain psychological acts and actions not by including but by eliminating external variables from the equation. Consciousness is not a phenomenon that psychology can study by asking what consciousness is mimicking the question of what atom is. Defining and explaining consciousness can only be achieved by building a construct that is capable of encompassing the boundaries of the conjectured phenomenon. Any activity to the contrary would be a fake epistemology on an imaginary ontology.

Problematizing the power to name in psychology

Seth Oppong †

Abstract

Naming things has a special role in every science. The power to name subjectivity determines what can count as useful objects of study and how we think about those objects. In psychology, like other sciences (social or natural), this power to name is not shared, evenly distributed, nor inhere in every single psychological scientist. It is understandable that only a few psychologists may have that power to name subjectivities and serve as judges of objects worthy of study at any point in time. However, this power tends to be held by only White male psychologists at certain institutions. Thus, epistemic agency is ascribed to the White male psychologists and epistemic centre status assigned to their institutions and languages. In this paper, I problematize this power to name and locate it within a certain sub-population of individual scientists, institution, publication process, language of publication, and internalization of lack of that power to name among psychological scientists in the majority of the world. Thus, one cannot blame the privileged few when the majority willingly accepts, condones, or expects the power to name by the privileged few. I seek to decolonise the minds of the marginalised to reject their subservient role in knowledge production. Ways of opening access to this power are recommended.

Keywords

democratising, epistemic power, hegemonic psychology, power to name, subjectivities

Introduction

Knowledge production and dissemination are key to maintaining wheels of the higher education systems oiled across the world. One way to create new knowledge is through categorization that enables researchers to name subjectivity or objects of study along with its associated properties or characteristics (Lerner & Lomi, 2018). Naming, therefore, has a special role in every science. More importantly, the privilege or power to name subjectivity determines what counts as useful objects of study as well as how we think about those objects. They also become the new lens through which other researchers and practitioners see the world; thus, naming subjectivities transforms how the world is understood and perceived if such categories or concepts become widespread in their usage. It is

also important to understand that without categories or concepts, principles (relationships among concepts), laws (principles valid in all possible situations), and theories cannot be built up (Champagne, 2015; Seel, 2012). Thus, the structure of scientific knowledge or the components of science knowledge is such that if no categories are created and named from verifiable data about the world (facts), we are left helpless when studying relationships among variables (which are empirical concepts or constructs) that form the basis of much of our research in behavioural and social sciences including psychology (Champagne, 2015). Indeed, concepts are “the building blocks of thoughts” that influence the processes of “categorization, inference, memory, learning, and decision-making.” (Margolis & Laurence, 2022, para. 1). But these concepts should also conform to some standards to deserve a place in science. For this reason, recommendations have been made about the quality criteria of a good concept in science (Gerring, 1999; Margolis & Laurence, 2022; Seel, 2012) as well as the process of developing a good concept (Podsakoff et al., 2016).

Indeed, the process of categorization is both cognitive and social (Lerner & Lomi, 2018). Thus, it often results from lengthy process of negotiation and contention among competing perspectives or views. An example is the so-called *Pluto controversy* in which International Astronomical Union (IAU) decided to exclude *Pluto* as a planet and redefine it as a dwarf planet (Hannan, 2010; Shiga, 2006). The more difficult question is: who names or has the power to name things in science? To a large degree, life sciences, chemistry, physics, and health sciences have established standard systems for naming things (Kennedy et al., 2005; Leigh et al., 1998; World Health Organization [WHO], 2015). In the sciences with established naming systems, there is often the issue of who serves as gatekeepers to grant access to the power to revise the naming standards or the formulate new ones. Thus, the mere existence of a naming standard does not mean that every academic has equal access to that power, talk less the power to create new systems. For instance, Deikumah et al. (2015) examined and described the bird naming systems by Akan people (the numerical majority ethnic group in Ghana) in terms of its divergence from the mainstream bird naming system in biology. Though they argued that the Akan naming system is akin to the mainstream nomenclature, it also created the impression that the Akan nomenclature is not to be valued but only in its association with the mainstream nomenclature (Deikumah et al., 2015). This shows that there are still issues of access and distribution of the power to name in the life and physical sciences.

There are no established standards or guidelines for naming in the behavioural and social sciences. Thus, behavioural and social scientists tend to retain greater power to name and grant recognition to names created by other academics in the field. The situation is no different in psychology. On the issue of naming, Leary (1995, p.267) argues that psychologists are compelled to “construct and convey our understanding of things through the use of terms previously reserved for other things, on the basis of some perceived or conjectured similarity” and psychologists often “refuse to accept that this sort of cross-naming and knowing-by-comparison is inevitable”. Despite this, psychologists cannot deny the fact that a large portion of what we know and

think in the psychology appears to be underpinned by cross-naming and knowing-by-comparison (Leary, 1995). The implication is that Leary (1994) seems to be admitting was that psychologists have no rule at all to guide the naming of concepts or categories. This is because the metaphors used are chosen by the scholar and the decision-making process is not known to anybody, sometimes not even to the scholar doing the naming. Notwithstanding, there are a few attempts to create a classification system to name things in psychology. For instance, Montero and León (2007) attempted to provide a naming system for research methods used in psychology.

Gerring's (1999) discussion about what constitutes a good concept in the social sciences, for instance, failed to address the question of the naming conventions used in the social sciences. Rather he argued for the use of a criterial framework consisting of the following as a guide to developing a good concept in the social sciences including psychology: 1) familiarity, 2) resonance, 3) parsimony, 4) coherence, 5) differentiation, 6) depth, 7) theoretical utility, and 8) field utility (Gerring, 1999). The question about how to name the concept was left to the whims and caprices of the social scientist. This creates room for scientists in psychology to have the power to create categories to represent subjectivities and label them. For instance, why was Skinner box so-named but not labelled as "rat box"? To respond by saying that Skinner "invented" leads to murky waters as one cannot understand why Puzzle box was so-named instead of Thorndike box. Thus, different rules seem to apply at each instance reducing the capacity to have uniformity in the naming process. However, the inability of academics in psychology from the majority of the world to create and name categories cannot be pinned down only to this lack of naming conventions or the power of the gatekeepers. This is also due to a lack of effort to develop new categories that meet most of the Gerring's (1999) criteria for quality concepts in the social sciences. I shall return to this issue of inability of academics from the majority of the world (AMWs) to create and name categories again.

You might argue that the lack of uniformity in naming in the social sciences or its constituent disciplines allows for the flexibility required to manoeuvre the difficult tasks of naming categories or concepts in the social sciences. However, this also allocates power to a few gatekeepers to recognise or deny the concept or category even if the category or concept itself meets the eight (8) criteria Gerring (1999) recommended. This power held by some gatekeepers relates to their role in gatekeeping publication and dissemination of new ideas. For others, the power to gatekeep lies in their ability to determine what is worthy of teaching by way of curriculum design and prescribing texts (articles and books) for teaching. Thus, it is through the publication, dissemination, and teaching of new ideas that enables those ideas to enter into the realm of normal science (see Kuhn, 1970) or becoming canonized or established in a discipline.

In the rest of this article, I problematise this power to name and locate it within a certain sub-population of individual scientists, institution, publication process, language of publication, and internalization of lack of the power to name among psychological scientists of the majority of the world. I argue that a sub-population of psychological scientists who happens to be White males and have

attended or are affiliated with a limited number of institutions of higher learning in the West tend to have this power to name while the publication process tends to strip authors who are part of the disadvantaged majority off the power to name. Lastly, I also contest the internalization of the epistemic de-agency by the AMWs as being complicit in this process of granting to the privileged few the power to name. I also suggest ways of accessing this power to name among academics from the majority of the world.

Uneven distribution of the power to name

A good place to start the uneven distribution of the power to name is to consider studies that have identified eminent psychologists. Two of these critical studies are Haggbloom et al.'s (2002) study of the 100 most eminent psychologists of the 20th Century and Diener et al.'s (2014) of eminent psychologists of the modern era. In this study, Haggbloom et al. (2002) used three quantitative variables (i.e., journal citation frequency, introductory psychology textbook citation frequency, and survey response frequency) and three qualitative variables (i.e., National Academy of Sciences membership, election as American Psychological Association [APA] president or receipt of the APA Distinguished Scientific Contributions Award, and surname used as an eponym). They generated a composite score to rank 100 most eminent psychologists of the 20th century. Twelve years later, Diener et al. (2014) also published a similar work that used three criteria (citation metrics, textbook page coverage, and major awards) to rank 200 most highly recognized psychologists. In the list that they produced (Diener et al., 2014; Haggbloom et al., 2002), one can find many of the well-known figures in psychology for the work they have done. This also described a list of psychologists who have held the power to name. I am not in any way say that their work did not deserve recognition; it rather illustrates that a few persons in psychology has always held this power to name things in the discipline.

Equally important studies to consider in this discussion are Cattell's (1906) publication of the *American Men of Science* and the one by Furumoto and Scarborough (1986) in which they attempted to describe further the 22 women psychologists who were among the 4000 persons described in Cattell's (1906) *American Men of Science*. Cattell (1906, p. v) included persons in his biographical directory on the basis of the person's contributions to the advancement of pure science or "membership lists of certain national societies". Even though this is about every know field of science at the time, Cattell (1906) could only identify 22 women psychologists. Thus, taken together these studies suggest that there has been significant underrepresentation of women in psychology and at the core of power to name. However, recent studies suggest that women are making progress in psychology (see Diener et al., 2014) but they do not have the same power and status compared their male counterparts (Clay, 2017; Eagly & Miller, 2016).

It is fair, therefore, to say that, in psychology, like other sciences (social or natural), this power to name things is not shared, evenly distributed, nor inhere in

every single psychological scientist. Studies on prominence in psychology illustrate that that only a few psychologists may have that power to name subjectivities and serve as gatekeepers or judges of objects worthy of study at any point in time (Diener et al., 2014; Haggbloom et al., 2002). However, this power tends to be held by mostly White male psychologists at certain institutions (Diener et al., 2014; Haggbloom et al., 2002). For instance, there were more male psychologists in both lists than there were female psychologists (Diener et al., 2014; Haggbloom et al., 2002). Again, Diener et al. (2014) found that most of the psychologists on their list work or worked at Harvard, Stanford, University of Pennsylvania, University of Michigan, and Yale. Besides, a majority of them were from the US, implying that English language was the means of conceptualization and dissemination of the ideas (Diener et al., 2014; Haggbloom et al., 2002; Ong & Ochoa, 2022; Tindle, 2021). However, there were no non-White psychologists (Diener et al., 2014; Haggbloom et al., 2002) and perhaps the same can be said about other categories of persons such as people of different sexual orientation and persons with disability. Thus, epistemic agency is ascribed to the White male psychologists and epistemic centre status assigned to their institutions and language (e.g., Oppong, 2019a; Yankah, 2012). However, one cannot blame them for their actions and consequences of their actions. This is because they must have a front to lead every discipline (Oppong, 2013).

When gatekeeping is viewed in terms of editorial control of the dissemination channels (journals or similar outlets), a pattern similar to the distribution of eminence appears. In addition to the fact that the power to name is located in a certain sub-population of individual scientists (White males), universities (Ivy league or top universities), and language of publication (English language), publication process also restricts this power to persons associated with institutions (universities and language). In fact, the gatekeeping is at its peak during this process. For instance, we know that women outnumber men in psychology, but women do not have the same power as men at the upper echelons of the discipline including editorial boards (Clay, 2017; Eagly & Miller, 2016). Recently, Palser et al. (2022) have shown that, among top 50 journals in psychology and neuroscience worldwide, 76% of psychology journals and 88% of neuroscience journals had over 50% of editors being male whereas only 20% and 10% of the psychology and neuroscience journals respectively, had about the same number of female editors as male editors. Again, they found that US-based academics outnumbered those from other regions as editors in both psychology and neuroscience journals (Palser et al., 2022). Power wielded by journal editors is so enormous that we determine what ideas get published or do not get published. For African authors, they are even instructed on the tone of language they can use, refusal of which can mean one's ideas are not published. As Yankah (2012) has indicated, the African scholar must be a good boy or girl to get published. And by good boy or girl, Yankah (2012) meant the African academic must be prepared to present his or her arguments in a manner that makes the editors comfortable.

In a study of Science Citation Index Expanded (SCIE, 1900–2015), Social Sciences Citation Index (SSCI, 1900–2015), and Arts and Humanities Citation

Index (A&HCI, 1975–2015), Liu (2017) reported that nearly 97% of the papers in SCIE, 95% in SSCI, and 73% in A&HCI were in English. This shows the dominance of the English language in the publication process or in naming things in the social and behavioural sciences including psychology. Besides, non-English speakers are often rejected at higher rates than native English authors and there is over-rejection of studies from samples from the majority of the world that have failed to replicate core psychological findings (Tindle, 2021). Even though it has been demonstrated that psychology research tends to neglect the majority of the world (Arnett, 2009; Thalmayer et al., 2021), it is more accurate to say that it does neglect not only the majority of the world in terms of research participants but also the publication process as well. Thus, the majority of the world is neglected in participating in the research process from mere participation as respondents to not being able to publish in non-English languages to being denied or denying themselves the right to name things in psychology.

Often, there are arguments that translation can be a solution to the language barrier. To this, Kurt Danziger, in an interview with Adrian C. Brook (1995), argued that:

Some kind of translation, of course, can be achieved but I (Kurt Danziger) think that one's grasp of the alien concepts remains quite tenuous and is not to be compared with the absolutely taken-for-granted character which the categories of one's own culture have. You need a paragraph perhaps to express something that you say with one word because you have to supply some of the connotations which these words have for us (p.12).

It is safe to say that the publication process tends to strip authors who are part of the disadvantaged majority off the power to name. The English language, being the dominant language of publication, also forces such authors to think in terms of a language without the taken-for-granted contexts and assumptions. This reduces the ability of non-native English authors to truly “speak” about things they wish to and remain authentic to the English language. There are some concepts and ideas that are not directly translatable into the English language from languages from the majority of the world. Thus, to be compelled to write in English forces one to not do justice to issues one writes about. There are cases of where non-native English speakers first think in their native languages before they translate into English, implying that some meanings are lost in the translation.”

Complicity of the less privileged

To begin this section, I ought to own up and openly communicate my positionality. I write this section of the paper as an African scholar and thinker educated in Africa; more specifically, I am located in Botswana, with a Ghanaian background, having lived in Liberia and travelled extensively through La Côte d'Ivoire as well as having interacted with some people from Eritrea, The Gambia,

Nigeria, Sierra Leone, Tanzania, Kenya, Malawi, Uganda, Zambia, Lesotho, Rwanda, Niger, Afghanistan, South Sudan, Cameroon, Tunisia, South Africa, and Eswatini. I acknowledge that this position in space and time and other areas of self-awareness may have a bearing on my outlook, biases, and/or worldview. Thus, there may be some missed opportunities (due to my positionality) to present a very nuanced discussion in this section that may be applicable to all AMWs in the same way.

Previous attempts to discuss the lack of power in knowledge production have been done from this through confrontation, consciousness raising, and challenging oppressive power (Ake 2012; Ndlovu-Gasheni, 2013; Nwoye, 2015). While it is important to decolonise institutions that perpetuate this uneven distribution of power in knowledge production, it is equally crucial to decolonise the minds of the marginalised. This is because their own actions and attitudes to contribute to their marginalisation. Thus, I contribute to the decolonisation scholarship from a different viewpoint that focuses on decolonising the minds of the marginalised to reject the subservient role they play in knowledge production and dissemination. To another way, I seek to address decolonisation at level of the individual researcher in the majority of the world rather than at the level of the institution. This is because it will take both changes in the institutions and behaviour of researchers to be able to gain and share the power to name among the underrepresented. Therefore, I approach the need to decolonise differently, and I adopt the perspective that AMWs are complicit in their marginalisation (Oppong, 2019a, 2022b). I generally maintain a position consistent the view that “when the coloniser is long gone, the once colonised are maintaining the exploitative systems by their own attitudes, cognitions, and actions, without realising it.” (Oppong, 2019a, p. 294). It also appears that many AMWs seem to possess a metacolonial cognition “a sense of self or self-knowledge among members of formerly colonised societies that represents the self as inferior, inherently dangerous, weak and less capable compared to members of the societies that perpetrated the colonisation or those who are like them.” (Oppong, 2022a, p.185). While it is true that institutional persistence generates metacolonialism through an application of de facto power (Oppong, 2022a) continues to impact metacolonial cognition, AMWs themselves continue to participate in this vicious cycle. Thus, the less dominant group in the Knowledge production are complicit to allow the conditions to prevail.

I have described epistemic agency as “the ability to engage in and to create for oneself systematic knowledge to meet one’s needs” (Oppong, 2017, p.9) and presented epistemic de-agency as the conceptual opposite of epistemic agency (Oppong, 2019a). In this regard, I argue that

it is not entirely the fault of the current bearers of the “truth” in psychology to deny the African part of the intellectual space to participate in the evolving discourse in the various subfields of psychology. Africans themselves continue to internalise and pass on such a state of mind to the next generation of Africans (Oppong, 2019a, p. 293).

The existence of metacolonial cognition together the internalization of the epistemic de-agency by the AMWs make the underrepresented complicit in this process of granting to the privileged few the power to name. In other words, one cannot blame the privileged few when the majority willingly accepts, condones, or expects the power to name by the privileged few. Without the willingness to accept, condone or acquiesce to one's marginalisation, it is very difficult for any person to have the power to subjugate another. It is, therefore, important to understand that the less privileged in the knowledge productions allows that to happen in the first place because they do nothing per se to correct the wrong.

How do the AMWs contribute to their marginalisation? First, many AMWs are too afraid to even try to name subjectivities in the discipline. They believe that they do not have any right or authority to do so. They deny themselves the epistemic agency to name things in the discipline of psychology. In other words, they are afraid to name things for fear of rejection. This fear of rejection often stems from a lack of understanding of the history of the discipline of psychology. There is often a misconception about what one needs to do to name things as many persons who name things in the discipline are often advocates of their own idea (Oppong, 2022b). Related to this fear is, sometimes, a genuine lack of competence on how to name things in the discipline. Many AMWs do not know how to start and from where to start even if there is a desire to partake in the process of naming subjectivities in the discipline. This lack of competence leaves them unwillingness to try. The technical know-how is critical as it builds one's confidence to want to name things. However, this assertion may not apply to every scholar in the underrepresented groups. For instance, researchers in places like Russia, Japan, China, South Korea have produced some of the latest innovations in research primarily in the natural sciences. The leading role Chinese scientists have played and continue to play in COVID-19 research is a case in point. In spite of this, one may argue that their innovations in natural sciences have been made possible because of the very existence of naming conventions that somewhat makes it possible to innovate and name the innovations. It is, however, difficult to spot the same trend from these countries in the social and behavioural sciences. It is important to note that, despite the innovations in the natural sciences, scholars from these countries are still underrepresented in both the natural and social sciences.

Similarly, AMWs are often imitative in their research (Yankak, 2012). Adair (1999) has argued that often the "first" psychologists in the colonial regions obtained their psychology education abroad and upon their return teach and study psychology in the manner in which they were taught by their psychology professors. Thus, you often see AMWs continuing in the line of research they were exposed to during their graduate studies in the West. Thus, the AMWs tend to use the same methodologies the learned to investigate the similar problems they learned. This leaves them to only collect data on established constructs to test existing theories in ways that do not advance the constructs nor the theories. Consistent with this, Yankah (2012) argues that African research is often to be too descriptive, data-driven and lacking theoretical or conceptual grounding. Thus, they collect on existing constructs and analyse

without much conceptual contribution to the discipline. However, the power to name goes to the people who contribute conceptually to the discipline. Perhaps, it is apt to say that African and other AMWs have resigned themselves to being standard-followers and learners instead of standard-creators and knowers (Oppong, 2019a; Ssentongo, 2020).

Sometimes, some AMWs defy all odds to name subjectivities. However, such “names” are rejected by both Western and AMWs. In the case of Africa, one tends to encounter the unwillingness to include African content in the psychology syllabi created and implemented by African psychologists for African students (Oppong, 2016, 2019a). While some believe there are no content of note for inclusion, others believe such contents are non-existent altogether (Oppong, 2019a). This implies that where there are even alternative African models or concepts, such ideas are never given the chance to germinate in the first place. While the instructors or lecturers may be comfortable with lack of local content in her or his instructions, the students who are the next generation psychologists have the right to know about these contents to further develop them.

Sharing the power to name with the privileged few

To share the power to name subjectivities in the discipline of psychology or any discipline with those who possess such power is not a call for a revolution. This is because there are no human groups on earth when presented with this power who will not take it. Thus, this idea of sharing the power is not to blame anyone nor to fight anyone. Those who wish for revolutions should consider the idea of creating their own ecosystem of higher education to compete with the extant higher education ecosystem as their solution. You cannot demand equality from people who created a system by engaging in a battle to wrestle power from their hands and place such power in yours. That will be replacement of one power with another with the same effect on those who once had the power. In other words, seeking to share the power to name things should be seen from the perspective of what the one who claims to be marginalized to do to occupy space through valuable contributions worthy of note. This does not mean that those with the power cannot be expected to do something, except I argue that such actions cannot be demanded nor forced on them. If we do not force equality among people of the same race in the face of the status hierarchy in such communities, then we cannot demand equality between races for the same reasons. If we deny one hierarchy and insist on the other, then we fail to apply our moral principles consistently. We must acknowledge differences in abilities and mindsets whether we believe people are naturally endowed or they benefit from their environment.

Having established context for sharing this power to name, I will turn my attention to discussing what can be done to share the power to name things. I shall present my discussion in the form of maxims. The first maxim is “No one will open doors for you if you do not open the door for yourself”. By this maxim,

I mean that the less privileged in this power to name should not waste time and effort to wait for an opportunity to make valuable contributions to the discipline of psychology. They need to use every opportunity available to them to make such contributions. Thus, they should not question their own ability to act when they should. It is understandable as many tend to use failed past attempts by people like themselves to just wish to wait for doors to be opened for them. However, such learned helplessness generates in them inertia that limits their capacity to act (Oppong, 2014). AMWs should understand that no one will hand them a golden spoon just because we seek to embrace social justice globally. They have a responsibility to embrace their own epistemic agency and create their own opportunities to make valuable contributions.

Related to the first is the maxim “Do not be too afraid or humble to speak”. People who wait for other to open the door for them are often afraid or too humble. I am not arguing intellectual humility as a concept. This is because academics need to recognise “that there are gaps in one’s knowledge and that one’s current beliefs might be incorrect.” (Porter et al., 2022, p.1). The humility I speak of is harmful and it is the kind that manifests in a low estimate of one’s importance. People who display such harmful forms of humility are less likely to speak until they are invited to, or they belittle what they have to say before they say them. On the hand, many AMWs are afraid to initiate an academic discourse; they often say to themselves “who are they to want to speak first?” Whether due to fear or harmful forms of humility (as discussed here), many AMWs are unable to or unwilling to speak. On a personal note, I remember asking a colleague to proofread a manuscript for me in 2012; this colleague provided feedback that I wrote like I am an authority on the topic. I also remember being accused of over-self-citation when I was writing on psychology in Ghana, a topic on which many people and I consider myself to be the best authority. This seems to show that many AMWs belittle themselves and show harmful forms of humility even in situations they are the best-known authorities (Oppong, 2013; Yankah, 2012). Thus, the AMWs need to heal themselves of this fear and harmful humility before they can participate in the intellectual space (Oppong, 2019a). This will not be done by anyone; it is an individual healing process and building one’s own capacity or competence.

Another maxim is “Be your own advocate”. Oftentimes, AMWs fail to cite themselves on issues over which they have the ultimate authority. Besides, they fail to teach concepts, theories, or ideas they have developed. They also fail to share during conferences things they have done themselves. It is important to note that no one owes anybody anything to advocate for one’s ideas. If people do, they do it out of the goodness of their heart, but it should not be expected nor demanded. No one exists solely to propagate someone’s ideas. It is important to understand that scholars who lead disciplines have intellectual humility, but they advocate for their own ideas. For instance, Singal (2021) recounted how Martin Seligman sold his positive psychology without substantial evidence to the US Army and got involved in rolling out PTSD-focused positive psychology interventions in the US Army. This implies that anyone who develops an idea or names something in most disciplines should be prepared to stand for themselves

and their idea, to market those ideas, so to speak. No one is obliged to do it for anyone for any reason. Thus, AMWs should be prepared to teach and share their ideas, theories, tools, and methods with others. It is only through disseminating their ideas that they may become mainstreamed. No matter how this argument here simplifies this complex issue, an idea that is not widely shared will never be known well enough to be accepted into the canon of any discipline.

Social influence exists and it can negatively influence a person. This echoes the maxim “Be mindful of social influence”. Thus, people around us can encourage or discourage us in our endeavours. In the case of AMWs wishing to have the power to name, they should be mindful of the people with whom they associate. Although it is not the only explanation, the dynamics at play when one gets exposed to negative social influence is similar to dynamics of Pull-him/her-down (PHD) syndrome. Oppong (2014, p.190) argues that PHD syndrome “is perpetuated by the older generation in order to minimize the tension they may experience if the younger generation succeeds where they could not”. This reflects “both conscious and unconscious attempts by members of a given social or cultural group to discourage and/or prevent its members rising to the top or outperforming them” (Oppong, 2014, p.190). Though I discussed the above quote in the context of intergeneration transmission of inertia, it equally applies when one is talking about peers as well. In other words, comments by people around AMWs can discourage them from trying or to even give up in the face of difficulties. I am not in way saying that this is specific to AMWs, but I argue here that because they lack this power to name, it is more likely going to have greater impact on their capacity to want to name things in the discipline of psychology.

Collaroy to the above maxim is “Do not be afraid of what people would say about you for being a nonconformist”. Societies in the majority of the world tend to have encourage conformity (Mead, 2019). Given the fact the power to name things in the discipline has existed outside the reach of AMWs, many have internalized that as natural and normal. Attempts to not conform to the state of mind of the majority is often seen as offensive or even punished (see Oppong, 2014; Ssentongo, 2020). Once you become a nonconformist, you are also seen as an outcast. However, one can understand this in terms of the dynamics of PHD syndrome as it makes those who may have failed where another has succeeded to appear incapable. On a personal note, I told by fellow Ghanaian academics to do serious research upon completion of my doctoral studies because my line of research did not align with theirs – the less conceptual and heavily empirical studies that do not make any valuable contribution to the discipline beyond providing another imitative data on a given topic (Oppong, 2019a; Yankah, 2012). Some even described me to others as intelligent but controversial and pompous. As an experienced scholar, Lamont (2019, p.34) advises young scholars to “keep in mind that what truly matters is not where you publish but what you publish: the work should be original, daring, stimulating. Otherwise, it is not worth doing... and it is unlikely to interest others. Doing exciting work opens all doors”. Her advice is equally relevant to many AMWs as well. Many of the AMWs have become obsessed with publishing in “designer” or “label”

journals or those indexed in Scopus or Web of Science in a way that is detrimental to making valuable contributions to the discipline. I do not in any way endorse publications in the so-called predatory journals but publishing in decent journals. This obsession is sometime legitimised by their institutional policies on appointment and promotion. No one encourages anyone to publish in predatory journals but when one focuses on making valuable contributions to the field, one will know and publish in places where the academic conversations are taking place.

The last maxim to be discussed is “Seek epistemological allyship from people who genuinely want to help you”. Everyone needs somebody at a point in time. This is true in social settings as it is in academic settings. I define epistemological allyship as the genuine assistance received in support of one’s epistemic agency. In other words, help received from people who want to help you because they see a gem in you. These people can be AMWs or Western academics who want to be your cheerleaders. These people tend to be established leaders in the field themselves and are willing to mentor young academics regardless of their demographic characteristics. When asked to recommend how to nurture African historians of psychology, I suggested that mentorship from established academics is a potential solution; this is because history of psychology is often pursued and taught by many African universities (Oppong, 2019b). This implies that many of the mentors will necessarily be Western academics, the people from whom many AMWs wish to wrestle power. On a personal note, I have benefited immensely from Robert Serpell as my best cheerleader in the discipline of psychology. Others who, unknown to them, also create a conducive environment for me to grow are Heidi Keller and Nandita Chaudhary. I also receive professional support from Paul R. Sachs and William Kwesi Senayah, a Ghanaian academic in the field of textile and garment production. Nandita and William show that support can come from sources from the majority of the world as well. However, these epistemological allies do not just appear on demand. They come to us through our own initial work. For instance, Robert Serpell found me through my critique on early childhood research and practice in Africa (Oppong, 2015). This is consistent with Lamont’s (2019, p.34) advice that doing “original, daring, stimulating...[and] exciting work opens all doors.”

Conclusion

In this paper, I sought to problematise the power to name and located it within a certain sub-population of individual scientists, institution, publication process, language of publication, and internalization of lack of the power to name among psychological scientists of AMWs. I contested that AMWs are complicit in this process of granting to the privileged few the power to name. In other words, one cannot blame the privileged few when the majority willingly accepts, condones, or expects the power to name by the privileged few. In order to share the power to name with the privileged few, I offer six maxims to assist AMWs to heal

themselves to share the intellectual space with the dominant others. These maxims are 1) no one will open doors for you if you do not open the door for yourself, 2) do not be too afraid or humble to speak, 3) be your own advocate, 4) be mindful of social influence, 5) do not be afraid of what people would say about you for being a nonconformist, and 6) seek epistemological allyship from people who genuinely want to help you. The arguments in this paper should be seen to be complementary to those that argue for structural or systemic changes to the higher education and publication ecosystem. I argue that people must be ready when systems have changed to accommodate their views. Thus, I argue that AMWs have a duty to prepare themselves to take advantage of system changes to share the power to name in the discipline of psychology. It should also be understood that the quest for intellectual space to name things in any discipline must not be adversarial and neither must it be approached with a zero-sum mindset. The intellectual space should rather be seen to be infinitely elastic – that it can be stretched or enlarged infinitely to create space for everyone to sit on it. Again, one cannot hope that a foreign army will willingly build your capacity to defeat it in a later battle. Thus, seeking epistemological allyship by AMWs should not be employed to create a sense of fear in those who offer such allyship. Thus, those who genuinely wish to offer a helping hand should not be made to be fearful so as not to want to help. This is because it becomes immoral to wish to replace one tyranny with another instead of enlarging the space for everyone to thrive.

He was also a Research Associate at Wits University in South Africa and the Secretary of the Pan African Psychology Union. He is best known for his work on history, critical, cultural, and indigenous/African psychology; epistemological violence; Anton W. Amo; and decolonising early child development in Africa. He passed away in February 2024.

Subjectivities and Subject Formation

Rethinking power and agency through the lens of intersubjectivity

Peter Busch-Jensen

Abstract

This article is about the phenomenon of power and its relationship to human agency. Power is a complex phenomenon. It can be both harmful and helpful; divisive and unifying; tangible or almost spherically relational. This article grapples with this complexity. Not as a problem to be fixed or simply a point worth repeating, but as a quality that needs to be explored, since it holds valuable contributions to our understanding of human agency and current challenges to it. On a foundational level, power pertains to agency, in the sense that power relates to a capacity for action that is also constitutive of agency. To explore the nature of power is therefore, to some extent, to explore the conditions of human agency. This seems particularly relevant today since our agency is threatened by a number of social crises: rapid climate change, and a diminishing trust in democracy, science, and the rule of law. In this article I relate these problems to insufficiencies in our understanding of the phenomenon of power, not least collective powers we have long relied upon when dealing with agentic challenges. Furthermore, I argue that psychology has a key role to play in this drama. Not because these problems are psychological by nature, but because they relate to a failure of psychology to relate human agency to social and political power in a sufficient way.

Keywords

power, agency, democracy, social critique, dialectics, critical social psychology

Power and its relation to agency

Power is usually related to questions of how people can achieve their goals, and how these goals can sometimes exist in competition, sometimes in concert. However, power is also at play in how we pursue and organize our everyday life and what space this leaves us to make, think, and re-imagine goals. There is, therefore, a chain from beliefs to actions (based on those beliefs), which ties knowledge, agency, and power together—a chain that can be forged in both beneficial and problematic ways, since knowledge is a resource that allows us to interpret our environment and, in the process, provides the scope with which we consider and imagine what actions are possible and advantageous. Power, understood as our ability to handle things and act in the world, therefore relates

to our knowledge in ways that require constant attention. This article focuses on our concepts of the phenomenon of power, their relationship to human agency, and how we understand its development and requirements.

Just 50 meters from where I live is a church, where the doors open twice a month for a climate change grief group. The group is a discussion forum where mostly young people come to share thoughts and feelings of despair, grief, and powerlessness. Contrary to traditional ideas of human problems, the frustrations expressed in this group are not caused by restrictions on what we know but rather result from knowing. Neither do they result from immediate restrictions on the group members' freedoms but rather from a failure to direct it or to exert some collective control over it.

Outside the church, a few are still pondering the potential aftereffects of COVID-19, which in yet another way revealed how expanded human powers are not simply a bridge to empowerment but also produce new vulnerabilities. Of course, COVID-19 is mainly a result of biology, but the pandemic was just as surely a disease of the Anthropocene: a result of man-made mobilities that have made virus containment almost impossible, briefly laying bare, in the process, concealed possibilities in our everyday life for a calmer, less hectic, and decelerated form of life, and limitations in the belief that free markets and competition grant us the power to handle anything.

A similar experience seems to roam in yet another pandemic: this one of mental health. A growing number of people with anxieties—maybe the anxieties of a relational being, who are invited, still more intensely, to celebrate meritocratic notions of self-efficiency, self-making, and “Everything is possible if you work hard” (Sandel, 2021, p. 41)—but nevertheless experience autonomy and self-care to be relational achievements riddled with coincidence and social interdependencies (Pols, 2015; Verkerk, 2007; Leget et al., 2011).

Along with several other challenges—e.g., our trust in science, democracy, and its institutions—these experiences point to urgent questions that do not simply stem from a lack of knowledge or immediate restrictions on our agency. Something less simple is at play. A sense of lack, maybe, not in what we know or do, but in alternative ways of knowing or acting. A feeling, perhaps, that we are expanding human powers in ways that somehow also threaten them. A bit, maybe, like how social media technologies were initially embraced for their democratizing potential, but now seem to threaten these very ideals while at the same becoming almost impossible not to use.

In a way, Karl Marx's now almost 200-year-old Communist Manifesto was one long expression of frustration with this paradox: a tribute, on the one hand, to capitalism and how it made visible the human ability to reshape the world and improve human living conditions; and on the other, a corresponding critique of capitalism's translation of this ability into an impersonal force embedded in a socially alienating society (Marx, 1848)

Power and our social imagination and differences

The disconnect between our unique human capacity to change the world and our limited control over it has, until recently, been framed almost exclusively as a political problem: a side-effect of a capitalist way of life, to which there is no alternative, but to embrace a demand for accumulation, deposit influence on production outside of democratic control, and leave social control to impersonal dynamics of competition. Because of the power of our imagination, we easily buy into shared fictions in our everyday life that portray social phenomena as more solid and natural than they really are. As in the fable of the emperor's new clothes, we tend to seek social confirmation and thus believe in the norms that others believe in. In this way, we reinforce the mental inertia that John Stuart Mill called "the deep slumber of decided opinion" (see Mulgan, 2022, p. 37). Marxists described this as "reification": what are in reality social constructs and relationships take on the appearance of natural facts of the world. The theory of false consciousness builds on this idea: we systematically adopt ideologies that can also ensure our own oppression, for example, by believing in the inevitability of markets or the infallibility of billionaire entrepreneurs. The problem with reification relates to its dimension of abstraction and concerns how forms of human life come to assume an independence from the human beings who have created them in the first place. This is the paradox of how human agency can be transformed into enslavement. The theory of false consciousness - although criticized for its implication that human beings are half-wits - remains all too plausible when it comes to our tendency to underestimate human agency and how much can change by use of collective effort. As a result, we tend to underestimate how we, as individuals, may in fact contribute to social transformation. This is one way ideas, for example about what we call power, can restrict us. As Foucault has elegantly explained, power also operates as an action upon our action, for example by how the way we interpret things effects the possibilities we are able to imagine.

Theoretical context

This article is not a typical study of power. It does not focus on specific forms of domination in society or ways in which some get power at the expense of others. Rather, the aim is to examine how our understanding of power impacts our sense of agency and engagement in the world. Therefore, the article is not solely a psychological study either, although I hope it can also shed some light on a question that perplex many students at my University, regarding the nature of critical psychology and how its mundane concepts relate to social critique and the study of social power (for more on Danish-German Critical Psychology, see Dreier, 2008; Holzkamp, 2013; Højholt & Schraube, 2015; Nissen, 2012; Motzkau & Schraube, 2014; Teo, 1999). This article aims to demonstrate how the study of power cannot be understood as only a domain for political science or

sociology. It also firmly belongs to psychology, just as psychological knowledge is indispensable for the study of power.

My starting point is a basic definition of power as a capacity for action, and of *social power* as about human possibilities and capacities for action. From this, I aim to present some further distinctions to examine a simple question: Can the problems discussed in the introduction be linked to an insufficient conception of the phenomenon of power?

At its core, power is related to agency, in that it represents a capacity for action that is also constitutive of agency. However, given the diverse cultural, social, and political characteristics of human agency, power can manifest in different ways and take on various forms, even to the extent that social power does not have a singular normative or ontological quality. To discuss this complexity, I differentiate between power as *power-to*; *power-over*, and *power-with*. The first two concepts are probably familiar terms (Boonstra, 2016; Wartenberg, 1990; Haugaard, 2013, 2015, 2018; Nesbit & Wilson, 2003; Pratto, 2016), while the latter term, *power-with*, is maybe less so and one I will explore further in the article. All three concepts highlight important aspect of social reality. However, as I hope to show, no analysis of just one of them, provides a comprehensive understanding of power in social life.

Numerous authors have delved into the phenomenon of power and its various aspects such as politics, law, knowledge, organization, and everyday life. My argumentation draws on several of them. That said, much critical research about power discusses power mainly in terms of its operational qualities and consequences. An explanatory analysis of what power refer to, is much more rarely undertaken. Neither is an explanatory analysis of the mechanisms by which social power not only relates to domination, but also to creation and empowerment, that might challenge domination. As a result, many students struggle to get a tangible sense of what to look for, when trying to analyze power. Although some statements might be familiar, such as late-modern bullet points about power being diffuse rather than concentrated, enacted rather than possessed, productive rather than purely coercive, and constitutive of agency instead of merely being deployed by human agents, their significance is sometimes difficult to fully understand. In this article, I therefore also aim to clarify the meaning behind these statements and their importance beyond academic pursuits. Along the way, I introduce terminology that draws from Foucault's ideas but also aims to challenge them by relating power more closely to human agency and our capacities for social action and participation. This brings the discussion closer to what I would call a dialectical approach to power. Of course, the term “dialectical” is not very helpful either, as it has worked its way through twenty-five centuries of interpretations that range from logical argumentation to philosophical and political concepts of evolution applied to fields of thought, nature, and history. Here, I simply use the term to signal that I am exploring power in a manner inspired by the Hegel-Marx tradition of dialectical thought (drawing also on Cultural-Historical Psychology, Activity Theory, and German/Danish Critical Psychology).

In dialectical thought transformation can mean many things, including the interpenetration of opposites, or even ‘the negation of negation’. However, at its core, dialectics is a way of thinking that grasps tensions and contradictions, not as something to wish away, but as a core quality of all identity and change. To think dialectically about social reality and power requires understanding things as not just what can be immediately observed, but also as potentiality: a manifestation of the past, made real by the present, that is also a seed and a precursor to the future. Thus, a dialectical study starts from the notion that the conflation of social reality with what is immediately observable is an abstraction, that needs to be challenged.

The article is structured in three parts. The first part elaborates on the broader relevance of the topic and demonstrates how the need for critical thinking about power goes beyond science. I aim to show how our understanding of power also defines our understanding of scientific rationality, which in turn affects our ability to handle social problems through democratic, agentic means. The second part highlights that our concepts of power are often vague, leading to fragmented critical thinking. This section consists of two parts. The first focuses on traditional views of power and critiques their inadequacy. It argues against three common misconceptions and structures the argument around each one. The second part investigates the complexity of the concept of power on a theoretical level. It explains why it is difficult to define power once and for all and discusses why power cannot be attributed any clear normative provision, but take different forms that must be distinguished and connected to each other. The third part discusses the methodological and theoretical consequences of the previous explorations and how they spill into broader questions of human agency, social life, and democracy, hopefully in a way that also provides some helpful ideas about how we might understand and address current political challenges.

Rationality as an example of how social power never transcends inter-subjectivity

A key idea within democracy is that, ideally, when people meet in public discourse, matters of social privileges and status are suspended so that a discussion among equals can take place. The notion of ‘equals’ simply refers to an idea of ‘membership in a universal humanity’: a universal human ability to contribute iniquely to the commons based on a universal capacity for rationality, inscribed in the event of political participation and further refined in the practices of science. Since the reference to rationality ideally removes the importance of social particulars (the participant’s title, gender, surname, status, station, wealth, or position etc.) from the social equation of legitimacy and membership, the notion of rationality has historically paved the way for a novel universalism and ongoing processes of social inclusion.

In democratic societies, social life is defined by inter-subjectivity, that is, by a certain level of reciprocity, which obligates us to treat and understand other people not as objects, but as subjects. The notion of citizenship, in fact, requires

this; it requires that all members are seen as possessors of agentic powers—the authority to author their own life—and therefore as ends in themselves. Our belief in this authority was originally thought to spring from logic and have a transcendental moral foundation (as suggested by Kant). However, it should rather be understood as an achievement of democratic social struggles and practices (Honneth, 1995).

Therefore, we are looking at a particular cultural formation, which, as such, maps out not only specific possibilities but also its own potentials for exclusion and self-destruction. Potentials for self-destruction, because the functioning of and access to this authority are never more ‘universal’ than our collective support for its norms and institutions allows them to be. Potentials for exclusion, because what is accepted as a legitimate form of participation and contribution still derives its legitimacy from a particular social distinction. No longer between, on the one hand, people’s social station, position, ethnicity, and gender, and on the other, their right to participate in public discourse, but now between the degrees of conformity to the paradigm of reason we inscribe in the event of being recognized as a legitimate member of rationality. Rationality, including scientific rationality, refers not only to individual capacities but also to collective capacities. The agentic powers that rationality makes possible are therefore about more than just freedoms from social norms and rules; they also require freedoms *provided* by such norms and rules, upheld by people abiding by them. This trivial observation invites two questions regarding our current crisis of rationality.

First, since what we understand by ‘rationality’ turns out to matter quite a bit for who we recognize as a legitimate participant in society, we need to ask how we define rationality and if our definitions are in fact as inclusive as we imagine. Secondly, since rationality is not simply granted by logic but also results from social life, we need to ask what forms of social life our notions of rationality and science are preconditioned by. Do they refer to a use of specific methodologies, procedures, and principles that are oriented towards objectivity and truth, or do they rather spring from messy social processes that generate collective support and engagement by means of reflexivity, transparency, and involvement in honest disclosure of interests and the contextual dimensions of knowledge?

Currently, the preferred public and political answer to this question seems to be the former: ‘specific methodologies and procedures oriented towards truth and objectivity.’ Politically, we see a systematic de-prioritization and underfunding of the humanities, while public discourse is permeated by an increasingly unambiguous fascination with STEM-based knowledge as the answer to all present and future challenges. Mark Zuckerberg demonstrated how intoxicated public opinion has become with this narrative when a few years ago, he was admired for explaining to the world how he would use machine learning to create “the clearest model of everything there is to know about the world” (quoted from Madsbjerg, 2017, p. 9). Faced with a new public sphere of social media (SoMe), which seems to threaten to destroy intellectual debate altogether, it is not difficult to understand why many consider it a bad idea to challenge or even debate public ideals of objectivity, truth, and rationality. Predictably, we

have therefore seen a revival of arguments for science that builds on what Hamilton (2013) terms the 'information deficit' model of classical science: the argument that 'people act irrationally because their knowledge is deficient' (Hamilton, 2013). However, as Hamilton continues to explain, this argument is inherently polarizing and therefore rather part of the problem than the solution. More importantly, it also ignores how 'facts have proven to be no match against deeply held values, the values embedded in personal identity' (as recognized also by more traditional psychologists, see e.g., Haidt, 2012; Kahneman, 2011). In other words, if we fail to understand rationality as something that isn't simply a question of methods and logic, but also of social practices, institutions, and forms of life, we might lose what we call rationality.

Donald Trump's refusal to accept the truth of his loss of the presidency in the 2020 US election might invite us to relate current threats to democracy to an eroding ability to distinguish what is true from what is false and respond to this threat by throwing more facts and truths on the table. What is missing from this reaction, however, is the recognition that Trump not only exemplifies how speaking power to truth can be just as efficient, which doesn't mean, of course, that science should therefore do the same. What it does mean, however, is that science does not start with 'knowing' or 'truth'. It starts with people finding knowing and truth relevant. That is, it starts and ends with a shared commitment to question what we know and seek its qualification. Throwing more 'facts' at this problem is therefore not very helpful since it is not about facts, but about commitment and our social life in common. The failure to understand this adds up to a failure to understand adequately the 'rationality' within modern society and our crisis of science and democracy.

The disassociation of the general from the particular

Perhaps in an attempt to counter a growing anti-scientific sentiment, many journalists, politicians, and even scientists insist on a rationality untouched by particulars and inter-subjective hermeneutics. 'These are the facts. Period!' As a result, current public debate makes social collaboration and understanding even more difficult while at the same time denying a relationship between this public use of 'reason' and social domination and division. I believe the current crisis of science and democracy is founded on this radical dissociation of the general from the particular, to the effect that, as Terry Eagleton put it: "when this dissociation becomes less plausible, (...) the public sphere will begin to crumble" (Eagleton, 1984, p. 17). If science and democracy are in fact not things we have but inter-subjective processes we share, it makes little sense to conceptualize these institutions as phenomena that transcend the relationships they in fact result from. This is precisely why democracy and science require other criteria of legitimacy than 'truth' and 'objectivity.'

The core of scientific rationality is not the reasonableness of knowledge itself but the reasonableness of social events and action; the reasonableness of 'the other.' It is the recognition of knowledge's relevance for and by 'the other'

that is crucial to the functioning of rationality since, without it, human rationality is quite helpless. As argued by Clegg, “self-regarding behavior in the absence of the recognition of the other and by others is of no value in itself” (Clegg et al., 2014, p. 29). “On these criteria, it is not the alleged ‘disinterestedness’ of a position that makes it worthwhile, but the degree of reflexivity that it exhibits in relation to the conditions of its own existence” (Hardy & Clegg, 1996, p. 701).

As simplified empiricist ideals of knowledge have traversed from the natural sciences into not only the social and human sciences but also into public discourse and politics, an alliance between science and politics has been forged that at first seems to offer a non-partisan alternative to moral and ideological disagreement. But disagreement is not a political problem; it is what constitutes politics. Therefore, to govern a democratic society first and foremost requires contending with disagreement, which again requires a deep understanding of how to disagree and why disagreements arise. The assumption that the source of political disagreement is a lack of information spurs the belief that political problems can be solved by inviting experts to enlighten the masses. But this belief is not oriented towards democracy. Rather, it leads towards a technocracy, where an elite of ‘experts’ (the well-educated and successful) eventually govern the rest.

We need to consider the possibility that current dysfunctions in our commitment to social conversation, science, and democracy are not caused by a lack of ‘rationality’ but rather by serious deficiencies in our conceptions of ‘rationality.’ Modernity relies on rationality as the main means for making democracy work. However, as discussed by Taylor (1971) and Flyvbjerg (1998): if we fail to understand that the interrelations between rationality and power are not as clear-cut as we tend to imagine, we end up with a notion of rationality that leaves democracy ignorant of how rationality and power work together, and therefore “open to being dominated by power, rather than rationality” (Flyvbjerg, 1998, p. 231). Given the challenges of our time – environmental, social, cultural, political – this is a problem we need to confront. A first step is to understand how power relates to human rationality and agency. When we examine this, we see that we cannot rely on a notion of rationality that abstracts away from the particulars of social problems, just as we cannot rely on a notion of competition as the primary source of human power or a notion of democracy that focuses mainly on representational democracy.

The concept of power

Power and its relationship to agency is a complicated matter. Our concepts of power are disputed, and not only in a grammatical sense of an unclear use of the term. There is not much agreement either on whether power is a positive (Arendt, 1970) or a negative (Althusser, 1971) phenomenon; on whether questions of power are best addressed empirically (Dahl, 1969; Latour, 2005, 2010) or theoretically (Marx, 1848; Foucault, 1984; Boltanski & Chiapello, 2005); and on whether power is a form of violence (Marx, 1848; Bourdieu, 1984) or if violence

is rather an expression of powerlessness (Follett, 1940; Arendt, 1970; Foucault, 1980).

While many critical approaches generally agree on rejecting the in-built atomism, individualism, and universalism of positivist and behaviorist methodology and conceptions of power, and while they also tend to agree on more hermeneutic and/or constructivist understandings of human relationships, consensus quickly fragments into heterogeneity as soon as the discussion moves on to questions of how to study power and, by extension, what ‘being critical’ entails (Ibáñez, 1997). Thus, instead of encountering a strong tradition of critical social psychologies, students find themselves on a stormy sea of disputes about realism versus relativism, humanist ideals versus post-human epistemologies, the ontological status of cultural symbols versus the material world, and the purpose and value of science itself.

As Spears phrases it, “This heterogeneity in itself is a refreshing sign in life to be contrasted with much of the mainstream, where meta-theoretical debates about method, theory, epistemology and ontology have long since been forgotten or repressed” (Spears, 1997, p. 1). I agree. However, if our agreement to disagree translates into fragmentation, it might pose a problem. It is in this context that we need to revisit our concepts of power. Not to provide a consensus about how to define power, but to better understand the problems of defining it. To do so, I argue below for an approach to power that invites us to think of power as grounded, on a foundational level, in reciprocal entanglements of highly different qualities. The term ‘foundation’ points to a ‘solid base of a structure’, usually situated below the ground. It is an unseen structure that helps support the weight of something—a building—or, in this case, a particular theoretical fabric into which other pieces can then be sewn. Foundations are typically unnoticed in everyday functioning since they are regarded as so basic that the way they anchor things also makes them hard to see (Clegg & Cunha, 2019). It is in this way that I will try to unearth the phenomenon of power as grounded in an unnoticed realm of intersubjective and socio-cultural reciprocity and collaboration. If we do not understand the foundation of human agency and power, we cannot secure its continued support and development.

A few words about my position

A dialectical understanding of power invites us to think of power as relational and to examine the material and social-cultural relationships from which social and agentic power emerge. This is relevant because a common denominator in current social, political, and ecological crises seems to pertain to overlooked contributions to our way of life, not only from the communities, we are part of, but also from nature, history, our shared institutions and far-away people and places.

A dialectical conception of power puts a series of social phenomena into a new light. For example, conflict – often viewed as a dangerous outcome of power struggles – can here be seen also as a means of creating groups and novel

resources for collective capacities for action. In general, a connection is engendered which does not divorce psychology from its worldliness, does not divorce the individual from the social and does not divorce social power from the relations its effects.

To see power as a property of relationships, rather than individual agents, is not new (see e.g. Fiske & Berdahl, 2007; Hogg, 2001; Pratto, 2016). Nor, however, is it uncontested. The social psychologist Felicia Pratto, for example, critiques relational understandings of power because they do not allow a measurement of individual powers unless they have a relationship (Pratto, 2016). The premise for Pratto's and many others critiques of relational understandings of power is that we should also be able to measure power and compare 'who has more' of it without necessarily referring to the relationship among subjects. In short, in order to be properly defined, power needs to have a quality that allows acontextual measurement and singular ownership. Yet in order to relate power to agency, we first need to ask how subjects are constituted in the first place since, if we ignore this question, we actually miss out on where most of the action relating to power takes place (Reicher, 2016). Furthermore, the relevance of studying power does not derive from questions of who has more or less of it. It derives from a need to understand better how to change and better people's lives, opportunities, and social coexistence.

Since there is no social world in which relationality is not crucial to human agency and self-enactment, a scientific approach to power should engage social life, not separate itself from it. Socio-material relations are not 'one factor' amongst many others that impact human agency. Rather, they are the medium in which 'factors' as such emerge. Insisting on a relational approach to human psychology is therefore not simply to place oneself in a certain corner of a theoretical map, but a way of pointing out what is necessary to study, if we want to understand human agency and social power.

Three traditional misconceptions of power

Rather than discuss power in all its forms, I wish to focus on forms of power that, resulting from human activity, belong to the realm of the social. I will begin by connecting the relational nature of social power to three misconceptions in traditional conceptualizations of power and discuss along the way the blind spots they leave us with, which we need to pay more attention to. These critiques are not new. They build on known critiques of empiricist notions of epistemology, subjectivity and science. I repeat them simply to clarify something that, while familiar, easily drifts into a misty fog in which power is not a thing but rather everywhere and nowhere in particular. I hope to clear away some of this fog.

First, power is often conceptualized within a realist empiricist ontology, which views it as either a possession or an effect of individual abilities (the will, wants, talents, interests and intentions of individuals or groups) or human-made constructs (laws, credentials, money etc.). As a result, power (as demonstrated by Pratto) tends to be understood and examined as something that some may or may

not possess in some measurable quantities, and that can be described and measured independently of its context and lived social reality. We observe this line of thinking reflected in everyday notions like “Once alcohol has you in its power, it’s difficult to stop drinking”, or in power-studies that identify the most influential people in society (often inspired by C. Wright Mill, 1956).

A well-described, albeit basic, issue with this conception is that it overlooks how individual abilities and capacities for action are always intertwined with situational dimensions. For instance, people’s possibilities, wants, interests, and intentions are shaped and transformed (in enabling and restrictive ways) by their understanding of the situation and how others perceive it. A non-relational ontology prompts us to interpret people’s actions, wants, and needs as simply reflections of personal traits, needs, or capabilities. This occurs when, for example, problems such as growing obesity are reduced to issues of individual willpower or biology, which can supposedly be understood and addressed independently of wider socio-cultural dynamics.

Second, power *relations* are usually depicted as a dyad between person A and person B, as exemplified by the political scientist Robert A. Dahl’s frequently cited definition of power: “*A has power over B to the extent that he can get B to do something that B would not otherwise do.*” (Dahl 1969, p. 80). Here, power relations are perceived as fundamentally dyadic, with a hierarchical structure between distinct entities - a relationship between one who dominates (a person or group) and one who is dominated. This dyadic model of power, as described by Wartenberg (1990), leads us to conceptualize power as a zero-sum game, thus overlooking the potential for social power relations to be mutually beneficial and plus-sum additive. Moreover, it discourages us from recognizing the dynamic nature of power relations, and how power relations could also have emergent qualities that can lead to significant transformations, as they frequently involve collaboration. To disregard this aspect of power is to overlook not only how adopting the position of a victim can also be a strategic exertion of power, and how individuals who were formerly oppressed may sometimes wield power, but also to overlook how we can effectively work to alter power relations. It’s crucial to remember that domination, hierarchy, and asymmetry are not inherently problematic, as power is not always a zero-sum game. Even instances of social domination may be driven by intentions to empower the non-dominant party, thus potentially resulting in transformative outcomes (Wartenberg, 1990), aimed at dissolving the power imbalance itself. This aspect is pivotal in various relationships, such as those between parents and children, doctors and patients, and teachers and students.

Third, in the quest for acceptance as a legitimate and scientific concept, power is often construed as empirically tangible and observable. Robert Dahl’s attempt to define power serves as a prime example of this approach. His endeavor involved critiquing prior definitions that he deemed unscientific, primarily because they did not align sufficiently with a behaviorist framework. As Dahl contends, “The behaviorist approach is an attempt to improve our understanding of politics by seeking to explain the empirical aspects of political life through methods, theories, and criteria of proof that are acceptable according

to the canons, conventions, and assumptions of modern empirical science” (Dahl, 1961, p. 767). Dahl's renowned definition necessitates that all operational facets of social power be observable (Wartenberg, 1990, pp. 56-57). Consequently, any instance of social power lacking such empirical grounding is either disregarded or dismissed. However, this model overlooks the fact that *keeping* certain actions from occurring (such as resistance, critique, or complaint) can often be an outcome of social power. Hence, the model fails to acknowledge the intricate structural forms that power can assume in everyday life, thereby hindering a clear conceptualization of how power relations actually operate (Foucault, 1980, 1982). According to a strictly empiricist notion of power, the power dynamics within, for instance, academic grading practices are perceived to stem solely from the actions of teachers and students. Consequently, they are also regarded as the parties capable of changing them. However, this perspective overlooks the interconnectedness and alignment of grading practices with various other practices, such as securing employment, forming relationships, attaining social status, or satisfying parental expectations. These ‘alignments’ significantly shape the perceptions of teachers and students and constrain their potential responses. To ignore this, not only fosters unrealistic expectations among students and teachers but also creates an artificial conceptual gap between human interactions and their broader socio-historical context.

Summary discussion

Earlier, I discussed various insufficiencies in our everyday notions of power, many of which stem from a general familiarity with empiricist notions of reality. I point out problems with this framework and argue that it leads us to overlook important dimensions of the worldliness and intersubjectivity of power dynamics. To underscore the main issue at stake in my own terms, we should note what is systematically placed outside our field of vision: namely, that social life exhibits emergent properties that render power relations productive in ways that traditional empiricist ontologies and cause-and-effect logic fail to capture. One of Michel Foucault's many contributions is to highlight this aspect by conceptualizing power not just as a form of action upon actions ("conduire des conduites"), but more precisely as the way in which actions condition the possibilities of other actions (Foucault, 1982, 1984). While empiricist notions of power attempt to safeguard the authority of knowledge by removing it from a hermeneutical circle of intersubjectivity, Foucault's work demonstrates the futility of this ambition by revealing it as itself a hermeneutical maneuver.

The attempt to argue for a domain of knowledge that functions independently of intersubjective processes of interpretation and meaning creates blind spots in empiricist scientific rationality that also affect our political thinking about human agency, social reality, power, and problems. To fulfill its requirements, the empiricist tradition reconstructs social reality as consisting solely of brute data. The idea of an intersubjective reality that might contradict this data-reality is wholly opaque to this epistemology (as explained in more

detail by Taylor (1971). Therefore, very little room is left to consider the possibility, for example, that “the power men have over women might not simply be constituted by the actions of particular men, women, or institutions, but that power could also manifest in a greater difficulty for a woman in making her fellow workers stand up for her in a conflict, or in differences in the ways we spontaneously interpret the likelihood of success for some people (women, ethnic minorities, people of color, or specific sexual orientations) in comparison to how we interpret it for others” (Wartenberg, 1990, p. 150).

Human activity weaves activities together into clusters of social practices that, through different forms of alignment and coordination, produce wider structural dimensions in social life (Wartenberg, 1990). In fact, this is one way we can understand power as productive, but also why power relations can sometimes seem difficult to change. Precisely because social alignments are ‘productive’ and provide opportunities and stability in social life, they also offer the benefits and rationale through which they are sometimes defended and reproduced. As when defenders of slavery in America argued how ending slavery would have a devastating economic impact, since reliance on slave labor was the foundation of the economy. Power also relates to human preferences. However, human preferences are complicated because they are adaptive; they respond to social circumstances. If society puts certain things out of reach for some people, they typically learn not to desire those things. This observation, made famous by Jon Elster in his book *Sour Grapes* (Elster, 1983), points to a significant difficulty in critical power studies: processes like exploitation and marginalization can be internalized to such an extent that they are perceived as natural and defensible. A worker brought up on images that equate ‘being skilled’ with someone who heroically suffers and does what he is told might not necessarily develop an appetite for workplace democracy, just as a woman, raised to find ‘proper’ femininity incompatible with work outside the home, might never develop an appetite for formal education. Since power relations have emergent properties that also make them productive, we tend to sometimes defend them even when we should perhaps try to change them.

Getting to active human agency

The fact that power relations take numerous forms illuminates a multitude of social engagements and reasons that motivate people to engage in them. For example, a student might participate in grading practices for educational, vocational, romantic, or social reasons, which pertain to relations that can simultaneously be exploitative, empowering, positional, or affiliative (See Pratto, 2016), as well as oriented towards both general and specific ‘orientational guidelines’ (See Marvakis, 2024). They are general because, as just mentioned, in the process of social development, more generalized action-environments also emerge from social coordination and alignment, which then serve as guides for individual orientation. This may take the form of career counseling, as well as institutions in a more common sense, or generalized discourses about expected

preferences and choices in life. They are specific because the variety and complexity of social alignments and connectivity necessitate subjective orientation and evaluation. Questions such as 'But what forms of social participation are relevant to *me*?' and 'Do grades actually matter to *me* and people important to *me*?'.

Since we participate in power relations not only for general but also for personal reasons, we cannot fully understand or study social power if we simply take the individual subject and its preferences and goals for granted, or reduce them to mere reflections of structural forces. Rather, we need to examine how such goals and preferences come about, how they might vary, conflict, and change, since human agency does not simply exist but emerges precisely from a parallel formation and co-production of the societal and the subjective. Therefore, the way and extent to which these dimensions overlap, collide, create friction, and change actually constitute the core of the productive relationship of social power relations. Studying social power without including a situated interest in people's first-person perspectives, and their social engagements and activities, is therefore just as problematic as providing a decontextualized report of people's preferences.

A dialectical concept of power

One word for different phenomena

Bertrand Russell once wrote that "the fundamental concept in social science is Power, in the same sense in which Energy is the fundamental concept in physics" (Russell, 1938, p. 10). In other words, Russell describes what we might term *force* or *energy* as power's primordial form, since power, at its most general level, describes a capacity for making something happen, which, in a sense, is fundamental to any sense of agency, human or non-human. When an agent of any sort makes a difference in the world, this agent manifests *power*, as in: a *power to* do something, to be a causal agent. This *power-to* definition precedes *power-over* relations, and refers to the simple fact that anything can be a force in the world if it brings something new—a change—into existence. This meaning is also reflected in our everyday language when we, for example, talk about 'solar power' or 'power cables' or 'the power of positive thinking'. Yet a different definition of power has become dominant within the social sciences and the humanities, namely an understanding of power as *power-over*; as a relational aspect of social life that poses questions of social justice and equality, and points to problems of polarization, exploitation, and marginalization. In lexical descriptions we therefore encounter at least two overarching definitions of power: one describes power as 'power-to', the other describes power as 'power-over' (Pansardi, 2012, Wartenberg, 1990; Haugaard, 2015).

At first glance, the difference between these definitions seems mainly one of hierarchy since power-over can be understood as a subset of power-to: some people's power-to do things is exercised by getting others to do them for them.

Nevertheless, the difference is greater, since it also marks a qualitative shift. In the first definition, we are talking about a potential for 'power' and 'action,' which makes us think of power as a resource, an ability, skill, or a kind of capital a person might have. In the second sense, however, we are talking about a relationship; a realization of power as constituting a relational effect. This duality, if not addressed, can result in unnecessary disagreements. As Wartenberg phrases it: "By acknowledging the fact that theories of power-to and power-over conceptualize different, though related, aspects of society, we see that these theories do not necessarily compete, as they would if power were an *essentially* contested concept." (Wartenberg, 1990, p. 31).

To take a recent example: When the first reports of local cases of COVID-19 (accompanied by images of scary scenes from Spanish hospitals) began emerging in the Danish media in 2020, the Danish public quickly and frantically began clamoring for scientific knowledge and political action. New regulations governing social behavior were announced, and in short order, public support for them mobilized on an unprecedented scale. First came face masks and social distancing, then closed theaters, restaurants, and bars, and later, of course, vaccinations. In close collaboration with doctors, public health officials, and other experts, the Danish government worked hard to establish a culture of social behaviors and expectations, which soon created an environment of intense self-disciplinary action and social monitoring. In no time, expectations of regular testing, self-quarantine, and support for full-scale vaccination programs became the norm.

These events, on the one hand, demonstrate a development of power-to: society as a whole handled a serious social problem through a collective ability to adapt and respond, which in itself is a positive thing. On the other hand, the development of this resource at the same time fits like a hand in glove with what can be described as a late-modern form of governmentality. It demonstrates an expansion of power-over: an increased political domination achieved through the disciplinary techniques of a well-oiled assemblage of knowledge-power strategies. In effect, the pandemic in Denmark constitutes a dual process: it developed a collective power-to (in the sense of 'being able to') handle a serious problem, while simultaneously expanding the political sphere's power-over and domination. We cannot determine, once and for all, how power is at play in these developments, since both interpretations are somehow valid. Therefore, the difference between them easily translates into a disagreement about how to understand our shared reality, even though the differing interpretations actually refer to an indeterminacy in the subject matter—namely, that the word power does not point to just one thing, but to a phenomenon that folds two dimensions of social life together. As 'substance,' power is a capacity to do, and as such, relates to questions of resources (skills, abilities, capital, etc.) and empowerment. As process, power is a relation and as such refers to questions of how we distribute and organize resources in our life-in-common; to questions of social dominance and justice, and empowerment for whom. We can ignore this duality and choose to focus solely on people's development of a collective capacity for action, and be puzzled by how something we think we should celebrate (the

empowerment of people through collective effort) can pose a problem for some critics. Likewise, we might focus solely on power-over relations and be puzzled by how people consciously and willingly participate in their own exploitation and domination.

But power is both of these dimensions. We develop resources and capacities for action, by applying them in *social* practices, that are organized around and thus contribute to develop and reproduce both: collective capacities as well as *power-over* relations: processes of social collaboration, selection, hierarchy, and inequality (Bourdieu, 1984; Honneth, 1995; Sandel, 2022). Therefore, no analysis of just one of these dimensions provide us with a comprehensive understanding of how power is at play in social life. Instead, the duality of power brings attention to social power as constituted in reciprocal dialectical relations between the individual and the societal.

In *The Forms of Power*, Thomas Wartenberg (1990) unfolds the history of the Western European concept of power. I wish to draw attention to a particular aspect of his account: the historical shift from a dialectical understanding of power to a dualistic understanding of power as measurable force embedded in cause-and-effect relations.

Plato defined power in the following way: "I suggest that anything has real being, that is so constituted as to possess any sort of power (*dynamis*) either to effect anything else or to be effected" (Plato, 1961, p. 992, in Wartenberg, 1990, p. 20). This definition, like Russell's, describes power as an ability to become a causal agent by enabling something to come into existence. However, Plato relates this 'power' to two separate but inseparable dimensions: one of qualities, which could allow something to happen, and one of reciprocal relations between such qualities, that allow them manifest. Since power is both a power to 'effect' or 'be effected', and one cannot manifest without the other, power takes the form both of *potentials* "either to effect anything else or to be effected" and of realization. Plato insisted on this duality, since any *manifestation* of power requires an encounter *between* capacities. Therefore, power is always *interactional* and capacities merely *potentials* until activated in some interactional form. To affect the world, we must engage the world just as it must engage with us. Otherwise, no effect, can be recorded. On the other hand, no change or effect is possible either, without its necessary potentials. The term *power* is therefore both a word for separate *potentials* (for agency) and a word for *realization* of relationships (between agency). The essence of power is thus described as double-sided: Power is a dialectical relationship between separate capacities and reciprocal relationships, with both cause and affect each other. As such, power, does not have a singular form, but constitutes a dialectical formation with emergent properties. Furthermore - and this is important - no agentic power is stronger than what is afforded by the foundational realm of relationships, that constitutes its actualization.

With the advent and success of a modern science, and its celebrated triumphs of physics and mathematics, the messy business of dialectic ontology

has long gone been re-arranged in more “appropriate” mechanistic terms¹. Also, the idea that power is a reciprocal phenomenon might seem counterintuitive. If someone hits me or a strong wind blows me over, it is difficult to see the reciprocity: exactly what ‘capacities for agency’ am I contributing to this situation?

Obviously, social life also confronts subject-object relations of power. Hannah Arendt’s distinction between power and violence confront this observation. Political power, she argues, relates to relations among *subjects*. Violence and coercion are therefore not power but refer to a lack thereof; precisely because brute force and coercion abolish the social world of intersubjectivity. According to Arendt, the frustrated father who forces his protesting child into the car seat operates in the same way as the wind. He acts not with power, but out of *powerlessness*, and therefore, for a moment, dissolves their shared social world by placing his child in a world of objects with no room for agency.

In democratic societies social life is defined by inter-subjectivity, that is: by a certain level of reciprocity, which obligates us to understand and treat other people not as objects, but as subjects. The notion of citizenship rests on this point; no citizen is seen as an object, but as the author of their own life, an end in themselves. We can discuss if this authority, as suggested by Kant, constitute the foundation of all moral systems. We don’t need to discuss if its social manifestation is primarily an achievement of collective social struggles and intersubjective practices and relationships (Honneth, 1995). Certainly, brute force, violence and coercion still exist, but not as useful forms of *social* power. Simply because the potential for being a human *subject*, cannot manifest in subject-object relations (As also explained by Hegel, 1969).²

¹ This development can be observed for example in the movement from Hobbes’s interpretation of power as “[a person’s] present means to obtain some future apparent Good” (Hobbes, 1985 [1641]: 150), to Bertrand Russell’s definition of power as “the ability to produce intended effects” (Russell, 1938: 35). Due to a preoccupation with autonomy, formulated not least by liberalist thinkers, we see a shift in focus from a focus on reciprocity to a focus on singular causal agency. John Locke (1632-1704), for example, spoke of power in somewhat similar terms as Plato, when, in *Essay Concerning Human Understanding*, he maintained that power was an ability both to influence the world and to be influenced (Locke, 1959: vol 2, Cp 7). However, Locke described the relational dimensions of power as a meeting between an *active* and a *passive* form, and thereby paved the way for a shift towards a cause-and-effect approach to power. As soon as attention is focused on the active part - and little attention is provided to the ‘passive’ - the road is not long to defining power as something that relates to an ability of individual agents to obtain *specific* goals and benefits for themselves by constraining the choices available to others. Hence, the split from here on between power as a capacity ‘to make something happen’, and power as a certain way of obtaining this power through social domination and exploitation.

² One might say that what distinguishes human agency from other forms of agency, is that even when it is annulled, it still acts as a *potential* for resistance, thus requiring constant attention and a dedication of resources by the dominant party (for control, domination etc.). Agency thus in itself holds a potential for social development towards forms of domination, that are not based on threats or coercion, but on authority and collaboration.

Power as productive - the emergent properties of human agency

A dialectical conceptualization of social power brings attention to the fact, that power is productive because human activities have emergent properties. These properties do not refer to something emerging from thin air, but rather to an ability of relational compositions to bring about qualitatively new things that demonstrate hidden possibilities via novel relations (Hegel, 1969). We can think of new metals, but some better examples include language, friendship, money, or nations. Just as there is no such thing as a 'private language' (Wittgenstein, 1953), a friendship or a nation cannot be said to belong to any one individual or individual contribution, even though it cannot either exist without individuals. Consequently, emergent properties are not tangible objects we can simply point to, akin to physical objects. Nevertheless, they indisputably exist and function both as causes and effects of human activity, as they are both results of human action and provide reasons for it. Consider a simple activity like playing tennis: one player serves, and the receiving player deflects the server's shot with a return. This new shot, in turn, is negated by the first player's attempt to deflect the return shot with an additional shot, and so forth (Engelsted, 2019, p. 40).

While the tennis duel showcases the players' individual abilities, it simultaneously demonstrates how these abilities only manifest through an intersubjective interaction, resulting in something we cannot simply reduce to its parts. The impact of the first shot persists in the second, and continues into the third, which is again present in the fourth, and so forth. In fact, all the shots remain relevant throughout the rally, which then evolves into a set, the set into a match, and the match into an event. None of these stages can be attributed to any particular agent; rather, they all belong to a broader foundational intersubjective realm of reciprocity from which new realities and opportunities emerge: a social world that eventually encompasses new places (tennis clubs), professions (coaches, professionals), industries, and events (Wimbledon, etc.).

As a metaphor, the tennis example allows for a number of interesting observations. First, it portrays human agency and its results as something that invites a more shared sense of ownership. Second, it points to an understanding of social power as potentially also a constructive means of collectively controlling the social-material relationships that constitute social life and activity. Third, it invites an understanding of human rationality as an engagement in reciprocity between causes and effects, rather than as an engagement in their separation. Fourth, it depicts differences and frictions not simply as problems to be overcome, but also as potentials for new opportunities. And lastly, it hints at a conception of social reality that affirms collective human agency and activity as its conscious, creative principle.

With these observations, we return to the initial questions of this article regarding our inability to tackle looming social problems of climate change, anti-science sentiments, and weakened trust in democracy and its institutions. The question posed was whether these challenges might relate to our concepts of power, here expanded upon as a problem of unrecognized contributions to the

powers we celebrate, potentially resulting in a failure to secure, defend, and develop them.

Democratic power and agency

When discussing community and shared social life, we often imagine a consensus of beliefs and values that belongs to its members. However, intersubjective meanings and powers can never be a property of individuals, as they are rooted in social practice - belonging inherently to communal interaction. This is why social reality cannot be simplified to its immediate manifestations: its institutions, laws, technologies, or even conflicts and disputes. Rather, the strength of these manifestations converges with the strength of their foundation of intersubjective meaning, without which even the most bitter lack of consensus could not exist.

This observation suggests that the agentic powers and opportunities we celebrate are built upon a foundation that remains largely unseen. One reason for this is that, as argued by Taylor, "Common meanings, as well as intersubjective ones, fall through the net of mainstream social science" (Taylor, 1971, p. 31). To delve deeper into this issue, we must address another misconception regarding power—this time in our understanding of political power.

Political power as competition or as collaboration

The modern state has evolved from governance based primarily on brute force to forms of governance that rely less on coercion and more on so-called soft powers associated with authority. While brute force remains a foundational premise of democratic state governance (defined by a monopoly on the legitimate use of force), its transition to 'soft powers' raises questions about authority and legitimacy—terms that define our understanding of the state's right to our allegiance. In essence, democracy hinges on collective support for its authoritative institutions. However, whether discussing power as force or authority, political power in Western liberal societies is almost exclusively viewed as adversarial. Our political systems are structured around the principles of representative democracy, where power - whether in the form of force or authority - is seen as inherently risky and is restrained through mechanisms such as 'checks and balances' (e.g., the separation of powers into legislative, executive, and judicial branches, as envisioned by Montesquieu). Consequently, like many of our other institutions, politics is framed within the context of civilized competition, deemed the optimal approach for societal progress and efficiency. This conceptualization of power, while undeniably valuable, inherently views power and politics as a zero-sum game, perpetuating an imagery of winners and losers, warfare, and struggle. Fully embracing this depiction of power and, by extension, politics, poses significant challenges.

Obviously, social power sometimes approximates a battle zone divided by fair competition at best, domination at worst. However, as noted by Lakoff and Johnson: “when we are preoccupied with the battle aspects, we often lose sight of the cooperative aspects” (Lakoff & Johnson 1980, p. 10). As many feminist theorists argue (Allan, 1998, 2008; Arendt, 1958, 1970; Bachrach & Baratz, 1962; Benhabib et al., 1995; Brown, 1988; Crenshaw, 1991), and as much community psychology demonstrates (Fisher et al., 2007; hooks, 1994; Hope et al., 2018; Kloos et al., 2012; Rappoport, 1987; Macías-Gómez-Estern, 2021; Serrano-Garcia, 1984, Thai & Lian, 2019), there is more to be said about power (see also notably Foucault, 1980, 1984, 1997; Lukes, 1994; Clegg, 1989; Nesbit & Wilson, 2003; Haugaard, 2015, 2018; Wartenberg, 1990).

Issues of dominance, control, competition, and inequality are central aspects of power, but they do not encompass its entirety. While individuals or groups may expand their capacity for action by exerting power over others, it is also possible—and indeed a common occurrence in everyday life—for individuals to enhance their capabilities by cooperating and seeking mutual empowerment *with* others, rather than just separate power. This process typically involves an ongoing, sometimes subtly evolving integration of perspectives and differences, resulting in new and more mutually informed modes of action. Through this, what was once perceived as the needs or perspectives of others may become intertwined with one's own, as individuals gain deeper insights into collaborative interdependencies. Thus, power is not solely about conflict, domination, or opposition; it also emerges from social collaboration and collective action.

Power-to, power-over, and power-with

When viewed through the lens of power, the agentic dimensions are emphasized, as power-to can be described as a 'capacity for action constitutive of agency' (Haugaard, 2018, p. 113). However, as this agentic power-to is rooted in reciprocal relations, it's important to recognize that human agency cannot be simply understood as the development of individual abilities or resources optimized for success within a hierarchical system of winners and losers. While this definition of agency may align well with a society that prioritizes competition, much of our agentic power-to—our ability to act and participate in social life—results from collaborative efforts and is thus also acquired through the imposition of restraints, limits, commitments, and restrictions on our agency. In everyday life, we are bound by numerous concerted human powers. I get annoyed if I am pulled over by a police officer, and when my son tested positive with COVID 19, I self-quarantined and then complained about it constantly.

Also, I might find it quite appealing if, by some strange cosmic event, I didn't have to pay any taxes. However, while various factors like this may seem to constrain my ability to act freely, I also recognize that they ultimately contribute to enhancing it. Therefore, I don't adhere to these constraints simply out of obligation or fear of consequences; I comply because I genuinely desire to

do so. Just as I appreciate the benefits of police officers fulfilling their duties and individuals fulfilling their tax obligations, I willingly adhere to societal norms and regulations. It is for the same reason that a political party should gracefully concede defeat in a democratic election—not out of fear of retribution, but out of respect and appreciation for the social institution that simultaneously empowers them by offering the opportunity to participate again and maybe win the election next time around.

As argued by Haugaard (2013): at the level of human practice, social rules, norms, and restraint are not necessarily opposed to individual powers and agency because their constraining qualities are at the same time enabling. The power at play here results from *concerted* powers, a socially developed form of *power-with*, that is neither simply zero sum, nor simply rooted in competition, since it does not belong to any particular participant but rather endows everyone with the capacity for future action. In *this* form, social power isn't simply a means to an end, but a goal in itself. Because constraints enable *generalized* capacities, this kind of power can be seen to provide a democratic form of agentic 'powers-to, that does not necessarily contribute to social power-over. Instead, it reflects and supports a shared intersubjective realm of meaning and power. We can name this power: *power-with*³

Power-with and the development of the common good

Social power is a product of a unique human capacity for cooperation. Cooperation can be defined as an exchange in which the participants benefit from the encounter, and through which one can accomplish something that one cannot accomplish alone. Of course, collaboration exists on a spectrum. It can be combined with competition (as in electoral politics or when children collaborate on rules for fair play), or it can take the form of a goal in itself, as in friendship or romance. Cooperation stretches from collusion (which might be destructive to others) to mutual pleasure (which potentially has no negative consequences for anyone). The main task of social co-existence, however, is to respond to others on their own terms, and here cooperation can help individuals and groups grasp the consequences of their own actions. Which is to say, that we can gain both insight and new capacities from collaboration, not least demanding forms of collaboration: new insights into ourselves, others and our shared social world, along with new possibilities for action that match these insights.

Since social cooperation and intersubjectivity are rooted in differences, it entails a risk of social conflict and warfare. The development of *power-with*

³ Attention to this aspect of power is often associated with Hannah Arendt's work and, in extension, Jurgen Habermas's *Theorie des kommunikativen Handelns* (1987). It was also elaborated on earlier, by, for one, the organizational theorist, Mary Parker Follett (1868-1933), who coined the term *power-with*, to draw attention to an additional dimension of power. "So far as my observation has gone, it seems to me that whereas power usually means power-over, the power of some person or group over some other person or group, it is possible to develop the conception of power-with" (Follett, 1940: 78-79). "Power is not a pre-existing thing which can be handed out to someone or wrenched from someone. The division of power is not the thing to be considered, but that method of organization which will generate power" (Follett, 1995: 113).

therefore raises difficult questions about how to handle competing interests, needs, perspectives and knowledge. In formal collaborations, this conflictive dimension of social life is often given a specific *political* form of 'representation,' where differences between social parties are negotiated in a strategic fashion without necessarily exchanging or altering people's perspectives and positions. This strategic presentation and negotiation of differences within representational systems can sometimes make it difficult for participants to actually come to learn about and understand each other's interests and concerns, leading the participants to understand the collaboration as a collaboration between opponents rather than partners. The tendency of each party to keep their real interests and insight hidden, in pursuit of an advantage in negotiations, is one reason why representative democracy is maybe sufficient for the development of democratic institutions and powers, but may still turn out insufficient to sustain their foundation of inter-subjective support and meaning.

Democratic power-with pertains to transformative processes of both individual and social development and self-transcendence. It involves developing shared perspectives of cross-contextual insight that invite participants to reconceptualize problems. Such insights are poorly, if at all, nurtured by strategic orientations, and for this reason, they are a rare sight in today's political life. Nevertheless, they are not unfamiliar in everyday life, often growing out of people's activities of working together on a problem from a shared engagement. This aspect of human agency and power, however, is under-conceptualized and often reduced to a somewhat mundane and naive aspect of everyday life; rarely examined in detail and frequently reduced to a trivial element of 'conviviality' (Neal et al., 2019, p. 70), which refers to the social skills deployed in everyday life such as good listening, being humble, curious, informative, and honest, finding common ground and managing disagreement, and avoiding frustration and fear when encountering differences and otherness. Often, these habits or skills are not considered worthy of translation into broader political discourse (with exceptions noted by Sennett, 2013; and Flyvbjerg, 2006). And if they are acknowledged, it is usually as a subset or derived effect of real politics, ignoring—again—the possibility that the foundation of political power may not reside in its formal institutions, strategic practices, and systems of representation, but rather in the hermeneutics of intersubjective practices and meaning that take place in everyday life. (Axel, 2020; Gidley, 2013; Højholt & Larsen, 2021; Lapina 2016; Schwartz & Nissen, 2023; Nissen, 2012; Samanani, 2022, Sargent et al., 2011; Wise & Velayutham, 2009; Watson & Anamik, 2013).

Power-with is not about formal representation or political projects that aim to empower and co-create by inviting people to respectfully engage in predefined activities or communities deemed to serve "the common good." Power-with doesn't emerge from having a consensus or common goals. Instead, it arises from social processes in which the common is produced in common, intertwining the development of power-with and the development of communities. Power-with is therefore not an epistemological project (as argued by Habermas, 1987) or simply a political pedagogy (as discussed by Arendt, 1958). Since power-with is always about something, it is not merely hermeneutics, but a worldly activity that

involves the joint creation of a shared social reality and practice, built on differences of perspectives and interests. Power-with can therefore be seen as a transformative social-worldly activity in which a transformative creation of intersubjective meaning and reality takes place.

Final thoughts - the long and short of it

There are at least two mayor approaches to the study of power. In one approach, power is facilitative; it refers to a “power to”, that is mainly seen as positive. The other approach to power is more widely known and stresses that power operates largely as domination and “power over”. This approach sees power as less of a facilitative capacity and more of a prohibitive one. This article disputes the notion that these approaches are mutually exclusive and incompatible. Instead, it proposes a dialectical concept of power that recognizes power as a dual quality that reflect and arise from reciprocal relationships between agentic potentials and their actualization; that mediate reciprocal connections between the particular and the general, past and future.

The normative quality of social power is not fixed. It is a both positive and negative productive force for agency. Relationships of power-over can be both domineering and transformative, making hierarchy and asymmetry not inherently problematic from a normative perspective. Additionally, agentic power-to can exist in both individual and collective forms and relate to a range of both competitive and collaborative processes, that create both division and unity. Therefore, we cannot determine the normative quality of a specific use of social power without considering its subjective, situational, and socio-material context.

The word ‘Power’ encompasses a dual meaning. Although such an understanding does not satisfy traditional criteria of clarity, it sheds light on why power is productive and not a topic psychology can just leave for other disciplines to study. The study of power also belongs to psychology. This article argues for a critical social psychology. Implicitly it also aims to explain, how the subject-scientific approach of German-Danish critical psychology and its framework of concepts and situated practice research can be seen to reflect an attention also to power relations and how to study power. This brings the discussion back to psychology in yet another way - as an important provider of interpretive frameworks for understanding not only human agency but also social power.

Just as there is no such thing as a fully private language, there is no individual power that is not indebted to uncountable contributions from others, from nature, and from human history. Current popular practices of attributing all the glory or blame to a single individual contributor thus simplify social reality in a way that not only allows for a false internalization of gains and externalization of costs but also for a misinterpretation of symptoms of social problems as their causes.

It is easy to imagine that what distinguishes agentic mastery—for example the experienced painter from the amateur—lies in a higher degree of control over

and independence from the materials used and the resources applied. However, I have tried to present a dialectical understanding of power that offers a different perspective, suggesting that what distinguishes human mastery and sets the experienced painter or theorist apart from the amateur is a more advanced form of collaboration. Antonio Stradivari (1644-1737), widely considered Italy's greatest violin maker, didn't attain excellence by imposing his will on his materials, but by working with them in unique ways. He knew and appreciated the qualities and strengths of different types of wood and their distinct reactions to moisture, heat, and sunlight, and he worked with, rather than against, the friction of its knots, twists, and movements. In other words, he approached friction in the world not just as a barrier to his agency but also as a potential resource for exploring more sophisticated forms of action, agency and "power". The same approach can be applied to social power and agency, and we can consider its potential relevance for understanding our current political problems.

I began this article with the following sentence: "Power is usually related to questions of how people can achieve their goals." I wish to end by returning to the notion of goals. Social practices and institutions, like scientific experiments, always include a more or less conscious framing of what we might call an opportunity space; a more or less set list of potential outcomes, similar to the result of rolling dice. The fact that power is productive means that our agentic powers expand and contract with the scope of the opportunity spaces we allow in social life and in our institutions. Since democracy is not defined by predefined goals, but is rather a practice that is a goal in itself, democratic power constitutes a form of power-with in which differences are put to work for, rather than against, the common good, so that the opportunity space—the space for possible outcomes—is never fully determined. Current issues of climate change, declining trust in democratic institutions, the rise of anti-science attitudes, and a pandemic of burnout and mental health problems collectively point to a deeper problem. I have argued that this problem might stem from a failure of our democratic institutions to secure, in a sufficient manner, the social foundation that is required to sustain them. If this is, in fact, the problem, these issues cannot be resolved by our institutions unless we change the way they currently operate. A more expanded opportunity space needs to be allowed for, both within and outside of them, that experiment with alternative forms of power. The concept of power-with aims to provide guidance for such experimentation and expansion.

The subject of psychology: Seclusion, contraction, immobilisation, objectification, privatisation, and depoliticization^{1*}

David Pavón-Cuéllar

Abstract

The seclusion and contraction of subjects in their individualities makes possible their reduction to objects of power apparatuses—of the State, Patriarchy, Capital, and the so-called objective human sciences, including psychology. Nothing is easier than objectifying an individualised, deactivated, and weakened subject who has been plunged into impotence and immobility. It seems that Christianity and capitalist modernity first neutralised subjects, turning them into harmless, isolated individuals, and later objectified them, transmuting them into objects of political, economic, and ideological-scientific systems with psychological devices. The paradox is that psychology developed to support paralysed and powerless individuals, already objectified and neutralised as subjects, in dealing with their emotional, intellectual, or emotional problems. Although such problems are fundamentally political, cultural, or socioeconomic in origin, it is individuals who must take responsibility for them and alleviate them in apolitical ways in their private individual spheres. This depoliticization and privatisation of depression, stress, and anxiety is correlated with the privatisation of all other aspects of our lives in neoliberal capitalist societies. Finally, the possibility is considered that psychology is transformed so radically that it reverses the psychologising process that engenders it: the process of individualisation, contraction, objectification, and depoliticisation of subjectivity.

Keywords

psychology, subjectivity, objectivity, capitalism, neoliberalism

^{1*} This article would not be what it is if it had not benefited from the valuable feedback from Nick Malherbe and Nadir Lara Junior.

Individuality as the prison of the subject

There was a time when the protagonists of human history were hordes, clans, tribes, communities, and peoples. These groups embodied humanity. Human subjects were collective rather than locked into individuality. Their problems were primarily group problems, as were the solutions to those problems.

Of course, humans were always individuals, but they recognised themselves as elements of the whole (Tönnies, 1887/2002). They understood that their individual problems were part of a problematic totality that encompassed and internally constituted individuals. The individual subjects knew that they depended on their communities.

Gradually, individuals began to close in on themselves (Swift, 1926). This process lasted for centuries and occurred in parallel in most, but not all, civilisations. In the European context, Christianity partly aided this process from the end of antiquity to the dawn of modernity, passing through the long Middle Ages (see Marx 1843/1987a; Dumont, 1982). Since their appearance in the Western World, Christians always act as individuals when they perform good works, fall into temptation, commit sins, examine their consciences, confess, do penance, and ultimately go to heaven or hell.

What weighs in the balance of the final judgment is the individual soul. Likewise, this soul has weight in modern capitalist societies through individual votes and rights, individual wealth, and individual private ownership. Everything in modernity is centred on the individual soul, which represents humanity and condenses subjectivity.

Modern human subjects, inheritors of Christianity, are imprisoned in their individual souls. These souls are the prisons of their bodies. Consider this well: the body no longer ‘imprisons the soul’, as Plato believed (*Phaedo*, 82d–85b). Instead, as Michel Foucault (1975) stated, the soul has become ‘the prison of the body’ (p. 38). The contradiction between Plato and Foucault reveals a historical mutation. Something has changed between the ancient Greek society and the modern French society of the second half of the 20th century. Foucault inverted Plato to actualise it in a precise historical context.

Contraction, immobilisation, and objectification of the subject

History may have freed the soul, but at the cost of diminishing it to squeeze it through an individual funnel. In Greek antiquity, the great soul of the Athenian free man, overflowing individuality and unfolding in a political space, certainly had reason to feel imprisoned and suffocated in the narrow human body (Constant, 1819/2010). However, over time, the body has increasingly been trapped in a soul narrowed to individuality.

The individual soul continued to shrink and eventually became the object of psychology. This object, in its various psychological, mental, conscious, cognitive, personal, and other forms, results from what Herbert Marcuse (1964/2010) described as an ‘atrophy’, a ‘contraction’ and a ‘lost’ of the internal

world (pp. 102-108). In the tiny, individual, internal worlds in which they have been confined by psychology, subjects are oppressed and crushed, as if buried, and can scarcely move.

Psychological subjects move without moving, turn without doing anything or going anywhere, and agitate without acting, freeing themselves, or transforming their world. The ‘restrictive agency’ offered by psychology (Holzkamp, 1985/2013, pp. 23-26) makes subjects no longer look like subjects (Castro, 2013). Unsurprisingly, they are constructed as the opposite of what they are—as objects of psychology understood as objective science.

Long before the emergence of psychology as an independent objective science, Immanuel Kant (1781/2004, 1786/1971) and others (e.g. Hegel, 1807/1973; Herbart, 1816/1901) criticised the fundamental absurdity of psychological knowledge—its aim of objectifying the subjective, which is the only thing “unobjectifiable” by definition (see Pavón-Cuéllar, 2019a, pp. 17-19). Now, we should ask ourselves how this objectification has become possible. I am convinced that the answer lies in the reduction of subjects to their individual internal worlds.

As Rosa Luxemburg (1905/1985) and György Lukács (1923/1985) have shown, subjects reduced to their individuality are devoid of much that makes them ‘subjects’, not ‘objects’ (see Pavón-Cuéllar, 2017a, pp. 79-80, 83-85). This is the case regarding the capacity for action and transformation of the external sociocultural world. In general, this world can be transformed only by collective subjects, since individual subjects are condemned to ‘contemplate’, passively and resignedly, what they cannot ‘transform’ (see Lukács, 1923/1985, pp. 230-231).

In their powerlessness, contemplative individual subjects are the *objects* of what they cannot transform. For example, individuals cannot end capitalism, but they are usually objects of capitalist exploitation. They are also objects of government oppression, from which they cannot free themselves as individuals. Similarly, whether they are men or women, gay or heterosexual, European or Latin-American, they are objects of the colonial, racist, sexist, and hetero-patriarchal system.

In order not to be simple objects, the subjects should come together and constitute a collective subjectivity. This subjectivity, specifically in the form of a movement founded on a social class, is the only true subjectivity for Luxemburg and Lukács: the only one capable of acting and transforming oppressive systems instead of being the object of them. The tacit teaching of Luxemburg and Lukács is that we can only collectively exercise our subjectivity, while individually we are condemned to be objects of the systems that oppress us.

In Lacanian jargon, *the Big Other*—the way in which the symbolic systems of culture appear to the subject—always finds ways *to enjoy*—to possess and exploit—the individual as its object (see Lacan 1975/1999). An individualised subject is defenceless against the enjoyment of, for example, capital (Exposto & Rodríguez Varela, 2020; Pavón-Cuéllar, 2022). We can only resist such *jouissance* as collective subjects—as ourselves, rather than as insignificant individual *egos* that cannot even preserve the subject condition in the ultimate bastion of individuality.

The seclusion of subjects in their individualities makes it possible to reduce them to objects of power apparatuses—of the State, Patriarchy, Capital, and the so-called objective sciences, including psychology. Nothing is easier than objectifying a subject who is individualised, deactivated, weakened, and plunged into impotence and immobility. It seems that Christianity and capitalist modernity first neutralised subjects, turning them into harmless, isolated individuals, and later objectified them, transmuting them into objects of political, economic, and ideological-scientific systems with psychological devices.

Freedom and subjectivity for capital

The users of psychology are products of the previously summarised story: a long history of individualisation, contraction, immobilisation, and objectification of subjectivity. This history is the same one that has led to neoliberal capitalism (Harvey, 2007; Laval, 2007) in which the psychological perspective, in all its forms, is triumphant (Parker, 2007; De Vos, 2012). The psychology that individualises, contracts, immobilises, and objectifies us is perfectly compatible with a neoliberalism that reduces us to the condition of atomised and isolated individuals, who behave as passive objects of the overarching free market with its wide-ranging movement of commodities (Pavón-Cuellar, 2017b; Adams et al, 2019).

Neoliberalism can only liberate commodities at the expense of people. The inaugural demand of any neoliberal policy is that we give up our freedom to commodities, the market, and the enjoyment of capital. Capital thus frees itself to freely enjoy neoliberalism. In the current regime of free market and free competition, as in the old free trade criticized by Marx (1848/1987b), the only freedom is the ‘freedom of capital’ (p. 155).

Neoliberal capitalism not only surrenders our freedom to capital but also represents the culmination of a long process by which we transfer our subjectivity to capital itself (see Read, 2009). This capital is the supreme subject of neoliberalism, usurping the place of all other subjects and dominating them, as only the unique divinity did in the most dogmatic and intolerant of religious times. We have become creatures and servants of capital, its fundamentalist and terrorist believers, its crusaders, and its suicide bombers. We give our lives to capital, which can thus enjoy our lives by sucking and absorbing our blood ‘like a vampire’, according to Marx’s (1867/2008, pp. 178-179) famous metaphor in *Das Kapital*.

Individuals as enterprises of capital rather than entrepreneurs of themselves

We are thus faced with a strange situation in which we are the objects of vampirish capital that is the only subject of neoliberal capitalism. We lose sight of this situation when we accept the famous Foucauldian formula of neoliberal

individuals as ‘entrepreneurs of themselves who are their own capital, their own producers, the source of their income’ (Foucault, 1979/2007, pp. 264-265). Foucault’s phrase is quite ambiguous, since it leaves us with the impression that individuals are simultaneously subjects and objects—entrepreneurs and their enterprises—when it is clear that they are only the objects and enterprises *of* something that inhabits and possesses them, i.e. the capital they ‘personify’ (Marx, 1867/2008, p. 178).

Let us recognise, then, that neoliberal individuals are, as Foucault (1979/2007) stated, ‘permanent and multiple enterprises that encompass everything in their lives, including the relationships, for example, with their private property, with their family, with their partner, with their insurance, with their retirement’ (p. 277). This quote by Foucault is revealing because it shows us that the relationship of entrepreneurs with their enterprise is part of the enterprise. In other words, the condition of entrepreneurs, their lives, and their entrepreneurial relationships with themselves is the enterprise of something that must, therefore, transcend individuality (see Brown, 2015).

From a Marxist perspective, neoliberal individuals are not their own entrepreneurs but the enterprise of capital that possesses them and makes them function as their own entrepreneurs. Their actions are the performance of an alien role—the role of capital. Hence, the only subject is capital—the entrepreneur underpinning all entrepreneurs—while the individual is the enterprise—the object exploited by capital and playing the role of entrepreneur, thus personifying capital.

Individuals are the objects of capital exploitation and the capital that they personify, and they suffer directly from the effects of such exploitation, such as by experiencing feelings of emptiness, chronic fatigue, lack of energy or motivation, and depression. Moreover, if individuals are lucid enough and have penetrating Foucauldian sensitivity, they will conclude that their suffering is for all they have exploited themselves as entrepreneurs of themselves. They will thus reproach themselves for demanding too much of themselves, for being work addicts, for not knowing how to rest or enjoy, for not sleeping enough, and for sacrificing what is profoundly important—life, love, pleasure, friendship, and sustenance.

All the reproaches are correct, except for one detail: they address the wrong person. Individuals do not waste their own lives. What ruins the lives of individuals is the capitalist system and the capital that individuals personify, even when they blame themselves. Their reproaches must be included in the list of grievances attributable not to individuals as their own entrepreneurs but to the capital that owns them and that makes them exploit themselves and then blame themselves for their own exploitation.

Blaming ourselves and apologising to capital

I once conversed with a man suffering from terminal cancer who blamed himself for his illness and suffering. This individual sensed that his illness was associated

with certain personality traits. He was extremely serious, industrious, obedient, self-sacrificing, and responsible, to the extent that he took responsibility for his own illness. His words made me think that this desire to take responsibility for everything, including his cancer, was perhaps precisely what had caused the cancer. The problem was that he blamed himself for everything, even the blame itself, and thus took the blame for the system.

Blaming oneself—unloading the guilt of the system on oneself—has become a persistent rule of behaviour since Christianity and later capitalist modernity locked subjects within their individuality. Good Christians who flagellated themselves for their temptations and sinful desires were already taking the blame for Christianity, the prohibitions of which excited their desires and temptations. Christianity then gave way to capitalism—the true universal religion—which has caused tremendous physical and mental suffering in subjects who reproach themselves for their own suffering.

Some patients blame themselves for their diabetes and obesity when advertising has led them to become intoxicated and put on weight by eating fast food and ultra-processed foods with added sugar. Others attribute their cancers solely to their smoking or poor diet, completely forgetting the role of tobacco companies and the factories that poison city air, produce carcinogenic foods, or inundate the agricultural industry with fertilisers and pesticides. Pharmaceutical capital is also often forgotten by its millions of annual victims, who find ways to blame themselves with the help of their doctors.

Psychology as exoneration of the system, depoliticization, and privatisation of cultural discontent

Medicine is usually biased in blaming the sick for their illnesses and exonerating the system that makes them sick. This partiality towards the capitalist system can sometimes be observed in medical practice and occurs regularly in the field of psychology, which is inclined to presume the innocence of the system. Indeed, psychologists tend to deflect attention from capitalism, absolving it completely through the guiding principle that individuals are responsible for their problems and must solve them with the support of professionals.

For example, a cognitive-behavioural therapist can help individuals solve their problems of anxiety, stress, or depression by offering treatment that includes reinforcing certain behavioural patterns, programming for progressive activities, training in problem-solving, and supporting the development of useful skills for coping with stressful situations. The ultimate purpose of this therapy is to encourage individuals to think positively and release the negative thoughts, feelings, and behaviours that feed anxiety, stress, and depression. The assumption is that anxious, stressed, or depressed conditions result from the ways in which individuals feel, think, and behave. Individuals are to blame.

Individuals are accused of what the capitalist system does to them. In addition to being victims of capitalism, they are revictimized by psychology. They suffer double: because they suffer and because they reproach themselves

for being the cause of their suffering. Their suffering, in fact, can be triple when they are victims of positive psychology, because then they suffer not only because they suffer and because they consider themselves guilty of their suffering, but because the very fact of suffering, because suffering is not good, because people are not allowed to suffer even when the capitalist system torments them by all means (Cederström y Spicer, 2015).

The system is not even seen when it is destroying the world around us through climate change and the devastation of nature. We accuse ourselves of the planetary catastrophe for using straws, for eating meat daily, for travelling frequently by plane, for driving a car several hours a day, or for changing smart phones or computers from time to time. It is true that these practices contribute to the environmental cataclysm, but the fundamental responsibility lies with capitalism, which has created devastating needs to ensure consumption and the profits linked to that consumption. All of this is missed by psychologists who, even when dealing with environmental issues, forget the capitalist environment and focus on the individual (e.g. Clayton et al, 2015; Nielsen et al, 2021). The key is in the individual sphere, although sometimes a little influenced by family and social factors.

Psychologists talk about society in order not to look bad, but the truth is that they do not know what to do with it. Hence, they project it as far away as possible in time and space, where it becomes invisible to them—either in the past, confusing it with the family, or behind the wall of the immediate environment, in the socioeconomic and structural background that supposedly cannot be transformed and to which it is necessary to adapt. Finally, for myopic, amnesiac, individualistic, and presentist psychology, only the present and narrow, private, individual spheres remain, where individuals, assisted by psychologists, manoeuvre.

Psychology, in general, starts from the premise that individuals must cope with their emotional, intellectual, or behavioural problems. Although these problems are fundamentally political, cultural, or socioeconomic in origin, it is individuals who must take responsibility for them and solve them in apolitical ways in their private individual spheres. This ‘depoliticisation’ and ‘privatisation’ of depression, stress, and anxiety, as Mark Fischer (2011) claimed, is correlated with the privatisation of all other aspects of our lives under neoliberal capitalism. It can be said that neoliberalism not only privatises culture but also cultural discontent and multiple sufferings in an increasingly privatised culture, progressively subsumed in capitalism.

Cope better with the world, or fight for a better world?

In almost all cultural spheres, the individual must solve the problems caused by the enjoyment of capital. Although capital enjoys, individuals pay the bill. This new form of exploitation, which is an extension of economic exploitation in the classical sense, requires psychology to justify itself by holding subjects responsible for their problems.

From a perspective of positive psychology and cognitive-behavioural models, for example, individuals are fundamentally depressed because of negative thinking (e.g. Teasdale, 1983; Norem & Chang, 2002). This thinking is the important thing. Positive and cognitive-behavioural psychologists rarely show interest in the structural causes of their patients' negative thinking, such as the negative reality in which they live, the cultural misery that surrounds them, life imprisonment in their individual prisons, their exploitation as workers and consumers, or their degrading conditions as objects of the enjoyment of capital.

There is enough evidence that capitalism and neoliberalism cause a variety of mental health problems, including depression and anxiety (Prins et al, 2015; Eisenberg-Guyot & Prins, 2022). This is understandable (see Mathews, 2019; Zeira, 2022). The capitalist system is quite depressing. How can we avoid becoming depressed in this world turned into a market in which increasingly interested relationships prevail? This world is becoming increasingly unstable, insecure, and troubling. How can we not be stressed and anxious in the face of neoliberalism, with its progressive acceleration, law of the jungle, job insecurity, accumulating debt, and ultimate devastation of the planet?

Of course, distressing problems and stressful situations interest cognitive-behavioural psychologists, who respond by offering training in problem-solving and the development of useful skills for dealing with stressful situations. However, what we learn in cognitive-behavioural psychology is to be skilled at dealing with stressful situations—not to be skilful in overcoming these situations when confronted by the neoliberalism that creates them. Similarly, we are not trained to escape the troubled capitalist system, but only to solve the distressing problems it causes.

Cognitive-behavioural psychologists, like almost any other type of psychologist, may justify themselves with the quite reasonable argument that they can only help individuals to deal with the world, but not to change it, since individuals cannot change the world. The most that psychology can offer individuals is change in their relationships with the world—change that makes the world less distressing, stressful, and depressing for them. The point here is that individuals who are less depressed, stressed, and distressed by the world have less reason to want to change that world.

Why do we participate in collective action to try to transform society when we can simply ask psychologists to transform our perceptions of society and our attitude towards it? Is it not easier and faster to seek psychologists to help free us from our negative thinking than to create a revolution to free ourselves from negative reality? The answer is yes: in this case, as in others, curing a disease is slower, more difficult, and more uncertain than alleviating its symptoms.

The problem with simply relieving symptoms is that the alleviation does not cure the disease. Instead, it allows the disease to progress. Capitalism thus continues to gain ground at the expense of humanity and nature. In the last 50 years, during the neoliberal phase of the capitalist system, we have not only witnessed the precariousness of our existence and the worsening of inequalities but also the disappearance of more than half the fertile land and animal populations on our planet (Kolbert, 2014; Ceballos et al, 2017).

Something better than psychology?

We are losing our planet, thus endangering our very existence as humans. This capitalist terminal illness can only be avoided if we escape from the narrow individual prisons in which we have been locked and snatch our subjectivity away from capital. We must stop being objects of capital and its devices, including psychology, and become collective subjects who can fight against capital through social movements and political organisations.

We need to recover the political, social, and subjective selves that are lost when we are psychologised. This requires us to leave behind the individual, apolitical objects of psychological science, and re-subjectify ourselves and re-collectivize our subjectivity through formations such as communist camaraderie, feminist sisterhood, and even religious brotherhood understood in a progressive and anti-capitalist sense, as in certain forms of Liberation Theology. The question is whether all this should make us abandon psychology for good.

Perhaps psychology is capable of transforming itself so radically that it reverses the psychologising process that engenders it: the process of individualisation, contraction, objectification, and depoliticisation of subjectivity. Maybe psychology will find a way to reconstitute collective and political subjects—the only subjects capable of opposing capital. This possibility has already been partially realised by critical, radical, and liberation psychologies, as well as by certain political and community psychological proposals, revealing that psychology need not necessarily be condemned as a capitalist device (see Parker, 2015; Pavón-Cuéllar, 2017c, 2019b).

Capitalism has been repeatedly challenged by psychology. The psychological field is a battlefield: it is a field not only for the domination of capitalism, but also for the struggle against capital. Although the field—as we have tried to show in this article—is not neutral and is already predetermined in some way in favour of the capitalist system, this does not exclude the possibilities of resistance and even subversion.

Past experiences teach us that capitalism loses control over those psychological proposals that commit themselves to collective and political anti-capitalist projects or movements. This external anchorage is essential. Psychology must come out of itself and must also collectivize and politicize itself to be able to escape capitalism and reconstitute collective and political subjects.

In fact, psychology has the potential to be an important ally of anti-capitalist movements and become less psychology than something better (e.g.; Parker, 2020; Parker & Pavón-Cuéllar, 2021; Malherbe, 2022). We clearly need something better than psychology (Parker, 2007). It does not matter if we continue to call it ‘psychology’, but it can no longer be what it has been until now.

Psychology should be deconstructed and rebuilt as something better (Parker, 2014). Only something better can help us to return to being the groups, communities, and peoples that we once were and that we can still be today when we act collectively to change our destinies. We can be something other than the

subject of psychology. We don't deserve its seclusion, contraction, immobilisation, objectification, privatisation, and depoliticization.

The politics of unconscious desire under virtual global capitalism

Kathleen Skott-Myhre & Hans Skott-Myhre

Abstract

The question of politics and psychology in the 21st century is increasingly fraught. This article interrogates psychology's relationship with emerging global capitalism. It takes up psychology's relationship to the emerging mode of production known as immaterial labor. The article argues that the emerging realm of virtual technologies has immense implications for psychology in recalibrating such fundamental conceptual fields as development and neurology, sublimation, and desire. Finally, a proposal is made for a reconfigured psychology that can build on the shifts in 21st century modes of production and shifts in consciousness to challenge global capitalism and initiate new forms of subjectivity with capacity to create new worlds and new peoples.

Keywords

Neurology, immaterial labor, consciousness, time, Marx, Spinoza

The question of politics and psychology in the 21st century is increasingly fraught. In what follows, we propose to interrogate psychology in its relationship with emerging global capitalism. We will take up psychology's relationship to the emerging mode of production known as immaterial labor (Hardt and Negri, 2005), as well as its ongoing complicity in producing forms of linguistic ideological obfuscation of capitalism as a system of exploitation and oppression. We will argue that the emerging realm of virtual technologies has immense implications for psychology in recalibrating such fundamental conceptual fields as development and neurology, sublimation, and desire. Finally, we will make a proposal for a reconfigured psychology that can build on the shifts in 21st century modes of production and shifts in consciousness to challenge global capitalism and found new forms of subjectivity with capacity to create new worlds and new peoples.

We begin with the assertion that, as we engage the early decades of the 21st century, human activity is reshaping the global landscape at all levels of living force. As Felix Guattari (2005) asserts in his work on how we might conceptualize the ecological realm, the Anthropocene is not only radically altering the geophysical world and the biophysical world, but human activity is

also forever altering the unconscious and neurological production of our relational fields of intersubjectivity. In other words, the Anthropocene is demonstrably opening new vistas of colonization, appropriation, and exploitation of those elements of human life that constitute the foundation of all political acts (McKewan, 2021). Indeed, we might say that the very capacity to think and act collectively as an assertion of living force is entering the territory of an endangered species.

Of course, an endangered species is not an extinct species, and there are still multiple acts of resistance and critical thought emergent across the landscape of global virtual capital. That said, there is little doubt in our minds that the tendency of social modes of subjectification are moving powerfully and incontrovertibly to appropriate and exploit living creative force. It has always been the goal of capitalism to dominate everything that comes within its grasp, animate and inanimate. The last four hundred years have incurred a global level of brutality exacted on all elements of the material world. We might say that the past four centuries have focused specifically on material bodies, including plants, animals (both human and more than human), geologies, bodies of water, all the way down to atomic and subatomic structures. The ever-increasing enslavement of every element of the planet to the abstract dictates of the money sign and its minions, has resulted in untold levels of impoverishment and destitution (Shepard, 2016).

While there are those who would argue that life for some human beings has improved (Obhof, 2003), we argue that the cost for such “progress” is not only unfathomable, but the effects are transitory and inherently unstable. Those who reaped the rewards of greater physical comfort in the form of heat, cooling, medical care, travel, and physical security are facing an erosion of quality and quantity of the standard of living built on the shifting sands of capitalism’s indifference to its effects. As climate change advances, and capitalism’s hunger for ever-increasing levels of abstract wealth escalates, the vast majority of living things will suffer an endlessly degraded environment of mass extinctions, and the scarcity of the basic elements that support life (McKewan, 2021).

Immaterial Labor

In the face of this escalating crisis of bodies, a concomitant incursion into our modes of sociality, intellectual and artistic creative capacity, and neurology have emerged. Hardt and Negri (2005) have referred to this as immaterial labor. They note a shift in the mode of production from industrial capitalism to global virtual capitalism. Of course, like all transitions from one mode of production to the next, mixed modes of production always entail all aspects of human creativity.

Using an example from an earlier mode of production, we did not abandon the agricultural mode that preceded industrialization when we moved into industrial capitalism with its emphasis on factories and Fordist modes of technology. We still grow crops, but as industrialization advances, the way we grow crops becomes increasingly mechanized, and the subjective identity

associated with farming refers to smaller and smaller percentages of the population. Indeed, in many cases, the farmer becomes a cipher that stands in for large multinational corporations who have taken over the land previously stolen from indigenous populations, colonized by the state, and allotted to settler families. The family farm, like the nuclear family, was a transitional and relatively short-term phenomenon that opened the door to ever-increasing technological appropriation by capital (Voegeler, 2019).

We would propose that we are living through a similar shift in the mode of production and the production of the political. Marx (2005) emphasizes the force of human productive labor as ever shifting, mutating, and evolving in a series of ecological entanglements that produce new modes of production, governance, and sociality. We create our social systems and forms of governance. They are not handed down through some form of divine dispensation. The systems that currently entangle and enslave us are built and sustained by our participation and continued creative activities. If the world of human society is to change, we are the ones who will change it. Indeed, we are the ones who are changing it, every minute and every hour of every day. That said, our relation to change is complicated because we live in a world composed of a system of dominance predicated in deception and sleight of hand.

Sorcery and Sleight of Hand

Building on Marx¹, Stengers and Pignarre (2011) delineate what they call the spell of capitalist sorcery. They call for an understanding of capitalism as the ultimate trickster, who routinely disassociates the actuality of our material lived experience and throws us into what Laing (2016) called a living dream or a state of trance. To understand this, Stengers and Pignarre argue that we cannot continue to root ourselves in the very language that underlies the sorcerer's hypnotic patter. The tools of Western European thought and philosophy are precisely the vehicles through which capitalism casts itself and, perhaps even more importantly, the curtain behind which the machinations of the magician's sleight of hand are hidden from view. Stengers and Pignarre argue that the faux rationality of capitalist science and its minions would have us think that psychic intrusions into the way we perceive the world and our identity within it are simply superstitious throwbacks to more "primitive" ways of perceiving the politics of domination and oppression.

This mode of ideological obfuscation would have us believe that intuition and body wisdom are archaic registers of a world long left in the dustbins of history. The argument is that if there is such a phenomenon of capitalist black-magic, it can only be bested in light of rationality, reason, and science. The truth is to be found in the portrayals of the world as an infinite progression of growth, driven by the power of individual creativity, as we overcome the limitations of nature through unimpeded technological growth.

¹ Marx's (2019) invocation of capitalism as a sorcerer in the communist manifesto

In this vision of anthropocentric politics, each human is the master of their own destiny and their own fate. According to the great wizards of the capitalist empire, we are all fated to be all we can be, if we just work hard enough, train hard enough, think carefully enough, and divorce ourselves from silly unrealistic superstitions that keep us from having a clear head and focused vision. For us, this is the most dangerous kind of superstition that not only blinds us to the conditions of our own oppression, but simultaneously keeps us numb enough to make it from day to day.

Superstition and Virtual Capital

Spinoza (2000) takes it as his philosophical mission to banish superstition. However, superstition for Spinoza is not simply a question of what is true or not true. Instead, Spinoza's descriptions of the world are either adequate or inadequate to account for the infinite complexity of relations that produce everything. For him distinguishing truths from falsehoods is relatively unimportant, although it is worth doing. What is more important is determining the level of inadequacy inherent in each description and how such inadequacies produce worlds of thought and action. In other words, for Spinoza, superstitions are essential to identify in order to understand their capacities. That is, not whether they are true or false, but what they can do.

We would argue that this is particularly important as we enter the world of global virtual capitalism with its endless vistas of simulacra, superstition, and grand lies. Many of us raised in the dying sunset of modernity were taught that such a great deceiver as virtual capital could be defeated simply by speaking truth to power. We were taught that if the truth behind the lies about the conditions of our oppression were spread far and wide, there would be a great revolutionary awakening. We could defeat the minions of capital by showing them to be false gods.

And they are false gods indeed. However, just because they have no material reality, does not mean they have no real effect. The realm of their very powerful effectuation is in the world of virtual social media and its associated extensions in schools, financial institutions, government institutions, churches, health care, mental health, and families, to name but a few. In truth, it is somewhat challenging to identify a segment of contemporary life that is not infiltrated or affiliated with some aspect of virtual media content. We live in a world saturated with such content. For many of us, substantial portions of our days are spent in front of screens that project and process information that produce goods and services, as well as increasingly virtual forms of sociality and subjectivity.

New Forms of Sociality and Subjectivity

These virtual forms of sociality and subjectivity have direct implications for who we imagine ourselves to be. In this regard, Moeller and D'Ambrosio (2021) refer

to the production of a new form of identity they refer to as prolificity or the self-reflexive production of ourselves on social media, where we create a representation of ourselves for the consumption of others who view our profile. This profile is skewed in significant ways and shaped by our perception of the other profiles we are consuming. Our profile is recursively shaped and reshaped to fit the proliferating field of social trends and demands that are produced and reproduced in an ever-shifting information flow. Our capacity to reconcile our material lived experience with our virtual modes of self-expression is often significantly challenged on at least two levels: temporality and absolute abstraction.

In terms of temporality, our experience of the material world operates at a certain speed. In other words, we perceive the material world within a mode of temporality that allows us to maneuver through the world at speeds that work within the frames of body/mind coordination. The speed of our engagement with the material world has been increasing steadily since the inception of industrial technologies. To move from the speed of walking, to the speed of the horse-drawn carriage, to the automobile, and to the speed of an airplane has demanded a reconfiguration of our body's response times and a reshaping of something as simple as our eye-hand coordination (Deleuze, 1986).

Foucault (2012) suggests that this is not a politically neutral shift. Instead, it is a mode of discipline that not only reshapes our bodies to conform to the requirements of an increasingly technological mode of production, but is also a method of social control in which we are gradually acclimated to ongoing supervision and training that becomes increasingly internalized. The modes of discipline initially exercised from the outside become standards of excellence and competence that define who we are and how we see ourselves. The ever-increasing speed of material production at all levels of society plays a role in obfuscating the relationship between self-discipline and social control.

Time

Our very conception of time is mediated in all historical periods (Casarino, 2003). Clock time, for example, mediates time within the industrial context, so that minutes and hours of labor can be monetized. There is very little need for clock time in traditionally agricultural contexts, where time is measured by daylight and the necessity to complete tasks between sunrise and sunset. The mediation here is the ability to read the light daily, but also in terms of seasonal changes in light that affects crop growth and the biological rhythms of animals and humans. The sense of time between the rhythm of the industrial clock and the rhythm of agricultural time holds radical variances in both speed and rhythm.

Perhaps the best example of this is the establishment of daylight savings time. The popular justification for switching the clock back an hour or forward an hour was premised on the need for farmers to have more daylight to work. However, agricultural time is not related in any meaningful way to clock time. Unlike a factory or a business, farms do not open or close in response to a clock.

The labor of a farm is not an hourly endeavor, but related to sheer production, and the time available to work is determined by light and weather rather than by the clock. Daylight savings was never about saving daylight for farmers. That was not ever necessary, and farmers have been one of the strongest political voices against daylight savings. The origins of daylight savings are due to attempts to save energy during wartime and the desire for hobby enthusiasts to have more free daylight time after work in the summer months (Livingston, 2019). In other words, these are investments premised on clock time.

What is of note to us here, once again, is the shift and tension between modes of production. In the mode of agricultural production, time is of a different nature, mediated by circadian rhythms and intensities of sunlight at different times of the day. In the industrial mode of production, time is mediated by the clock, and we get work and leisure defined by the factory clock that tells us when we must work and when we can have leisure. For the farmer, leisure occurs as dictated by task necessity. The farmer can relax when it is no longer possible or necessary to work. The industrial laborer can only relax when the clock time defined by the capitalists says work is done now.

It is important to point out that in the 21st century, the speed of material production is vastly increasing as we enter the virtual realm. As we move from industrial time to virtual time, there are new tensions and contradictions. Lohmeier, Kaun, and Pentzold (2020) sketch the complexities of temporal relations as we engage the world of virtual media. They note that it is not simply a matter of acceleration, although that has considerable implications for how we produce ourselves and are produced within a virtual context. They note that time and media constitute a complex nexus of contradictory struggles and ruptures. The newly emergent technologies speed up how information is processed and presented to us. We have instantaneous access to a seemingly infinite amount of data arriving through an array of screens at work, at home, in our hands, and on our wrists. The constant flow of information we receive via e-mails, texts, social media platforms, introjected advertisements and enticements, and internet searches we initiate as serious forms of inquiry or as casual exercises of curiosity move at astonishing speeds. We can process some of this information consciously, but it would be fair to say that quite a lot is processed subliminally and effectuates a range of unconscious processing modes.

However, Lohmeier et al. suggest that our sense of time is even more powerfully altered by what they call datafication. Datafication refers to how the information about our lives is processed through an ever-proliferating array of algorithms that automate how we make judgments, evaluate things, and most importantly, how we make decisions. The complex array of data processing points that we engage in during our daily lives gives us a powerful stream of constant data that overcodes our phenomenological experience of the life world and colonizes it with increasingly abstract modes of signification. These algorithmic forms of coalescing and processing the data of our lives are extracted from the field of our social relations and fed back to us, translated into capitalist sets of value. The way data is collected and processed operates outside of lived time.

In the virtual world of post-industrial capitalism, the algorithms deployed draw from our memories, our contemporary experience, and projections of future desire. The commonplace ad campaign that states or infers that the *future is now* is premised on how data about future probabilities is mediated through vast computer networks running possible scenarios of virtual futures at atomic speeds. In the virtual world, the future is continually being produced now and streamed to us in ways that collapse time into a series of temporal multiplicities that leave us disoriented and yearning for a way to enter the time of our lives as participants rather than subjects alienated from our own experience. The quantification and transformation of all of the elements of our lives into digital streams that simultaneously weave our nostalgia for a past that no longer exists into a future imploded into a present where we never arrive.

In his ever more prescient “Postscript on the Society of Control,” Gilles Deleuze (2017) refers to this as a society of infinite postponement. In his account, virtual capitalism seduces us into a world in which we are constantly denied any sense of actual accomplishment. The process of infinite postponement is a profound perversion of the logic of what Deleuze calls infinite becoming. Infinite becoming is a proliferating set of acts and expressions that have their origins in the sets of living relations that extend our capacities for expression. Infinite becoming, then, is quite different from the system of infinite deferral in which our capacities are brutally reconfigured to the necessities of a capitalist economy that leaves us in a state of lack and desperate longing.

Lohmeier et al. refer to this as a “form of colonizing the lifeworld in order to extract value from social relations” (p. 1522). They note that datafication is all pervasive and “marks a new stage of capitalism . . . [that] establish both new economic and temporal regimes that dominate globally” (p. 1522-23). We would note that this predatory mode of temporality not only controls our behavior but also has the capacity to reshape our kinesthetic rhythms and patterns of life. This may well provide access to our modes of unconscious desiring production. That is to say, this virtual process that collapses modes of temporality can seriously interfere with our conscious capacity for processing information. As our conscious mind is overwhelmed, the task of making sense shifts to the autonomic nervous system.

Those familiar with hypnosis will recognize this as a common trance induction. The hypnotist uses patter (script) that challenges the ability of our conscious awareness to create linear sense. As this occurs, our autonomic nervous system begins to pull us back from the confusion, causing us to “space out.” To alleviate the cognitive dissonance, the hypnotist suggests that we simply relax and let go, shifting the processing of information first to the body and then the unconscious.

We might also recognize this as a trauma response. We could certainly argue that the combination of speed, information overload, depersonalization of virtual information flows, and an autonomic sense of threat could be traumatic. The paradoxical formulation of this double imperative to let go and relax on behalf of virtual capital and to be hypervigilant on the part of our autonomic

nervous system may well create the current proliferation of anxiety, depression, and suicidal rage against ourselves and others we see in contemporary society.

Difference

If temporality constitutes one critical element in the practice of capitalist sorcery, then another vital element may be immersion in a world of absolute abstraction. Gregory Bateson (2000) tells us that communication is information that makes a difference. Similarly, Gilles Deleuze (1994) centers difference as the central element in the production of identity. However, difference for both these thinkers is not a binary delineation between pre-existing properties. Difference is the production of what we call *becoming capacity* or the material actuality of the virtual as infinite possibility. What is central for us here is that difference in the production of thought or materiality brings the virtual into actual thought or action. Alternatively, as a binary distinction, difference creates an abstract distinction rooted in language as, what Deleuze and Guattari (1987) call the *order word*.

Difference as a function of linguistic nominalization orders the world by defining this thing from that thing. We learn that things are differentiated from one another taxonomically and hierarchically. This mode of ordering the world into this versus that has a secondary effect. When we accept how we have used language as a function of society to order the world, we also engage in the process of ordering ourselves in relation to the world of difference rooted in language. As such, we begin to order our bodies, thoughts, and actions based on how we are taught to define ourselves; male/female, white/black, gay/straight, intelligent/stupid, rich/poor and so on. This binary ordering of the world situates vital elements of identity within an abstract framework of difference that reflects a set of power relations through which social relations are ordered. As an entirely virtual form, the world of cyber order works precisely within the development of abstract binary configurations that branch out in an always expanding network that orders us into categories of this vs. that in ever finer gradations. Of course, this abstract set of orders has powerful effects, but is held in dynamic tension and contradiction with the co-evolutionary imperatives of living difference.

In a recent book review of a book about Herbert Marcuse, Ian Parker (2022) notes an early formulation of how what was at the time emerging virtual capitalism orders reality. Marcuse describes a variation of reality that drives us to perform as an essential aspect of our identity formation. Prefiguring the work of Moeller and Ambrosio, Marcuse tells us that this is the mandatory drive to perform ourselves as “little masters of others and of ourselves” (Parker 2022, np). Of course, this is akin to the work done later by Judith Butler (2002). However, Marcuse adds what we see as an essential element of identity formation in our contemporary period: a claustrophobic recursive folding in on the self in an infinite series of folds or spirals that lock us into ourselves and alienates us from the world of living relations. Marcuse notes an element of

addictive propensity to this form of identity formation that appears to offer what Parker (2022) terms “an alluring and toxic illusion of freedom” (np).

For Marcuse, freedom in this accounting is premised on the freedom to express ourselves through our performances. However, the self-recursive nature of such performances is both profoundly insular and premised on predetermined social tropes. Our enjoyment is far from any relation to what Spinoza (2000) would term joy as the expression of the unique capacities of each body as unique and idiosyncratic singularities. Instead, our performances take all that makes us an unrepeatable assertion of living capacity and turns it to the dictates of capitalist necessity. As Parker (2022) notes,

This is, Marcuse argues, ‘controlled liberalization’ that is still repressive. It looks and feels like we are releasing something that has been channelled, ‘sublimated’ into this ‘vicious circle of progress’ of commodity culture, but it is repressive, it is what Marcuse calls ‘repressive desublimation.’ (np)

Repressive desublimation might well be the hallmark of social media within the identity formations of the 21st century. In Marcusean terms, repressive sublimation eradicates actual difference in Deleuzian or Batesonian terms. Any living fragments of difference as becoming are mediated and flattened into difference as sheer binary delineation. The move here is to take the force of living creative force as difference and translate it into the entropic linguistic formulations of sales and the money sign. Everything becomes a commodity, which opens vistas of appropriation into the realm of our capacities to think, create, and dream.

Psychology, Virtuality, and Consciousness

Luhmann (1995) refers to the social system that has emerged as virtual capital as a set of social relations radically dissociated from living things, but profoundly influential in how we order ourselves. In his work on the media, Luhmann (2000) describes a system that inadvertently exerts social control. Oddly, Luhmann posits the media as a recursive set of information flows that generates what he calls a *transcendental illusion*. In his formulation, the media produces a communication system built on binary distinctions between what is media and what is not. This system is built on observations that produce facts without directly engaging with what is observed. The media produces itself without regard to the living subjects that provide the foundation of its observations. For Luhmann, the media is sheerly technological and disseminates itself through an ever-proliferating and expanding system of mediating machinery that takes the becoming difference of life and reproduces it as an absolute binary abstraction. In this sense, it has no interest in what is true or false. The media is only interested in creating a binary difference that can be disseminated in ways that perturb the realm of living subjects and allow for more observational data that can be mediated into abstract formulations that create further perturbations. To produce

this binary difference, the media must search for information that goes beyond, and preferably violates, earlier information to create surprising or novel information that can be reported or disseminated. As Luhmann (2000) states, “The system presupposes itself as a self-producing irritation, without being accessible through its own operations, and then sets about transforming irritation into information, which it produces for the society (and for itself in society)” (p. 12).

When Luhmann wrote this in the late 20th century, the system he described was in its initial stages. Technology was advancing, but still being developed, and the human element in print and broadcast media still held a moderate if partial role. As we enter the second decade of the 21st century, it would be hard to disentangle our consciousness or sense of self from the escalating effects of our media-saturated environment. Certainly, we could read this as the historical moment Marx predicted in the *Fragment on Machines*, where human consciousness is embedded in a global network of machinery as modes of connectivity between machines. Marx (2005) states that,

The production process has ceased to be a labour process in the sense of a process dominated by labour as its governing unity. Labour appears, rather, merely as a conscious organ, scattered among the individual living workers at numerous points of the mechanical system; subsumed under the total process of the machinery itself, as itself only a link of the system, whose unity exists not in the living workers, but rather in the living (active) machinery, which confronts his individual, insignificant doings as a mighty organism. (p. 693)

The question for us is twofold: Does this shift in the mode of production call for a shift in the way we approach the political, and does psychology have a role to play? To both questions, we would answer in the affirmative and suggest that in the emerging cyber-dominated global capitalist society all questions of liberation must include an analysis of how our consciousness and the productive capacities of unconscious desire are being appropriated and exploited by the machinery we have been delineating so far. In this analysis, the place of psychology is founded on the role that psychology plays as the field of thought most engaged in how we understand and practice modes of conscious and unconscious awareness.

Although the unconscious has a history that dates back to antiquity, by inference, and was an element in the writing of romantic poets such as Schelling and Coleridge, it was the work of Freud that brought the concept into popular and professional parlance (Woodman, 1980). Over the past century, it has been psychology and psychoanalysis that has utilized the term as a significant aspect of theory and practice. That said, the American version of behavioral and neurological psychology has largely dispensed with the concept (Fuller, 1986). In our analysis here, we are reintroducing the term into a reading of contemporary psychology that opens it within contemporary readings of neurology and the brain.

To engage the question of psychology as a political project within the world of 21st-century cyberculture, we would suggest that the term politics requires some examination. As Foucault (2012) points out, politics is the assertion of

power in its manifestation as *puissance* (dominant power over) and as *pouvoir* (living creative force). In the first instance of *puissance*, we have the exercise of the power of constraint through the application of varying forms of violence, both physical and psychological. In the 21st century, this can take the form of physical war, torture, incarceration, or police action, among other forms of violence inflicted on the body. It can also take the form of psychiatric medication, cyberbullying, precarious labor, social instability, never-ending vistas of debt, and other forms of violence to our psychological and neurological sense of self. The double weaving of violent force to constrain and delimit the full capacity of what we can do takes both a state and corporate form, although the boundaries between the two are ephemeral at best. Indeed, we might follow Hardt and Negri (2001) in referring to the current form of dominant rule as a new form of Empire premised on the virtual capacities of cyber capitalism.

The fact that this form of Empire has opened new vistas of appropriation into the domain of what, in one term, we call our neurology, and in another term, our desiring unconscious has significant implications for politics in the 21st century and psychology in particular. In this regard, we would argue that the question of desire and its relation to the political becomes ever more pressing for a politics that asserts *pouvoir* against the dominating force of Empire's *puissance*.

The shift in the mode of production we have been outlining has taken the very definition of desire and produced a psychology of the cyber subject premised on a very particular reading of our subjectivity. The subjective desire of a global cyber Empire is rooted in a long lineage of philosophies of Empire and the state. The legacy of these modes of thought relies on a repudiation of the earth and materiality as an entirely sufficient autopoietic system in favor of an appeal to a transcendent realm of perfect form far exceeding the imperfect and corrupted Earth.

Desire and Lack

This lineage of desire always seeks greater degrees of perfection that cannot be fully attained, leaving the subject in an ever-present state of lack. Rather than seeking harmonious relations with the existing ecological system in which the subject is embedded, the lacking subject seeks to constantly "improve" the world according to a set of standards that bear little relation to the actual material conditions of lived experience. This constant drive to do more and better opens the subject as an insecure and definitionally insufficient form of subjectivity who never arrives, but is driven to meet expectations set by an abstract system of perfect form.

It is this world of abstract perfection that the current mode of production deploys to enter the world of desire rooted in lack and splays in infinite iteration across the cyber social. This is cyber capitalism as a relentless predator that feeds upon our deepest insecurities to access and mobilize the actuality of our desire, which is not founded on lack but plenitude. The field of politics becomes the

struggle between desire as the relational capacity to act rooted in the ecological force of life itself and desire as lack founded in a binary system of abstract dualities.

Framing political processes as ecologies of relational capacity opens a field of thought and action whose foci are the ongoing and unending tensions at all levels of contestation between abstract forms of becoming and becoming as the expression of living force. In positing political relations in this way, the political is seen as an inherent and ceaseless struggle. For those of us interested in liberatory modes of psychology, this infers that in the politics of the 21st century, any politics founded in forms of an ideal outside will be appropriated to the ends of cyber capital and used as a vehicle to induce the insecurity necessary to produce docile subjects overdetermined to use their creative living force in exchange for the promised utopias that never arrive.

If we are to read psychology within this framing of the contemporary political field, it is crucial that we determine psychology's function. We suggest that this requires reading it against the abstract field of disciplinary enclosure developed through its articulation as a handmaiden of industrial capitalism, as well as its permutations as a series of control logarithms within postmodern virtual capitalism (Deleuze, 1992). The aspect of psychology that produces it as simultaneously ideal for deployment by capital as an extension of the logic of rule and as a profoundly subversive set of possibilities lies in its articulation of states of consciousness, capacities for action, and the biomechanical production of deviance. In a discursive deployment of these domains of human activity and underlying structural capacity, each becomes what Deleuze and Guattari (1987) call an apparatus of capture. As we have noted, in producing them within the confines of language, they operate as the *order word* (Deleuze and Guattari, 1987). Each is subjected to taxonomic and hierarchical delineations that continually foreclose and delimit their social function.

For example, consciousness is created as a binary formation of the conscious and unconscious. The relation between the two is set out as the contestation between reason and unreason, savage, primitive desire and civilization, perversion and normality. Our capacities for subjectivity are founded in a prefigured structural incapacity for apprehending the actuality of our lived experience. Because that apprehension is defined as fundamentally linguistic, other modes and alternative ways of articulating ourselves are marginalized and subjugated.

Likewise, our capacity for action within the framework of traditional psychology is founded on a conflicted set of desires premised on the primary relations of lack we delineated above. Psychology places us against an ideal set of normative standards premised on the colonial registers of inherent competition and the drive to succeed and exceed the other, even when the other is ourselves. No act holds singular value as capacity. All acts are measured against an embedded system of value that valorizes profit. Our capacity to act is valorized to the degree it can be monetized through the particular mechanisms of appropriation within the development of capitalism. In other words, psychology will produce taxonomies and hierarchies of valorized acts differently under

industrial capitalism than it does under virtual postmodern capitalism. Different acts at different historical moments will be configured as an ever-proliferating field of diagnoses, exceptionalities, and mysteries.

For example, autism and ADHD emerged in the latter half of the twentieth century and expanded as both deficit (behaviorally in schools) and exceptionality (cogent sets of skills for working in the virtual environment). Indeed, these two diagnoses (autism and ADHD) open vast fields of research that use science's most reductive capacities to delineate and proscribe the biomechanics of our brain. Neuro-psychology is rapidly colonizing the discipline of psychology as the apparatus of control that reduces our capacities for experience to electrical transits and chemical exchanges in different regions of the physical organ delineated as our brain (Moncrieff, 2008; Sampson, 2016).

As one can see, this form of psychology is the emerging face of psycho-fascism in the 21st century. Where the psycho-fascism of the twentieth century sought to produce docile bodies that could be behaviorally molded to the factory, 21st-century psycho-fascism seeks docile forms of consciousness that can be appropriated to the exploitation and appropriation of capacities for social creativity. We contend that the trends we have noted above, are designed explicitly for the task of producing subjectivities willing and excited to develop soft skills and virtual social networks, cultivate an insatiable hunger for virtual experience, and to understand themselves as an infinite set of failed selves available for psychological intervention, correction, and training. To this end, we have created a psycho-fascist society as a giant asylum with all of us as the technicians of social control, self-diagnosing, self-medicating, self-isolating, and virtual-lobotomizing in the pursuit of absolute psychic alienation from a hostile and genocidal system of rule.

Towards an Alternative Psychology

At this point, the question is: Can psychology do something else? Can we develop a liberation psychology forceful enough to deinstitutionalize the global asylum of virtual capitalism? To answer this, we might begin with the definition of the brain that Deleuze and Guattari (2014) offer us in *What is Philosophy*. Arguably, the brain constitutes the central attention of the last century of psychological investment. Here, our behaviors originate, our thoughts emerge, and our emotions are configured. The geography of the physical brain has been mapped and re-mapped from phrenology to neuroscience. While there have been competitors for the attention of psychology from biomedical theories of disease, anthropological and social mappings, and psychoanalytic structures to genetic pre-figurations, we would argue that each of these, at the end of the day, arrives at the brain.

It is notable for our purposes here that Deleuze and Guattari conclude their explication of the philosophical with the brain. Deleuze and Guattari's argument is deeply and profoundly rooted in the psychological frameworks of gestalt, phenomenology, and emerging neuroscience. Their proposal is one in which the

brain eludes its description as a closed organic system. Instead, they suggest that we might read the brain as a site of entanglement for the production of the social preconscious. This preconscious is the set of virtual capacities derived from the ecological entanglements of the emergent self. It engages chaos and distills what Spinoza refers to as the unique capacities of the body to act and the mind to think.

This is what we have referred to earlier as Deleuze and Guattari's concept of desiring production, actualizing the virtual, or the emergent random configurations of life in process as the idiosyncratic subjectification of the social subject. This process lies outside our bifurcated conscious awareness and produces us at all levels throughout the body and its environs. It is precisely this that cyber capitalism seeks to appropriate and that always exceeds the binary capacity of abstract systems of dominance. In this, it is crucial for the cyber capitalist empire that our consciousness remains bifurcated, so that it can perform its acts of psychic savagery behind our backs.

However, suppose we begin to use psychology in an ecologically entangled manner. In that case, we might begin to open sets of living relations that exceed any attempt to wrestle them away from us. Our relations with all things material, including thought, might emerge, if we were to conceptualize the brain and our neurology as a site of connectivity, where our perceptions integrate as points of transit between an infinite system of ecological interconnectivity. To rethink the brain and neurology, we would want to remove the binary distinction between thought and sensation and open up the possibility of the brain as mind and mind as simultaneously affect and thought. That is, the brain as rooted in sensate vibration that travels in multitudinous directions across all dimensions of the living ecology in which we are embedded. Deleuze and Guattari refer to this as the brain-subject becoming "soul or force" (p. 211). In this realm of soul or force, in the sensate domain, a genuinely ecological psychology is proposed. Deleuze and Guattari tell us that, although not every organism has a brain, there is a network of sensations that produces the combination of all species as a collective brain that includes "vegetal tissues in the 'small species'" (p. 212). This field of "chemical affinities and physical causalities" produce resonating chains of force and what they term an "inorganic life of things" (p.212).

We wonder what a psychology would look like that was capable of apprehending and articulating the brain in these kinds of registers. What would be the political implications of a psychology that modeled itself on the brain as a "junction" between those planes of human endeavor that "cast nets across chaos." What if we were to see the field of psychology as a genuinely transdisciplinary set of propositions and practices? Would we be able to find the *becoming other* of psychology as a field of infinitely liberatory transits centered in a radical reconfiguration of the brain, thought, sensation, and experience? Would this be the ground for a politics of psychology that could plunge the abstract codifications of global capital into the immanent sphere of lived materiality?

Common Worlding

While we cannot point to a definitive example of what such a politics would look like, one initiative we find evocative is the Common Worlding collective initiated by Veronica Pacini-Ketchabaw (Taylor and Ketchabaw, 2018). The project draws a transdisciplinary collective of teachers, children, academics, and activists to engage the question of living in common with non-human species and the material world we inhabit. By engaging in collaborative activities with adults, children, and the world we share in common, the project weaves and entangles real-world experiences (i.e., the feel of water, earthworms, ash from a forest fire, mud), encounters with other species (deer and raccoons for example), legacies of anthropogenic environmental impacts, colonial land theft, global inequalities, art, and movement into platforms for early childhood pedagogies. Drawing on feminist proposals of posthumanist physics and biology (Barad, 2003; Haraway, 2003), the collective works to “reassemble worlds by countering the divisive distinction that is often drawn between sociocultural contexts and natural environments. It resists the epistemological division between society and/or culture as distinct from nature and other living things that underpins post-Enlightenment Western thinking” (Taylor and Pacini-Ketchabaw, 2018). In short, the collective entangles science, philosophy, and art in a bricolage of living force that we have articulated above as a form of politics. We would argue that projects such as this move toward opening lines of affect, thought, and expression that may well point towards radically new subjective positions firmly situated in materiality. Transdisciplinary projects like this seem to have suggestive resonances for psychology and a political project.

Psychology Inside Out

At the end of, *What is Philosophy?* Deleuze and Guattari tell us that to produce the becoming other of science, philosophy, and art, each discipline must engage a foundational relationship with the “No that concerns it” (p. 218). Suppose we are to enter into a political engagement with capitalism that creates it as strange to itself. That being so, we must first escape the way that it makes our discipline of psychology so familiar within the orbit of its twenty-first-century rule. To do that, we need a non-psychology that comprehends psychology from the inside out. We must apply the logic of immanent politics to our psychological science, philosophy, and artistic inclinations. Psychology must take its own relative deterritorializations to the absolute and make it pass over the plane of immanence as a movement of the infinite and suppress it as internal limit [so that it] turns back against itself so as to summon a new earth, a new people (Deleuze and Guattari, 2014 p. 99).

Psychology as a politics of immanence is set as a precise point of intersection and entanglement of science, philosophy, and art. As such, it has the virtual possibility of producing each discipline as indiscernible and unavailable to the appropriation and capture by the taxonomic regimes of capitalism. These

counter-intuitive politics do not necessarily charge barricades, overthrow governments, or speak truth to power. Instead, they locate psychology as a politics that sets the ground from which an onto-eco-logical system of rule might emerge that is premised on, what Foucault called the *actual* (Deleuze and Guattari, 2014). We need not be opposed to anything, but instead seek the entangled edges of our non-identity; the becoming other of psychology, psychologists, and, of course, ourselves.

From the technology of behaviour to surveillance capitalism: Psychology as a means of control in the digital era

Christos Krystallis & Nicole Sarla

Abstract

This paper delves into the transformation of behaviourism into surveillance capitalism and its implications for societal control in the digital age. By tracing the historical roots of behaviourism and its influence on modern psychology, the paper explores how surveillance capitalism leverages behavioural data and technology to manipulate human behaviour for profit. Ethical considerations regarding privacy, autonomy, and the power dynamics at play in this digital landscape are critically examined. Through an interdisciplinary lens that merges psychology and technology, this study illuminates the intricate interplay between subjectivity, power, and societal influence in the contemporary era of surveillance capitalism.

Keywords

technology of behavior, surveillance capitalism, behavioural economics, behaviourism, subjectivity

1. Introduction

Behaviourism arose when psychology struggled to be established as a scientific discipline. Behaviourism was only one among the various branches of psychology that emerged at the field's beginnings.¹ As Danziger explains, the adoption of the concept of behaviour early in the 20th century facilitated the disjunction between the inner and the outer aspects of human action at its most extreme form, "spawning, first, a 'systematic' introspective psychology of consciousness, and then, in an almost immediate reaction, a radical behaviourism that equated action with observable movement." (Danziger, 1997: 145). The idea that psychology is the science of behaviour enabled a more positivistic vision of

¹ Various approaches arose within the foundation of psychology (psychoanalysis, Gestalt psychology, systemic theory, cognitive psychology, etc.). Our focus on behaviourism derives from its relevance to behavioural economics and surveillance capitalism in the digital era and the application of its theoretical implications on the use of psychology as means of control.

psychology as a natural science, distancing itself from –what was considered to be– an occult character of inner experience. Behaviourism’s main focus was on *observable* behaviour: whether it was because of the inaccessibility of mental phenomena (methodological behaviourism) or because of the reduction of all mental phenomena to observable behaviour (radical behaviourism) (Hergehnahn, 2009). More importantly, as Watson (1913), who popularised the theory of behaviourism, proclaimed, its goal –as a branch of natural science– was the prediction and control of behaviour. This was no incident; behaviourism and neobehaviourism –until the advent of its alleged rival, cognitive psychology– attempted to make sense of why people behave the way they do by postulating that behaviour can be analyzed, predicted, and controlled by understanding the organism’s current structure and the control of the environment over it (radical environmentalism). This was the basic concept that behaviourism bequeathed not only to psychology but to the intellectual background of the 20th century.

The digital transformation of this century irreversibly transformed the private and social life of the individual. Many digital technologies in one way or another are based on some type of psychological knowledge. Whether it is the understanding of the mind in order to build an intelligent agent or the analysis of the behaviour of the platform’s user in order to create a profile for prediction and control of behaviour. What is of most importance in all of these cases is the cooperation between technological advancements and psychological approaches and the multiple consequences of such a cooperation (epistemological, social, psychological, etc.). In this respect, the question arises concerning the specification of the type of psychological knowledge applied in the aforementioned cooperation.

One distinctive example of a relevant analysis is Zuboff’s *The Age of Surveillance Capitalism*, where the emergence of surveillance capitalism and the related multilevel transformation are closely examined. In this argument the role of behaviourism in the function of the Artificial Intelligence (AI) systems used by the platform becomes central. Different theories conceptualizing cognition and intelligence have influenced the development of AI. Symbolicism focuses on the hypothesis that a physical symbol system has the necessary means to generate/exhibit general intelligent action (Shi, 2011: 10); connectionism –as part of cognitive science– focuses on parallel processing of sub-symbols and its models are based on a neurophysiological approach of the brain (Medler, 1998); behaviourism focuses on intelligence without representation, without reasoning and promotes the idea “that intelligence is determined by the dynamics of interaction with the world.” (Shi, 2011: 11). In researching the relationship between science and society, specifically when trying to clarify the mechanisms that work beneath the surface and enable the use of science –in this case, psychology– as means of control in the digital era, one important concept comes to the foreground: *subjectivity*. Based on the aforementioned, the focus on behaviourism derives from the interest in defining what constitutes the specific interaction of the intelligent agent (whether it is a human or a machine) with the world. More specifically, within the foundation of behaviourism, a passive nature is attributed to the subject and, consequently, a specific conceptualization of

subjectivity by behaviourism is established.

Another aspect of this conceptualization concerns the use of the notion of the *individual*. The relationship between environment-society and the individual-subject appears to be external. Within the theoretical framework of psychology, two different and contradictory approaches to this relationship can be found: either the environment-society defines the subject's inner life (radical behaviourism), or the individual is considered to be structurally detached from their environment, with the potential of willingly "entering" social environment (individualistic psychological approaches). The idea of the disjunction of the environment-society and individual-subject is highly problematic mainly for two reasons. Firstly, the notion of the individual is historically transformed, acquiring its detached character with the separation of the private and the social sphere, which separation reflects specific social relations (see Dafermos, 2012); secondly, an individualistic conceptualization of the subject misses out on the structurally significant part of social environment on human psychological (and not only) development. As Marx writes in his 6th thesis on Feuerbach "[...] the human essence is no abstraction inherent in each single individual. In its reality it is the ensemble of the social relations" (Marx, 1845). More than thirty years before the foundation of the first experimental psychological laboratory that studied conscious subjective experience, Marx identified the simplest, most important, and at the same time most difficult idea that psychology would encounter since its birth: the fact that the subject is defined within social relations.

The idea that the world gives birth to subjectivity and therefore subjective experience has been an issue that many psychological theories attempted to integrate one way or another and to some degree. To name some examples, in Lacanian psychoanalysis "The subject is not simply determined by the structure. To become a subject, one must take a position in relation to the desire of the Other" (Homer, 2005: 74). At the same time, systemic approach emerged as a critique to psychoanalytic practice and transcended what was considered to be an individual-centered approach and the boundaries of the individual mind by examining some phenomenon or appearance "within the context of all completed circuits which are relevant to it" (Bateson, 1971: 244). However a view that transcends the individual-society division in psychology requires more than transcending the boundaries of the individual. It requires a different perspective on the process and the content of internalization by the subject as a social being, as well as its activity as a social being. This perspective has been systematically undermined by behaviourism since conceptualizing the subject as a social being transcends its total determination and control by the environment; it refers to the interaction between subjectivity and the social environment. Aspects of this undermining can be traced also to behavioural economics and surveillance capitalism where the focus turns to specific characteristics of the subject, those that can be utilised in specific social and economic processes.

In this paper, we examine the question of how psychology can be used as a means of control in the digital era by investigating the conjunction between behaviourism, behavioural economics, and surveillance capitalism, all of which

share a behaviouristic background as well as a relation to technological advancements related to prediction and control of behaviour. In this respect, the notion of subjectivity emerges, not as a notion thematised by these approaches. On the contrary, we argue that behaviourism, behavioural economics, and surveillance capitalism, all three converge on the *abolition of subjectivity*. When investigating this process, we focus on the status of subjectivity in the aforementioned approaches: how it is conceptualised, which of its aspects are set aside, as well as the consequences of this conceptualization. The latter constitutes a rejection of those aspects of the human being that refer to will, intentionality, the uniqueness of subjective experience, as well as the social character of the process of internalization. Discussing different theories of the production of subjectivity is beyond the scope of this paper. Instead, for the examination of psychology as a means of control in the digital era we find it very useful to highlight conceptualizations of subjectivity as they appear in the most prominent analyses related to the topic. This enables outlining the characteristics of psychology that these analyses exclude from the examination, which therefore helps us outline a conceptualization of the subject of politics that needs to be preserved when considering the use of psychology as a means of control.

Based on the aforementioned in this paper, we will briefly present the emergence of behaviourism in psychology and Skinner's vision underlying the establishment of the science of behaviour as well as the appearance (or lack) of the concept of the subject. Next, we will examine the emergence of behavioural economics and highlight convergencies and divergencies between behaviourism, behavioural economics, and cognitive psychology in order to examine the role of subjectivity in these approaches. In the last section, we examine Zuboff's analysis of surveillance capitalism and the economics of the different platforms in order to outline the process of applying behaviourism –an incidentally technocratic psychological approach– as a means of control in the prevailing digital era.

2. From behaviourism to cognitive psychology

2.1 The historical transitions in psychology

Behaviourism emerged as an alternative to the dispute between structural and functional psychology (see for example Hergenhahn, 2009, Ch. 9, 11-12), highlighting the quagmire into which psychology had sunk. John Watson (1878-1958) was the introducer of behaviourism in North America; in his famous article *Psychology as a behaviorist views it* (1913) he attributed psychology's dead-ends to the "erroneous" research method that psychology had adopted –i.e. introspection– and its also "erroneous" subject matter –i.e. consciousness. He proposed a solution based on the principles of behaviourism which were founded within the context of adopting experiment as a methodology and observable behaviour as the subject matter of psychology, aiming to *control* and *predict* behaviour (Watson, 1913). Behaviourism's programme was based on the idea

that both the control and the prediction of behaviour were founded on determining the laws that govern the stimulus-response (S-R) relationship. The rejection of consciousness as the subject matter of psychology was associated with the idea that consciousness drives or causes behaviour. The main premise of behaviourism lies in the conception that it is learning that is critical for the emergence of behaviour and behaviourism was founded on the concept of “classical conditioning” which refers to learning as a process of events correlated based on the laws of associationism. In that way, the “psychology of consciousness” became the “psychology of stimulus-response”.

Burrhus F. Skinner (1904-1990) expanded behaviourism with his theory of operant conditioning. Skinner describes succinctly the idea of operant conditioning of behaviour: “When a bit of behaviour has the kind of consequence called reinforcing, it is more likely to occur again” and, subsequently, he distinguishes between positive and negative reinforcing (Skinner, 1974: 46). As we shall see, Skinner focuses on positive reinforcement for the modification on behaviour. What is most important is that for Skinner explaining behaviour in terms of operant conditioning is not simply described within the context of the relationship between stimulus, response, and the reinforcement that took place for the response (behaviour) to appear. For Skinner the process of reinforcement is not associated with the feeling of good; it is the *survival value* of the reinforcement that’s of most importance in Skinner’s behavioural theory. The prominent role of evolutionary theory, instead of the psychological aspect of subjective experience for explaining behaviour, can be discerned in the following passage: “The behavior occurs because appropriate mechanisms have been selected in the course of evolution. The feelings are merely collateral products of the conditions responsible for the behavior” (Skinner, 1974: 47).

What becomes clear is the mechanistic approach to which behaviourism yields. Within this mechanistic approach, the subject is the sum of responses to external stimuli; the appearance of behaviour is the only important concept for the study of behaviourism –although Skinner would oppose the concept of *concept* since it implies the existence of an inner structure that processes the concept itself. This becomes clear when Skinner discusses motives as something we infer from the behaviour, a mentalistic concept that we don’t know exists since all we are aware of is that a person “behaves energetically” (Skinner, 1974: 51). It is this emphasis on observable behaviour, and subsequently the rejection of any inner structure that leads behaviourism, on the one hand to naive empiricism and on the other to the promotion of a passive nature of human beings. To be exact, by focusing only on the mechanisms selected in the course of evolution and relating them to the concept of reinforcement, as well as by focusing on the behaviour, leaving aside subjective experience, behaviourism equips its theoretical framework with a passive organism that relates with its environment only to absorb and react.

Cognitive psychology is usually viewed as contradictory to behaviourism since it moved from the extraneous S-R relation to the intrinsic stimulus–stimulus (S-S) relation, which was grounded on the investigation of mental processes previously rejected by behaviourism. This is based on the idea that the

“cognitive revolution” was so radical that it overthrew behaviourism, a claim rejected by some historians who describe cognitive psychology more as sophisticated behaviourism (Leahey, 1992), rather than a contradictory theory to it. By the 1960s, after the “cognitive revolution”, the formation of cognitive psychology led to accomplishing what psychology had started the previous century: psychology was always, in a sense, cognitive; it was only behaviourism that distanced psychology from mental life. But, at the same time, behaviourism developed a conceptual apparatus that would follow psychology for a long time.

The term “cognitive psychology” was coined by Ulric Neisser (1928-2012) in his book *Cognitive Psychology* (1967). As Hyman states in his introduction to Neisser’s book, “the cognitive movement was a scientific revolution and Cognitive Psychology became the rallying cry for the cognitive revolution.” (Hyman, 2014: xv) Neisser integrated recent work concerning cognition which “refers to all the processes by which the sensory input is transformed, reduced, elaborated, stored, recovered, and used” regardless of the presence or absence of the stimulus (Neisser, 2014: 4). The concept of information processing was the foundation for this development.

If we tried to summarise in just one sentence behaviourism’s critique of cognitive science and any kind of scientific theory related to it, we would focus on the concept of *subjectivity*. Behaviourism was based on the emphasis on the role of the environment and on discovering the rules that govern the S-R relationship through the concept of operant conditioning by rejecting any other level between stimulus and response. Psychology of consciousness, which preceded behaviourism, reserved a unique place for subjectivity by studying the phenomena and the contents of consciousness (see for example the work of Wilhelm Wundt (1879-1920) and William James (1842-1910), two of the most prominent psychologists who studied consciousness: James, 1950; Wundt, 1897). Although the psychology of consciousness didn’t focus on the formation of a theory of subjectivity, by retaining consciousness as its subject matter and introspection as its method, it preserved a place for subjectivity as a level of inquiry evaluated as important and scientific. Behaviourism’s attempt to make psychology an objective science, minimizing the importance of subjective experience was one of the many aspects of the abolition of subjectivity. Interestingly, behaviourism’s programme, though very influential, didn’t manage to supersede the emphasis on a level of subjectivity in psychological inquiry. Cognitive psychology emerged as a revisit to this subjectivity by focusing on the level of processing of information (see Lachman, Lachman & Butterfield, 1979).

Although cognitive psychology didn’t reject the subjective level of experience, questions arise concerning the narrow, dualistic, fragmented understanding of consciousness that had already been established before its disappearance and the way that this understanding influenced, limited, or liberated the examination of consciousness later on. As we shall see, this ambiguity also applies to behavioural economics since there exists a level of mental life, a type of processing, but the focus on response –and most importantly the beneficial behaviour and ophelimity– leaves aside subjective experience itself.

Though Skinner advanced the study of behaviour, we won't go beyond the line by saying that what he was aiming for was more than just establishing scientific psychology and understanding behaviour for the sake of scientific knowledge. His most aspiring goal was to transform humanity and society based on his diagnosis of what's wrong with it and his pessimism about where human beings are driving themselves. This is why beyond conditioning one of the most important ideas that Skinner launched was that of the *technology of behaviour*; for that technology of behaviour to be accomplished, subjectivity needed to be abolished.

But before we go further into this, it is important to detect and comprehend the underlying idea of Skinner's thought concerning humanity, society, and what a solution would look like in his view. In what follows we will describe Skinner's utopia for the perfect programmable behaviour which is further contextualised by his idea of the technology of behaviour. This will set the scene for the examination of behavioural economics and their relation to behaviourism and cognitive psychology, from which conclusions are drawn concerning their sui generis interrelation.

2.2 Skinner's utopia

The American philosopher David Thoreau (1817-1862) is widely known for his book *On the duty of civil disobedience* (1849), where he expressed, perhaps for the first time, his belief that citizens should not entrust the government or the state with the responsibility of organizing their daily lives. In this way, their conscience is dulled. A few years later, Thoreau wrote a short story entitled *Walden* (1854). There we find the following paragraph:

If there is not a new man, how can the new clothes be made to fit? If you have any enterprise before you, try it in your old clothes. All men want, not something to do with, but something to do, or rather something to be. Perhaps we should never procure a new suit, however ragged or dirty the old, until we have so conducted, so enterprised or sailed in some way, that we feel like new men in the old, and that to retain it would be like keeping new wine in old bottles. Our moulting season, like that of the fowls, must be a crisis in our lives. The loon retires to solitary ponds to spend it. Thus also the snake casts its slough, and the caterpillar its wormy coat, by an internal industry and expansion; for clothes are but our outmost cuticle and mortal coil. Otherwise we shall be found sailing under false colors, and be inevitably cashiered at last by our own opinion, as well as that of mankind. (Thoreau, 1995)

To write the above, Thoreau distanced himself from civilization to be close to (his) nature. There what is not necessary disappears and people can be frugal but with such harmony and precision that all their needs and desires are met. Issues such as interest in new clothes would be secondary as people could easily find something to be without worrying about consumption.

On the other hand, we would be willing to let Thoreau and his concept of

natural life and life in nature be forgotten in the distant 19th century. Paradoxically, however, almost a century after the publication of *Walden*, B.F. Skinner would write his utopia and call it *Walden Two* (1948). Skinner identifies in Thoreau's book a common vision: the vision of a fully automated society regulated by the physical rules of the human's natural state. Life in the natural state is perfectly functional and programmed; what to the common mind seems like a compulsion, for Skinner is absolute freedom.

Let us take a look at the way Skinner answers the question of dress and aesthetic diligence in open conversation with Thoreau's *Walden*:

But isn't dressing up precisely the sort of unnecessary trouble that a Utopia should dispense with?" said Castle. [...] "It really isn't so much trouble," said Mrs. Meyerson. "Our dress isn't severe; it's just enough to meet current standards." "And we have time for trouble," said Frazier. "You're thinking of dressing in the usual rush, after driving home from a late appointment at the office through rush-hour traffic to reach a dinner party in time for cocktails. None of that here, you see. We have plenty of time for everything. We like a break between the active part of the day and the quieter social hours at dinner and in the evening. A bath and a change are an important point in the day's schedule. They are psychologically refreshing. (Skinner, 2005: 30- 31)

Unlike Thoreau, Skinner identifies the functionality of the change of clothes and integrates it organically into the programming of society. Clothing rotation is psychologically refreshing and enhances the sense of satisfaction that community members derive from their daily activities. People are looking for something to be.

Zuboff writes very characteristically when commenting on Skinner's utopia:

Skinner's utopia was meant to illustrate the possibility of a successful social order that transcends the use of force and rejects the need to dominate human souls. The *Walden Two* community equally disdains the practices of democratic politics and representative government. Its laws are derived from a science of human behavior, specifically Skinner's own radical behaviorism, founded on the physicist's ideal of the Other-One. His utopia was a vehicle for other ambitions as well, intended to illustrate the behavioral solutions that are essential for improvement in every domain of modern life: the nuclear threat, pollution, population control, urban growth, economic equality, crime, education, health care, the development of the individual, effective leisure. It aimed to cultivate "the good life," for which all the ideals of a liberal society—freedom, autonomy, privacy, a people's right to self-rule—must be forfeit. (Zuboff, 2019: 374)

In the 1976 introduction, Skinner will reveal something else –something extremely important. *Walden Two* is not just a utopian short story. It is a political utopia in conversation with one of the greatest economists of the 19th century. Skinner is in conversation with Thomas Robert Malthus (1766-1834), a fact made explicit by a brief mention of Malthus' name very early on, at the beginning of his introduction and developed emphatically thereafter:

The first is from Henry David Thoreau's *Walden*: by reducing the amount of goods we consume, we can reduce the amount of time we spend in unpleasant labor. The second appears to assert just the opposite: we must all consume as much as possible so that everyone can have a job. I submit that the first is more reasonable, even though the second is defended by many people today. Indeed, it might be argued that if America were to convert to a network of small communities, our economy would be wrecked. But something is wrong when it is the system that must be saved rather than the way of life that the system is supposed to serve. (Skinner, 2005: xiv)

The utopia of a behaviourally programmed society is a political programme toward a cultural change that responds to the problems that Malthus warned society about in the early 19th century (Malthus, 2015). The behaviourally programmed society is a proposal for birth control, for the regulation of the population's behaviour, for the regulation of consumption to the rates of production. In other words it is a remedy for every crisis of the capitalist mode of production.

2.3 The technology of behaviour

Skinner presents the technology of behaviour as a postulate that arises from the contemporary development of society. For Skinner, the idea of a technology of behaviour comes as a necessary development for the survival of the culture and the possibility of solving the difficult problems it deals with:

[...] beyond the accomplishments of the individual, we must take into account where the culture as a whole is going and just to be happy, just to feel free, just to feel worthy will not deal with all of the problems that face us. Beyond freedom and dignity lies the future and that is what we must take into account we must make sure that human behavior will be so designed that will maximize our chances to solving our problems and leaving a decent world to the people who follow us. (Skinner, 1971)

In Skinner's thought –that coincides with the thought of the behavioural economists– the development of hardcore Science is bound to their political proclamation. This means that the development of an empirical science founded on hardcore empirical data was a presupposition for the political proclamation of the two approaches.

Skinner's discussion of the technology of behaviour is related to the diagnosis of the terrible situation that humanity is headed: "In short, we need to make vast changes in human behaviour, and we cannot make them with the help of nothing more than physics or biology, no matter how hard we try" (Skinner, 1971: 10). Skinner creates a special place for psychology to determine the future of humanity: psychology as a behavioural science can lead the way to envisage the problems of society that are being deteriorated by political choices. Skinner attacks any psychology that is not a psychology of behaviour for muddying the

water and delaying the development of a truly scientific psychology through which the technology of behaviour will be possible.

Two characteristics are fundamental for the technology of behaviour: *environment* and *control*. One of behaviourism's main contributions to psychological knowledge is the role of the environment in human development and how it puts human-environment interaction in the spotlight. Radical environmentalism supports the idea that human behaviour is caused by environmental experiences. Radical environmentalism combined with radical behaviourism promotes the idea that every experience is as experienced, leaving aside any mentalistic concept, and denying any inner experience as such since all mental, inner experiences are physical and bodily ones. The interrelation of control and environment come together to advance psychological knowledge since "our increasing knowledge of the control exerted by the environment makes it possible to examine the effect of the world within the skin and the nature of self-knowledge" (Skinner, 1974: 17). It's not only that environment causes behaviour, but also that the fact that behaviour can be controlled provides a precedent for the manipulation of the environment for behaviour to be controlled.

For Skinner, the emphasis on the environment is intertwined with the foundations of scientific psychology. By centering examination on the environment, Skinner lays the groundwork for scientific psychology to study the physical systems and conditions under which the human species evolved, as well as the contemporary conditions in which humans exist (Skinner, 1971). This allowed the connection between behaviourism and evolutionary theory. One of the most important characteristics of the role of environment in behaviourism is that "the environment not only prods or lashes, it selects. Its role is similar to that in natural selection" (Skinner, 1971: 24).

This is where control comes into the foreground. If every psychological phenomenon can be reduced to behaviour, and the environment plays a crucial role in the formation and emergence of behaviour, it follows that manipulating the environment can lead to desired behavioural outcomes. This is the foundation of the technology of behaviour: the engineering of even more control of the environment to control and predict behaviour. This is the point where Skinner's theoretical edifice meets Watson's proclamation of behaviourism.

For Skinner, the engineering of control is deeply related to the essence of the technology of behaviour serving the survival of culture. The purpose of the structure is to create a spot for applying positive reinforcement to the modification of behaviour for the benefit of society. This is why, according to his view, control is desirable, and more of it is needed. As he explains:

What is needed is more control, not less, and this is itself an engineering problem of the first importance. The good of a culture cannot function as the source of genuine reinforcers for the individual, and the reinforcers contrived by cultures to induce their members to work for their survival are often in conflict with personal reinforcers. (Skinner, 1971: 173)

Since Skinner has identified the great danger of the degeneration of the culture

and society and the solution of technology of behaviour, his scheme serves the goal with which he started. But what is often omitted is the conservative character of his structure –both politically and epistemologically. His tendency towards conservatism interestingly appears when he examines the purpose of the evolution of the culture and the subject's role in it:

A culture which for any reason induces its members to work for its survival is more likely to survive. It is a matter of the good of the culture, not of the individual. Explicit design promotes that good by accelerating the evolutionary process, and since a science and a technology of behavior make for better design, they are important 'mutations' in the evolution of a culture. If there is any purpose or direction in the evolution of a culture, it has to do with bringing people under the control of more and more of the consequences of their behavior. (Skinner, 1971: 142)

Skinner's use of the technology of behaviour is applied towards the preservation of culture as it is, without any deep and essential modifications, apart from integrating the benefit of others into the control of behaviour. Skinner is unable to comprehend the contradictions he observes in society, leaving him with a technology of behaviour that should avoid these contradictions for the preservation of culture and society fundamentally as it is, with minor modifications, which constitutes the conservative character of behaviourism.

When we assume that behaviour is solely controlled by the environment, the next logical question is how to exercise control humanely and determine the optimal behaviours to reinforce. This is where Skinner left and from where behavioural economics continued. But the fault lies in accepting the first premise: *behaviour is controlled by the environment*. Skinner's radical environmentalism rejects every inner structure (conscious or unconscious) as non-existent and everything is defined by external contingent stimuli. On this ground, there is nothing worthwhile in the inner structure that can define behaviour, psyche, mental functions, etc. This is related to the abolition of subjectivity, which in turn constitutes a specific type of subjectivity. The subject is then conceptualised by behaviourism as passive since its main characteristic is that it can be molded according to one's desires and there is nothing within the subjectivity's structure able to resist this manipulation.

In a way, subjectivity –as a psychological level related to will, consciousness, motives, etc., and not simply observable behaviour– could operate as an obstacle to the application of the technology of behaviour and the entirety of the programme of behaviourism. This becomes more explicit in the attempt to apply behaviourism beyond the field of psychology, in economics.

3. The birth of behavioural economics

3.1 A new foundation for economic science

Daniel Kahneman (born in 1934) became the first psychologist to be awarded the

Nobel Prize for Economic Science in 2002. Fifteen years later, Richard Thaler (born in 1945), Kahneman's colleague and co-inventor of the field of Behavioural Economics, will also receive the Nobel Prize. So it seems that the 21st century finds psychologists in a privileged position of interlocutor with a seemingly alien scientific field to them: economics.

The relationship between economics and psychology, although it extends over time and can be traced back to Adam Smith's work, *The theory of moral sentiment* (1759), does not acquire a systematic relationship until the emergence of a new field of research: behavioural economics.² Richard Thaler in his book *Misbehaving: The making of behavioral economics* (2016) accurately presents the history of the organised meeting of the two disciplines in the 1980s in the USA.

Despite years of processes and the deep common philosophical horizon of the two disciplines, one could claim that the birth of behavioural economics occurred at the moment when Richard Thaler met Hal Varian –the later proponent of Google economics– and the already famous Robert Stiglitz, who invited them to participate in the founding of a new journal for economic theory, the *Journal of Economic Perspectives*. The first issue of the journal in 1987 features a column with the curious title *Anomalies* and the signature of Richard Thaler. Thaler begins his article with a reference to the following passage, which he attributes to Thomas Kuhn: "Discovery commences with the awareness of anomaly, i.e., with the recognition that nature has somehow violated the paradigm-induced expectations that govern normal science" (Thaler, 2015: 171). In this way, he established a direct association with the revolutionary aspect of Kuhn's work.

The reference to Kuhn, although it sounds paradoxical, should not impress us. Kuhn was particularly popular as his book, *The structure of scientific revolutions* (1962), was and still is of interest to researchers in all scientific fields. Thaler, however, had more incentives for a reference to Kuhn. He believed that the foundations of economics were not stable and that a small scientific revolution, a Copernican turn, was needed for economics to achieve a stable foundation –which is very similar to behaviourism's diagnosis of the situation in psychology, although Kuhn's work was not available at the time. The reference to Kuhn was thus a declaration that neoclassical economics had collapsed: the theory that underpinned that the economic actors can decide rationally and that attempted to organise economic science within the foundation of the anthropological type of Homo Economicus had nothing to say for the economic actors of the time and was more of an impediment for economics. Thaler frankly describes his ambition:

My goal was much more modest: just get a few more papers published and begin to establish the case that adding some psychology to economics was an activity

² Although there are many essential differences between Smith's political economy and behavioural economics, one of the most prominent ones, which also concerns epistemological issues, is the mixed methodology that Smith adopts, combining deductive and inductive reasoning, history and theoretical analysis to develop his, admittedly, individualistic theory of economic development (Fine & Mylonakis, 2009) contrary to the reductionistic approach of behavioural economics.

worth pursuing. But I had certainly read Kuhn's path-breaking book *The Structure of Scientific Revolutions*, and had wondering whether anything like a paradigm shift could ever be possible in economics. (Thaler, 2015: 168)

The journey that culminated in the two Nobel Prizes of the 21st century began with the launch of a successful column in a new magazine in 1987. More importantly, it begins with the establishment of a community of economists who begin to negotiate economics while rejecting the rational choice theory of economic actors. But if Homo Economicus is not the starting point, what can be the foundation of a new economic science?

3.2 From the normative to the descriptive theory of decision

Daniel Kahneman in his book *Think, Fast and Slow* (2011) explains in detail the rupture he attempts to make in the foundations of economics. He has already realised that the term *utility*, which economics has included from its very birth, needs to be formulated more clearly. He elaborates with an example:

My fascination with the possible discrepancies between experienced utility and decision utility goes back a long way. While Amos and I were still working on prospect theory, I formulated a puzzle, which went like this: imagine an individual who receives one painful injection every day. There is no adaptation; the pain is the same day to day. Will people attach the same value to reducing the number of planned injections from 20 to 18 as from 6 to 4? Is there any justification for a distinction? I did not collect data, because the outcome was evident. You can verify for yourself that you would pay more to reduce the number of injections by a third (from 6 to 4) than by one tenth (from 20 to 18). The decision utility of avoiding two injections is higher in the first case than in the second, and everyone will pay more for the first reduction than for the second. But this difference is absurd. (Kahneman, 2011: 418)

Based on the aforementioned, Kahneman argues that we should refer to utilitarianism in two different forms: in terms of experience and in terms of decision. He goes further to explain that these two forms of utilitarianism arise as our thinking is divided into two systems:

System 1 operates automatically and quickly, with little or no effort and no sense of voluntary control.

System 2 allocates attention to the effortful mental activities that demand it, including complex computations. The operations of System 2 are often associated with the subjective experience of agency, choice, and concentration. (Kahneman, 2011: 22)

So if Economic Beings have a powerful System 2 that can regulate every human reflex, Real Beings (us) have a lazy controller System 2, which most of the time fails to respond to the complexity of System 1. Kahneman's (and Thaler's) project is to attempt to ground economic science on the actual behaviour of real

people. In a way, the entirety of the project of behavioural economics relies on the transition from the *ideal economic beings* to the *real human beings* that correspond with the economic actors.

For Thaler, this transformation constitutes a move from a normative to a descriptive theory of human behaviour. The great opponent in this process was the great mathematician John von Neumann (1903-1957), who in his book *Theory of Games and Economic Behavior* (1944), formulates the theory of expected utility. Thaler describes von Neumann's project as follows:

The way that von Neumann and Morgenstern created the theory was to begin by writing down a series of axioms of rational choice. They then derived how someone who wanted to follow these axioms would behave. The axioms are mostly uncontroversial notions such as transitivity, a technical term that says if you prefer A over B and B over C then you must prefer A over C. Remarkably, von Neumann and Morgenstern proved that if you want to satisfy these axioms (and you do), then you must make decisions according to their theory. The argument is completely convincing. If I had an important decision to make—whether to refinance my mortgage or invest in a new business—I would aim to make the decision in accordance with expected utility theory, just as I would use the Pythagorean theorem to estimate the altitude of our railroad triangle. Expected utility is the right way to make decisions. (Thaler, 2015: 29)

In contrast to this approach, Thaler proposes building a descriptive theory for human behaviour. Most people know what the Pythagorean Theorem is, yet they do not perform their daily necessary calculations based on it. Similarly, although most people, if they had the time, energy, and patience to calculate, would weigh their choices better, they still make decisions given their circumstances and their strengths. The mission of behavioural economics is therefore to describe the actual decision-making process of real people and draw up a theory based on it.

Therefore, they do not start from an axiomatic conception of how people decide—how we decide—but start from an experimental project that attempts to study how people negotiate their daily dilemmas through interviews and empirical research. In doing so, they find that human behaviour is pervaded by patterns that overturn attempts to interpret it according to the principles of expected utility theory.

3.3 Behaviourism, behavioural economics, and the bridge with surveillance capitalism

Both Skinner's behaviourism and behavioural economics set new foundations for the disciplines they address. The new foundation of radical behaviourism is characterised by the absolute rejection of any internal structure and the absolute identification of behaviour with the situation that causes its appearance, which can be traced back to the contingent reinforcements from the external environment. The new foundation of economic thought is characterised by an

emphasis on empirical studies to see real people, within which a conceptualization of decision-making arises.

Skinner's rejection of any psychological inner structure aligns with his suggestion that freedom and dignity constitute impediments to the development of a technology of behaviour. The special position of scientific psychology once again came to the foreground. The abolishment of prescientific terminology associated with freedom and dignity will guarantee not only the development of a scientific psychology (i.e. psychology as a science of behaviour), but it will also guarantee the development of a technology of behaviour, the endgame of behaviourism. As he frankly stated, the technology of behaviour:

[...] will not solve our problems, however, until it replaces traditional prescientific views, and these are strongly entrenched. Freedom and dignity illustrate the difficulty. They are the possessions of the autonomous man of traditional theory, and they are essential to practices in which a person is held responsible for his conduct and given credit for his achievements. A scientific analysis shifts both the responsibility and the achievement to the environment. (Skinner, 1971: 30)

Skinner fully undermines and downgrades any sort of inner structure –the psyche, the consciousness, and its contents– as well as any sort of value system related to the behaviour exhibited by human beings. For Skinner, the traditional theory about human beings –i.e. the subject of modernity– is deeply flawed when attributing motives and responsibility to the subject, since the subject is only the outcome of its environment.

The same can be discussed for the understatement of System 2 thinking by Kahneman since System 2 is characterised as a “lazy controller.” Following Kahneman's mode of writing, the best way to describe his degradation of System 2 is by presenting an empirical study. Kahneman (2011) presents a study where judges were reviewing applications for parole and the rate of acceptance and rejection of the applications was correlated with the food breaks of the judges, concluding that the approval rate was higher when the judge was reviewing the application at a time closer to the previous break. The presentation and interpretation of the findings suggest that the judges' decisions are correlated to their biological needs, leaving aside any value system within which behaviour arises.

The same idea, adjusted to the assessment of surveillance capitalism, is discussed by Zuboff when referring to *instrumentarian power*. Instrumentarian power is one of the two powers (the other being totalitarian power), which is associated with the modification of behaviour exhibited within digital economies. The main characteristic of instrumentarian power, which is in a way interrelated with the views of Skinner and behavioural economists, is how the essence of humanity, personality, and every aspect of a person's identity is indifferent to its function. As she lively describes:

Instrumentarian power has no interest in our souls or any principle to instruct. There is no training or transformation for spiritual salvation, no ideology against which to judge our actions. [...] It has no appetite for our grief, pain, or terror,

although it eagerly welcomes the behavioral surplus that leaches from our anguish. It is profoundly and infinitely indifferent to our meanings and motives. Trained on measurable action, it only cares that whatever we do is accessible to its ever-evolving operations of rendition, calculation, modification, monetization, and control. (Zuboff, 2019: 360)

Behaviourism, behavioural economics, and surveillance capitalism all meet at the point where subjectivity diminishes. More specifically, their meeting point is where subjectivity's most significant characteristics –from thinking and morality to meanings and motives– can be set aside since they are assessed as insignificant. This movement, therefore, sets the ground for other characteristics to emerge as important: observable behaviour (behaviourism), automatic and quick operation (behavioural economics), and behavioural surplus (surveillance capitalism). It clearly appears what all three views have in common: they focus on a level of subjectivity that coincides with what's most easily to influence and modify and what can easily be quantified and predicted.

If we follow Sotiropoulos, Milios, and Lapatsioras statements in their book *A Political Economy of Contemporary Capitalism and its Crisis (2013)*, we will understand that quantified and predictable behaviour is the only aspect of subjectivity that can be conceived from the standpoint of capital. So, the production of that type of subjectivity is the production of a low-risk behaviour for the reproduction of capital. On the contrary, a subjectivity grounded on its needs and desires is a high-risk subjectivity with high-risk behaviours. Behaviourism, behavioural economics, and surveillance capitalism diminish the essence of subjectivity, and with it, they diminish the want and desire in order to let beneficial behaviour arise as a low-risk behaviour.

3.4 What do we learn about psychology from behavioural economics?

Cognitive psychology could be seen as more relevant to behavioural economics since both reserve a role for mental activity, although behavioural economics present an idea of mental life –a concept highly rejected by behaviourism– only to influence it in a specific manner. In Kahneman's conceptualization of System 1 and System 2, we discern the convergence between behaviourism and cognitive psychology. System 1 can be associated with behaviourism's idea of the automatic process of S-R, since it “operates automatically and quickly, with little or no effort and no sense of voluntary control” and System 2 can be associated with cognitive psychology since it refers to a mechanism that deals with mental activities that require a specific amount of effort and computations and its operations are “associated with the subjective experience of agency, choice, and concentration” (Kahneman, 2011: 22). Behavioural economics may describe a distorted “wholeness” of human beings by integrating automatic and volitional functions; but it is highly focused on the part that can be more easily influenced.

But how could cognitive psychology proclaim to be a revolution contrary to behaviourism if their convergence is so easily applied to another discipline that

studies human behaviour?³ This could be elaborated by taking into consideration one important aspect of the history of psychology and another one concerning the goal of behavioural economics. Firstly, cognitive psychology emerged in order to deal with the inadequacy of neobehaviourism in examining specific psychological phenomena (Greenwood, 2009: 504-513). Even though it turned the lens inside the mind and the brain where mental phenomena appear, it didn't manage to overcome the mechanistic approach facilitated by behaviourism, which led many prominent figures of the cognitive revolution to criticise the course of its programme (Bruner, 1990; Chomsky, 2012; Neisser, 1976). Secondly, behavioural economics focuses on two main concepts: *ophelimity* and *beneficial behaviour*.⁴ It distinguishes between ophelimity and desirability in order to clarify and preserve the idea that what is wanted is not necessarily beneficial. In that way, it is not rational choices that should direct behaviour at the cognitive level. On the contrary, it is the maneuvering of System 1 –which works automatically– that initiates the modification of behaviour.

But the existence of a level of mental activity as proclaimed by behavioural economics when mentioning System 2 does not suffice to establish subjectivity, subjective experience, and an active role of the organism. Based on the aforementioned the advances in cognitive psychology did not leave their mark on behavioural economics, despite its revolutionary character. Contrarily, Skinner's critique of cognitive psychology and its focus on mental life was reserved and further established by behavioural economics. Skinner's rejection of even this susceptible to influence level of subjectivity regarding behavioural economics is described by him as follows:

To the extent that economic theory is concerned with what people *say* they will do, SEU [subjective expected utility] theory may be adequate, but a behavioral scientist (and, one would suppose, an entrepreneur) must be concerned with what they actually do. People most often do those things which have been most abundantly reinforced, without making subjective estimates of the probabilities of reinforcement; and the reinforcers are real, not expected. (Skinner, 1985: 296)

At the crossroads of behaviourism, cognitive psychology, and behavioural economics, what we see is the convergence of a theory that abolishes or sabotages the examination of subjectivity. At the core of this theory, we find the reinforcement of behavioural modification based on a superior understanding of rationality. More importantly, this understanding of rationality is not embedded in the subject, but it is implemented from above: it is *the science of behaviour that can model beneficial behaviour* for the benefit of an abstract, rationally modeled society. The neutrality that follows the diminishment of subjectivity sets the ground for infinite opportunities to nudge human beings toward an always

³ This question can also be applied to the cognitive-behavioural therapy, but such an examination requires a deeper and at the same time wider presentation of the history of psychology which exceeds the aims of this paper.

⁴ The theorists of behavioural economics attempt a paradigm shift on the anthropological foundation of economics, but the use of the term “beneficial utility” reveals that they cannot escape from the neoclassical economics and the concept of marginal utility.

fluid direction, ready to serve any interest needed.

4. Psychology, technology, and politics

4.1 The political vision of surveillance capitalism: behavioural data and instrumentarian power

The endeavors of establishing a scientific examination of behaviour for its prediction and control further facilitated the focus on behaviour, leaving aside other mental phenomena contributing to human activity. But it is not just the observable behaviour that is at the center of attention. Beneath the focus on the behaviour lies a demand for the quantification and, consequently, the monetization of behavioural aspects. This is what the idea of behavioural surplus expresses: capital's ability to make a profit by finding the most beneficial ways to acquire data about any person's behaviour and eventually optimizing existing models for a more accurate prediction of behaviour. Most of all, the prediction of behaviour does not rely on a general search for an explanation of behaviour with the means of scientific methodology. It is the making of more profit that is served: the markets associated with the prediction of behaviour rely on acquiring even more accurate data for prediction by utilizing aspects like our personalities and emotions (Zuboff, 2019).

The neutrality of the subjectivity established by the aforementioned approaches facilitates the focus on behaviour and its quantification and what's of most importance is that none of these would be possible without the fundamental work of behaviourism and behavioural economics. The political vision of surveillance capitalism would not be possible without the launch of empiricism inspired by these fields.⁵ In the case of psychology, behaviourism indulged in a cult of empiricism in order to achieve objectivity. What made it a cult was partly the obsession with controlled observations (Toulmin & Leary, 1992) since it is this controlled environment that enables the quantification of behaviour. This is not indifferent to what surveillance capitalists did: within digital platforms, they induce nudges that encourage specific choices and it is this manipulation of behaviour that enables its further modification. Zuboff offers an enlightening example:

The result is data scientists trained on economies of action who regard it as perfectly normal to master the art and science of the “digital nudge” for the sake of their company's commercial interests. For example, the chief data scientist for a national drugstore chain described how his company designs automatic digital

⁵ Although human sensory experience is important to the production of (scientific) knowledge, we argue that these fields (behaviourism and behavioural economics) provided the epistemological basis for the analysis within the foundation of surveillance capitalism with specific unfavorable and narrow means for examining subjectivity. Specifically, these fields provided an empiricist approach to behaviour which not only does not include important aspects of behaviour that lie beneath the surface examined by naive empiricism and in fact explain behaviour (i.e. motives, internal conflicts, unconscious lapsus, etc.), but they also regarded as absolute the quantification of behaviour.

nudges that subtly push people toward the specific behaviors favored by the company: ‘You can make people do things with this technology. Even if it’s just 5% of people, you’ve made 5% of people do an action they otherwise wouldn’t have done, so to some extent there is an element of the user’s loss of self-control.’ (Zuboff, 2019: 294)

Surveillance capitalism is novel. Its emergence defines a break in the course of modernity or rather opens up a post-modern field: it challenges the foundations of the state, governments, and democracy in the various forms that we find in the 19th and 20th centuries. For Zuboff, the political innovation of espionage capitalism lies in the creation of a radically new form of power: *instrumentarian power*, which is defined as:

[...] the instrumentation and instrumentalization of behaviour for the purposes of modification, prediction, monetization, and control. In this formulation, “instrumentation” refers to the puppet: the ubiquitous connected material architecture of sensate computation that renders, interprets, and actuates human experience. “Instrumentalization” denotes the social relations that orient the puppet masters to human experience as surveillance capital wields the machines to transform us into means to others’ market ends. Surveillance capitalism forced us to reckon with an unprecedented form of capitalism. (Zuboff, 2019: pdf. 352)

Instrumentarian power is novel as it is radically indifferent to the beliefs, practices, and forms of consciousness developed by individuals or social groups –let alone social classes. It is radically indifferent to subjectivity. Conduct of conduct –to refer to Foucauldian biopolitics– is not concerned with the organization of the disintegration of life (Foucault, 1982), but instead allows the individual to live their life as long as they meet the imperatives of data mining. Any behaviour could be datafied. The glaring stakes of instrumentarian power, however, is that this behaviour is offered as pure, raw material, for which infinite computing power is not needed to be expended for the necessary information to be produced.

At this point we need to digress a little to describe the basic stakes of spy smoking: amidst two decades of alliterative crises starting with the “dot-com bubble,” continuing with the US insurance market crisis, the Euro financial crisis, the pandemic crisis, and of course, the current geopolitical and energy crisis, the capitalists of surveillance capitalism are trading certainty. Zuboff notes that:

Seven decades ago, Skinner’s proto-instrumentarian behavioural utopia, Walden Two, was met with revulsion. Today the real thing is inspirational fodder for surveillance capitalist rhetoric as leaders promote the tools and visions that will bring the old professor’s ideas to life... to our lives. The processes of normalization and habituation have begun. We have already seen that surveillance capitalism’s pursuit of certainty –the mandate of the prediction imperative– requires a continuous approximation to total information as the ideal condition for machine intelligence. On the trail of totality, surveillance capitalists enlarged their scope from the virtual to the real world. The reality business renders all people,

things, and processes as computational objects in an endless queue of equivalence without equality. Now, as the reality business intensifies, the pursuit of totality necessarily leads to the annexation of “society,” “social relations,” and key societal processes as a fresh terrain for rendition, calculation, modification, and prediction. (Zuboff, 2019: 398-399)

The attempt to modify human behaviour –to transform energy without unnecessary waste– into minable and accessible raw material aims at creating information which consequently aims at creating and selling certain predictions. The instrumentarian power, the political dream of surveillance capitalism, leads to the end of the societies of negotiation and the emergence of the societies of certainty. The capitalists of surveillance capitalism proclaim themselves as the answer to the chaotic social movement of the 21st century. Their ability through their instrumentation power to extract data from human behaviour gives them access to predicting future human behaviour as well. And in doing so they promise access to a certain future.

Let’s form an example to make instrumentarian power more understandable. Suppose that Mr. X drives a large-capacity motorcycle and that he consumes 3 to 4 glasses of vodka per day by paying by card. Like everyone else, he pays his bike’s regular insurance premiums, while also paying for a private insurance policy that gives him access to certain health services. Mr. X also uses the same card to pay for his membership in a boxing school. At some point, a consultancy firm is engaged to improve the insurance programme used by Mr. X. It then becomes clear that Mr. X’s behaviour creates a high risk to his insurance company, as he is likely to either crash while driving drunk or break his nose in a boxing match. This leads the insurance company to raise the motorcycle premiums and remove the nose surgery from Mr. X’s insurance plan.

The example is extremely simple. Imagine how much more complex it would become if the consultancy could access the data from the motorcycle’s brain showing how slowly or quickly he was riding at night hours, etc. The collusive data extracted by the surveillance capitalists cf. the consultancy and its experienced data analysts lead to the sale to the insurance company of the certainty that Mr. X will exercise more carefully if he knows he won’t have access to a free nose job and that, in addition to paying a bar for his usual vodkas, he will pay higher premiums.

It is important to dwell on one aspect of the above example: Mr. X cannot hide from his insurer, nor can he make sense of his behaviour differently. He has to contend with certainty, with the certain prediction that the advisory firm has produced from his behaviour. In other words: he has to reckon with himself as if he were a stranger to him, with himself as a certainty, as a system that reacts beyond his control and will.

Our reference to the insurance market in our example is by no means accidental. The safe predictions in the insurance market are yet another point of intersection between surveillance capitalism and financialization as a method of enforcing low-risk behaviours (Sotiropoulos, Milios & Lapatsioras, 2019). Insurances as financial products can reveal the role of the financial system as a technology of power that can assess the behaviour either as high or low-risk. The

instrumentarian power of the surveillance capitalists and its attempt to convert subjectivity to a datafied behaviour is a part of the risk assessment process. So the instrumentarian power is an aspect of the normative function of financial technology of power.

4.2 Nudge units: a new political practice

Let us now try to generalise the above example. If Mr. X is just a whimsical case of an insured person, what happens to Mr. X as a voter or as a member of a party or minority? How can their desirable behaviour be defined, or better, based on the distinction we have underlined above: how can they drive a beneficial but not wantable behaviour? In other words, how can Mr. X either pay more for their health insurance or stop drinking vodka?

Behavioural economics has the answer. This time not as a body of knowledge, as a science, but as a political practice. In 2008, during Barack Obama's incumbency, Cass Sunstein, the co-author of *Nudge* (2008), was hired by the federal government to organise the Office of Information and Regulatory Affairs. In 2010 the UK government formed the Behavioural Insights Team (BIT) in the UK Cabinet Office. BIT prompted those owing fines to the UK Courts Service with a text message ten days before the bailiffs were to be sent to a person, which doubled payments made without the need for further intervention. This innovation has reportedly saved the Courts Service £30 million a year by "sending people owing fines personalised text messages to persuade them to pay promptly". (Verhulst, 2014)

Similarly, the Behavioural Economics Team of the Australian Government (BETA) conducted a trial with the Australian Department of Human Services on timely reminders to report on time. Individuals on welfare payments for job seekers and students are required to report their income every fortnight before the payment is made. This is essential for the accuracy of payments. Over 80,000 individuals are late for reporting every fortnight which can result in the cancellation of payments. BETA designed three different SMS reminders to be sent the day before reporting was due. The SMS messages included a short reminder, a cost-emphasizing reminder, and a benefits-emphasizing reminder. The findings illustrate that any SMS option increased the number of individuals reporting by 13.5% at a faster rate than ones who did not receive a text. This further led to 1.7% in fewer payment cancellations (BETA, 2017).

Nudge Units' action so far may be on issues of taxation or welfare state support, but we can nevertheless discern within it a new kind of political practice. This kind of political practice ignores the conscious world of the individual; it ignores the color or the specific terms based on which it is constituted. Instead, its only interest is to provoke the appropriate stimulus. Propaganda, political campaigns, or anticipation of the outcome of an election or the outcome of a meeting seem to come from the past. States can now claim the challenge of inducing the appropriate nudges to throw off purposes beneficial to them.

5. Conclusion

In this paper, we examined the use of psychology as a means of control in the digital era. The promotion of the theory of behaviourism with its postulate that the manipulation of the environment leads to the modification and thus control of behaviour was examined within the framework of the technology of behaviour, which constitutes Skinner's answer to the social challenges. In this case, the idea that behaviour can be controlled became crucial. As we attempted to outline, behaviourism provided the epistemological background for behavioural economics, which promoted an automatic and quick operation of economic agents by rejecting the importance of any cognitive process (without rejecting their existence). It also provided the epistemological foundation of surveillance capitalism, which manages to extract data from human behaviour on digital platforms leading to the prediction of future behaviour by applying instrumentarian power. This concluded with the common conceptualization of the subject by the aforementioned approaches: they all focus on observable, quantified, and predictable behaviour which is the only aspect of the subject that can be influenced and modified through nudges as a low-risk behaviour for the production of the capital. At the same time, this abolition of subjectivity from the examination enables a neutrality characterised by infinite opportunities to nudge and modify the subject's behaviour towards any desirable direction, since no resistance emerging from the subject itself has been recognised. Finally, these endless possibilities of the desirable modification of future behaviour have been associated with the concept of certainty –against chaotic social movement– provided by capitalists which guarantees its prevalence against –what seems to be considered as– chaos or turbulence of the existing socioeconomic setting. This is the intersection between psychology, control, and the digital era.

The examination of the epistemological assumptions of behaviourism, behavioural economics, and surveillance capitalism allows us to extrapolate aspects of subjectivity that facilitate using psychology as a means of control in the digital era. Firstly, behaviourism's assumption that behaviour is controlled by the environment outlines a fundamental characteristic of the subject –according to the behaviouristic paradigm– its passivity. No other process affects behaviour, and all psychological processes or human statuses (freedom, will, etc.) are reduced to the manipulation of the environment for the desired behaviour to be achieved. Secondly, behavioural economics, by leaving aside the operation of System 2 regarding complex processing and by focusing on System 1 which is characterised by the lack of volition and an automatic character of activity, attribute an automatic and non-volitional character to subjectivity. Thirdly, surveillance capitalism, indifferent as it is to individual consciousness, belief systems, and subjectivity in general, outlines a subjectivity characterised only by its externality of behaviour and the instrumentation of this behaviour for profit. At the same time, these negative assumptions concerning subjectivity offer an opportunity to outline aspects of subjectivity that unsettle the aforementioned accounts, aspects that –if enhanced– can be an obstacle to such a control. These aspects pertain to activity, which involves an inherently active process of

internalization. Simultaneously, they enable and presuppose the interaction between external and internal elements, encompassing volition and reflection. Consciousness, as a concept transcending the individual, derives its intentionality from its fundamentally social structure. But this requires a psychology worthy of undertaking the definition and examination of the aforementioned aspects without rejecting, abolishing, or relinquishing them and, most importantly, without retaining their communal and social character.

In 1985 a book called *A century of psychology as science*, edited by Sigmund Koch and David Leary, was published in order to examine and reflect on what had happened in psychology in its first century as a science and guide it into its second century. Setting aside historiographical issues concerning the establishment of science on a specific date, as well as the evaluation of whether their work managed to guide psychology since 1985, the editors ask one simple, interesting, and very important question: “*Where do we stand at the present time?*—in relation, of course, to the historically constituted objectives of the ‘new’ psychology and the hopes of the founders” (Koch & Leary, 1992). In this paper, we attempted to outline that psychology not only hasn’t answered this question, but also that epistemological issues arising from one of the most prominent psychological theories, i.e. behaviourism, had already been used to inform the architecture of digital platforms, not for the public’s benefit or a greater purpose, but for facilitating the modification of the subject’s behaviour for big tech companies to make more profit. Moreover, we attempted to provide evidence of how the know-how developed by “digital nudges” could and partly has already been applied beyond digital platforms, in the everyday life of citizens.

The non-transparent character of digital platforms –the fact that the users don’t know how the AI systems used for the function of the platform work, how the platforms make a profit, i.e., the economic model they apply, etc.– makes it even more difficult for the public to have access to the architecture and operation of the digital environment and it further beclouds its operation. The fact that psychological knowledge is used by the architect (i.e., data scientist) to produce digital entities (like nudges) to modify human behaviour makes it a requisite not only for the psy-community but for the general public as well to understand psychology’s role in designing digital platforms. Like Koch and Leary, who asked a similar question for psychology more than three decades ago, and theoreticians who examine the digital turn (see for example De Vos, 2022), it’s time for us to ask and further examine the digital means that we don’t really understand; the digital means used as means of control in ways we can’t even imagine. The technical difficulties concerning digital technologies and the non-transparent way that big tech companies operate have already been some impediments in this endeavor –to name a few.

But isn’t subjectivity’s aim always to make sense of reality and define its next moves? The diminishment and rejection of subjectivity as non-scientific and metaphysical as well as inaccessible and useless by the science of behaviour does not only serve as a more superficial study of behaviour for its quantification, monetization, and thereby its prediction and control; it also serves as a guarantee of the current establishment and the social order, by providing certainty and

conserving the actors in the position they should be for everything to function as it already does –if not to further “optimise” the current function. Based on the aforementioned, we propose that by preserving subjectivity and its unique characteristics we may be able to resist the use of psychology as a means of control.

At least, we preserve something unique to human beings and their civilization –conceptualised as an entity– and we take the responsibility to further examine subjectivity itself, whatever the consequences. What we describe falls under Marx’s idea of alienation: the fact that the labour’s product is confronted as a power independent of the producer and “the more the worker spends himself, the more powerful becomes the alien world of objects which he creates over and against himself, *the poorer he himself –his inner world– becomes, the less belongs to him as his own*” (Marx, 1975: 272, emphasis added). Of course, in this paper we didn’t examine labour itself; but *mutatis mutandis* we can conceptualise digital technologies as products of abstract labour –which calls for further examination. Having said that and keeping in mind Marx’s extrapolations of what happens to the inner world when confronted by a world full of estranged products, created with the complicity of this inner world, there’s only one thing left to examine: *Where do we stand at the present time and where do we want to go?*

The following old aphorism remains sufficient for understanding the world:

All the notions of justice held by both the worker and the capitalist, all the mystifications of the capitalist mode of production, all capitalism’s illusions about freedom, all the apologetic tricks of vulgar economics, have as their basis the form of appearance discussed above, which makes the actual relation invisible, and indeed present to the eye the precise opposite of that relation. (Marx, 1990: 680)

The emergence of behavioural economics is another part of this process. A modern attempt to put the subject out of politics and view social transformation as a set of modified behaviours. It is a new way to achieve an old goal.

In order to overcome the nudge ideology, its behaviourism, and with it the contemporary techniques of the governance of collective capital, we must ground our politics in the concept of the subject: the subject produced from the means of production and the productive relations, the subject that is appealed by the ideology of the capitalist state and yet constantly stands against them, and therefore against itself.

Acknowledgments

We would like to thank Manolis Dafermos for clarifying aspects of our argument (sometimes even to us) and helping us make it more explicit and clear, as well as for highlighting the crucial points of our argument. We would also like to thank John Milios for opening up the perspective of the Marxian theory of the subject and for his helpful references to the intersections of behavioural economics, surveillance capitalism, and financialisation as a technology of power. Last but

not least we would like to express our gratitude to Jan De Vos for the systematicity of his crucial and apt remarks concerning the presentation of our argument and, most importantly, for pointing out all our contradictions.

Christos Krystallis was born in Piraeus in 1992. He studied History and Philosophy of Science at the National and Kapodistrian University of Athens. He has a M.Sc. in the History and Philosophy of Science and Technology with a strong interest in the relation of labor and technology. His master thesis entitled *Watt, Babbage, Carnot, Ure against the luddites*, tried to point out that the struggle against machines was a class struggle against the experts of the first industrial revolution. At this moment, he is Ph.D. candidate at Sociology Department of National and Kapodistrian University of Athens, studying History and Theory of Scientific Management. He is also a co-editor at the literary magazine, *Vlavi*.

Nicole Sarla holds a B.Sc in Psychology and she is a Ph.D. candidate at the Sociology Department of National and Kapodistrian University of Athens on the topic of the relationship between Psychology and Artificial Intelligence. Her thesis concerns “Information, computation, and the metamorphoses of psychology in the 20th century: From the scientific study of mental phenomena to artificial intelligence.” Her thesis is the continuation of her work during the M.Sc. History and Philosophy of Science and Technology and, specifically, her thesis concerning “The exile of consciousness: the cooperation between

cybernetics and psychology, 1946-1953.” Her interest in Cybernetics led her to get trained as a systemic psychotherapist. She currently works as a researcher on Ethics and Research Integrity as a member of the R-NANO Lab of the School of Chemical Engineers of the National and Technical University of Athens. She also works in private practice as a psychotherapist.

Looking at the Tekel Resistance through the Class Unconscious Approach¹

Baran Gürsel

Abstract

The article presents the conceptual foundations of the Class Unconscious Approach, proposed through a dialogue between the conceptualization of class as a process of formation/deformation and the psychoanalytic approach as well as a case study based on the Identification Stages of Class Model. Workers, in their relation to the universal experience of primary insecurity and through the effects of individual and social mediating factors, produce expressions of class experience that correspond to the Narcissistic, Ambiguous, Civilized and Symbolic-Ethical stages of class. Any set of class experiences that occur in a chosen space and time and brought to our attention by any means of communication or direct observation can be studied in terms of these stages. The theoretical discussion is accompanied by an analysis of the Tekel Resistance, a mass workers movement that gained a lot of attention and support from other sections of the society and had impacts on different levels of society, including social movements.

Keywords

psychology of class, class experience, class unconscious, identification stages of class, Tekel resistance

Introduction

I believe that the resistance initiated by Tekel workers in December of 2009, which presented itself as a “tent city” at the heart of Ankara until the March 2010, plays a critical role in the formation of *Association of Psychologists for Social Solidarity (TODAP)*—a key actor in the institutionalization and progress of critical psychology in Turkey. When the Tekel Resistance began, the debate on institutionalization within TODAP², of which I was a part, had just started.

¹ Translated by Dilara Sari

² The association was formed officially in 2010. That said, due to it being a continuation of our activities through *Critical Psychologists and Students of Psychology*, and later *Psychologists for Social Solidarity*

Discussions on class issues with relation to psychologists were ongoing; these discussions were led not only by those involved in the movement itself, but also by and within the group of people interested in critical psychology in general.

Back in the day, TODAP was treating the support it provided to Tekel workers not as “expert support” but as a “class solidarity”: “Psychologists are with our Class Brothers and Sisters” read our banner, signed by “psychologists and psychology students”; our published article³ referred to this equality in addition to the critical use of occupational knowledge. Debates on how psychologists can meet Tekel workers in class solidarity and how critical psychology can review this class solidarity and struggle continued in critical psychology platforms and all through the second *Critical Psychology Symposium*⁴, which took place in 2010. TODAP’s approach, in formation at the time, and its critique by critical psychologists were both included in the September issue⁵ of *Critical Psychology Bulletin* of the same year. The tripartite perspective included in TODAP’s introductory texts and charter, upon which the institution was resting, was clarified and solidified on paper through these discussions (Gürsel, 2010).

TODAP’s axis of labor⁶ does not center itself on “solidarity” with the worker-other, assuming all psychologists to be of the middle class; but instead builds itself on policies that respond to the needs and demands of those who are already proletariats, and those who are in the process of proletarianization. Therefore, the relations formed by the group with other segments of workers are not “from the outside” or “from above”—they are formed based on a mutuality that comes from class experience and social interests⁷. For that reason, the unique knowledge and experience provided by the discipline of psychology does not imply a structural advantage or a social domination; rather, this expertise is an experience open to the use of other segments of workers within the mutual struggle, and one which the worker psychologists will contribute to the class struggle.

I believe that the clarification, completion, and absorption of the class concept within TODAP was heavily impacted by the protests of Tekel workers, as well as by the desire of solidarity with them. The group’s approach represented by the initial statement⁸ made in support of Yörsan workers had changed by the time of the Tekel resistance. In the latter, the main motive of support came out as class solidarity and the desired functionality of a

Association Initiative, and due to the incompatibility of reducing the entire movement to officiality with our activities, I consider the beginning of TODAP to be 2008. I do believe, however, that it would be unfair to TODAP’s desire of differentiation and the alternative desires in its critique, to *directly* consider the time before the group’s meeting following the first Critical Psychology Symposium as part of TODAP’s process.

psychologist within class struggle. Class discussions were led simultaneously with discussions of institutionalization. To cement the approaches formed through discussions and activities, and to render the subject more recognizable and permanent, the *Association of Psychologists for Social Solidarity* was formed in December of 2010. I do not support the opinion that the formation of the association trapped TODAP in a non-horizontal process; instead, in my opinion, the group's perspective expanded over time, and its content was multiplied via the contributions of those that were in critique of it. After completing my take on Tekel Resistance through the Class Unconscious Approach, I will later return to the interpretations of institutionalization the Tekel Resistance brought to organizations like TODAP (the *Plaza-Action Platform* for instance, which began in the same era, and maintains a unique position in class struggle).

This study aims to present a review of Tekel Resistance through the Class Unconscious Approach, on which I am currently working. That review will also present ideas on how to conceptually connect the institutionalization of TODAP to the impact of the resistance. Thus, we can place the brief history I provided within a social context based on Marxism and the dialogue of psychoanalysis.⁹ I will first proceed through a conceptual discussion that will set the background for my approach and make various conceptual suggestions. I will further delve into the different stages of the class process through studying various examples from the Tekel Resistance and offer interpretations on the resistance itself. I will then complete this study by identifying certain arguments that those interpretations allow me to make.

Approaches to Psychology of Class

The purpose of the Class Unconscious Approach is to study the conscious dimensions of the *expressions of class experience*¹⁰ such as thought, discourse, action, symbol, and institutions individually or collectively produced by the workers through the relation they have to the unconscious thought, fantasy, anxiety, desire, identification and defenses; as well as identifying the state of a worker or a group of workers according to the class formation and deformation

⁹ The framework of this study was taken over from another study that I conducted, *Looking at the Resistance of June 15-16 through the Class Unconscious Approach* (Gürsel, 2020), which focuses on a different workers movement, again through the lens of the Class Unconscious Approach. Some of the ideas presented on the Tekel Resistance had also been previously presented, in their very early stage, at the VI. Critical Psychology Symposium, during a presentation on *Class Unconscious: A Phenomenon Between Critical Psychology and the Theory of Class*. With the focus on the article continuing—hopefully—to mature, this study both reflects some of those similarities, but also carries some differences. To see the early stages, you may look at Gürsel, 2018a, 2018b, 2018c.

¹⁰ This concept was derived in line with Wood's understanding of class (2008a) to make visible everything produced by the class through class experience, which is considered as the central component of class distinction. The concept of a "class formation and deformation process" as used in the text is itself derived from Wood's definition of class as a process based in (vertical and horizontal) relation formation, and the innateness of non-formation/ inability to formation/ deformation. Compatible with Wood's approach, this concept will stand against the notion that "class process"—in its briefer version—is solely limited to the formation of classes, and instead, it will oversee the formation and deformation of this state, as well as other possibilities.

process, and to reveal both the *effects* that serve to create that state, and the *mediating factors* that cause those effects. Before I proceed to presenting the theoretical discussion on which this approach is based on, I would like to touch upon the relation it has to various other studies within the field of *psychology of class*.

To me, psychology of class is a field of study and thought that overlaps with a wide range of approaches—from mainstream to the critical, from psychological to sociological. Some of these approaches and schools of thought are: Mainstream industrial/ organizational psychology, critical industrial/ organizational psychology, psychology of labor and work, labor studies that benefit sociology of emotions, immaterial labor approaches, clinical sociology, studies shaped by Bourdieu's understanding of habitus, the sociological and cultural approach of Paul Willis, and finally, Thompson's logic of class experience.

While mainstream industrial/ organization psychology focuses on subjective notions like the emotions, behaviors and thoughts of workers within the framework of the work itself, its process, the space within which it occurs, the management overseeing it and other similar factors (Tevruz, 1996), critical industrial psychology instead analyzes the relation the mainstream approach has to social power structures, and highlights the significance of the worker's potential and the researcher's self-reflexive approach (İslam and Zyphur, 2012).

Psychology of labor and work studies the detrimental impact of the capitalist wealth acquisition regime and its labor ideology on the individual's life in and outside work, and derives arguments on their relation, and on alternative approaches (Sandıkçı, 2019).

Labor studies that take from the sociology of emotions focus on the emotions, emotional tension and changes that occur within the states, reflections and relations of being a worker in the social universe and study the dynamic subjectivity of being a worker in social relations (Dinler, 2014). The immaterial labor approach centers around processes that exist in the current order where all social life is subject to how capital works and what counts as labor remains elusive. They transform subjectivity itself into a material of production and produce a perspective on the subjectivity of the new form of labor through an analysis of the current form of capitalism and how it can be overcome (Lazaratto, 2005). Clinical sociology is rooted in the argument that a different labor ideology persists today than in the past and it highlights the relations formed between the worker and its labor, the identification and emotional investments and the tension, conflict and disturbance caused by this modern labor ideology (De Gaulejac, 2013.)

Bourdieu's concept of habitus looks into how the distinction between classes, the feelings and movements that have been allocated have been internalized within the subjectivity of the worker, and how they are reproduced through externalization as social differences (1979/2017). Paul Willis' approach, however, aims to explain how class distinction within the framework of education, institutionalism and in-house relations is formed through subjective attitudes and behavior in a mutual relation with cultural codes (2017). Thompson

(1978, 1963/2012) approaches the working class as a formation related to class subjectivity, and in telling the story of how class subjectivity, pressured by a social objectivity, is molded through values, emotions, affections, religious experience, group activities, humor, symbol and institutions, reveals how workers turn into a class.

Despite all their differences, these approaches all place various implications of a worker's subjectivity (from values to emotions, from individual behavior to collective action) at a central position in their theorization, and work to establish the relation between that subjectivity with social objectivity. Even though the distance with which the worker's subjectivity stands to the center of the approach differs from one to the other, excluding this line of thought from these approaches will surely hollow out their substance—therefore, it makes sense to perceive psychology of class as a distinctive crossroad. The answer as to why I chose not to define this area as “labor psychology” can be found in studying how these approaches work, and in their limitation to the discipline of psychology.

The Class Unconscious Approach can be taken, similar to others, as a window to the psychology of the class; however, this approach refuses to limit itself to certain pieces or dissectional views of the worker's subjectivity. On the contrary, the suggestion here is to include and interpret all individual and collective expressions of the workers, the spaces (workspace or outside of it), the period of time (neoliberal period, or prior to it), various aspects of the subjectivity (individual or group, blue collar or white), the forms of psychological components (emotions, thoughts, likes, values, actions or symbols) and the expressions (resistance), regardless of whether they need to be dealt with by other disciplines. This approach claims to “converse” with others on their “study objects”, without denying the uniqueness of how they theorized their impressions. This is not rooted solely in the argument that psychoanalysis is a comprehensive theory of the mind, but also in the idea that all expressions of class experience can be placed on a formation/ deformation line. Thus, class perspectives pointed out, identified and explained by the *Identification Stages of Class Model* can be included within this approach.

From here, we may move on to discussing the model and the approach.

Relations of Capitalist Production and Subjective Primary Insecurity

Historical materialism considers the action of people, and the social relations built through them (Marx and Engels, 1845/2004; Wood, 2008b), as the material of history. Relations of production are formed around and through production, and since all societies must deal with the material production of life, these relations constitute the principal organizations of social nature (Wood, 2008a).

Even though the capitalist formation of these relations makes certain parts of them (e.g. means of production, means of livelihood, products) appear as though they possess powers unique unto themselves (Marx and Engels, 1845/2004), and cause labor to be experienced as part of the person (Marx, 1867/2015), production is not outside of social relations and is indeed one of them

(Wood, 2008b). Wood (2008c) questions the usefulness of the superstructure-infrastructure metaphor arguing that the use of the metaphor often results in identifications, separations, and discourses that are incompatible with Marx' perspective.

To Wood, relations of production are not independent of what is considered as superstructure—legal, political, ideological and cultural elements—but are direct carriers of their certain forms. Relations of production cannot be considered as independent from the political and legal elements that create and constitute them; even in capitalism, a unique production type based on the formal separation of economic and political power, exploitation occurs, unlike in precapitalist forms, through an economic method. Political intervention to initiate structural transformations in property relations are needed to set capitalist relations, to render the exploiter and the exploited subject to market obligations, and to enable the exploitation of surplus value.

Capitalism is not the result of a self-developing economy, of the processes of wealth accumulation or of the desire of wealth at the right opportunity, but rather that of the appearance of market obligations as a result of certain struggles under certain historic conditions, and of the struggle to expand those obligations' domination (Wood, 2003). Here, class struggle occurs to enable and maintain the seizure of labor through economic methods, rather than non-economic ones.

In capitalism, the process of production is not entirely excluded from the political struggle occurring to exert the domination of these economic obligations. Wood (2008b) forms a continuity between the property owner's domination of the production process and the privatization of political power in the West. According to her, not only has the economic field been differentiated, but production has also been integrated into property ownership, and politics have been privatized. Oppressive political functions have settled into the private space of the property owner. All these discussions relay production relations to us as a framework extending beyond a pure, abstract and economic nature.

Compatible to this approach, I believe we can identify psychological elements that are components of the capitalist relations of production. I argue that capitalism, which cannot exist independently of political, legal, and social conditions, creates psychological circumstances for every worker through subjection to the market, commodification of labor power and limited access to livelihood to labor. Thompson (1978) talks about the influence of capitalism's sphere of power as an objective force in the formation of class experience. This sphere of power forces people to change their lives in certain directions and, by forcing them, communizes what they experience with others—and what others experience with themselves. If the capitalist market universally forces the worker to work in order to live, *objective primary insecurity* may have a subjective and universal counterpart. I identify that counterpart as the *subjective primary insecurity* and place it at the heart of *class experience*—which is emphasized by Wood, in reference to Thompson, in defining class as relationship and process: Subjective primary insecurity as a universal experience that, through their own experience and the experiences of others whom they observe, causes in all workers a potential to act.

Wood (2008a), through Thompson's approach, states that class experience plays a critical role in overcoming the methodical dualisms of theorizing class. Class experience helps solve that dualism by exerting itself as a transitory concept between structural position and the subject's action. Class (working class) is the process of interpretation and realization of class experience that begins to form due to the effect of the position in the relations of production. Class is formed through interpretations—verbal, actional or institutional—that develop through the common interests of the exploited as positioned against the exploiter. Wood (2008a), starting from the difference set by Thompson (1963/2012) between being a worker and being a class, develops and expands the potential of that perspective, and refers to it to better comprehend the role of all classes.

Marx' history as class struggle gains momentum from the tension between class relations and relations of production. As classes antagonize each other through their struggle to produce and reproduce themselves, tensions with relations of production can turn into crises. Solutions to these crises require class interventions that can create historic transformations: struggles and interventions drive history. What constitutes common ground within the class experience—or whether or not it exists at all—can be dealt with separately for each class. My perspective states that the claim for the common experience of the working class is based on the objective primary insecurity as a state universally faced by workers.

Subjective primary insecurity can be taken together with the fundamental, primary helplessness that a baby enters at birth. According to Freud (1926/1959), the baby comes to the earth in helplessness, and is dependent on the other/object to calm internal stimulants and fulfill survival needs. This absolute dependency is the source of baby's experience of the object as omnipotent (Laplanche and Pontalis, 1988). Winnicott (1974) emphasizes that the process of moving—via the facilitating functions of the environment—from absolute dependency to relative dependency, and finally to independency, always carries within the threat of regression. The experience of helplessness continues to exist in the unconscious through the fear of falling back into it. To Winnicott, however, ego exists, matures, and unifies when it goes through psychosomatic experience and primary narcissism, as against the experience of destruction.

In their discussion of narcissism, Laplanche and Pontalis (1988) argue that infantile narcissism corresponds with the formation of ego, highlighting the formation of self through a narcissistic identification with the other as a fundamental thought for psychoanalysis. Lacan (1949/2006) also forms a connection between the fictional side of ego—the ideal self—and narcissistic identification. The narcissistic identifications underlying ego are not the only form of identification that impacts the formation of subjectivity. The first of Freud's three types of identification is an identification of this kind, being the primary form of emotional attachment to the object (1921/2017). The second type of identification sees connection to the object as a substitution to a psychological agent, whereas the final type of identification is built upon a perceived commonality with a person.

We will further discuss these and similar other types of identifications and classifications during the section on the stages of the model. What really deserves attention here is Freud's emphasis on the role of identifications in the formation of subjectivity, and on their relation to anxieties. The referenced text (Freud, 1921/2015), includes anxieties felt in survival, in the loss of the object's affection, and in positions of dependency. Freud (1913/2014) also draws attention to identifications that can form towards the overcoming of the state of dependency by bringing about the end of a cruel power. Bion (1961/2004), too, sets group relations that can utilize thought capacity and creativity, occurring within the framework of identifications built on common ideas and goals, apart from group relations investing on infantile ideals, and relations, where the leader substitutes the psychological object.

With limited access to livelihood, those who have been turned into workers become dependent on wages and on the work and the people that can provide them. This situation, which can be likened to the object dependency of an infant, constitutes the state of objective primary insecurity; subjective primary insecurity can be seen as its psychological projection. Coming from a similar angle, Chibber points to the desire to work behind certain cultural codes as an urge that is the obligatory result of the objective deprivation of the worker. Thus, the state of subjective primary insecurity involves the anxieties awakened by the same urge, but preceding that desire.

These experiences are the universal core of class experience, as referenced by Thompson (1963/2012), where workers are communized. The workers, in turn, formulate identifications that seek to psychologically process these experiences, to put into order internal stimulants, and to render anxieties durable; these identifications become sources of desires not limited to the desire to work. Identification formed with other objects are excluded from this model, and some of these identifications are formed towards *objects related to the relations of productions (capital, employer, labor force, commodity, money, state, politics, the law, unions, workers' organizations, workers, etc.)*. Expressions of class experience are produced upon the foundation of these identifications; if we are to look at them from the other way around, we can make deductions on identifications and anxieties by interpreting expressions of class experience.

I will further delve into forms of identifications that workers can develop through that process, but first, we must clarify the concept of the *class unconscious*.

The Dual Quality of the Class Experience and the Class Unconscious

According to Wood (2008a), Thompson developed an approach that combined historic determination with history as made by people in response to the critique of not treating culture as an autonomous field and of reducing class to culture and ideology. As objective determinators, relations of production impact the historical persons that carry historical heritage, tradition and values. Capitalist relations of production do not touch abstract people who appear at that very

moment; instead they touch those who live within certain continuities. These relations pressure them and force them to change their lives. People carry their own histories to social relations they have been pushed towards; they are impacted by these relations and effectively develop mechanisms of affection, thought and action. People are the objects of social processes and are affected by them, while simultaneously being social creatures with material power that *affect* those processes. Even in situations where they appear passive, each person is a subject that develops active responses and makes those responses visible in a wide spectrum, from cultural codes to actions (Thompson, 1995).

Thompson connects through the concept of “experience” the determinative quality of limitations created by social relations and drawn out through human actions as well as that of creating these limitations and the act of transforming them. Experience stands between people as “social creature” through their material relations and the “social consciousness” that expresses the self-consciousness of that creature (Trimberger, 2014). In other words, experience is the field of transition, transformation, and translation between the determining and determined. Experience stands as the *determined* factor in a person’s encounter with the social creature and as the *determining* factor, when people affect their own state and act on common or conflicting interests. This transitory nature of Thompson’s theory is why it stays central to Wood’s class approach. Experience as created by relations of production and exploitation comes to life through the interpretation and action of the experience of the exploited, who come together to constitute the foundation of class.

Class experience taken as the determined and the determining provides us the ground floor for the class unconscious. At one end, we witness the psychological traces of relations of production which the subject will have to deal with in various ways (the determined aspect of experience), and at the other, we see the attempt to translate these traces effectively into assessments, emotions, actions and institutions (the determining aspect of experience.) We can take the determining aspect of the class experience as *class consciousness*. Class consciousness points towards the understanding of thought, action, and interests of the class within the structure of the society, and the unification and synthesis of the causes and the results. Therefore, towards the development of revolutionary intervention (Lukacs, 1967/2014). This is one aspect of experience—which brings up the question: Can we call the other (determined) aspect of experience, the objective traces upon which individual and collective construction occurs, the *class unconscious*? Yes, and no.

In their summary and discussion of Freud’s topographic approach, Laplanche and Pontalis (1988) shine a light on the separation of unconsciousness from the preconsciousness-consciousness on account of function, content and process, highlighting the dynamic approach and the contradiction between these two systems. According to Freud (1915/2013), the unconscious is made up of drive representations: unconscious thoughts come from displacement and condensation processes; urge representations are ordered as fantasies. To Freud, reaching pleasure is the main principle, and it needs no reality, doubt, certainty, or time. Freud’s differentiation of psychological agents, which comes later on,

replaces his conceptualization of the contradictions and relations among systems of the unconscious and the preconscious-conscious, defining id, ego and superego (1923/ 2012).

The id is completely unconscious, but the other agents have varying levels of unconsciousness. Ego, for instance, contains compulsive defenses; superego is home to unconscious prohibitions and demands (Laplanche and Pontalis, 1988). Laplanche and Pontalis (1988) relate Freud's move from the first approach to the second—replacing the relation between two systems with relations between psychological agents—to his realization of the role identifications play in the permanent structures of personality. Therefore, identifications play an important role in both the formation of the psyche, and the unconscious. Özyıldırım (2022) has a critical perspective on Freud (1920/ 2013) arguing for the existence of a death instinct through his writing on the possibility of a principle in psyche beyond pleasure. According to Özyıldırım, that deduction prevents Freud from seeing that unconscious representations born out of the mother-infant relation form a primary connection that enables the functioning of the pleasure principle; that repetitive appearances come from the malfunctioning of that connection. So the unconscious is both determined and actively determining, as its organization is formed through relations and identifications with the objects and carrying the contents and processes of the agents.

Within this framework, the class unconscious is the unconscious thoughts, identifications and anxieties related to the primary insecurity that is experienced during the formation and deformation of class. In other words, *the class unconscious is the unconscious dimension of the class process*¹¹. These unconscious elements play an active role in the production of conscious expressions, and in broader terms, of expressions of the class experience. As presented by Lukacs (1967/2015), if class consciousness is considered as completed expressions that the primary insecurity has turned into symbols based on egalitarian identifications, carrying desires of transforming the social reality, then the class unconscious can refer both to the forces that shape it and to the raw material itself (Gürsel, 2018b). The Identification Stages of Class Model can provide the opportunity to study this relationship even further.

¹¹ Though it is important to discuss how the concept differentiates from “class consciousness” and “habitus,” it is better to do so in other mediums. Just to give the reader an overall idea, some points can be briefly presented. “The class unconscious” is designed as a concept above the deformation of the “class consciousness” or its absence as “lack of class consciousness.” It defines the active unconscious dimension that is present both in situations where conscious examples of the class process completed in emotion, word and action are dominant as well as in situations where they are now. In situations dense with unconscious identifications and defenses, egalitarian identifications will obviously suffer, and appearances of the class consciousness will diminish. It can be argued that in examples where the class consciousness appears more completed, the unconscious experiences will begin to have less weight, and get turned into symbols. What we truly need is an approach that goes beyond whether or not it exists; one that provides the opportunity to study the relations in between in both cases. Despite defining class in different terms, the “habitus” approach does highlight the unconscious identifications formed with the group, and between groups, but it still falls short of providing enough room to study the contrasts and contradictions between identifications, as well as the diversity among the objects of identification.

The Identification Stages of Class Model

Through various mediating factors, workers translate the primary insecurity experience during class formation and deformation into various individual and collective expressions of the class experience. There may be emotions, thoughts, words, actions, symbols, organizations, institutions, etc. that are produced during the class process—which begins with being forced to work, or in other words, proletarianization (Wood, 2008a) and is expected to end with class dismantling capitalist relations of production, along with itself (Marx and Engels, 1845/2004). The mediating factors that distinguish the production of expressions can be taken as working conditions, the labor supervision processes, qualities of the political climate, state pressure, the class history of the family, socioeconomic status, occupation, gender, sexual orientation, sexual identity, social relations of various levels, biographical stories, daily events, etc. By structuring identification tables applicable to limited (with a set beginning and an end) time-space sections, this model aims to open the relation between the expressions of experience and the factors to further study, and to render the class unconscious recognizable.

	<i>Proletarianization</i>	<i>Resisting proletarianization</i>
<i>Hierarchical Identifications</i>	Cluster A The Narcissistic Stage of Class	Cluster B The Ambiguous Stage of Class
<i>Egalitarian Identifications</i>	Cluster C The Civilized Stage of Class	Cluster D The Symbolic-Ethical Stage of Class

Table 1

The Identification Stages of Class Model (Table 1) stands on two axes: the first one represents the identifications that form the fundamental contradiction of class psyche (proletarianization and resisting proletarianization); the second one represents the two levels of identification that form the basis for expressions of class experience (hierarchical and egalitarian).

The root of the idea that sees psychology of class as divided along the line of contradiction between *proletarianization* and *resisting proletarianization* lies with Holloway's (2011a) argument that the current conditions of capitalism force the person to split between classification and resisting classification. According

to Holloway (2011a, 2011b), on one hand is the domination by abstract labor, the transformation of labor into labor force, the pressure of abstract labor fencing concrete labor; and on the other is the resistance to that pressure, the tendency to avoid the domination of abstract labor and being reduced to labor force and the attempts at overcoming it. These two contradicting tendencies interrupt the person's psyche and turns into a struggle occurring in the subjectivity of that person. With everyone living under the real subsumption, Holloway (2011b) associates this contradiction to all people.

However, we will use Holloway's idea to make sense of the internal conflict of those with a worker status. We will also employ the same "translation" between concepts and choose proletarianization and resistance to proletarianization over classification and resistance to classification. This is based on the distinction, as previously discussed, between being a worker and being a class. It is sensible to maintain that distinction; this text's perception of being a class includes the acceptance of the domination of abstract labor, as well as the attempts of undermining it and striving towards its destruction. An acceptance and internalization that does not recognize its destructive aspect or relies on the attempt of denial is only unique to certain and "early" stages of class. Therefore, Holloway's concepts must be made compatible with that understanding.

The levels of identification, which make up the second axis of the model, stem from Freud's approach on identifications with authority or siblings. While theorizing on the relations urges have with existing within a group, Freud argues hypothetically that humans decided to build a new order that replaced a patriarch's absolute power and prohibitions with one that is based on a new contract and defined common rules (1913/ 2014). At this stage, private interest was swapped with the laws of the group, which prevents the domination of anyone's private interest; thus a sense of law based on group relations was constructed. As patricide became an internalized prohibition, that law changed into "the law of the father." Still, according to Özyıldırım (2018), the "law of the father" as presented in Freud can be considered an abstraction of the siblings' later internalization of collective action and rules. This law regulates the relation among equals and refers to a contract created by mutual sacrifice. Rather than the irregular and whimsical act of the authority, the law of the siblings brings about a collective law that is limiting, binding, and leveling to all.

As siblings and generations grow apart, they grow closer through laws and roles. Marcuse claims that throughout human history, Freud's ties of fraternity fall short of completion, and are instead overrun with different types of guilt and father figures (1968/2016). In that context, sibling ties that limit private and aggressive interests point towards *egalitarian identifications*, as opposed to hierarchical ones. Freud (1915/2015) draws attention to the risk of regression where group and social relations, formed egalitarian, can regress towards hierarchical (and aggressive) ones. In a similar vein, Freud (1921/2015) mentions instances of where, upon replacement of a psychological agent—loss of an object—via regression with a leader, relations are built with other members of the group through identification with the leader. These are equal to hierarchical

identifications. As Bion (1961/2004) points out, egalitarian identifications can be formed in non-dependent groups; identifications occur among group members through certain ideas and ideals, which give way to a mutual creativity.

The Identification Stages of Class Model, based on four types of identification, allows for a two-way motion, forward and backward: from A to D, or D to A. The movement from A to D represents progress in class process, *the formation of class*; while movement from D to A represents regression of the class process, *the deformation of class*. Class formation is the experience of symbolization of primary insecurity in the psyche. This psychological transformation favors transforming of relations with the outer world as well. As progress takes place, workers demand purifying the outer world from oppressive ways, and for it to change in ways that are more complete. They begin experiencing their active status beyond being the passive receivers or components of power. That is why I refer to the effect of the mediating factors that contribute to class formation and push class forward as *transformative symbolization*. Class deformation, however, signals the separation of the experience of primary insecurity from preconsciousness-consciousness via various defenses, or its abandonment without processing. This psychological transformation favors isolation and avoidance in its relations to the outer world. Therefore, I refer to the effect of factors that regress and deform class as *avoidant defense formation*.

The four clusters/stages of class do not follow one another in a linear time frame, and a single phenomenon (expressions of the class experience of a worker or a group of workers within a certain period) is not limited to a single stage. Rather, stages are differentiated qualitatively, and any phenomenon is capable of holding expressions of class experience that correspond to each stage. I will be handling the Tekel Resistance as a phenomenon of such and study how the process can be seen through the stages and the framework of the model. I must pause here to briefly mention another aspect of the method. During the discussion, I will be using indirect material on the Tekel Resistance; though even direct observance may be considered as indirect due to the perspective, conscious and unconscious aspects of the observer. What will be used here as material will be the reflections from two documentaries that investigate the resistance.

It must be taken into consideration that the visual and narrative elements of both documentaries remain unedited and provide the opportunity for transparent observance. The interpretations that come from them will be based on observation, but will also carry the shadow of what has been left outside. Whether or not that shadow risks the validity of the interpretation may be discussed elsewhere—and can only be revealed by comparing interpretations from studying more material. I am confident, however, that the interpretations and deductions as made in this text—whether they are debated against alternative data and alternative methods—hold a certain internal integrity that can sustain those debates. That is the purpose of the model.

Of the two documentaries chosen for inspection: Murat Utku's *Direnışçi* (*The Resister*)¹² (2010) looks into the 78 days in which the resistance was occurring, while *Tekel 51* (2010) by TAKSAV's Cinema Workshop documents only the 51st day of the resistance. The former was chosen due to its documentation of the whole period of resistance; and the latter due to its intensified gaze into a single day, and therefore its capacity to include certain elements otherwise left out by *The Resister*.

Class Identification Stages and the Tekel Resistance

A. The Narcissistic Stage of Class and the Ideological Effect

The primary appearances of the class process is part of this cluster. The primary state of that appearance is not an issue of time but of quality—even though not all class processes begin there, this stage contains the “earliest” identifications that each class process can potentially regress to; it can also be considered as a starting point that borders on proletarianism, is obligatory, and has nothing prior to it. Expressions falling under this stage are built on the idealization of objects related to the relations of production, on the subsequent internalization of these persistent objects, and their inclusion into self.

According to Lacan, the ideal ego, as the fictional side of self, comes from the child absorbing a complete, fundamental, and stable object (1949/ 2006). As mentioned before, this narcissistic identification provides the child with the first unity of ego. In their review and discussion on the concept of idealization, Laplanche and Pontalis (1988) highlight that the idealized object is internalized as ideal, and thus made part of ego itself. Therefore, expressions of class experience that fall under this stage refer to this kind of relations with objects connected to relations of production. Marx' “commodity fetishism” (1867/2015) and Lucaks' “reification” (2014) define the kind of relation that occurs as the worker idealizes the labor force, accepts it as absolute and unchangeable, internalizes it as part of self, and self-defines through it. Here, “worker” is being internalized as an identity and, through identification with an object in a *hierarchical* status, *proletarianization* takes place.

Primary insecurity is experienced in different ways on each stage, while becoming the foundation for identifications in all stages. With the primary stage bordering on deprivation and insecurity, that border translates to a case of survival and death. Chibber sees deprivation as a driving force for that reason: working is necessary to survive, and according to Chibber, that is why working is desired (2017). Therefore, it can be said that primary insecurity at this stage is experienced as the anxiety of *perishing or being destroyed*. We have already

¹² The documentary was awarded the “Best Documentary” title in the 43rd Turkish Cinema Awards. For further info, you may look at: <https://m.bianet.org/bianet/diger/128170-en-iyi-belgesel-odulu-murat-utku-nun-direnisci-sine>. I am mentioning this as a way to draw attention to the institutional signification and credibility of the work; beyond that, this is not the place to discuss the status or the award, or the documentary as compared to others of its kind.

mentioned that, as Winnicot (1974) suggests, the anxiety of perishing, which represents the deepest desperation of a person, also forms the basis for idealization and identification with an ideal object.

When we look at the Tekel Resistance through the *Direnışçi* and *Tekel 51* documentaries, we observe that the expressions that can be placed in this cluster as opposed to others are quite few. At this stage, we can study the idealizations in *Tekel 51* expressions such as “*In this country...I did everything this country told me to do. Do I have to be dispensable after that?*” (Tekel 51, Episode 1, 6:10); “*Just like our friend said, we did everything our country told us to do. What else can we do?*” (Tekel 51, Episode 1, 6:31); “*What did I do? I served this country, I paid my taxes, I worked for this country...then pity me, do not pity me. Not giving me what’s mine—I don’t want that. I don’t want it... just give me what’s rightfully mine,*” (Tekel 51, Episode 1, 6:38). Here, the relation to the idea of “country” can be perceived as an idealization relation. In related expressions, “country” appears at the root of identity as an authority figure whose demands must be met, to which occurs an imagined relation of complete compatibility. What’s imagined here is a relation where the assumed expectation is a perfect match to its response. In that relation, as the authority figure is set, being a worker is defined as an activity done for the sake of that figure, resembling servitude, and matching the opposing figure’s expectations with something compatible (tax).

Ideological effect is what gives way to expressions of this kind that fall under the narcissistic stage of class. This effect occurs on the primary insecurity experience that is created by the process of proletarianization; and serves to ideologize that experience. We can define the “ideological effect” as the effect that perceptively places the subject within a network of social relations (based on power). Through the ideological effect, the subject constructs a position and an identity related to that position. As is apparent in the previous expressions, thinking that the position may be lost creates a perception of the position that is idealized. The ideological effect here has a regressive nature; it can trap the worker within an understanding of proletariat as an abstract and conflict-free identity, one that resembles a form of citizenship. We will soon be seeing that these effects (ideological, institutional, memory) may not be directly related to the factors we think they are related to; the root of the ideological effect may not be the complete “ideology” and can be transferred through factors such as institutions and actions as well. Looking at the documentaries, we cannot differentiate through which factors that ideology is being carried, but it may be possible that a “public” ideology which focuses on the welding of worker and state, was carried through workers and their organizations. Since that line of study exceeds the documentary’s limits, it will be subject to a different discussion.

B. The Ambiguous Stage of Class and Ideological, Institutional Effects

Klein argues that at the stage of the individual psyche that is defined as paranoid-schizoid, the self divides itself and part-objects and objects as good and bad to preserve itself and objects (1921/2008). That divide is the source of ambiguous attitudes and emotions towards objects. Abraham draws attention to the fact that following a stage that can be considered narcissistic, and until love and aggression is united, we go through ambivalent stages, where hostile emotions accompany love. The object is simultaneously loved and hated. If the object is assigned aggression, it becomes a cause of fear and doubt towards the object, and of a feeling of being under its cruel oppression (Klein, 1946). In the existence of projections, the line between self and objects, between internal and external world, is elusive (Klein, 1923/ 2008). As is emphasized in the works of Laplanche and Pontalis (1988), ambivalent attitudes and emotions towards an object are psychological elements that are not simply in contrast to each other, but stand next to each other, and preserve their strength despite contradiction, while resisting synthesis. The ambivalence is related to the state of hesitancy, which exists both in a conflicting double existence, and in what Klein (1923/ 2008) connects to failed divisions and syntheses, as well as the failure of structuring a trusted “good.”

Identifications that create the expressions that fall under this stage rest on fantasies, where- unlike unity, saturation, and lack of conflict- one is both part of the hierarchical objects and fearful of their power. Fear and hatred accompany the idealization of objects. Anna Freud’s process of identification with the aggressor can be considered as an identification that belongs to this stage (1937/1983). That identification refers to being in the position of -or trying to be like- the authority figure in order to overcome the threat coming from him/her. Here, according to Lagache (1962, referred by Laplanche and Pontalis, 1988), the other is misperceived, restrained, and destroyed. In that context, identifications with an authority figure indicate a control relation with the other. The hierarchical identifications with elements like state, commodity, and employer are also carriers of the desire to overthrow, to reject, to replace, to control—even without a tendency to deform the hierarchy; there is a *resistance to proletarianization* in question. Within the framework of hierarchical identification, one enters an ambiguous relation and struggle with authority; this is accompanied by *horizontal* differentiations and struggles against equal others in exploitation/oppression relations, rather than *vertical* struggles and differentiations that come through the recognition and symbolization of the difference from the authority.

Qualities resigned to dominant elements such as omnipotence, overcontrolling, having no limits, and the notion that what is needed can be found with them, are experienced simultaneously with the anxieties of retaliation and cruelty. Therefore, at this stage, the primary insecurity can be seen as *the anxiety of being persecuted*. As opposed to the previously mentioned anxiety of perishing, the anxiety of being persecuted comes from the belief that the self, or

parts of it, is or will be taken under control by pressure, creating an experience of deprivation and pain.

Direnışçi (The Resister) shows the complicated relation between anger and pain. A worker utters the words, “*We are making the children get used to hunger. We are now teaching them how to feed themselves with very little money*” (Direnışçi, 14:46). The expression here contains both anger and pain; but here, as pain becomes anger, anger is expressed through showing of the suffering, and is expectant of the visibility of it. In the imaginary moment here, the state which teaches to suffer (hunger) is also identified with; therefore, the hierarchical identification is next to the anger felt towards the object of that identification. A similar dynamic is apparent in the words of another worker: “*The selfishness is really bad. This is how a country can be run—this is the worst a country can be run. And we don’t understand why they insist on it when today, whichever court we go to, they know the workers will win*” (Direnışçi, 20:17).

What is worthy of mentioning is that the negative notions about the state here are next to positive assumptions. In talking about not understanding why the government is insisting, the expression seemingly refers to a “good” side of the government. It refers to a hierarchical identification: to the notion that the state does and will think like a worker—it will have a sense of justice, and respect. The emphasis on a “good” quality appears related to the denial of the conflict of interest that exists in between, and the attempt to distance the “bad” interest of the other. The misspoken words at the beginning where the word “bad” gets dropped mistakenly (from *this is how...a country can be run*) is indicative of this argument. The negative thought appears expressed, but its existence within the sentence remains undecided. How the “bad” will be incorporated into the thought is not completely understood.

Expecting conscience, pity and guilt in the following expressions from *Tekel 51* comes from a relation based on imagined comradeship and affection with something not equal, but hierarchical: “*If the prime minister is in good conscience, if he calls himself a believer...let him go on TV... if can make a living with 700 lira...I will sign it, right away... Should these kids become drug addicts, violent attackers? Isn’t it a sin, what’s being done to us? Everyone has a regular life... we can’t live like them... We do not have villas; we have nothing*” (Tekel 51, Episode 2, 5:03); “*What is this? This prime minister is inflicting this on us. If his son goes hungry for a day, will he be able to stand it? If his children come here under this snow, in this time of winter, and join us, will he also accept it? We brought him to power twice...He is now very spoiled*” (Tekel 51, Episode 2, 3:52); “*Enough, pity us, what is this state? We have been destitute here for fifty-one days*” (Tekel 51, Episode 4, 7:22). Control in these thoughts has been completely surrendered, via the “hope” of being seen, to the object in that position. The anticipation of comradeship in emotion can be detected in the following lines: “*If he tells us that this is our livelihood...If he can provide for my kitchen, for my everything—we are OK with that. We do not want his salary, his ships; we want our rights. What’s wrong with that?*” (Tekel 51, Episode 4, 5:13). The present emphasis here on the desire to retain whatever the other has

harms the antagonistic quality of the concept of “right,” which can be considered as related to the previously discussed anxieties of being persecuted.

A similar hierarchical identification formed with the union can be seen in here as well: *“Our respect to the union’s decision is infinite; we did not come here on our own. We came this far with a union head leading us, we should follow his judgement”* (Direnişçi, 41:35). The hierarchical identification formed with the union and the president here differs from the identification present in a statement such as: *“There is a decision made by the union. Of course, this doesn’t mean we will be going back home and sleep. We’ll be doing things in the places we go; we will be preparing action plans by talking to people”* (Direnişçi, 41:5). The latter expression signals something beyond contentment with the union’s decision; following the recognition of the decision as a reality, expressions of egalitarian identifications and common activization follow. In the former, however, the referral is not to the recognition of a reality, but to compatibility within a hierarchical identification and to the idea of unity with the authority. That tendency of identification aligns with the sentiment in the expression *“Why are they breaking our strike? Dismantling our tents is breaking the strike. We don’t want our tents to be removed”*; and with the slogan *“The tents remain, the resistance persists”* (Direnişçi, 41:02).

As seen in the previous expressions, the hierarchical identification with the union shows itself in the passive assumptions that occur following the recognition of reality, rather than searching for ways of activization; the latter expressions show the denial of passiveness through a sudden move. In a similar vein, the union is assigned omnipotence, but with the recognition of its cruel use of that power; the attempt is to reverse the grievance felt from that through the rejection of the current state. This interpretation, independent of right or wrong, refers to the division of the resisting workers group into subgroups that contradict in idea, but are equal on identification levels.

What causes these types of expressions that fall under the ambiguous stage of class are two kinds of effects that come from various factors within the context. The first one is the previously discussed **ideological effect**. In contrast to Cluster A, the ideological effect here has affected towards progressive—in other words, transformative—symbolization, and caused expressions in the ambiguous stage. We have previously defined the (regressive) ideological effect in the narcissistic cluster through its positioning of the subject within a network of social relations. The (progressive) ideological effect here comes from the feeling that what was promised through that positioning has not been delivered. What gives way to the class expressions under Cluster B is the relation and tension between the expectation from the subject’s ideological positioning and the state of deprivation that the subject is currently in. That is why these expressions contain the notion that what’s being done is immoral, “sinful,” and against what has been promised as well as sentiments of surprise and objection such as “how come?” and “why?”

The documents reveal that certain statements from Erdoğan, the prime minister at the time, and statements from other government officials are among the factors that contribute to these effects. By voicing “ideology” in his

statements, the prime minister's words about the strike appear as a blatant attempt at pushing the discussions towards ideological ground: *"An unfair strike... It is an ideological strike...Almost 10.000 people are now being paid without working in these warehouses... There are millions of unemployed people in this country that will work for the wages of the 4-c"* (Direnişçi, 6:37). That reasoning aims to replace the previously mentioned tension between expectation and deprivation with a new one and expresses the wish to redefine the wages and rights of the workers, as well as the socioeconomic section they will eventually belong to. The ideology employed here has neoliberal qualities (Koray, 2015). The minister of treasury at the time also speaks in a similar manner: *"We are not wasting away our people's money in luxury. We built a model where no one will be at a disadvantage. If there is a mistake, it comes from our sense of mercy"* (Direnişçi, 7:47). That statement also comes from a wish to redefine the social status of the worker, and to replace a relation of right with a whimsical, hierarchal one (Çelik, 2015).

The impact of these factors, however, fails to have a regressive effect, and instead causes a progressive ideological effect that can be seen in the following expressions: *"Mr. Erdoğan says we get paid lying down. We did not lie down, he put us down. He is the one who stopped production...He is the one who ended tekeli shops. He is the one who ran us out of business...there is our right that had been earned...We will not give up on that; there is no way we will"* (Tekel 51, Episode 1, 6:48); *"I served these men... for years. Now he is saying that these are not from AKP, these are marginal groups. He is right, we are marginal for having served... I will no longer have anything to do with them. Completely—in fact, I will have nothing to do with the right anymore; they turned me into a communist by force"* (Tekel 51, Episode 3, 1:03); *"For 20 years we worked with our rights and benefits, we don't need anyone's mercy"* (Direnişçi, 7:58). The lack of regression in these attempts of verbal intervention makes more sense if it is taken within the ideological framing of the union members. As apparent in expressions such as *"We believed, and we won. The justice in this country accepted our right and our law; I hope the administration will too"* (Direnişçi, 0:12) and *"To rip the worker away from the union...to de-unionize the workers... We did not allow it; we will not allow it"* (Direnişçi, 32:49), the tendency to define the relation of right against the political power may have also served to feed the ideological effect. The expressions at this stage carry the institutional effect along with the ideological one, but this effect is regressive, not progressive. In other words, this effect causes expressions of class experience to appear not in the civilized stage, but in the ambiguous one.

The institutional effect can be considered as an effect that places the subject within group bonds and improve—or block—egalitarian group relations. With an effect that blocks egalitarian identifications, the expressions that fall under this cluster can be defined as the intensification of investing in hierarchical others, while withdrawing the psychological investing done in an equal other. Here, the institutional effect can be implemented both by *existent* factors such as state violence (either through illegalization or by other threats of violence), or by *missing* factors such as the social and egalitarian functions that cannot be

accessed institutionally through the union or through other means. Some of the statements made in the early days of the resistance such as *“Well, the worst was the tear gas, the sewage water, the torturing. That was absolute torture. It was a show of strength to stand up to that and to resist. We became stronger after that”* (Direnişçi, 1:29), and *“We first thought that if this was what it was, it wasn’t that bad. It turns out that was a little exercise. A day later we experienced things that were more nightmarish. Then we took refuge in Türk-İş”* (2:27) reveal what happened through the return of the “nightmarish.” The documentary shows us the violence in the most naked form (Direnişçi, 1:14). The threat of violence can be detected in the prime minister’s answer to a question on the police intervention: *“These are not legal applications, but we tolerate them for now. We are not expecting [police intervention] until the end of the month, but we will when that time comes”* (Direnişçi, 20:35). The news channel CNN Türk defines the strike and protest of the Tekel resistance as *“the protests deemed illegal by the Ankara governor”* (Direnişçi, 30:32).

State violence keeps alive the anxiety of being persecuted that underlies the expressions of this cluster. The disintegrating, regressive, and individualizing effect of violence can also feed on the lack of new relations and safe zones, and on the incapability of creating them. For instance, when the prime minister refers to unemployment in his statement, it points towards the state’s inability to provide social security. This is an institutional shortcoming. The head of Tek Gıda union, Mustafa Türkel, also signals an institutional shortcoming in his words: *“You can look at the February 4th incident in two ways. First off, it was the first time the worker stopped working for solidarity, for reasons outside of their own. When you do a general evaluation, you see that the February 4th solidarity strike did not bring the expected results. ... on the contrary, we witnessed the existence of union members who wanted this struggle to fail”* (Direnişçi, 27:35). Therefore, it can be said that both progressive ideological effects and regressive institutional ones (on levels such as the state, law, social security system, unions, workers movement) give way to expressions that appear at the ambiguous stage of class.

C. The Civilized Stage of Class and Institutional, Memory Effects

The psychological signs of proletarianization in the expressions of class experience do not have to rely solely on hierarchical identifications with dominant elements. This proletarianization can also rely on identifications formed with objects in equal positions, such as fellow workers as well as on realizing a difference in power with dominant elements and the subsequent struggle with them. According to Wood (2008a), this is what defines class as a relation: class is both a relation of mutuality, and one of contradiction.

Klein (1957/ 2016) connects the transition from paranoid-schizoid to the depressive via the abandonment of the other’s perception as part of the ego and via the synthesis between the good and bad. In the period of mourning, Klein suggests that following the early-stage fantasies and experiences such as

enthusiastic identification, fall of the object, the desire to overthrow the object, and the intense guilt from that desire, it becomes acceptable that the ego and the objects are imperfect (Klein, 1935/2008). The acceptance of the limits of and differences between the subjects and their flawed nature has an important place as the child comes out of narcissistic identification, idealization, intense destructiveness, and destructive anxieties. Freud, too, draws a connection between sibling identifications, the limitation of absolute authority, and the abandonment of identifying with it (1913/2014). In fact, to him, civilization relies on identifications over common thoughts, unifications against singular interest, and forming a sense of solidarity (1930/2011). In that context, the civilized expressions of class come from the contradiction against singular interest and whimsical obstruction, from the abandonment of identifying with authority and the desire of overcoming dependency—but not from denying it through identifications with omnipotent positions.

Workers form class by identifying with each other through a mutual recognition of realities (for instance, ‘circumstances of existence rely on the obligations forced by the market’ [Wood, 2003] and ‘the conflict of interest between the exploiter and the exploited is a necessity of the existence of capitalism’ [Marx, 1867/ 2015]), through the interpretation of experiences, and by forming groups and institutions on common contracts. In this context, class is something like “work groups,” which Bion (1961/2004) refers to, forming common ideals and connecting over the investments into those ideals; these connections provide an environment for creativity.

At this stage, we can take the primary insecurity experience as experienced through the *anxiety of lacking, of being deprived*. The exploiters (and state) exist by seizing, and it is not only possible, but obligatory, that they would want more. The group, however, can resist together, and limit the act and desire of seizure through regulations and law. According to Özyıldırım (2018), Freud’s idea of “the law of the father” highlights the democratic and egalitarian tendency of the siblings. In Marcuse’s (1968/2016) argument, that tendency is never carried out to completion due to the replacement of father figures and the preservation of guilt. Wood (2011) argues that for social relations to be organized without capitalism, intervention by the working class is structurally and strategically indispensable. At the civilized stage, the workers construct themselves in a differentiated, common, and antagonized position, but they lack the designs to destroy class relation itself.

Expressions that follow as referring to the construction of a group story can be taken at this stage: “*We got stronger after going through that. As you know, we are here to protect the future of our children. We will be... for the sake of the future of this country*” (Direnişçi, 1:29); “*This was a slow burn formation, good things began here*” (Direnişçi, 2:27); “*We became a family here*” (Direnişçi, 5:59); “*We stayed up through the night without our friends of struggle...we united in our labor*” (Direnişçi, 12:37). Expressions which, while designing commonization, possess both a desire to activate, and the recognition of the other’s desire to seize also have roots in egalitarian identifications: “*There is a just struggle here*” (Direnişçi, 7:17), “*We are right, and we will take what’s our*

right. This won't be just for us, but for sub-contractors as well" (Direnişçi, 7:37), *"We don't need any mercy. We worked with the same rights and benefits for 20 years, with no need of anyone's mercy... What they want is a cheap slave, a nation dependent on them—let me hit them on the head, give them a bag of coal, pasta, keep them dependent on me"* (Direnişçi, 7:58), *"He is the one who left us unemployed. We have rights that we earned. We won't give them up. We won't"* (Tekel 51, Episode 1, 6:48). As opposed to the previous stages, these expressions possess an understanding of rights that has not been curbed; the power which belongs to those which the struggle is against is not a source of excessive fear. Power, instead, is what prevents the use of right and deprives the person of fulfillment; the one exercising that power is no longer elusive, but understandable and recognizable in the eye of the worker.

Expressions that refer to workers sharing emotions with each other rather than with the dominant forces also fall into this cluster. These emotions can be of deprivation, of hope and of separation: *"We are living in unhealthy conditions, we are away from our families, but we have hope in the decision of the court, and we have hope in the struggle of our friends"* (Direnişçi, 10:32). They can also be of loss: *"They called me on the 14th-15th day to tell me that my daughter is sick. I went there, and I lost her on the third day. I came here for their future. I lost my daughter, and I don't want to lose my son"* (Direnişçi, 15:55); *"We lived that sorrow, and we mourned. But we had to resist"* (Direnişçi, 17:00). What is being shared can also be desperation: *"We told him not to go... He did. A friend came over and told us that he had an accident. We began to run; we were shocked; we couldn't do anything. We saw how painful helplessness can be here, we saw that here"* (Direnişçi, 37:56). Of reviving anger: *"We were a small spark, now we are a strong flame. We will burn those who wish to burn us"* (Direnişçi, 35:36); or *"Our rights, we will take them by force"* (Direnişçi, 11:49). Of gusto: *"We won a victory, my boy...keep up the struggle"* (Direnişçi, 40:43); *"I am very happy, I am very happy. It's been a struggle of honor and the honorable ones won"* (Direnişçi, 0:35) and *"We are right. We will win."*

The exchange of emotions can be seen in the farewells and embraces of the final day, as well in the crying and laughing (Direnişçi, 40:04). All these emotions are considered as shared between "siblings" and bringing them together, thus they can be placed within egalitarian relation designs. When we look at the news report on CNN Türk, which delivered, *"A sad event occurred on the 72th day. A Tekel worker crossing the street was hit by a car and lost his life. Hamdullah Uysal lost his life near the workers' tents, but police did not allow his coffin to be placed in front of Türk İş"* (Direnişçi, 37:23), we can see how sharing a common feeling can indicate a separation from the dominant element. The desire to claim the loss, the emotions, memories, and relations can be experienced as a struggle against the other, which intends to seize and to oppress.

We mentioned the difference in power when we talked about the relation that egalitarian identifications have with the acceptance of difference, but at this stage, what is also accepted is the difference between equals. In the expressions *"It's very hard to be a woman in the east; you are born into struggle. We fought that war. We came here after we overcame that difficulty. We lived through great*

difficulties when we first began working here, about 21 years ago, but we overcame those as well. We came to Ankara and learned to live on the streets. We joined the sitting protest for days, on the streets, with my daughter. My daughter was a resister too” (Direnişçi, 9:46), and *“Here, we experienced an environment where people come from all regions, live with their identities and their cultures, shoulder to shoulder. Not even the smallest issue came out. Everyone lived together seeing the other as the other”* (Direnişçi, 32:12), we can see the idea that no contradiction exists between being “from the east,” “a woman,” “an identity,” or “a culture” and being a group. The relation of recognition and encompassing as reflected in these thoughts and in the dances of “halay” and “horona” in the footage (Direnişçi, 32:40) also defines the matured, fully formed working class: Class is a group process that neither isolates the pieces by disconnecting them, nor pressures them into conformity. As is apparent in the statements *“We can make some gains here, or make none at all, but the winner will be Turkey’s working class”* (Direnişçi, 21:27) and *“Every place is Tekel, every place is resistance!”* (Direnişçi, 10:17), class contains the tendency to expand towards different people and places.

Expressions which reflect identifications expanding towards different workers’ sections can also be studied here, such as these words spoken about a group of workers shoveling snow at the resistance: *“I pity their state, they are laborers like us... They have children”* (Direnişçi, 13:12). The slogans shouted by a European group and the slogan of *“We will win by uniting and uniting”* (Direnişçi, 17:33) that was shouted following them are indicative of the bonds that have been formed. Another indication of that bond can be seen in the lines *“Your friends, comrades, are supporting you in protest from across Europe”* and the following *“Long live class solidarity!”* (Direnişçi, 17:53). Here is group formation among different workers’ groups—Tekel workers and supporters—as a way of forming groups among workers based on mutual feelings, experiences and stories. Identifications within the group that are based on shared experiences have expanded to the outside of the current group via similar identifications connected to laboring.

In that context, the class experience that becomes material to mutuality is, at one instance, pain, laboring and delivering and feeding children, and, at another, it is the struggle. Activities such as marching, waiting, staying up all night, conversing, singing folk songs, watching films etc. (Direnişçi, 0:01; 24:08; 35:36, 41:46) are based on egalitarian identifications. It must be noted here, though, that this interpretation does not overlook various other types of identifications that occur during these activities, but only indicates the necessary ones that enable them.

Two effects occur during the emergence of expressions of class experience at the civilized stage. The first one is the ***institutional effect***, and this time around, it has a progressive nature. At this stage, the institutional effect that enables egalitarian relations between workers and thus place them within a group can also be coming from the intermediary factor of the union (Tek Gıda İş) and the confederation (Türk İş). We note the following statement from the workers in the documentary, *“We thought, if this is what it is, it is not that hard. But this*

turned out to be a little exercise. We experienced much worse, nightmarish things a day after. We took refuge in Türk İş after that” (Direnişçi, 2:27) as well as the statements from the head of the confederation to which the workers took refuge: *“We will see our strength, that comes from production, between 8 AM and 5 PM on February 4”* (Direnişçi, 23:57), and *“Dear Prime Minister please, come here, and see this place. If you are saying that unions are not being honest, then come here once and show the grace of listening to the Tekel worker one. I call on the government on this day of protest, resolve this issue”* (Direnişçi, 28:28).

We also witness statements from the union head: *The justice in this country accepted our right and our law; I hope the administration will too*” (Direnişçi, 0:12); *““You can look at the February 4th incident in two ways. First off, it was the first time the worker stopped working for solidarity, for reasons outside of their own. When you do a general evaluation, you see that the February 4th solidarity strike did not bring the expected results. ... on the contrary, we witnessed the existence of union members who wanted this struggle to fail”* (Direnişçi, 27:35); *“We did not and will not allow the de-unionization of workers”* (Direnişçi, 32:40); *“In a minute, from noon, we will discuss these with our friends here and remove the tents at 1 PM. We end the mutual tent protest at 3 PM”* (Direnişçi, 40:48). Based on these statements, we can say the clustering discourse of the union and the confederation (this is not to say that these discourses are not in interaction with the workers, or are free of their impact), and the way in which the agenda is set, followed, and kept alive; the movement between workers and the state, their ability to make decisions and to pass them on—all constitute the institutional effect over the class experience of the Tekel workers. But these effects exist with the institutional effect from the workers’ actions. The active and “official” (Direnişçi, 15:15), day and night, sun and sleet, “tent city” (Direnişçi, 5:54) life the workers built at the site of resistance can also be taken as a mediating factor implementing an institutional effect over the connections of the workers. This life functions as the cradle of affections, designs, actions, and struggles based on egalitarian identifications. The cradle is kept alive through supporting sections and the support that contributes to the institutional effect, referred to in these expressions: *“We had beautiful friendships, people we never knew came to support us. We saw support in levels we never hoped for. That was great. From every section...they came to support us”* (Direnişçi, 5:12); *“This is no longer a Tekel protest. Global press, global unions, mass organizations are all with us. It makes one very proud. The world heard our voice, hopefully, so did Tayyip Erdoğan”* (Direnişçi, 18:10); (written on a sign) *“Thanks to the people of Ankara and the shopkeepers of Sakarya for their support”*; (directed at the shopkeepers) *“The workers are proud of you”* (Direnişçi, 43:24).

The memory effect accompanies the institutional effect of these mediating factors, but for expressions on this stage that effect is regressive; the memory effect here is missing and filled with gaps. The *memory effect* is what either integrates the historical, egalitarian, and democratic aspects of social relations into memory, or what partially saves and erases them. Within the context of Cluster C, civilized appearances, no matter how much they rest on egalitarian

identifications and stand on the potential place to overcome hierarchical social relations, do not contain designs of dismantling and restructuring hierarchical relations. This cluster is, after all, on the line of proletarianization; therefore civilized representations of primary insecurity are somehow lacking. The memory effect here is marked with forgetting and carries an *antidemocratic* quality.

One of the mediating factors that cause this effect is the limitation of the relation between the workers and the supporters to a “supportive” one—be it with a workers group from Europe (Direnişçi, 17:33), workers from a different sector such as firefighters (Direnişçi, 34:01), citizens (Direnişçi, 42:33), or other groups. We can see from previous expressions that these relations are perceived as supportive relations and met with gratitude, happiness, and pride; this, among other factors, may have caused the Tekel resistance to remain in a civilized stage. In other words, one can see the impact of memory gaps in the failure of these relations to enable designing egalitarian orders together and mutually. Further discussion can focus on how the opposite can be made possible—including the needed capacities of other groups. It must be noted here, however, that the documentaries lack definitive information on what the Tekel workers learn from supportive groups (on struggle and building new lives)—we will talk about the only example of that kind in Cluster D.

As we discussed, the union and the confederation, which have a certain impact on the workers’ experiences, lack the capacity to carry over the democratic memory of social relations and thus have a simultaneously regressive effect. This can be seen in the consent towards the union’s decision, or in the statements of the union head: the workers are experiencing the union’s decision as “news.” This constitutes an example of the workers experiencing the union in an external manner. Even though that experience can be overcome through the internalization of democratic memory, and the absorption of memory to relations, that has not occurred here.

D. The Symbolic-Ethical Stage of Class and the Memory Effect

The final stage of class formation is built on the symbolization of class experience in a way that indicates the overcoming of capitalist relations and its transformation into a new ethical framework. In other words, the symbolic-ethical feelings, designs, and actions formed at this stage are the signs and the potential of class and capitalism breaking down. Delving further into what situations enable the actualization of this potential is outside the focus of this article; however, the development of potentials is a prerequisite of social transformation. These potentials are formed through the subjectification of the primary insecurity experience, and its absorption into the psyche—similar to the absorption and subjectification, as Rousillon (2017) indicates, through symbolizations, of the traumatic experiences that fail to integrate into the psyche. The symbolization process tells the story of the “traumatic.” Through Thompson’s point of view (1995), the workers discover themselves as a class in

this story; but through Lucaks' point of view (2014), this story is beyond class identity and motivates the destruction of capitalist relations and class itself. This experience, which carries the tendency to unify history with the present—and future, by logic—, can also be considered as Holloway's (2011b) re-unification of the capitalism-induced separation between foundation and existence.

Class does not interpret its experience solely through the effect of elements that are at proximity, but also through the relations that enable these effects and it keeps the formation of these relations within its field of vision, intending to transform them. Therefore, expressions of class experience emerging at this stage, despite their roots in egalitarian identifications, develop beyond the thought of "proletarianization," by connecting to the idea of belonging to the group, or society. Identifications expand beyond the workers' group, accompanied by the desire to render subjects equal, thus, carrying the tendency to resist proletarianism. As class resists proletarianization through designs that redefine the relations that create class itself, it also turns towards expanding the fraternity to a wider section of the society. In line with Marcuse' (1968/2016) argument that Freud's sibling democracy was interrupted by the designation of the "father" figure, we can say that this stage exists beyond that interruption and carries qualities that are beyond civilization.

At this stage, primary insecurity is experienced as *an ethical anxiety* that forces a reframing of relations. Starting from Levinas, Butler (2013) talks about an ethical anxiety that is beyond the circle of conscience based in the cruelty of the superego, where banned aggression towards the other is replaced with aggression towards the self. According to Butler, that anxiety reveals the vulnerability of the other in a way that overcomes the narcissistic qualities of a guilty conscience. Butler states that the process of identification carries by obligation a perception of differences, and the tendency to overcome that difference. It separates the identifications based on the belief that the difference can be overcome by the connection tendencies that accept the impossibility of overcoming. The indicated "critical image" represents the latter type of tendency. Therefore, the phenomena in this last stage of class comes from the critical images of class. Class becomes an object of identification that is formed through the recognition of differences and the renewal of ethical contracts, where the need exists to create relations that do not place pressure on differences.

When we look at the Tekel resistance through the documentaries, we see the symbolic-ethical stage of class in the following expressions: "*Well, we started on this road to protect our rights and benefits, but people learnt a lot of things in this university-like tent city. Our struggle goes on in this country...so that our children, grandchildren can be saved from these troubling working conditions*" (Tekel 51, 1:37). There is a story being told here: In a place that turned out different than expected, with relations built that are not what had been expected, where motivation and ideas that existed early-on, but were then dropped, the vividness of relations between people and generations became more attractive. There is no change in the line of egalitarian identification, but the reference made to the image of a public space, where different classes,

generations, experiences, and types of knowledge interact,¹³ does indicate an expansion and enrichment of identifications. What is referenced here is beyond a relation of support; it is a relation of learning.

On the other hand, the dream of overcoming proletarianism and uniting in an egalitarian space (students can become equals among themselves or the teacher can realize how much there is to learn from students) is qualitatively different from resistance on the basis of hierarchical identifications. At this stage, the ambiguous tendencies that, under cluster B assign excessive power to the authority, transform into designing new relations for those in the place of authority and those who lack power. The university can be considered as a place of relations that differ from a high school or a company. Of course, here, we preserve the parallel associations with the source indicated in the footnote: At the university, students are adults; and the authority must reorder anytime it puts on oppressive or pacifying qualities. In that regard, the worker seeing the place of resistance as a university calls for the restructuring of relations in that place in a manner that leaves behind the state of proletarianism. This singular example also redefines occupation: occupying a city space also constitutes a form of realization of the resistance to proletarianization at the stage of egalitarian identification. As the occupation continues, it takes on qualities beyond defending rights. We must consider here both the malfunctions it creates on the social order and the “novelties” that come from the relations the person living there builds with him or herself, with the space, with others and with labor. The workers then create an organism that builds and processes these novelties—in other words, they create *a livingness that forms in a collective body*. We can see the anxieties related to the scattering of this body (Direnişçi, 41:02) as not only a sense of defenselessness, but maybe of losing the “psyche.” In objecting to ending the protest, you can also detect the anxiety over the irreplaceability of this “psyche” being voiced. You can’t find a similar example in the documentaries, like that of the “university,” which verbalizes that aspect of the occupation. Therefore, in a continuing protest of symbolic-ethical quality, there is a discrepancy in its meaning and that meaning’s verbalization.

There is a progressive *memory effect* that gives way to the emergence of this cluster’s expressions. This memory effect, compatible with the fact that it’s intensified in clusters B and C, may not be very strong and that may prevent the open development and multiplication of revolutionary designs. Still, the Tekel resistance has aspects that go beyond civilized experiences and these aspects have come from the impact of certain mediating factors. One of the reasons behind the workers’ identification with egalitarian memory is the worker experiencing the life and creativity of the collective body, which is created as a response to the insistence on unsafe work and police aggressiveness. In that case, the intermediary factor is the unity itself. What makes the worker think of a university and what keeps the protest going, is that body.

¹³ Many of the statements made by Boğaziçi University Academicians can be seen as supporting this association, but this one particularly does: <https://www.evrensel.net/haber/437210/bogazici-universitesi-akademisyenleri-kimse-bizi-evimizden-koparamaz>

Table 2

Further deductions

The approach presented here aims to study the unconscious dimensions of class formation- deformation within the framework of relations to conscious appearances. It also relies on a specific model to relate expressions of class experience produced under various contexts to unconscious identifications and thoughts and to the interaction of those identifications and thoughts with the effect of individual or social factors. The model employed allows for ideas on the positions and states that can be found en route from proletarianism to discarding capitalism. While introducing this model, my attempt here has been to construct interpretations, through the Tekel Resistance, on both the psychological dynamics and the effects that create those dynamics (for a visualized representation see Table 2). Though they may not reflect all aspects of the resistance, I believe that the documentaries that have been referred to throughout this study have enriched these interpretations by forcing us to reconsider the resistance through what has been visible and by providing us with new material.

To further study the June 15-16 Resistance (Gürsel, 2020), I used the conceptualization of triple effects (ideological, institutional and memory), which I argue follow each other along class formation. In fact, I now consider these effects as conceptual parts of the model, and through this text, I tried to better define their meaning. The effects help us better understand the reflections and operations of the “inside”—the formation of evasive defenses and what it takes to put into motion the transformative symbolization—independent of our preexisting notions of what those factors are. Here, we form the relations between our chosen factors and these effects, and thus move beyond treating these factors as “independent variables.” For these factors are included in the game as *dependent*—only through the level of effect they are capable of and through how they themselves are affected.

Jumping off from this notion of effect-factor, we studied the table of identifications present at the Tekel Resistance. Our study shows: A strong ideological effect has been preserved through the resistance; an attempt to bring meaning and position, in struggle with neoliberal ideology, has been in effect, which we can see in the limited lapses into the narcissistic stage. But the same ideological effect remains strong because the ambiguous stage presents an intensification similar to that of the civilized stage. This indicates that the ideological effect did not transform into other effects and in certain ways stayed as it was. The untransformed ideological aspects may have rendered the resistance more vulnerable to regressions. Discussions into that vulnerability can benefit from looking into other examples, as well as looking into what happened after the resistance ended. These discussions may develop further through questioning whether the workers lapsed into narcissistic appearances and identifications with state, labor and proletarianism, the level of these lapses, or what occurred instead of them in the aftermath of the resistance.

We can detect the strength of an institutional effect beyond an ideological one in the accumulation at the civilized stage. The institutional effect that has been riddled with certain acts of forgetting—which is needed initially to form a group—and which levels the workers with each other in manners of emotion, thought, action and organization, can also carry reflections outside of the group. The legal gains¹⁴ can be an example of these reflections. On other hand, the resistance might have institutional effects as well. For instance, it can be further discussed whether the Union Power Unity Platform¹⁵—which was formed the following year by Türk İş member unions under the banner of “We united for a democratic, struggling, strong and new union”—can be seen as an example of the union struggle being civilized through the impact of the resistance. Perhaps the resistance affected in a similar manner those who came in contact with it. TODAP and PEP’s institutionalization can also be considered in this framework, and others may be added. In my view, the fact that these groups have communized the class experience of those that they contacted and unified their

¹⁵ For further information: <https://www.tekgida.org.tr/sendikal-guc-birligi-platformu-atagi-12485/>

own class perspective at the time should be taken as some of the civilized traces of the resistance. This is a contribution to the egalitarian reminiscences of social memory; it should not be overlooked that the relations these pieces have (laws, groups, institution) to each other and to the Tekel Resistance appear to have been forgotten.

It now makes sense to delve into a discussion on the memory effect. As previously mentioned, the memory effect is not strong in the Tekel Resistance: even though the appearances belonging to symbolic-ethical stages were noteworthy, they fail to transform into clear appearances of a post-capitalism society. The partial forgetfulness that defined the civilized expressions were not replaced with something else. This could also mean that the collective body was not collectivized enough to multiply the mutually creative designs. In other words, this collective has yet to find the basis of relations (the university) it needs to form strong identifications with the egalitarian history of the society and therefore failed to multiply expressions beyond the civilized stage.

As we are discussing this, we must investigate the relations between the resisting workers and those that show up to support them. To say that these relations stay at the level they do because the workers, or others, have defined them as “supportive” would be to present what we hope to explain as an explanation. In my opinion, the difference between the capacity of those who are “supporters” to take on, internalize, and carry institutional effect has kept this relation from further collectivization. That difference may have presented an obstacle between the flow of experience and memory between various sections. The communizing effects that the supporters -whether they have come by themselves or as groups or they have shown their support from far away- have designed in their own living and organizational spaces are at best insufficient, which has prevented the forming of a mutuality in that relation. This could have resulted in some people or groups compensating for those insufficiencies or to continue the state of avoidance/forgetfulness. Therefore, what a resistance of the past can teach us—as we dream of being rid of capitalism—is far from over.

Modalities of agency: How ultimate concerns and conduct of life frame biographical research

Michalis Christodoulou

Abstract

Traditionally social theorizing on agency suffers from the shortcomings either of the teleological models of social action stemming from rational actor theories or of the normative theories of action as proposed by Parsons. Psychological theorizing on agency is dominated from cognitive or developmental approaches which conceive of individuals as spectators of social life who process cues from the external environment. Criticisms to both kinds of theorizing underline the need that sociality needs to be considered in order that problems concerning determinism or voluntarism to be avoided. In this chapter we argue that Critical Psychology (CP) and Critical Realism (CR) might be two viable alternatives to the above strands of thought by bringing to light how these two theoretical currents approach agency. In particular, we show how CP scholars prioritize a subject-oriented in which the possibilities of action are highlighted and how CR scholars emphasize how subjects' being-in-the-world gives shape to ultimate concerns through which they navigate in the world. Both approaches theorize three dimensions of self-formation which are missing from the traditional theories of agency, namely, temporality, historicity and contextuality.

Keywords

agency, reflexivity, ultimate concerns, conduct of life, action possibilities

Introduction

Numerous attempts have been made to overcome the shortcomings/weaknesses/limitations of the agency/structure dualism, one of the main intellectual traditions that social theory inherited from Enlightenment philosophers. As is well known from the Anglo-Saxon literature on social theory which revolves around self-formation, the two dominant theoretical "camps" on the issue of agency are the rational action theories which end up in what is called analytic sociology and explains agency through mechanisms located at the individual level of belief formation and the constructivist approaches which

conceive of the world as a gift of society, as Archer puts it. Standard psychological approaches to agency consider it as an individual trait which acts as a motive pushing agents to actively influence their environment (Bandura, 2006). The deficiency of this approach is that agentic action is an internal affair limited to how cognitive schemes process environmental cues and that context, although considered as a “factor”, is not theorized as an integrative property of agency itself. This deficiency is reflected on the methodological level since agency is operationalized as a variable-centered effect of which the variation is described by these trait-like constructs (Judge et al., 2002). What is lost from this approach is not only contextuality but also temporality, relationality (Meyer & Ronald, 2006), and historicity (Parker, 2020). This article aims to put forward some theorizing which center on contextuality, temporality, and relationality as the main dimensions framing agency. We will delve into these issues as depicted in the points of theoretical and methodological intersections between Critical Psychology (CP) and Critical Realist (CR) approaches to the study of agency in biographical research. We have structured the article as follows: first, we highlight their socio-ontological commonalities regarding the genesis of self-consciousness, second, we bring to the fore the theoretical gains issuing from these commonalities which feed specific theoretical approaches to agentic action and, finally, we show the methodological orientations which frame the biographical study of agency in sociological research by presenting biographical material analyzed through the lens of CP and CR. Developing theory from a handful of cases is an additional common methodological perspective shared by these two approaches which are discussed in the last section.

Socio-ontological approaches of CP and CR to agency formation

A common feature, that both approaches to agency share, is that they do not reduce subjectivity either to rational action theories or to transcendental structures the foundation of which is a-historical. Tolman (1994, p.26) mentions the criticism on phenomenology put forward by Holzkamp who argues that it is history and society which impose limits to the subject's intentionality (Doise, 2012) and that by prioritizing indeterminacy, phenomenology does not theorize possibility-relations which are built up on social contexts. In contrast to this mode of approaching agency, Tolman sets at the center of theorizing the idea that thinking is necessarily subject to the logic of the capitalist social formation and that consciousness emerges out of particular modes of economic and social exchanges. The most intriguing consequence of this simple idea is that “consciousness remains not only shaped by the economic form; it remains unaware that it is thus shaped, with the result that it spontaneously and unconsciously reproduces it” (Tolman, 1994, p.48). According to this line of thought, any theorizing about subjectivity and agency must be critical in the sense that it must take into account how bourgeois contradictions create modes of agency that reproduce them or, under specific conditions, transform them. The most important methodological consequence stemming from remaining mute to

the historical formation of the subject is that the end result of most survey research designs are mere statistical descriptions of observable regularities without theoretical elaborations or developments as to how agency works.

CP scholars propose relationality as the main theoretical category for making sense of human beings as living organisms (Tolman, 1991). Relationality here refers to the fact that one of the essential features of human beings is that they require interaction in order to preserve themselves, and ultimately to reproduce themselves. Tolman uses the word *metabolism* for describing the creation of living organisms' properties generated through their interaction with the environment. Psyche is borne of this process and its function is composed of (1) orientation and meaning; (2) emotionality and need; (3) communication and social structures; and (4) modifiability, learning, and individual development. Humans learn gradually to orient themselves in relation to the environment by selecting among environmental properties through which (selection) the capacity of responding in various ways to differing units of objective meaning emerges. In that way, human beings know from the start that meanings must be considered as both actual and potential (Holzkamp, 1991a). Living organisms' emotions are developed by anticipating how the external objects would behave in case they acted in one way or another. In that sense, human emotionality emerges out of this preparedness for action, and this explains why it is action in context through which emotions evolve, not "cognitions" (Holzkamp, 1991b). It follows that anticipation which takes place as a reflexive process in the form of internal dialogue is the basis for the creation of motives in so far as motives concern how past habits interact with future expectations so that present decisions can be taken. It is within this framework that one should make sense of social life.

At the social level, what the individual confronts is neither the natural world in itself nor even the natural world mediated by the actions of others, but the world as a structure of meanings. Humans approach the external world as something which contains possibilities of action which are made sense of, through this structure (Holzkamp-Osterkamp, 1991). The individual thus comes to relate consciously to societal action possibilities, and consequently also to relate as a first person to others in their societal relations by making use of his/her reflexive powers. Tolman insists on the importance of distinguishing between a first-person and a third-person perspective, which is between the self as knower and the object known. By relying on this distinction, the individual becomes the center of the intentionality exactly because of the epistemic distance separating the two. In contrast to the constructivist version of self-formation according to which the mind is conflated with the world because of the language through which the mind becomes socially constructed, Tolman underlines the fact that self-awareness emerges only on condition that there exists a reality independent of what humans believe of it and it is this independence which fuels humans' reflexivity about their action possibilities. As Tolman puts it

If we live in a possibility relation to the world, we must have alternatives with respect to the action taken, or even whether we act or not. There must exist for any instance the possibility of having acted otherwise. It is this condition that

lends a peculiarly human sense to words like choice and freedom. (Tolman, 1994, p.110)

According to this view, relationality means possibilities for action upon which humans reflect and this, in turn, makes it feasible for the individual to plan and anticipate particular outcomes of his or her courses of action. Life plans and decisions are not free-floated moves of the individual, but they emerge out of the dialectical relation to the opportunity structure within which his/her natal world is lived as taken for granted. This life situation, as Tolman calls it, is composed of the house we live in, the people with whom we live, work, and play, the stores in which we shop, etc. It is, in short, the immediate world in which we find our satisfactions, frustrations, amusements and the spatial-temporal expression of the overall societal structure and process of which we are a part. The modes of consciousness which emerge from such life situations sometimes entail self-deception and self-hostility or tend to make individuals who live in a marginalized or dominated position to identify their interest with those of the dominant groups. The role of the unconscious and of ideology is crucial at this point but, given that these issues have been covered satisfactorily by other scholars (Parker, 2020), I will not analyze them further. What is important to note here, however, concerns the fact that human beings in their natural attitude fail to grasp the whole social conditioning which precedes them or to control the full range of the social mechanisms which have shaped their preferences, needs, and desires. This is a socio-ontological idea to which both CP and CR subscribe and of which the origin is to be found not to some old-fashioned deterministic philosophies of science but to the pioneers of documentary and biographical research, William I. Thomas and Florian Znaniecki who wrote *The Polish Peasant in Europe and America*:

Indeed, the individual's sphere of practical acquaintance with social reality, however vast it may be as compared with that of others, is always limited and constitutes only a small part of the whole complexity of social facts. It usually extends over only one society, often over only one class of this society; this we may call the exterior limitation. In addition, there is an interior limitation, still more important, due to the fact that among all the experiences which the individual meets within the sphere of his social life a large, perhaps the larger, part is left unheeded (ignored, forgotten), never becoming a basis of common-sense generalizations. This selection of experiences is the result of individual temperament on the one hand and of individual interest on the other. In any case, whether temperamental inclinations or practical considerations operate, the selection is subjective—that is, valid only for this particular individual in this particular social position—and thereby it is quite different from, and incommensurable with, the selection which a scientist would make in face of the same body of data from an objective, impersonal viewpoint. (Thomas & Znaniecki, 1918–20/1927, p.5)

What we have mentioned up to this point bears striking similarities with the socio-ontological ideas of CR. Given the numerous articles which have been written on the issue, I will briefly present those aspects which intersect with the

socio-ontological ideas of CP. CR is a philosophy of social science which has received considerable attention in the last 20 years. Most of the work has been done in the field of social ontology and epistemology of social science and particularly in clarifying what are the distinguishing features of a CR position regarding social research. The most popular socio-ontological idea of CR is the iceberg metaphor of social reality. While in most epistemological traditions (Hermeneutics, phenomenology, positivism) social reality is flat, for CR reality is stratified, which means that it is one thing how humans make sense of reality (the Level of Experience), it is another thing the Events in which they live their lives (the Level of Actual) and it is quite another the causal powers which make events to take place (the Real Level). For CR thinkers, social phenomena are composed of entities the nature of which is stratified. Entities are composed of lower-level parts the peculiar relation of which gives rise to novel and unpredictable emergent higher-level properties. Within this stratified social ontology, the entity on one level may be seen as part of another level. In that sense, entities can be conceived as wholes, the emergent powers of which are not the end-product of an additive process because a possible replacement of a part will not affect an entity's properties (Christodoulou, 2021). What matters is the relation among the parts and the configuration it takes in time, and this explains why emergent properties are not possessed by each separate part. Emergent properties of the form of the relation are quite dissimilar from the resultant properties possessed by each part even if they are not related to each other. Emergent properties correspond to how entities' internal parts have been relationally formed and have the power to affect them causally (Tsiolis & Christodoulou, 2021; Donati & Archer, 2015; Elder-Vass, 2005, 2010). In this stratified social ontology, relations matter because they highlight the fact that ontological levels are not disconnected. On the contrary, the relation is the medium for explaining both the emergent properties of the whole and how its parts are affected. This means that the source of the emergence is tied up with how the parts are connected and with the maintenance of the form of their relation. Emergence is relationally defined by Archer as follows:

Emergent properties are therefore relational: they are not contained in the elements themselves, but could not exist apart from them . . . The highest orders of emergence are nothing more than the relations between the results of interaction. Nevertheless these “feed-back” to condition subsequent interaction at lower levels (Archer, 1982, p. 475, cited in Elder-Vass, 2007, p.26)

The approach to self-formation CR scholars offer is based on this concept of emergence. Archer's conceptualization of agency offers a powerful perspective for grasping the complexities of how emergence intermingles with agency. In contradistinction to both rational action theories and Hermeneutics, Archer makes sense of the genesis of self-consciousness as a pre-linguistic process that is deployed while human beings act within the life world and come to terms with its objects. The order of practice and embodiment takes priority over the order of discourse for the development of personal identity, which means that the sense of self precedes sociality (Archer, 2003:121). For CR thinkers, the relation between

nature and nurture should be conceived of as a continuum, not as a discontinuity or a gap, as phenomenologists suggest. Archer draws upon the work of Merleau-Ponty to support the idea that self-consciousness is a pre-linguistic matter by arguing that our primary experience of the world is like an undifferentiated reality, a unity. Self-consciousness starts to take shape while human beings transact with the world for satisfying such needs as hunger or thirst. It is the experience itself which sets the stage for realizing that there exists a reality independent of my perceptions of it. Powerlessness (that the kid's hands cannot reach the toy cars on top of the table) and the fact that the objects resist my desires (I cannot eat a stone) are what give shape to the limits which separate the mind from the world. The sense of self does not have to wait for the discursive capacity in order to be formed. Hence, the sense of self is a monological process which entails practical concepts structured through our embodied engagement with the world. It is not the Cartesian cogito that provides access to the world but the sense-motorial potentialities of the body and its practical capacities (Archer, 2000: 82-95). Within this line of thought, Archer prioritizes emotions as a cornerstone dimension for the genesis of agency. Agency is an emergent property of the sense of self to the extent that emotions are nothing but comments upon human concerns. Emotions emerge in relation to how humans are engaged with the order of nature, the order of practice and the order of discourse. Emotions, in that sense, transform the main concern which corresponds to these three orders of reality (see also Demertzis, 2020). In the order of reality, the main concern has to do with self-maintenance, the main concern in the order of practice has to do with the skillful adjustment to the objects of material culture and the main concern in the order of discourse has to do with self-esteem. Given that it is impossible to summarize successfully all of the subtleties of Archer's work, what needs to be underlined here is that reflexivity is not a property of the order of discourse but it is already at work in the order of nature (when humans try to deal with the concern of self-maintenance) when, for example, human beings start to fear by anticipating what are the consequences of touching the fire, and in the order of practice (when humans try to grapple with the artifacts) when, by remembering a past achievement, they hope that they will skillfully do it again. In other words, emotions emerge out of the interaction between the real or the imagined existence of an event and the concern of a human being. For Archer, emotions, as emergent comments, provide information which could be proved to be wrong, sometimes make us not see the good things in a situation which is bad and could be controlled as a result of human's self-reflection. In that sense, emotions are moral guides for leading a life of which the foundation is the internal conversation. Archer has delineated three stages of this reflexive process, discernment, deliberation, and dedication (Archer, 2000, pp.99-117).

Discernment is the reflective process upon the question "how much do I care about living a life by putting in action the X life project (for example, to start a family, to stay young, become a vegan, or write books)?" The function of this stage is that it facilitates individuals to discern the things they care about by separating the pleasant from the unpleasant and sets in motion the second stage, that of deliberation. In this second stage individuals are called to answer such

questions as “how much do you care about X” or “how determined are you to pursue this plan?” so that the main concerns can be compared and organized. In the third stage, individuals start to form personal judgments about the things they care about the most and the things they will dedicate themselves to. What we have mentioned up to this point explains why Archer says that personal identities are not only different from social identities but more fundamental for making sense of people’s life decisions throughout their biographical transitions. In addition, of crucial importance is the fact that humans’ internal dialogue (self-reflexivity) has to be conceived of as a real causal power since it is through this power that they take decisions when they face the necessities of their life world. Our decisions have causal effects on the external world, either its reproduction or its transformation. Whether transformation or reproduction prevails depends on how individuals’ ultimate concerns (the things they care about) are formed. Archer’s contribution at this point needs careful examination because it is important in order to understand the modalities of agency. She argues that individuals’ ultimate concerns take shape in conjunction with whether their natal experiences have been experienced as relational goods or relational evils. Keeping in mind that for CR thinkers, social relations should not be reduced to mere “interpersonal relations”, relational goods refer to individuals’ bonds and interdependencies at the empirical level amongst the persons who populate their natal environment. Love, reliance, caring and trust related to individuals’ natal experiences are some of these goods which are evaluated as crucial for leading their life. Respect for relational goods means the endorsement of the family’s *modus vivendi* which appear to work as a consensual norm circle. On the opposite side, relational “evil” or harm refers to natal experiences of domination, antagonism, maternal dependency or domination, coercion, and exploitation. In other words, the quality of familial relations gives shape to various forms of decision making and of selecting life projects not in an automatic or unidirectional way on the part of individuals but through internal conversation which fuels various modalities of agency.

Theorizing agency for biographical research

From what we have said up to now it seems that relationality, self-reflexivity, possibility relations, action potentials, and ultimate concerns constitute the common ground of the socio-ontological framework of CP and CR for making sense of agency. These commonalities, in turn, provide theoretical guidelines for carrying out biographical research through similar points of view. In this section, we present the details of these guidelines. For both CP and CR, individuals live by taking part in social practices – not by their own efforts alone. Recognizing that individuals are participants in social practices means that one must conceptualize individuals as participants in social relations. For Holzkamp (2016, p.70) this conceptualization is termed as *conduct of life*, a term which tries to frame how people lead their life in various social circles or domains of life. Leading a life is an active effort carried out by people who try to integrate the

various “demands” from the respective domains of daily life. The conduct of life must be understood as a mediating category between the subject and societal structures and concerns the scope for action that subjects have as they grapple with these structures. Understanding the conduct of life from the standpoint of the subject means that researchers should focus on the mediating level of people’s reasons for action to deal with everyday life demands to identify the mechanisms which explain whether reproduction (morphostasis in CR terminology) or transformation (morphogenesis in CR terminology) occurs and the details of their modalities of agency which emerge from this dealing with the external demands. The life-world people live in provides them with meaning constellations from which they extract certain premises for action that they adopt as theirs. The intentions to act arise from these constellations and are experienced as sensible in the sense that it is in people’s interest to act according with them (Holzkamp, 2016, p.87).

Holzkamp’s argument at this point bears striking similarities with Archer’s approach to the temporal dimension of social conditioning of which the formation has been made in a temporal frame before the one in which people face external demands in the present. He says that the general aspects of an existing meaning constellation people extract as their personal premises for action, depend on the historically evolved generalized possibilities for and/or restrictions on action themselves that are “objectified” in the respective concrete meaning constellation (Holzkamp, 2016, p.89). In addition, selection and choice depend on people’s interests in life, in which the grounds for their actions are rooted. This also implies that they do not have unlimited options, since such alternative actions that are not compatible with their interest in maintaining or increasing their influence on societal conditions and/or their quality of life, are excluded from the start for “psychological” reasons. The “interest in maintaining or increasing their influence on societal conditions and/or their quality of life” is the most crucial point of intersection with Archer’s theory on how ultimate concerns fuel the modalities of agency. What kind of thing is this “interest” and what are its determinants? For Holzkamp interest has a “material a priori” in so far as

Our actions can be at variance with our objective interests in life but not with ... our interests in life as we experience them as our situation. The statement that human beings cannot consciously harm themselves contains so-to-speak the only material apriori of the ‘science from the standpoint of the subject’. (Holzkamp, 2016, p.90)

However, according to this line of reasoning, it seems that Holzkamp conflates two different issues, the degrees of freedom involved in cases where sometimes people may consciously act against their interests in life and the possibility relations from which the end result is reproduction or transformation. He seems as if he does not have an answer to a question he poses “what reasons I could have for nonetheless contenting myself with the option of acting in accordance with the prevailing conditions and thereby forgoing an increase in my quality of life” (Holzkamp, 2016, p.91). Archer’s theory provides a comprehensive answer

to this question, that is to the question of how to theorize these possibilities of action (or action potentials), by offering a detailed account on the interplay between a) how agents define and dovetail their ultimate concerns as they have emerged out of their relational goods/evils, b) how they start to develop concrete courses of action (projects) and c) how they manage to establish satisfying and sustainable practices. It is from this interplay that researchers could identify the morphostatic or morphogenetic consequences of agentic action. Let me summarize how this takes place.

Even though humans' reflexivity is causally effective, the impact of this efficacy depends upon what Archer calls "contextual continuity, discontinuity or incongruity", from the pertinence of which four modalities of reflexivity and agency arise. Or to put it in Archer's terms, the mode of reflexivity from which specific modes of agency prevail, is the product of the interplay between people's nascent 'concerns' (the importance of what they care about) and their 'context' (the continuity or discontinuity of their social environment). Contextual continuity refers to the continuity which exist between the life contexts of parental concerns and that of the individual, or, between the natal concerns and the ultimate concerns of the individual. In such cases, the individual shares all his/her contextual references like "history and biography, unchanging geography, familiarity with the same schools, hospitals, churches, factories, employers, pubs, buildings, and a common fund of anecdotes, idioms and local knowledge" with his acquaintances (Archer, 2007, pp. 25-40). Whenever this situational logic prevails, the communicational mode of reflexivity takes shape. Communicative reflexivity means that people's internal dialogue is completed when others give their assurance and only then a line of action is implemented. In that sense, trust and respect are fundamental for whatever decision is to be taken without this meaning that individuals are mere copy-paste versions of their parents. As Archer puts it, "reproduction entails innovative action" because individuals must deliberate upon the means for staying close to their natal concerns or upon how to adjust them to their own life context. However, communicative reflexives run the risk that without external consultation, their internal conversations would revolve inconclusively.

This external reliance ends up in a mistrustful dismissiveness about private mental deliberations. This leads, in turn, to a growing uncertainty as far as decision taking is concerned. In other words, when individuals are imbued with this modality of reflexivity their agency is blocked and is based upon similar others in order to navigate the world. Obviously, in such cases, the non-intended effect is social reproduction to the extent that individuals which are communicatively reflexive (or *identifiers*) tend to embrace their natal *modus vivendi* as their own or as something they would live their life by. In any case, Archer repeatedly underlines that this mode of reflexivity is decreasing in our times for various socio-structural reasons and this is what differentiates Bourdieu's time in which social reproduction was the dominant mode of society's function. In contrast, contextual discontinuity and incongruity is the dominant route through which young people today come to forge their ultimate

concerns and to develop agentic action (Archer, 2003, pp. 45-60; Archer, 2007, pp.82-96).

In particular, Archer describes as autonomous reflexives those who deliberate according to an instrumental rationality style of thinking and try to craft their own agendas as far as their occupational prospects are concerned. The internal dialogue in these people presents a kind of self-sufficiency that fuels their courses of action. Autonomous reflexive people (*independents*) are the inverse of the previous mode of reflexivity since they act by being based on their own cognitive resources and powers, not on others' affirmation. When they are faced with problematic situations, they make use of these powers to deal with them by experimenting with innovative practices. The cost of deliberating independently is the time these people spend organizing their course of action on their own terms. This makes them have no difficulty in coming to decisions since their form of selectivity is not distracted by reservations or self-interrogations. Most of the time, these people have experienced contextual incongruity in the sense that their natal backgrounds reflected the absence of relational goods rather than the presence of relational evils. Absence means that the parental orientation towards the children is not characterized by the preservation of the common good of the parental relation as a couple but by the fact that two individuals try to parent a child.

Contextual incongruity is a term Archer attributes to this style of parenting in which parents are more preoccupied with themselves and not with the well-being of the family relationship. This is why a high form of selectivity is the distinguishing marker of autonomous reflexives in so far as selection is what emerges when one distances him/herself from the initial context of involuntary placement (Archer, 2003, pp. 71-80; Archer, 2007, pp.111-1213). As a consequence, contextual transformation rather than replication frames their modality of agency because in most cases in their puberty they have assumed domestic responsibilities which are usually associated with adult roles, and they do not have any particular bond with the geographical area in which they have grown up. Archer argues that the lives of "autonomous reflexives" were considerably eventful due to the mobility they experienced which made them inaugurate new cycles of internal conversation. Even though most of the features concerning the third modality of reflexivity and agency according to Archer, the meta-reflexives resemble those of the autonomous reflexive, there are some striking differences between them. Although they do not search for the affirmation of similar others regarding their decisions, as autonomous reflexives do, meta-reflexives engage in a great deal of self-monitoring thinking regarding their everyday life and their life plans. These acts of self-monitoring have emerged out of the disengaging stance against their natal backgrounds.

This stance is not identical with the independence of the autonomous reflexive but is more like the "loner" who deploys an exploratory outlook towards the social. While contextual incongruity sustains the ultimate concerns of the autonomous reflexives, meta-reflexives' ultimate concerns have been shaped through contextual discontinuity. This means that while they are dissatisfied with the familial *modus vivendi*, as it happened with the autonomous

reflexives, meta-reflexives are permeated by a critical detachment against the individualism which framed their parents' orientation towards the family bond. While autonomous reflexives tended to adopt various elements of the *modus vivendi* from one of their parents which provided them with the means for selecting careers that fell within the same spectrum as those of their parents, in contrast, meta-reflexives tend to be *disengaged* from the individualism prevailed in their family contexts and to evaluate it negatively. This is why meta-reflexives develop a vocational stance towards their career plans and values, as Archer puts it. While autonomous reflexives tend to be more instrumental regarding occupational plans, meta-reflexives are characterized by the importance they attach to living up to an ideal, to the internal goods of work, and to listing a value-commitment amongst their main concerns in life. Value commitments entail perfectionism on the part of meta-reflexive subjects who strive for a self-transcendence and a social transcendence that would enable them to do more and thus better realize their ideals. This explains why in most cases they have a deep concern for the underclass, the oppressed, and the globally deprived. Their stance regarding structure and culture is full of tension because neither social arrangements nor the institutions or organizations to which they are vocationally drawn approximate their ideal. This is what makes them social critics. This is why the disengaged have the greatest difficulties, during their life course, in completing the sequence, "concerns → projects → practices", and in defining a satisfying and sustainable *modus vivendi* over the long term. Note that meta-reflexives exhibit a high form of selectivity even if their familial *modus vivendi* offers them relational goods, which underlines the fact that this modality of reflexivity gives shape to a modality of agency characterized by a disengaging stance from the family *roman* as a whole.

Hence their restless volatility. Meta-reflexives are idealists ever seeking a better fit between who they seek to be and a social environment that permits their expression of it (Archer, 2003, pp. 131-158; Archer, 2007, pp.204-226).

There are specific and insightful implications for biographical research from the abovementioned presentation of Archer's and CP's theorization of agency. What is common to these approaches has to do with the prioritization of the active cultural agent in the socializing process since agents' reflexive powers make them apply their own values to the present and future circumstances, that is, to contexts that increasingly do not replicate those of the parental generation. This means that the subjects examine and selectively accept and accentuate the values transmitted to them. The conduct of everyday life – as the concept proposed by Karin Jurczyk, G. Günter Voß & Margit Wehrich (2016) describes – focused on the ambivalent way and the discrete creative efforts made by subjects to develop their own ultimate concerns. In addition, both approaches do not view early socialization as the exclusive source of an individual's value commitment for the rest of his or her life.

Unpredictable contingencies issuing from the open system that is society can undermine whatever socialization processes are underway. The importance of these contingent interventions for a subject's subsequent life history can significantly modify or completely override family influences (this applies only

to the disengaged and the independent modalities of reflexivity, according to Archer, not to the identifiers). Unpredictable or chance events such as striking experiences, illnesses, medical conditions, or geographical relocation are usually responsible for subverting the normativity of subjects in a particular direction or for initiating a radical selection process within a set of values, one in which some elements are discarded and others are reinterpreted. Karin Jurczyk, G. Günter Voß & Margit Weihrich (2016) applied this line of reasoning to the field of precarious and flexible work by collecting biographical interviews from the fields of journalism, care for the elderly, retail, and industrial work. They relied on the abovementioned concept of “conduct of everyday life” as a framework for analysis by using it as a sensitizing concept. In particular, the conduct of everyday life concerns the structure of the activities that are part of life on an everyday basis and is characterized by the ways in which people position themselves in relation to the various social spheres to which they refer. It is a system of action that integrates the various activities in which people are engaged and it is invariably actively constructed, as well as adapted, when necessary, to changing conditions by every person with reference to their individual social situation or position. According to this conceptualization, the conduct of everyday life should not be taken as a substitute for voluntarism but as a way for taking into consideration the more or less inflexible constraints and demands faced by the individual as they are actively appropriated by him/her through his/her life conduct. The theoretical fruit of this research application is what is called typological theorizing, that is configurations of conditions each of which combines specific variables of theoretical interest in each of which (configuration) specific cases fall. For instance, the life conduct of the journalists concerns balancing acts in order to secure themselves against irregular working hours, expectations of mobility, insecure income conditions, and high intrinsic motivation to work without the guarantee of a return. Four such types of balancing acts were identified, the “control” type, the “discipline” type, the “acrobatics” type, and the “trust” type each of which presents different ways of practicing agency in unpredictable working conditions. However, the researchers did not stop their work with the identification of the types as they emerged from the interviews. They moved to theory development. By re-working the sub-types in comparison with the sub-types from the rest of the interviews obtained from the other fields of work, the researchers elaborated a theoretical formulation for dealing with how the modernization of society affects the increasing rationalization of life conduct. As a result, the ideal types of traditional, strategic, and situational life conduct emerged (Jurczyk, Günter, & Weihrich, 2016, pp.40-3). By using a terminology from the Grounded Theory toolbox, this research exemplifies how one can generate new knowledge on a substantive area (how people deal with precarious jobs), not through blind inductivism but by using interchangeably induction, deduction, and abduction as inferential strategies, by elaborating on the scope conditions of the theoretical concept “conduct of everyday life” and on the explanatory power it provides for the cases which fall within this scope. In the next section, we illustrate an application of the theorizing of agency to biographical research material by elaborating on the

methodological implications related to how one can combine these three modes of inference when conducting biographical research.

How temporality frames agency in a longitudinal framework

Below we present three biographical interviews from a research project which took place in 2020 in traditional working-class neighbourhoods of Piraeus and West Attica (Greece) and aimed to identify the determinants of agentic action by asking how an emergent property connected to social relations (work precarity) shapes a subjective situation (vulnerability) connected to decision making¹. By drawing upon a mixed method design (cross-sectional research and biographical interviews (for methodological details see Christodoulou et al, 2022)) we tried to unpack how job trajectories affect the life decisions of the residents of this area. In order to reduce the amount of the collected data, we made use of two conceptually defined axes. The first derives from the work of Archer on the modalities of agency we presented in the previous section and the second has been formed inductively by emerging from the material. In particular, the first axis is a continuum ranging from contextual continuity (1) to contextual discontinuity (-1) and the second is a continuum ranging from conditions of material possession (1) to conditions of material dis-possession (-1). Then, by studying the collected material intensively through Schutze's (1987) and Rosenthal's (2018) principles of analysis, we distributed the biographical interviews to the four quadrivia each of which constitutes a combination of the intersection of these two variables of interest (scheme 1). Three things deserve our attention:

First, we observe that most of the cases fall into quadrivium A composed of the combination of contextual dis-continuity with conditions of dis-possession and that all of these cases concern vulnerable people (brown color).

Second, there are two “deviant cases” in the sense that I13 and I2 (I refers to “informant”) are vulnerable persons even though they have been raised in favorable material conditions.

There are no vulnerable people in quadrivia C and D.

In the following pages, we briefly analyze these two deviant cases in order to highlight the specific mechanisms through which theory development may be produced, by considering Archer's and Jurczyk, Günter, & Weihrich's theorizing of agency. The point we want to underline here is that the outcome (vulnerability) is produced through two different combinations of conditions within which peculiar mechanisms are developed and not through separate variables which act as difference-makers.

¹ In particular, it concerns a research project titled “Cultural conditions in the formation of class identities: culture and working class in Piraeus and Thriasion”, funded by the OP Human Resources Development, Training and Lifelong Learning 2014–2020 and monitored by the University of the Peloponnese for the academic period 2020–2021, under the academic guidance of Professor Manos Spyridakis, University of the Peloponnese, Greece. Dr Panagiotis Koustenis, Dr Giorgos Bythimitris and Dr Michalis Christodoulou were also members of the research team.

Scheme 1. Distribution of interviewees to the four quadrium.

At the time of the interview (2020), I2 was 65 years old (born in 1954) and began his narrative as if he were an observer of his childhood who had a thorough knowledge of the neighborhood where he grew up.

Well, I was born here in (...), Piraeus, which was a newly built district, consisting mostly of refugees but also internal migrants. In other words, Piraeus in general is rather a mixture of refugees and migrants, mainly from '22. But at the same time, it also has extensive internal migration because of the port. So, let's say I grew up in an area that was a mixture of refugees- who were fewer than in other parts, though- because most of the refugees here in Piraeus moved to the edges of the city, to the left side of the city, i.e. Kokkinia, Nikaia, Drapetsona where refugees mainly reside. In my area, there were mainly islanders coming mostly from the Cyclades. I was already born and raised, which means that I got the chance to see it. It was a notorious district, it was difficult, there were vagrancy crimes, hashish, and a port. Petty thieves, you know, this whole thing about poverty let's say and the poor who worked more and they lived more in a slightly refugee situation, people who worked in the port, it's [...] like that, heavens and all that sort of thing.

Without the intervention of the researcher, I2 continues his narrative by referring to the financial collapse of the previous generation of his grandparents. His

father's father was a tobacco merchant, whose family, however, due to financial difficulties, was forced to move to Piraeus, and he became the owner of a boat that transported food from Crete, something that his father engaged in and later developed into a shipping business. That is why he presents his childhood not as if he grew up in a "working class" family and environment but rather in a more prosperous one with a relatively good standard of living.

We have had a maid at home ever since I can remember, these were mostly girls who used to come in those years, this one was brought by my father, yes, some orphan from Crete. She raised the kids, you know, did all the, the heavy chores. And I grew up in a house, in an environment that was pretty good. Private school, the first ones that were built then, the primary school I mean, primary school. The environment was very sheltered and very relaxed.

In Table 1 below, we depict his biographical transitions by using a timeline form so that a more complete picture of his decisions connected to his age and life period can be obtained. The informant wished to project his initiative when he consciously and despite his father's refusal manages to travel on a merchant ship and later, at 18, when he moves to England for maritime studies. During this period, he experiences a first condition of precariousness due to the fact that his father's shipping company collapses and there is no money to help him continue his studies; then the dissolution begins and there comes a very big disaster, a total disaster with periods of great hunger.

YEAR	AGE (at the time of the interview)	EVENTS	EDUCATION	JOB HISTORY	TURNING POINTS	MAIN THEMES
1954 birth date	66					“I am this kind of person because a lot of misfortunes happened to me”
1970	16	He starts working as a sailor with his father in a ship				
1973-1976	19-22		He travels to the United Kingdom to study ship technology	He works on a ship illegally in UK as an immigrant		
1976-1978	22-24	Army service				
1979	23			He works at his father's job (travel agency)		
1980 -1981	24-26			He works as a sailor for a limited period Works as an accountant at another travel agency (1 year),		
1982	27			He starts working as a bank employee offering ship loans	Due to ship financial crisis, he goes to another bank and becomes its union leader	
1992	37				He opens a bistro and a cafeteria	
1996	42				He sells the bistro and keeps the café for 15 years	
2009					He finds himself in debt due to the 2009 financial crisis	

Table 1. I2's timeline of biographical transitions

Chance events are particularly decisive in people's lives in the sense that they change a person's life trajectory. For I2, this chance event is his contact with a friend, from whose acquaintance he managed to switch to the banking sector and in particular to shipping loans.

I had a friend I hung out with, she was a shipping lawyer and she told me that at the American Express Bank they're asking, the manager is asking for an assistant in the shipping department, in the shipping loans. I tell her that she is a goddess, I do an interview and they hire me. And so, I enter a very good sector.

It is obvious that the transition to the bank marked for our informant the transition to another life, clearly better than the one he was living. After a year, however, due to economic circumstances which led parts of the shipping industry to bankruptcy, our informant is faced with a work impasse. The solution was provided by his manager from his previous job, who suggested that he become an employee in an American bank. This relocation seems to have ensured him greater financial comfort mainly or rather, thanks to the strong trade unionism of the time as from September 1982 onwards "we had more than doubled, not to mention almost tripled our payroll".

Agency itself does not explain much unless it is embedded in contexts and situations, one of which, as we show here, is the structure of chance events. As our informant's narrative flows, the emphasis is now on his transition into the business sector. Once again, this transition was determined by a chance meeting of our informant with someone he knew who suggested that they start a business in the catering sector.

And at some point, I had a friend who asked me if I wanted to help him find some job. I was looking to find something – the shop in Aegina closed – to find something here in Piraeus to set up a shop and so on. I really have a strong liking for–lots of things – but I really like industrial spaces, old industrial spaces. I have already been involved for a time in [...] here in the municipality of Piraeus where I had a good friend, the deputy mayor and we were organizing cultural events in such places [...] and he says to me, 'do you want to open the shop together?' I asked him to wait till I tally up; then I said that I would find this money that I had never had, but I promised I would find it.

This transition began in 1992, a time when the "opening" of banks to business lending had already begun and large sections of Greek society began to have access to mass consumption. This gave our informant the motivation to create a second business in the city center. This shop was with a partner but because things were very expensive,

I suddenly became a big owner and gained fame. And we opened the second one and the second one also took off and things were unimaginable... 'all hell broke loose'. You understand there was a second takeoff. All these within 2-3 years.

From 1992 onwards our informant has held both jobs (at the bank in the morning and at the companies in the evening) and in 1996-out of sheer weariness- he decided to look for ways to retire from the bank, but payment he got was extremely small and a portion of it was withheld for taxes. The gradual increase in rents combined with the crisis of 2008 led I2 to an accumulation of debts and a financial impasse with "the last blow, of course, being 2015 and the lockdown of banks; that was the final blow, but we were already on a serious downward spiral

of destruction." From 2008 when he closed his businesses for good until 2015, our informant had been working as a secretary in a cultural club so that he could top up some pension stamps. The intensity of his vulnerability is captured in the way he closes his narrative when he adds

I have lived a good life and now, within the last 5 years, I live a hunger regime. The shift is terrible, it is... no man can ever imagine that. I am telling you literally, it's not, you know, a manner of speech, it is unbelievable. How a society gets rid of whole parts. I mean totally expelled from society. And I was a man who has many friends, and acquaintances and social environment and, and, and.... I achieved nothing. Many disasters in a row, out of the blue. I have to admit- I think about it many times- I take risks, I like it, maybe I like to live a little riskily, so to speak, do you understand?

One could say that the extent of the biographical time of his life's rise is inversely proportional to the biographical time of his fall, in the sense that what he positively experienced in a thirty-year period was very quickly and violently reversed in a five-year period. Perhaps this uneven concentration in the layers of our informant's biographical time explains the intensity of disorganization that is reflected in the vulnerable state he experiences.

Agency is something that also characterizes the life decisions of informant 13 who (born in 1968) chose to differentiate himself from the expectations of his father who was a mathematician. Raised in an environment in which there was financial comfort, our informant was affected by the death of his father when he was 14 years old, as after this event he faced no reaction to his plans to pursue a career in theater and direction. The death of the father brought many financial problems to the family of the informant, who had to work for his pocket money while still already a teenager.

Since we were now in a very bad state financially, in relation to the past, when I was 17- 16, I went to work for the second time. When I was 15, I worked for the first time for a friend who had..., he did repairs on compasses and stuff like that to get pocket money. At 17 I went with an uncle from my father's side to (city location) and I first worked in a hotel, uh, as a waiter. Then I came back and worked there for three years in the summer season, so I gained a lot of experience at all levels. I had a very nice time and for my age, working during the summer months was just perfect. In the winter I worked here as a bartender or waiter; I worked in a lot of shops and at the age of 22 I decided to turn my father's summer house on the island into a shop which I kept for ten years.

In Table 2 we also present a timeline for I13 summarizing his biographical data.

YEAR	AGE (at the time of the interview)	EVENTS	EDUCATION	JOB HISTORY	TURNING POINTS	MAIN THEMES
1968 birth date	52					He defines himself as a "risky and uncompromising guy"
1983-1987	15-19		Completes high school	He works as a waiter		
1988-1998	20-30			He transforms his summerhouse into a small business		
2001	33				The drowning of his sister	
2002	34			He rents the small business in the island and returns to Athens in order to run a catering business		
2004	36	He meets his wife				
2006	38			He presents his theatrical performance		
2008 and 2012	40 and 44	He becomes a father of two children				
2016				He runs a real estate agency		

Although the informant entered the world of work quite early out of necessity, we observe that there was a financial resource (property) that he used in order to escape from uncertainty. Nevertheless, in this case, as well, the debts accumulated in a way that our informant could not manage, resulting in the vicious cycle of borrowing.

I fought it from the beginning, I took loans, I got out of debt, I also provided for the family...in the winter I worked here as well. I went through anxieties, okay, but I also had a very good time, that is, there may have been this financial pressure regarding the loans, their payment in full, and finding ways of investing in the shop, despite the fact that this shop never actually paid off.

While our previous informant presented a biographical self-understanding of the 'I am who I am because I've had a lot of setbacks' genre, Informant 13 often shifts his narrative to identify himself as 'risky' and 'nonconformist'. Hence his extensive references to his reluctance to get married or "commit", to his many soul-seeking trips to Asia, and to the fact that he also did drugs but did not get "hooked". The death of his sister, however, was a sudden event that made him

leave the life of a businessman and return to Athens to fulfill his desire to become a director.

He returns to Athens in 2000; for two years he works in an amusement park and at the same time attends a theater workshop. In 2002 he moves into organizing cultural activities/events together with an acquaintance he made at the workshop. He, then, manages to put on a theatrical show in 2006 but at the same time, the woman he was in a relationship with becomes pregnant. Nevertheless, he thought of it as a risk that someone takes when living with a person for 6 months.

Eh, we just weren't happy about it because at the same time when our first child was born, the financial crisis started. For us, I mean people in this line of work, this crisis was more obvious than for the rest of the people who did not realize it until later.

Financial resources, such as the property he had rented and some money he received from the shows he put on, were what allowed him to respond to the insecurities created by the financial crisis of 2008. But the collapse of the advertising company led to increasing debts and the creation of a vulnerable situation.

I also made the professional mistake of keeping the advertising company and its accounting books for emotional reasons, which was a mistake. This means I was charged with penalties and these are things I regret to this day. At that time, our second child was born and I was very happy on the one hand and very scared on the other.

A chance encounter with a friend from his teenage years, who suggests he join a real estate agency, an offer he accepts even though it is not something he relates to or ever thought he would do, seem to break the stalemate. Nevertheless, it is something that creates insecurity for him because he lives in a rented house, his wife does not have a stable job, the children's obligations are increasing and so are the debts from previous choices, resulting in a feeling of self-blame and failure.

Now I'm also worried about whether I'll get the rent from now on and how I'm going to get it. Another thing is the work I'm doing, which is somehow unstable. It is possible to make some good money one time, but not make anything the next or just make little money. The obligations have increased a lot, I confess that it is a period in my life that is probably one of the worst, not to say the worst, while I have been through a lot; well, this is something that worries me very much because I am... I am in so much debt; the day after tomorrow I am losing the arrangements I have made at the tax office for the third time, which means that the chase begins again, a chase that has lasted for about 15 years...banks included[...] my failure, in general, is rather professional, that is, where you sit yourself down, you admit your mistakes, you see the problems that are amplified and you face yourself. Those moments in the morning when I see myself in the mirror, I realize a lot of mistakes. I don't know if I have found a way to correct them, but I try

without having the same abilities as in the past; judging both from external and internal factors, I do not have the same endurance. I really don't know if it was worth it.

Theory development through case studies

Let me summarize the above findings by treating them as cases of agentic action of vulnerable people. We observed that the agency of these two deviant cases does not have to do with planning a future that is brought to the present in order to be realized in a subsequent time frame, but it has to do with a future the informants do not have at all. In that context, to the extent that agency concerns the attempt to get away from the uncertainty of the present, it follows that agency is more like an “instinct”, not like competence to plan the future. Obviously, instinct is used here for lack of a better term because it is shaped longitudinally, that is through temporal and relational conditions. This is in stark contrast to a conceptualization of agency in which agency is identified with the ability to plan the future, in a long-term perspective, intentionally, and in a stable way for a long time. In other words, planful competence, according to this approach, is an a-social attribute that affects agency (Brandstädter, 1984). In contrast to this approach, what our research brought to the fore is that agency is a praxeological issue shaped by the intersection of biographical temporality with social time in the sense that its meanings emerge through the social contexts in which agents develop their line of actions throughout their life course. Agency is neither a motive that preexists action pushing the people to act nor a medium that makes agents comply with class conditionings. We might hypothesize that this “instinctual” version of agency does not concern only adolescence and the school-to-work transition but it is a socially formed permanent stance against problematic situations which people face through their life course and that, instead of being treated as an emblem of fatalism, it could be seen as a version of optimism through which vulnerable people try to deal with the vicissitudes of the present.

This is testified by the willingness of the participants for risk-taking in order to actively counteract the uncertainty of their life. In other words, it is a mid or short-term optimism through which they attempt to not return to previous precarious conditions and to create spaces of security and living standards capable of protecting them from future social threats. A crucial dimension of this line of thought concerns the structure of chance events which are closely related to the modalities of agency. Our analysis showed that the implementation of the agentic action has not been affected by some permanent social networks created in the past, but it has been fueled by chance encounters with people who influenced the risk-taking habitus of the agents (Bouzanis and Kemp, 2019). Hence, we argue that the “instinctual” nature of agency as well as the structure of these chance events constitute two relational mechanisms or processes which are connected with making people vulnerable in a subsequent life period. Undoubtedly, we should note the role played by the form of social relations in

the temporal grounding of vulnerability. In particular, we observe that such practices as the involvement in trade unions, the participation in welfare structures and schemes or being part of a dense network are frameworks that give shape to agency. This means that one should not draw a direct line from class origin to the temporal grounding of temporality, or else, from past to the present and then to the future. In contrast, while agency is to some extent rooted in the past, what gives form to it concerns how the present, enacted as action potentials or possibility relations, makes possible the creation of a future capable of protecting people from precarious conditions of living. In that sense, it is preferable to talk about contexts of vulnerability framed by various modes of temporalities than about psychological traits which predispose those who are possessed by them to vulnerability.

Our analysis, we believe, provides Archer's modes of reflexivity with more depth and explanatory strength for the following reasons. A close reading of these two deviant cases (both of them raised with high standards of living) shows that they resemble the autonomous reflexive people since they have been involved in a high form of selectivity from their teen years in order to transform the relational goods of their natal contexts. We think they are not like the disengaged mode of agency because they exhibit an individualist stance, and they are not critically detached from their parents' ultimate concerns. Although these modes of agency promote social transformation during T1 life period, they end up in vulnerability during the T2 life period, which means that agency is not a psychological motive possessed by individuals but a relational property that is shaped through the intersection of biographical temporality and social time. Their chance encounters fueled a dis-equilibrium between the temporal horizon of the autonomous reflexivity and the social time of the financial environment. The social time of finance is full of sudden subversions and present-based while the temporal orientation of the autonomous reflexives is a risk-taking habitus and liable to experimentations with opportunism. In periods of huge financial crisis like the one that took place in Greece during the 2009-2018 period, the action potentials enacted by independents may undermine this mode of agency. In other words, we believe that Archer's theory of agentic action could profit if tested in cases other than the university students of Warwick because researchers could explore the temporal grounding of autonomous (or disengaged) reflexives in a longitudinal research design. To frame it with the Grounded Theory terminology, we could say that Archer's approach to agency is a substantive theory applied to university students and that it could be transformed into a formal theory in the case that more comparison groups are taken into consideration. Similarly, the concept of "conduct of life" put forward by CP scholars may be enriched by discovering new dimensions in the four types of the balancing acts each of which presents different ways of practicing agency in unpredictable working conditions by comparing them to the "extreme" cases of huge financial crisis which occurred in Greece in the 200-2019 period.

The teaching of written language in Brazil: Between the limits of precariousness and emancipation challenges

Adriana de Fatima Franco, Fernando Wolff Mendonça & Lígia Márcia Martins

Abstract

This text analyzes, within the framework of Historical-Cultural Psychology, the issue of the formation of alienated consciousness in the literacy policy proposed by the Brazilian government (2018-2022). Emphasized in the mechanistic relationship of the methodological procedures offered for teacher training and, for the student, the emptying of meaning in learning written language. To do this, we refer to the concept of written language in Historical Cultural Theory and the need for developmental teaching, in order to criticize the current educational model. In proposing to overcome the model proposed in Brazil, we understand that the concept of humanization through the appropriation of written language as a complex symbolic system originating from the most elaborate forms of human activity is necessary. To this end, we will revisit the authors involved in the constitution of the relationships between teaching activity (Vygotsky, Leontiev and Davidov) and learning activity (Vygotsky, Leontiev, Luria and Davidov) in order to analyze the documents produced by the neoliberal bias of the current proposal for teaching writing in public education. We point out the limitations and regressions of the proposed model and indicate the need for teaching (human action) that qualifies omnilateral educational practice.

Teaching, written language, cultural history psychology

She also discovered that knowing how to read and sign her name was not enough. Another wisdom had to be learned from reading. She had to authorize the text of her life, just as she had to help build her origin's story (...). And realize that beneath the signature of her very fist, there were other letters and marks. (Evaristo, 2021, p. 110)

In Brazil, 2022 was the year in which we experienced the COVID-19 hangover, expressed in more than 660,000 deaths, accompanied by growing food insecurity and hunger risk, which affected about 36% of Brazilian families, according to research data by the Getúlio Vargas Foundation¹. The wave of destruction has advanced on the rights historically won by the working class, including labor and pension reforms, deepening the abyss of social inequality. In this scenario of death and destruction, the attacks on public, free, secular and quality education have intensified. Education, as we have been following, is one of the fields most attacked by the current government. Since 2018, the Ministry of Education (MEC) has undergone the passage of four (4) ministers, namely, Ricardo Vélez Rodrigues, Abram Weintraub, Carlos Alberto Decotelli and Milton Ribeiro. All of them were involved in polemics that touch on everything from technical capacity, close relations with religious groups, and allegations of embezzlement (Zimmermann & Cruz, 2022). The attacks can be noted at all educational levels, emphasizing cuts in resources and scholarships, university autonomy, high school reform, education militarization, and the National Book and Teaching Material Program (including early childhood education), among others. As if these events were not enough, the Chamber of Deputies intends to amend articles of educational laws to facilitate homeschooling outside the State's responsibility.

All this, led by the advance of extreme right-wing forces, neoliberal ideology, and obscurantism (named by Duarte (2018) 'bellicose obscurantism'), which concerns the "spread of an attitude of attack on knowledge and reason, of cultivating strongly aggressive attitudes against everything that might be considered threatening to conservative and prejudiced ideological positions" (Duarte 2018, p. 139). Duarte points out that the phenomenon is not new in the Brazilian scenario. Still, with the expansion of the virtual world, it presents some peculiarities, benefiting primarily from "fake news."

Regarding neoliberal ideals, we highlight the commodification of education and its transformation into a promising market niche. Considering the above, we wonder how psychology's contributions can help us understand today's scenario and assist in constructing a new project in the country. Specifically, what can the teaching of writing contribute to the foundations of historical-cultural psychology and historical-critical pedagogy in this process?

It is known that theories alone do not immediately interfere with concrete reality. However, the greater the degree of reliability with which they reflect said reality in the individuals' consciousness, the greater the possibility that they operate as essential mediators for effectively conscious actions, that is, for science-based actions on causal and teleological dimensions of typically human activity, which means to say: work. In our opinion, both historical-cultural

¹ For further information, please read FGV Social (2022).

psychology - in the realm of psychological sciences - and historical-critical pedagogy - in the sphere of pedagogical sciences - have managed to capture the movement of the real and represent it in the form of ideas, concepts and judgments, expanding, each in its field of interference, the possibilities for the fundamental intelligibility. Therein lie their most outstanding contributions.

This text does not intend to exhaust the analysis of all issues involved in teaching problem writing, but rather to seek elements that guide us to reflect on the current state of Brazilian education and the purposes for which we want the educational process to be directed. Therefore, the challenge posed to teach written language demands technical competence and political commitment to the working class (Saviani, 2011). Only then will the language domain be at the service of the dominated, who, possessing humanizing cultural contents, will be able to instrumentalize themselves for liberating actions from the condition of domination (Saviani, 2018).

We highlight that school cannot be understood apart from its relationship with society. We recognize that school knowledge is intersected by the contradictions generated by the class and the ideological struggle that accompanies it. Finally, we know that this movement for learning socialization in school in a capitalist society does not revolutionize society. Still, it can transform alienated social relations (Duarte, 2016).

This text is organized into two sections to develop the topic at hand. First, we present the educational policy aimed at teaching writing in the early years of literacy - embodied in the National Literacy Policy (Política Nacional de Alfabetização [PNA]) and its alliance with the process of the commodification of education. Second, we talk about the counter-hegemonic approach posited by us as an alternative to educational barbarism, represented by historical-cultural psychology and historical-critical pedagogy precepts, and emphasizing the process of writing appropriation.

Literacy policy, obscurantism and education commodification

From the outset, we announce that attacks on education are not exclusive to the current government. The reforms that are being put into practice were already underway since the Fernando Henrique Cardoso – FHC era (1995-2003), including the offer of financing to the private education sector in Luís Inácio Lula da Silva's and Dilma Rousseff's governments. They culminated in Michel Temer political reforms (2016-2019), after the parliamentary, legal and media coup against President Dilma Rousseff, who took care to take some measures that would facilitate, even more, the future work of Bolsonaro and Paulo Guedes, Minister of Finance and was responsible for the current economic organization (Souza, 2022, p. 178). Montes (2018), in his article published in the newspaper 'El País', under the title "The bonds of Paulo Guedes with the 'Chicago Boys' of Pinochet's Chile" (Los lazos de Paulo Guedes con los 'Chicago boys' de Augusto Pinochet), highlights the link between the Brazilian economy minister and ultraliberal models of Milton Friedman with the Chilean dictatorship. The

strongman of the Brazilian President Jair Bolsonaro, Guedes - and the president himself - always flirts with right-wing authoritarian models.

It is necessary to clarify these affiliations to understand the impacts of multilateral agreements on the history of educational policies in force over the last few years in Brazil. In 1990, the country entered a process of democratic opening after 30 years of military dictatorship. The new Brazilian constitutional charter pointed to what we call the 'Citizen Constitution,' where, for the first time, guarantees of education, health, and social security had obtained victories in their legal foundations.

However, conservative bases in the Brazilian legislature imposed intense pressure on the executive to expand its economic ties with developed nations. In this context, neoliberal ideas were taking their roots in the State reform promoted by financial guidelines issued by the Washington Consensus, as mentioned by Vaz and Merlo (2020). In education, they were removing the primary conditions for a humanizing education. We emphasize that the current setback in the educational area is enormous. However, we do not disregard the expressions of the class struggle present in the implementation of public policies, since the present guidelines leave no doubt about the type of person they intend to form, which is a person adapted to the prevailing model of society and trained to meet the capital dictates.

This fact finds its foundations in official documents such as the National Curricular Guidelines for Basic Education Teacher Training (*Diretrizes Curriculares Nacionais para a Formação de Professores da Educação Básica* [Brazil, CNE/CP. Opinion (09/2001], which presents the concept of "competencies" to teachers, for example in the National Literacy Policy (*Política Nacional de Alfabetização* [PNA]), which proposes literacy through the phonetic method, the National Book and Teaching Material Program, and "homeschooling" (Ministry of Education, 2001). In our perspective, these normative instruments are not loose lines or antagonistic proposals. On the contrary, they are aligned with the same political and ideological project, all articulated to combat knowledge, in which neo-liberal prescription and a fragmented and simplified conception of human development predominate. This combat, in turn, makes the terrain more fertile for obscurantism, for the acceptance of phenomena appearance and the denial of reality in its multiple determinations. When criticizing this model of education, Antunes (2009) highlights: "education in the era of financialized and flexible accumulation of today's (destructive) world of capital must be agile, flexible and lean, as capitalist companies are today" (p. 31). This political-pedagogical context directly impacts the teaching and appropriation of writing and, consequently, the psychological development of the individual.

We will place in the foreground the analysis of the training of Basic Education teachers, considering that Brazil's professionals are the ones who suffer the most from impacts arising from the pedagogical lightening of neoliberal reforms. These teachers are mostly under the tutelage of 5,600 municipalities that make up the Brazilian State (IBGE, 2021) and, in the last ten years, according to data brought by technical notes of the last School Census

(Censo Escolar [Brazil, IBGE, 2021]), suffer a stagnation in their careers, without improvements in salary conditions. Many teachers work three shifts (mornings, afternoons and evenings), in several different schools, in order to get paid for 40 hours of work, with precarious working conditions, and unstable possibilities for career advancement. Additionally, approximately 30% of teachers working in basic education, in which literacy is a core element, do not have specific training in pedagogical activities to teach reading and writing. Mendonça (2017) underscores that most of them started their primary school education after 1987, a period of significant transformation of Brazilian educational models. The author warns that in this period, collective work and the appropriation of historically systematized knowledge overlapped with the centrality of ‘individual know-how competencies’ that are anchored in Delors’ thesis,

The Commission considers educational policies a permanent process of knowledge enrichment and know-how, but also, perhaps primarily, as a privilege to build the person himself and relationships among individuals, groups and nations (Delors, 1998, p. 12).

Thus, we identify a gloomy scenario for a teaching career nowadays.

Another critical aspect Mendonça (2017) considers is the meritocratic and marketing link attributed to teachers’ continuing education. A large “educational products industry” transforms human knowledge into a commodity, and teachers’ access to any form of continuing education has to come from his or her income. A perverse exploitation of teachers’ work is created, where their work activity is moved out of their reach.

Currently, access to quality and free public education at universities is assured to a reduced number of students, with low impact on teacher training. For the great majority, all that is left to do is to use distance learning of dubious quality, offered in a precarious and fee-based way, to access their continuous study needs to keep up with challenges imposed by the pedagogical work in the current conjunctures or even to achieve a meager career progression. As if that were not enough, basic teacher training curricula suffer from the impoverishment of conceptual knowledge that has been replaced by practical teaching activities emptied of their theoretical foundations. Thus, the teacher ends up acting in literacy classes deprived of conceptual and didactic elements to support them.

Another of the most recent expressions of neoliberal ideology in primary education is materialized in the guidance booklet for the PNA, which was established through Decree 9,765 of 11 April 2019, and decreed by President of the Republic, Jair Messias Bolsonaro and the Minister of Education, at the time, Abraham Bragança de Vasconcelos Weintraub, through the Literacy Secretariat (Secretaria de Alfabetização [SEALF]), whose secretary is Carlos Francisco de Paula Nadalim (MEC, 2019). The PNA allowed programs to be created, with the premise of implementing programs and actions of the Federal Government in collaboration with federated entities. In the same year, courses were implemented, through the Avamec platform, aimed at Basic Education teachers and civil society, based on the new literacy policy, namely: “Science-Based

Literacy” (Alfabetização Baseada na Ciência) - 180 hours (2019); “Text Production Practices” (Práticas de Produção de Textos)- 120 hours (2019); “Literacy Practices” (Práticas de Alfabetização) - 30 hours. All the courses mentioned are part of the “Time to Learn” (Tempo de Aprender) program, approved in 2019. Besides, there was another implementation in the same year with a family literacy program, “Tell me” (Conta Pra Mim) (2019), targeted at Brazilian families (Almeida & Piatti, 2021).

The PNA carries in its core a series of noteworthy elements, such as the concept of science and school education, highly compatible with neoliberal prescription; the conception of human development, pointing to its naturalization, fragmentation and simplification; an understanding of oral and written language taken by themselves and separated from their multiple determinations, explaining a reductionist view on them - all of this expressed through an ideological discourse disguised as scientific, to highlight the theoretical-methodological incongruence between the National Curricular Common Base (Base Nacional Comum Curricular) implemented since 2011, with a constructivist bias, and the PNA, which is of a behavioral cognitivist nature. This fact reiterates the lack of a consistent and coherent theoretical-methodological ‘educational national system’ (Franco & Martins, 2021).

We also believe it is essential to mention that -although it mainly focuses on school education- the PNA does not cite any pedagogical theory that guides the teaching and learning process and does not seem to consider that pedagogy is the science of educational methods (Franco & Martins, 2021). On the other hand, it reaffirms the centrality of psychology in teaching and learning processes, presenting cognitive science and neuroscience as theoretical contributions to support these processes. With that, the document carries out a direct transposition from psychology to education, subordinating the second to the first. In line with this, the PNA highlights brain functioning as the core of the development of understanding and learning, as if the brain were its only determination. It should be noted that we do not disregard the role of biological processes for literacy acquisition. However, we are contrary to biologizing reductionism, when natural (organic) bases are placed at the center of the formation and development of a being, whose nature is social. By displacing the acquisition of reading and writing from educational and activity plans intentionally organized by the teacher to the child’s brain functioning, the document reiterates the naturalization of learning and, thus, may favor its pathologization and relegate the teaching process to a secondary position.

Another essential aspect of the PNA document concerns the reduction of literacy problems in the country to questions of literacy methodology. This debate and its limits are not new in our country and have already been addressed by Mortatti (2006, 2009). In this direction, the PNA document wants us to think that an innovative and supposedly neutral alternative to solve all literacy difficulties in the country would be the phonics method.

Although it is essential to consider the need for a language teaching method -since a child does not learn writing spontaneously-, in our perspective, the phonics method presents a superficial understanding of writing and reading,

approaching them as a technique or conditioning limited to associations between sounds, letters and syllables. The document omits that this type of teaching presents only rudiments of literacy, corroborating a lightened school education addressed at working-class children, which directs them from early childhood to training for, at best, the reproduction of the workforce. In Franco and Martins (2021) words,

By prioritizing the phonetic side and seconding the semantic aspect of the word, they limit the possibilities of this human objectification to operate as an instrument for understanding the world beyond its appearance and/or beyond the simple codification and decoding of graphic signs. (p. 85)

In our opinion, the core of this discussion is in the conception of language anchored in formal logic, which does not go beyond an analysis by elements. Science concepts, development, and language in the PNA pave the way for the insertion of schoolbook programs starting in early childhood education and for “homeschooling.”

The discussion about the Early Childhood Education textbook is not recent and dates to the 1980s. Authors like Nosella (1979) and Faria (1994) have already discussed its ideological function. Since its origin, the textbook has been in the service of directing teaching practice, but it has contributed little to the mediation of knowledge, especially at this educational level.

One last aspect of being considered that fits so well with the neo-liberal package for school education concerns homeschooling as it is under discussion in Congress. It seems to be no coincidence that the PNA does not include a specific item aimed at teacher training, but the document presents a sub-item directed to families concerning the education of children aged 0 to 6 years, called ‘Family Literacy (Literácia Familiar).’ It highlights the role of the family, pointing out that literacy success is strongly linked to the family environment, affirming the need to value early childhood, and stressing the family’s role in developing numerous skills.

Considering that only a trained person can deal with pedagogical issues, the document disregards the need for solid training for those teaching young children and, implicitly, paves the way for homeschooling. This time, it ends up transferring to individuals the educational responsibility that was once institutional and, at the same time, makes the school role secondary; these data meet the reduction of investments in Education in general and in Early Childhood Education in particular (Franco & Martins, 2021). It draws our attention that homeschooling, even in the legislation process, provokes demand from publishing companies that organize themselves to sell material kits for this purpose².

In our opinion, the issues we illustrate through the explanations about the PNA are representative of the political-ideological project that seeks to transform education (anti-commodity) into a service and commercial product (commodity) to fulfill the interests of different fractions of the business class, that is, to

² This news can be read in full at Bimbatti (2022).

radically commodify education (Martins & Pina, 2020). Against the grain of these economic-ideological aspirations and policies, we understand School Education as an institution (the school and pedagogical system) and as a practice (the act of educating), as a specifically human and historical-cultural practice implied in each vision of person, society and knowledge. Thus, we consider the need to go beyond the provisions of current policies, calling for constructing a public policy to transform education such that it makes human achievements available to all and contributes to building a free and universal human being. The alliance between historical-cultural psychology and historical-critical pedagogy is placed in service of this ideal.

Teaching writing with an approach of Historical-Cultural Psychology and Historical-Critical Pedagogy

In the previous section, we analyzed a general panorama of adversities imposed on school education by current political-ideological conditions that are expressed mainly in the national policy proposed for literacy. And it is precisely this scenario that has mobilized enlightened teachers and managers in search of alternatives, established resistance postures, and strengthened the call for a public school education of transition, able to resist the present and gestate another future. We must recognize that the class struggle is not cooling down, despite the mishaps that impose obstacles on it. In this scenario, historical-cultural psychology and historical-critical pedagogy, both based on historical-dialectical materialism and advocating a school education that promotes the omnilateral development of individuals, emerge as counter-hegemonic theoretical-methodological possibilities able to subsidize pedagogical practice.

Although significantly expanding their penetration spectrum in schools, such theories, for understandable reasons, have few expressions in teacher training, and when these expressions occur, their foundations are often subtracted. The gaps here are numerous; in this paper, we are particularly interested in those involved in teaching and learning reading and writing. According to Martins (2013), historical-cultural psychology provides psychological foundations for historical-critical pedagogical theory, considering that both approaches share the same conceptions of humans, society, knowledge formation and, notably, the role of appropriating signs in promoting psychological development. In his studies, Vygotsky (2003) stated that to educate is to transform; otherwise, education would be unnecessary. But for this to be effective, it is necessary to know what is required to change and into what. Therefore, not just any psychological and pedagogical theory allows us to advance, because it is not just any human being we intend to form.

Teaching and appropriation of writing analysis require clarity on pedagogical science that supports it; this will bring us an understanding of educational purposes, identification of school content, and didactic orientation of scholarly work. We agree with Abrantes (2015), when he asserts that assumptions of historical-critical pedagogy “are based on the perspective that

educational praxis fulfills the function of knowledge socialization and does not occur as an adaptive activity to capitalist production mode and alienated socialization forms” (p. 135).

Historical-critical pedagogy conceptualizes educational work as “the act of producing, directly and intentionally, in each singular individual, the humanity that is historically and collectively generated by men as a whole” (Saviani, 2011, p. 17). Still, according to Abrantes (2015), this concept of educational work represents a double orientation as it “offers direction to education workers in internal struggles in the educational field and points out principles that can only become effective with overcoming class society” (p. 136).

In this sense, Saviani (2004) defends teaching that places education in a revolutionary perspective, as an instrument of transformation for working-class children. In these terms, it is necessary to have an education that does not aim at conformation, but rather at transformation. This transformation necessarily passes through the educator’s philosophical training, given that education and teaching are central determinations for the formation of people’s consciences. We agree with Abrantes (2015) that it is necessary to “politicize the discussion on knowledge socialization and defend the position that disseminating the theoretical link with reality is an object of class struggle” (p. 130).

For success in constituting a child as a fully developed human being and, in this direction, for them to acquire reading and writing domains, the teacher needs solid training, since they are the bearer of the signs that mediate psychic development. The humanization process, being a cultural fact, requires the intervention of another human being who has appropriated the achievements produced by humanity (Martins, 2013).

With Mendonça (2017), we understand the professional teacher as a subject culturally created to ensure knowledge transmission produced by humanity. Consequently, the teacher must have a solid primary education to conduct their task. Their continuing education must guarantee the theoretical deepening of concepts and forms of teaching actions regarding socially produced knowledge that are relevant to collective life. In this way, teaching is dependent on the teacher’s actions. To perform this act with developmental intentionality, it is up to the teacher to scientifically appropriate the knowledge they will transmit and the means of conducting this transmission. After all, they must lead the new generations to access the most elaborate human conquests, which go beyond acquisitions limited to the social belonging of everyday life.

According to the historical-cultural conception of development, children are not born with developed complex psychic functions; therefore, activities requiring such training will be necessary. As proposed by Leontiev (1978), man is a social and historical being, and apart from social relations, he would never develop qualities that resulted from the long cultural development of humanity. According to historical-cultural assumptions defended by both Leontiev and Vygotsky, human development occurs through educational processes to which an individual is subjected throughout life, even though there are qualitative differences due to the type of education to which he or she has access.

Concerning the appropriation of writing, the heart of the matter is in the conception of language. Vygotsky (2001) states, “thought and language are keys to understanding the human consciousness nature. [...] the word plays a central role in consciousness, not isolated functions. [...] The conscious word is the microcosm of human consciousness” (pp.485-486). This excerpt highlights the author’s analysis of the relation between thought and language; he points to words as the unit of consciousness analysis. Developmental teaching, which effectively transforms consciousness, must necessarily enable the understanding of conceptual links that insert the word’s meaning into a conceptual system.

The word, in turn, is always a generalization, as it never refers to an isolated object, but to a class. Therefore, the appropriation of a word cannot be watertight, mechanical, or static. However, generalization is an act of thought that, in turn, forms and develops. The thesis defended by Vigotski (2001) asserts that the word’s meaning develops and changes its structure throughout ontogenesis. In this direction, the conquest of written language enables a qualitative leap in the development of conceptual thinking, altering a child’s psychic functioning. And when it comes to methodological treatment for teaching writing, it must be considered that writing is not affected by isolated and independent elements such as in a perspective of a mere association between sound and graphic elements.

According to Martins (2013), success in writing acquisition is not something limited to the moment in which a child is ‘taught to write,’ but it depends profoundly on the history of his development, that is, to learn to read and write, a person must operate with symbolic instruments through logical operations of reasoning -namely, analysis and synthesis-, comparison, generalization and abstraction, inferring the means of graphic representation of sounds. Based on historical-cultural psychology and historical-critical pedagogy, we highlight that writing appropriation does not reproduce the path of the acquisition of spoken language. However, it will be through it – as a sign system - that the possibility of representation and, therefore, the formation of the ‘idea of something’ in other terms will arise. Writing will only be possible when a child can take an object for another, abstract, and elaborate on the word concept (Franco & Martins, 2021).

Vygotsky (2001), referring to this process, states: “[...] if external language appears in evolution before internal language, writing, in turn, appears after internal language, already assuming its existence” (p. 316). In other words, the internalization of language enables the duplication of the material world and the possibility of representing and relating ideas, expanding the person’s opportunities to reflect the world and himself subjectively. Objects acquire meaning due to the alliance between language and thought. What is at issue is teaching a child to abstract the essential traits of things.

In this sense, when a child begins to speak, naming objects, “[...] the possibility of representing something is created, and this moment marks the beginning of a long process that brings with it the possibility of developing writing. as a psychic tool” (Franco & Martins, 2021, p. 110). In this wake, Luria (1986) points out that the word, as an instrument of interpersonal relation and

knowledge, also emerges as a means of regulating higher psychic processes directly linked to voluntary act origins.

In summary, a child's development path culminates in achievements that allow him to take one thing for another and internally represent external reality through signs. These achievements will bring with them the possibility of making concept formation more complex and, consequently, elaborating the word idea/concept. This acquisition is supported by logical operations of thought, especially in generalization and abstraction (Franco & Martins, 2021).

Speech is, therefore, an essential tool for writing appropriation by organizing thought through concepts, making psychic functioning more complex, constituting, in the child, the possibility of forming uniquely human capacities, namely, social experience, accumulation appropriation, and behavior self-control.

Recognizing the intrinsic relations that exist between oral language and written language, without, however, taking the second as a direct transposition of the first, Franco and Martins (2021) emphasize that the methodological teaching path should consider the word as the linguistic unit of reference, especially in the early years of schooling, which should be subjected to analysis through teaching organized for this purpose intentionally. For that matter, school education needs to focus on the representation process and concept development possibilities, seeking to generate in the child, at the end of this procedure, the need to represent his idea graphically. Only then will the literacy process be successful, remembering that graphing ideas implies being able to abstract the sensory aspect of speech and advance in the construction of an "[...] abstract language, which does not use words but representations of words" (Vygotsky, 2001, p. 313).

In the same direction, Dangiό and Martins (2015) posit that the movement between phonetic and semantic faces of the word appears, in teaching processes, in didactic actions and operations with reading and writing. If the objective is to learn the writing system, the emphasis is on phonetic and phonological tracts; if the aim is to interpret the textual supports of the word, the focus is on its meanings and senses (Franco & Martins, 2021). Supported by the ideas of Dangiό and Martins (2015), we consider that written language teaching represents for the child the possibility of mastering a complex symbolic system and his success is directly related to the development of higher psychic functions throughout child development. In this direction, the set of learning that involves writing and reading will allow the qualitative transformation of a child's relations with reality. He can think about the world beyond immediate reality through science, art and philosophy instruction, initiating incursions beyond the phenomena's appearance. Thus, providing conditions for teachers to organize their pedagogical practice is crucial for student learning. But for that, we must provide conditions for teachers that go beyond the apparent dimension of the teaching organization and, through a learning process, to be able to reframe their way of organizing their activities. For the teacher to achieve the conditions for organizing teaching, it is necessary to overcome existing training models that are based on technical instruments and little conceptual training. The current conditions offered in primary and continuing teacher training have promoted the emptying of the possibilities of working consciously with language. It is

necessary to form a teacher's conceptual thinking about the written word, and this is only possible with training activities committed to this objective. Only a theoretical-methodological understanding of the formation possibilities of a child's conscience allows for adequate planning of study activities, enhances didactic resources, and allows the student a significant appropriation of writing and reading.

Final considerations

The issues outlined here present challenges imposed on an emancipatory education. We understand that neoliberal models offered by the capitalist mode of production take education as a commodity, reduce the social right to it, and subject schooling to market demands. In this direction, educational policy reforms implemented in recent years in Brazil do not meet working-class interests.

Against these proposals, we argue that schools can contribute to unveiling the nature of social relations in capitalist society and their effects on the processes of exploitation and alienation. However, the fundamentals supporting this text indicate that critical knowledge is necessary for the class struggle and the construction of a socialist revolution. Based on Marx, Frigotto (2021) reminds us that theory constitutes a revolutionary material force. Still, its revolutionary character is not exhausted in the correct understanding of how human reality is produced under capitalism. Moreover, the scientificity of knowing makes explicit its potential revolutionary in practice.

Considering the above, we return to our introduction, where Evaristo (2021) points out, *"She also discovered that knowing how to read and sign her name was not enough. Another wisdom had to be learned from reading. She had to authorize the text of her life, just as she had to help build her origin's story (...)"* (p.110). This excerpt takes us back to foundations of historical-cultural psychology and historical-critical pedagogy, which we presented with an emancipatory education in mind. In dealing with literacy, we understand that it is not enough to understand writing as a motor act that limits teaching to tracing letters and the writing, often mechanical, of words, phrases and sentences. In Vygotsky's (1995) words, "[...] we need to teach the child the written language and not the writing of letters" (p. 203).

Literacy presupposes, above all, access to literate culture and allowing subjects' psyche to reach their broadest development possibilities, represented by rigorously abstract thinking. We consider that the alliance between these two acquisitions imposes itself as a condition for individuals to establish themselves as subjects of their history, equipping themselves for the struggles to be waged against objective and subjective conditions that stand as obstacles to this. However, we cannot lose sight of the fact that language is one of the most complex psychic functions; its functioning is related to other functions, mainly to thought (Dangiό & Martins, 2015). The transformation of thought contents and other higher psychic functions are subordinated to people's living and

educational conditions and deeply marked by socially determined cultural development. Therefore, the struggle for emancipatory education is identified with overcoming social-economic inequalities produced by private ownership of production modes.

“To become aware of something and to apprehend something is initially necessary to have that thing” (Vygotsky, 2001, p. 287). To authorize the text of one's life and help build one's history, there must be a teaching that is able to instrumentalize this ideal construction. As Carvalho and Martins (2016) state, a tireless battle must be fought towards training that culminates in adult individuals who are more subjected and less subjected to the alienating conditions of capitalist society.

Is disability a social construction?

On the critique of social constructivist views in (German-language) disability studies¹

Michael Zander

Abstract

What exactly do we mean when we refer to disability as a social construction? How viable are the justifications for this? These questions are explored in this paper. To this end, various theories that are influential in German-language disability studies are examined and criticised. These include Oliver's social model, furthermore the "Thomas theorem," Berger and Luckmann's sociology of knowledge, Foucault's discourse theory and Waldschmidt's theory on disability as "naturalised difference." Subsequently, social constructivist approaches of Watzlawick and Gergen and Gergen are discussed. It is shown that a relativistic understanding of social construction can be used to deny facticity and thus undermines the foundations of scientific knowledge. This danger must be taken seriously when defending the scientific basis of disability studies.

Keywords

social constructivism, sociology of science, materialism, truth, claims of validity

1. The question

As is well known, disability studies are a spectrum of interdisciplinary approaches in the social sciences, humanities and cultural studies that have one thing in common: They generally distinguish between (medically diagnosable) illness or impairment, on the one hand, and socially caused disability, exclusion or oppression, on the other. In contrast to reductionist and medicalist approaches (cf. Oliver, 1983, pp. 2., 1996, p. 31), this distinction is intended to open up new perspectives for social and cultural studies research on disability and, beyond this, to provide a basis for political intervention in the interests of disabled

¹ Translated and slightly revised version of: Zander, M. (2022). Ist Behinderung eine soziale Konstruktion? Zur Kritik sozialkonstruktivistischer Auffassungen in den (deutschsprachigen) Disability Studies. *Zeitschrift für Disability Studies*, 1/2022, DOI 10.15203/ZDS_2022_1.04.

people. If social disability is no longer misunderstood as the inevitable consequence of a medically describable impairment, the deficiencies of social conditions, infrastructures and institutions can come to the fore. The distinction between impairment and disability is the basis for what has been called and much discussed as the 'social model of disability.' Other models, such as the so-called cultural model and the human rights model, have been derived from it and developed in distinction to it.

Furthermore, the thesis that disability is a social construction has become established - not only, but especially, in German-speaking disability studies. According to Gisela Hermes and Swantje Köbsell (2003, p. 9), disability is regarded as a "constructed category" and disability studies is dedicated to "the question of how this social construction of disability takes place or has taken place historically, economically, culturally, politically, legally, psychologically, etc." (p. 9). Similarly, Theresia Degener (2003, p. 24) states that disability is "socially constructed, i.e. disability is artificially made into a problem by society." Michael Maschke and Justin Powell (2003, pp. 80) ask "how long old constructions that have become institutionalised in space and time remain stable." In short, they say that "disability is simply what politics defines as disability" (Maschke & Powell, 2003, p. 81).

The view that disability is a social construction has become a defining feature of disability studies in German-language literature. Anne Waldschmidt speaks of a "constructivist basic consensus" (Waldschmidt, 2015, p. 336) in disability studies. David Brehme et al. (2020, p. 9) state: "Disability studies does not understand disability as a natural, super-historical phenomenon – but as a socially negatively valued difference that is socially constructed and therefore must always be analysed, interpreted and made understandable in its respective historical, social and cultural context."

While there are competing currents with different philosophical foundations in international disability studies (Shakespeare, 2014), social constructivist approaches predominate in Germany. Anne Waldschmidt, probably the most influential sociological theorist of disability studies in the German-speaking world at present, places a social constructivist understanding of disability at the centre of her work. Social constructivist approaches have hardly been discussed controversially in German-language disability studies, apart from exceptions that have received relatively little attention to date (Kuhlmann, 2003, 2005; Kastl, 2017; Trüper, 2019; for international debates, see e.g. Hacking, 2001; Shakespeare, 2014). This is noteworthy because the above statements and definitions already reveal a central problem of social constructivist approaches, namely the tendency to equate the concept of an object with the object itself. The concept of disability and the ideas associated with it are addressed, but not what these concepts and ideas refer to. It is well known that the *term* 'dog' doesn't bark. However controversial diagnoses such as cerebral palsy, deafness, early childhood autism, depression or schizophrenia may be, they all refer to something that persists even if it is changed or abolished. The same is true of possible manifestations of social disadvantage, such as increased unemployment or reduced life expectancy.

What exactly do we mean when we talk about disability as a social construction? How viable are the justifications for it? This paper discusses these questions and critiques the 'basic constructivist consensus.' It does so by tracing a line of theoretical development that has led to the dominance of social constructivist views. The starting point is Michael Oliver's social model, about which so much has been written in recent decades that its original content needs to be recalled. Oliver uses the term "social construction" in his works, but rejects social constructivism; at the same time, he invokes - in a not unproblematic way - Marxian theory. The line of development, as will be shown, leads from the so-called Thomas theorem via Peter Berger's and Thomas Luckmann's conception of the social construction of reality and Michel Foucault's discourse theory to Anne Waldschmidt's social constructivist positions and to constructivisms in relation to psychiatric diagnoses, as advocated by Paul Watzlawick and Kenneth and Mary Gergen, among others.

The critique of the basic constructivist consensus in (German-language) disability studies pursues four main goals: First, to remind us of the "objective facticity" (Berger & Luckmann, 1991 [1966], p. 30) of nature and society and that people do not create their world out of nothing. The recognition of that objective facticity is the precondition of science, but it is increasingly evaporating in the course of social constructivist theorising. Second, it will be examined what is understood by the "cryptogram" (Plessner, 2018 [1969], pp. X) of social construction in each of the works discussed and what inconsistencies this implies. Third, attention is to be drawn to political dangers of epistemological relativism in the age of 'fake news' and 'fake science.' Fourthly, the critique is intended to break the postulated social constructivist basic consensus and create more space for non-constructivist approaches within disability studies.

2. Social model and social construction of disability by Michael Oliver

For the formulation of the social model of disability, Michael Oliver (1983, pp. 23) draws on publications of the British Union of the Physically Impaired Against Segregation (UPIAS) from the 1970s (UPIAS, 1974, 1975). He distinguishes between impairment and disability: the former means the absence or impairment of a body part or a body or organ function, the latter includes disadvantages or activity restrictions caused by the organisation of society and its lack of consideration for disabled people (Oliver, 1990, p. 11).

Impairment and disability in the sense of the social model are different and at the same time interrelated. For example, if a building is only accessible by stairs, this constitutes a social disability for people with walking impairments, but not necessarily for others. While the lack of a ramp or lift may also be a disruptive obstacle for people travelling with a pram or who need to deliver goods, in these cases it is not a disability.

Differentiating disability from impairment opens up a specific perspective. Oliver illustrates this with the example of items from a survey by the UK Office

of Population Censuses and Surveys (OPCS). These only record impairments as supposed or real causes of limitations: "Can you tell me what is wrong with you? What complaint causes your difficulty in holding, gripping or turning things?" "Are your difficulties in understanding people mainly due to a hearing problem?" (Oliver, 1990, p. 7). Oliver contrasts this with alternative questions that focus on disability: "Can you tell me what is wrong with society? What defects in the design of everyday equipment like jars, bottles and tins cause you difficulty in holding, gripping or turning them? Are your difficulties in understanding people mainly due to their inability to communicate with you?" (Oliver, 1990, p. 8) The comparison not only illustrates the difference between impairment and disability, it also shows the individualisation and medicalisation of disability in the OPCS questionnaire.

Against the background of the social model, Oliver discusses sociological and historical theories of disability. He also cites ethnological literature which shows that the treatment of impairments or disabled people varies with the respective culture and form of society. His main focus is on the development of capitalism in Britain. In the course of industrialisation during the 18th and 19th centuries, pre-capitalist and agrarian living conditions dissolved and with them the peasant and domestic production, in which impaired people had been more or less integrated. Within increasingly capitalist conditions and in view of a growing demand for labour, the question of who is or is not fit for work in industry and how to restore the ability to work has become a problem (Oliver, 1990, pp. 28). This has led, among other things, to the medicalisation of disability, a contradictory process that has also brought gains for disabled people, including an increase in their average life expectancy.

Oliver (1990) argues that British capitalism and social policy in the 1980s constructed disability (or the problem of disability) ideologically and socially. Firstly, beliefs expressed in social policy, such as that disability is a personal misfortune and a medical problem; secondly, construction means producing real social relations in which disabled people are not just seen as dependent, but actually are. However, the concepts of ideological and social construction do not seem to be entirely distinct, as they both involve socially and politically enforced stereotypes about disability. For Oliver, unlike Karl Marx and Friedrich Engels, ideology is not a socially imposed deception about social conditions and human motives for action (Zander, 2020), but simply a set of values or beliefs (Oliver, 1990, p. 43). Although Oliver speaks of social construction several times, he distances himself from social constructivism, which he accuses of reducing historical processes to the substitution of labels (Oliver, 1990, p. 82).

Oliver's work is generally regarded as Marxist, but the extent to which this characterisation is accurate is debatable. It is true that Karl Marx is quoted several times and capitalism plays a central role, but at the same time Oliver refers to numerous non-Marxist "classics" such as Auguste Comte, Max Weber, George Herbert Mead, Claude Lévi-Strauss and Michel Foucault, without resulting in a coherent theoretical account. Some of his theses may sound Marxist, but they are not compatible with Marxist theory. For example, the strange assertion that in capitalism the category of disability is industrially

produced like cars and hamburgers (Oliver, 1996, p. 127). Marx is concerned, among other things, with the buying and selling of commodities and commodity-like services, and the production and appropriation of profit. It is not clear how a category can be industrially produced, how it can be bought or sold, and how profit can be made from it. Despite such inconsistencies, it must be acknowledged that Oliver has at least presented the outlines of a materialist theory of disability under capitalism.

3. The "Thomas Theorem"

To underline the importance of definitions and constructions, Oliver (1990, p. 2) refers to the so-called Thomas theorem, according to which a situation defined by people as real has real consequences. Depending on whether disability is understood as personal misfortune or as social oppression, this has different consequences. Rehabilitation, according to Oliver (1996, p. 102), consists of the sum of those practices that are defined as rehabilitation. This is reminiscent of the position of Maschke and Powell (2003, p. 81) cited earlier, according to which disability is what politics defines as disability. The term Thomas theorem comes from Robert Merton (1968, p. 575) and goes back to a formulation by William Thomas and Dorothy Swaine Thomas (1928). It is worth discussing the Thomas theorem in some detail because it raises theoretical issues that also arise in the context of the thesis that disability is a social construction.

In their book, Thomas and Swaine Thomas address delinquency, behavioural problems and disorders in children against the background of social change in the United States (Thomas & Swaine Thomas, 1928, p. xiii). In the methodological section, they advocate, among other things, the evaluation of 'behavioural documents,' including case studies, life histories and statements from psychoanalysis. The authors counter the objection of behaviourists that such introspective self-reports are not objective and valid and do not reveal the actual mechanisms of behaviour. They argue that these behavioural documents reveal how a person interprets a situation and how he or she acts on the basis of that interpretation. As an example, they cite a prison inmate who is said to have killed people because he thought they had insulted him, when in fact they had only been talking to themselves. It is in this context that they formulate their famous phrase: "If men define situations as real, they are real in their consequence" (Thomas & Swaine Thomas, 1928, p. 572).

The so-called Thomas theorem is undoubtedly true in the sense that people act on the basis of their beliefs and that their beliefs relate to, among other things, what they take for granted and what they do not take for granted in a given situation. Of course, beliefs can be wrong, as when someone believes they have been insulted by passers-by when they have not. Or, to take a more recent example: A person may believe that coronavirus type 2 is no more dangerous than ordinary influenza viruses and, based on this misconception, may not follow mandatory or recommended hygiene rules during the coronavirus pandemic.

However, it would be problematic to interpret the Thomas theorem as a recommendation to examine situation definitions only in terms of their influence on action, neglecting whether or in what respect they are true or false, appropriate or inappropriate in terms of content. In other words, one has to take into account the possible – and in fact addressed in the example of Thomas and Swaine Thomas – "*difference* between subjective perception and what is perceived" (Markard, 2013, section VI). Of course, it is not always possible to make such a difference, whether for practical or principled reasons. Not every circumstance can be elucidated and not every situational definition can be judged by an objective standard. One may perceive disability as a personal misfortune or as a social oppression; one is no less true than the other; moreover, the two views are not necessarily mutually exclusive. In other cases, however, there is a clear difference between the perceived and the perceived. The passers-by were not insulting the prisoner, as the latter believed, but talking to themselves; COVID-19 is much more dangerous than influenza, for example, as measured by mortality rates, contrary to the claims of the so-called Corona sceptics.

When it comes to situational definitions or beliefs in the sense of Thomas and Swaine Thomas, one of the tasks of science is not only to register and understand them, but also to explain them. Depending on the focus of the investigation, explanations can refer to individual reasons for action against the background of concrete living conditions or to developments in society as a whole. In the case of a 'Corona denier,' the overall social context of the crisis caused by the pandemic, the emergence of the conspiracy ideology movement and - related to this - personal problems may play a role. The importance of relying on scientific explanations can be seen in the refutation of false perceptions of impairment, where errors are a necessary part of scientific development. For example, hardly anyone in the scientific community today assumes that emotionally cold and at the same time above-average intelligent parents are partly responsible for the development of early childhood autism (Kanner, 1943, pp. 248), or that schizophrenia is triggered by double-bind communication in the family (Bateson et al., 1956).

The social sciences can and must, of course, investigate imaginations and their efficacy - for example, belief in horoscopes, transubstantiation, human races, world conspiracies, and so on. - but their own concepts must not be purely imaginary if the claim to a scientific basis is not to be abandoned. Rather, scientific terms must be associated with the claim to understand and explain real phenomena that exist in the world independently of scientific investigation. For example, terms such as poverty or disability cannot be defined scientifically without theory, but they should refer descriptively, analytically and in the most factual way possible to empirical phenomena that are real and independent facts. If this were not so, then these terms would have no scientific content and there would be no reasonable standard against which they could be verified. For the discussion of whether disability is a social construction, two conclusions can be drawn from these considerations, among others: Firstly, scientific terms should not be arbitrary 'constructions' alongside others; secondly, a careful distinction should be made between the designating terms and the objects they designate.

4. The "Social Construction of Reality" by Berger and Luckmann

Peter Berger and Thomas Luckmann (1991 [1966]) introduced the concept of the "social construction of reality" into the debate. In his preface to the German edition, Hellmuth Plessner comments on the eponymous book title as follows: "As attractive as such a cryptogram may be to philosophers who take pleasure in ciphers - the adepts of sociology, to whom it is nevertheless addressed, could be downright put off by it. The element of construction, after all, is perceived as an adversary of every scientific endeavour that attaches and must attach importance to the faithful reproduction of real conditions" (Plessner, 2018 [1969], pp. X). Therefore, Plessner continues, the "explanatory addition in the subtitle" is to be welcomed (p. XI). This clarifies that the authors present a "treatise of the sociology of knowledge."

Plessner's assessment is interesting in three respects: First, it articulates the expectation that the audience will not find the concept of "social construction" immediately comprehensible, but will regard it as a "cryptogram" to be deciphered. Secondly, it addresses a potential tension between the construction thesis and the claim to scientifically describe "real conditions" (Plessner, 2018 [1969], pp. X). As will be shown, Berger and Luckmann did not see this as a contradiction, but the tension that developed in later postmodern currents of social constructivism towards a radical epistemological scepticism is nevertheless already inherent in their work. Thirdly, it is clear from Plessner's commentary that the neologism of the book's title was originally intended as a technical term for a specific sub-discipline of sociology - namely the sociology of knowledge - while its use today has a following in virtually all social sciences, cultural studies and the humanities. Incidentally, the main title of the book is an allusion to a work by Berger and Luckmann's academic teacher: "Der sinnhafte Aufbau der sozialen Welt" ["The Meaningful Construction of the Social World"] by Alfred Schütz (2016 [1932]) (cf. Luckmann et al., 2015, p. 428).

According to Berger and Luckmann (1991 [1966], p. 15), the sociology of knowledge has to deal with "whatever passes for 'knowledge' in a society, regardless of the ultimate validity or invalidity." It has to fathom how knowledge is "developed, transmitted and maintained in social situations" and "must seek to understand the processes by which this is done in such a way that a taken-for-granted 'reality' congeals for the man in the street" (p. 15). This process is the social construction of reality. The respective knowledge depends on the social location within and between societies: "What is 'real' to a Tibetan monk may not be 'real' to an American businessman" (Berger & Luckmann, 1991 [1966], p. 15).

The thesis of the location-dependence of knowledge leads the authors to ask how claims to the validity of sociological findings can be justified. "How can I be sure, say, of my sociological analysis of American middle-class *mores* in view of the fact that the categories I use for this analysis are conditioned by historically relative forms of thought, that I myself and everything I think is determined by my genes and by my ingrown hostility to my fellowmen, and that, to cap it all, I am myself a member of the American middle class?" (Berger & Luckmann, 1991 [1966], p. 25). Berger and Luckmann do not dispose of this problem through

substantive arguments – one could, for example, invoke the fact that scientific theories and methods secure the validity of findings – but by excluding it from empirical sociology. Such questions belonged to the methodology of the social sciences and to philosophy (Berger & Luckmann, 1991 [1966], p. 25).

There is no doubt that Berger and Luckmann claim validity for their own statements. In their book, they deal extensively with "society as objective reality" (pp. 65), including the biological characteristics that enable people to form institutions. The "subjective reality" includes in particular individual socialisation, i.e. the "internalisation of reality" (p. 149). This internalisation can become a problem for members of stigmatised groups, if society has stamped them as a type: "the cripple, the bastard, the idiot and so on" (p. 185). However, the stigmatised could "join together in groups" and "introduce their own socialisation process" in order to protect themselves "from the total internalisation of the reality of their society" (pp. 177).

An example of an institution that, according to Berger and Luckmann, generates knowledge and is supposed to protect society from deviation is therapy. Its methods range "from exorcism to psycho-analysis, from pastoral care to personnel counselling programmes" and serve social control (Berger & Luckmann, 1991 [1966], p. 130). To illustrate and invert the prevailing homophobia, the authors create the counter-image of a society in which heterosexuality is frowned upon and in which a heterosexual soldier is "a sure candidate for therapy" (Berger & Luckmann, 1991 [1966], p. 131). In passing, they invoke the Thomas theorem but, like Merton before them, attribute it only to William Thomas and not Dorothy Swaine Thomas (Berger & Luckmann, 1991 [1966], p. 221), whose co-authorship Merton (1995) later added.

As stimulating and rewarding as Berger and Luckmann's analysis is to read for long stretches, it also has some serious problems. The "man in the street" (Berger & Luckmann, 1991 [1966], p. 13), to whom the authors refer several times, appears to them as a largely passive recipient of knowledge. He obviously has no way of testing statements for truth and norms for reasonableness. He cannot therefore use these criteria to distinguish between exorcism and psychoanalysis, or between different variants of psychoanalysis. The concept of knowledge used by Berger and Luckmann, at least in relation to the 'man in the street,' is so general that it can no longer be used to distinguish between knowledge and its opposite, i.e. ignorance, deception and prejudice. Perhaps the most appropriate name for their enterprise would not be sociology of knowledge, but sociology of opinion. Opinions can be well-founded or unfounded, true or false, whereas the classical concept of knowledge (Boghossian, 2006, p. 10 ff.; Carlshamre, 2022, ch. 1) already contains a qualitative judgement: If something is actually known and not only supposedly known, then it is the case.

Berger and Luckmann distance themselves from social constructivism. Some 40 years after the book's publication, Luckmann stresses that Berger and he "could not have known then about constructivism, which did not yet exist, and do not want to know today about the later epistemologically and scientifically untenable developments (...)" (Luckmann, 2008, p. 33). (Luckmann, 2008, p. 33). Compared to positions such as those of Paul Watzlawick (see below), Berger and

he are "in a certain sense materialists" (Luckmann, quoted in Keller et al., 2013, p. 11). Similarly, Berger complains that a "sociological direction" has emerged that "to our annoyance called itself 'constructivism' and claimed that all interpretations are equal and, moreover, that there is no reality at all outside of social interpretation" (Berger, cited in Keller et al., 2013, p. 10).

5. On Foucault's theory of knowledge and discourse

Michel Foucault's works played an important role in the emergence of the variants of social constructivism criticised by Berger and Luckmann, although the concept of social construction does not appear in them. Foucault was and is also widely read in disability studies (Waldschmidt, 2020, pp. 98). In his inaugural lecture at the Collège de France in 1970, Foucault (1981 [1970]) presented his research programme, for which the concept of 'discourse' is central. For him, discourses are certain rule-bound systems of statements that are produced on certain subject areas – such as sexuality, politics or science – and which together form the discourse of a society. Discourse is a "thing pronounced or written" (Foucault, 1981 [1970], p. 51) whose production is "controlled, selected, organised and redistributed" (p. 52), among other things with "procedures of exclusion" (p. 52). These procedures include prohibition and the drawing of boundaries, e.g. the "opposition of reason and madness" (p. 53) and the "division between the true and the false" (p. 54). Within a discourse, the "division between the true and the false is neither arbitrary nor modifiable nor institutional nor violent;" but if one goes on "to different scale" and asks about the "will to truth," then one will see "perhaps something like a system of exclusion, a historical, modifiable, institutionally constraining system" (Foucault, 1981 [1970], p. 54). The will to truth tends to "exert a sort of pressure [...] on other discourses" (p. 55). In science there may be "no errors in the strict sense," as these "can only arise and be decided inside a definite practice" (p. 60).

For Foucault, discourse seems to have a direct effect on the facts it thematises, which are supposedly unknowable without it. There "is no prediscursive providence which disposes the world in our favour. We must conceive of discourse as a violence that we do to things, or in any case as a practice that we impose on them" (Foucault, 1981 [1970], p. 67). Overall, Foucault wants his research programme to be understood as a contribution to the "history of ideas" (p. 69). Later on, he sharpened his views even further. It is assumed that "power produces knowledge," which is why the relations between power and knowledge cannot be analysed "on the basis of a subject of knowledge;" rather, the subject of knowledge and the object to be known are equally "effects" (Foucault, 1995 [1977], pp. 27) of the relations between knowledge and power.

Among other things, Foucault's research programme is directed against Marxism, which was influential in French sociology and philosophy in the 1970s. Typical Marxian problems disappear and are replaced by others. Marx and Engels assume that in the course of social activities based on a more or less

division of labour, people must feed, clothe, house, reproduce, in short, keep themselves alive and satisfy the corresponding needs before they make history. To do this, they have to enter into a metabolism with external nature and organise their production with historically determined and conflictual relations of production. Foucault, on the other hand, prefers to deal with discourses, ideas, knowledge, language and power, which in his theory lead a strange life of their own. For Marx and Engels, ideology was a socially suggested deception that can be overcome by scientific means. But a discourse can no longer be said to contain illusions or not. The view of Marx and Engels was that there were generalisable interests and that people in social conflicts struggle to arrange the world according to their needs; with Foucault, merely one regime of power and knowledge replaces the other.

When Foucault characterises the distinction between true and false statements as an institutional exclusion mechanism, he abstracts from the fact that scientific statements can claim validity, if they can be substantiated and elaborated into a coherent argument. Foucault's "interest in truth (and validity in general) is restricted to the effects of holding-something-as-truth" (Habermas, 1998 [1985], p. 373). But there is a crucial and non-negligible difference between the Vatican indexing Galilean astronomy and a US university dismissing a history lecturer who claimed "that Nazi death camps were an anti-German hoax" (Evans, 1997, p. 208). In Foucault's theory, the difference between oppression and refutation threatens to disappear. Foucault accuses the "will to true" – an expression that not coincidentally recalls Friedrich Nietzsche's "will to power" (cf. Rehmann, 2022) – of exerting "pressure." It is not comprehensible why discourses should impose themselves on their subjects. Scientific essays on cerebral palsy or on the unemployment rate among people with cerebral palsy have no direct influence on what they deal with. What is created in universities, colleges and research institutes – errors and ideologies included – can have negative consequences for disabled people, and these consequences can be an expression of power. But power and knowledge are not necessarily fused, otherwise there could be no science that can claim validity for its statements, only politics. As Jürgen Habermas (1998 [1985]) points out, this problem also arises for Foucault's own work. If the claim to truth and the superiority of Foucault's analyses did not show in these themselves, but "were to expressed in the effect of its suppressing the hitherto dominant scientific discourses, then Foucault's theory exhaust itself in theory politics" (Habermas, 1998 [1985], p. 279).

6. Disability as "naturalised difference" in Waldschmidt's work

The work of Anne Waldschmidt, a leading representative of disability studies in Germany, is characterised by a particularly elaborate theoretical underpinning of the thesis of disability as a social construction. Key points of reference are Berger, Luckmann and Foucault (Waldschmidt et al., 2007; Waldschmidt, 2011, 2018). The core idea of the theory, which has been formulated and varied several

times, is that disability and the body are not "natural facts," but social constructions. The medium of construction is discourse, i.e. mainly concepts or categories. In this sense, it is said that bodies "do not exist a priori as simple facts of nature," but are "constructed through discourses and in discourses" (Waldschmidt, 2011, p. 94). The human sciences in particular produce a "knowledge of power" that determines "how bodies are perceived and treated" (Waldschmidt, 2011, p. 94). In general, "abnormalities and deviations" are regarded as a "(natural) given, in the sense of a supposedly objectively existing, medico-biologically definable damage or impairment, and not as a social differentiating feature" (Waldschmidt 2011, p. 98).

Waldschmidt explicitly relates her statement to impairment and links it to a definition and positioning of disability studies. In contrast to conventional approaches, disability studies "see disability, i.e. not only disability but also impairment, as a product of social and cultural mechanisms of exclusion and oppression rather than as an expression of medical pathology" (Waldschmidt, 2011, p. 91). Disability does not exist objectively and cannot be defined medically or biologically (Waldschmidt, 2015, p. 335). The construction of disability has the function of "producing the naturalised level of intervention impairment and at the same time withdrawing it from criticism by considering the latter [...] as prior, given by nature" (Waldschmidt, 2011, p. 98). In the context of a study on everyday work in sheltered workshops, it is said that the "category of difference disability" is not a "biomedical or psychological fact, but a tense interrelation between 'normality' and a specific type of 'otherness'" (Karim & Waldschmidt, 2019, p. 270 f.). Essentially, "'intellectual disability' is not an objectively measurable fact that is merely reflected in the degree of disability, but a contingent relationship that can only be explained in interaction with existing institutional structures" (Karim & Waldschmidt, 2019, p. 279).

As an example of a constructed difference, Waldschmidt (2018) mentions deafness, which is commonly understood as a loss of hearing and a biological deficit. The Deaf community counters this by arguing that deafness is a cultural difference and a sign language competence. Deafness, according to Waldschmidt, is not a "natural fact," but a "naturalised difference" (Waldschmidt, 2018, p. 75); disability exists only insofar as certain differences can be distinguished within a given order of knowledge.

The question is whether these opposites are mutually exclusive and whether, in analysing disability, we really have to choose between 'natural' and 'cultural'. Deafness has intrinsic characteristics and identifiable causes. For example, it can occur as a result of an infection and in this case, like other disabilities, it is the residue of a disease. The fact that deaf people sign and thus develop a specific culture only argues against the fact that deafness must be a misfortune and a deficiency, but not against the fact that it is also a medically describable fact. The medical approach emphasises different aspects of deafness than the cultural approach. Deafness as a physical characteristic – like most other impairments – exists in all societies and cultures, but the classification of hearing impairments and the everyday living conditions of deaf and disabled people may be different in each case. At the same time, impairment can be a differentiating

factor, for example, when society regulates who is entitled to compensation for disadvantage and who is not.

The term construction tends to create ambiguity here. It would be more appropriate to speak of social interpretations, because interpretations do not change their object – e.g. deafness –, but accentuate different aspects from which different conclusions can be drawn. For example, a medical diagnosis does not necessarily lead to a particular medical treatment, such as the use of a cochlear implant. Terms, classifications, correlations, etc. are made or constructed, but they refer to impairments, i.e. to facts and phenomena that have not been constructed, but at most modified, e.g. deafness or spasticity.

It is not clear why deafness, cerebral palsy, trisomies or early childhood autism should in themselves be products of "social and cultural mechanisms of exclusion and oppression" (Waldschmidt, 2011, p. 91), unless it is not deafness, cerebral palsy, trisomies or autism as such that is meant, but certain prejudices and stereotypes about these impairments. The same goes for statements about bodies. It is not the bodies themselves that are obviously socially constructed, but at best the ideas that people have about them. These ideas, when they become relevant to action, may have real consequences in the sense of the Thomas theorem, but they may themselves be true or false, appropriate or inappropriate to varying degrees. Even if disability is understood as a relationship between institutional requirements and personal characteristics, this does not mean that the personal characteristics – if they actually exist and are not merely the result of attributions – exist only within this relationship. In any case, disability is more than just an "effect of social attribution practices" (Waldschmidt, 2020, p. 36). The thesis that the construction of disability has the function of "producing a naturalised level of intervention impairment" and a "technical-strategic access" (Waldschmidt, 2011, p. 98) implies a general and obviously negatively evaluated motive, without saying whose motive it is. That the distinction between medically relevant and social aspects of disability can be necessary and in the interest of disabled people is obvious when one thinks, for example, of barrier-free access to appropriate medical care.

Waldschmidt (2020, p. 34) refers to disability as an "empty signifier" and explains that terms "do not simply denote reality, but produce the facts of which they speak" (Waldschmidt, 2020, p. 34). Empty signifiers are "open to a multiplicity of meanings": they are contested and "'filled' by discursive processes determined by hegemonic positions" (p. 34). Against this, it can be argued that the content of the term 'disability' may be contested, variable and contradictory, but it is not arbitrary. If I say 'disability' but talk about share prices, the weather and potato salad, I have missed the point and my counterpart will look at me uncomprehendingly. The term obviously has a relatively solid semantic core, referring to something real outside itself.

Overall, Waldschmidt's theory tends to emphasise concepts, classifications and symbols, and to dissolve in them what's conceptualised, classified and symbolised. This tendency is also evident in a contribution to so-called disability history. In the context of a research project on West German post-war history, Gabriele Lingelbach and Anne Waldschmidt (2016) define historical caesuras as

"interfaces" and "concise markers" that "clearly influence developments" (Lingelbach & Waldschmidt, 2016, p. 13). At the same time, they postulate that caesurae are "not properties of history per se [...] but place-dependent constructs" and "an interpretive achievement of the historian" (Lingelbach & Waldschmidt, 2016, p. 14). This dichotomy is not conclusive. Without interpretive services, there can be no historical science, but interpretations must be based not on fictions, but on objectively ascertainable characteristics of the historical process that are independent of the historian's location; otherwise they would be irrelevant, arbitrary, and thus unscientific (Evans, 1998). Nor should the assumption of social constructions lead to the reduction of disability history to "conceptual history" (Waldschmidt, 2020, pp. 24). It is important to remember that, as Hans-Walter Schmuhl (2010) writes in his history of the concept of disability, language is only "one of the factors" that "constitute social reality" (Schmuhl, 2010, p. 10), and it is not the most important one. Rather, language is "a sensitive seismograph that reflects the change of social reality – no more and no less" (Schmuhl, 2010, p. 10).

Schmuhl examines the historical processes by which an overarching category of disability was established, to which people could be assigned and to which they could assign themselves, and which Berger and Luckmann (see above) still subdivide into smaller groups. While this practice of categorisation can be described as a 'social construction,' this does not say anything about the ontological status of impairments and disabilities, nor does it prove that this form of categorisation is more exclusionary than others and that its elimination would be desirable for those categorised.

More recently, disability studies have received approaches from the so-called new materialism, which claim to overcome the language-centricity of social constructivism and poststructuralism (Hamraie, 2012; Feely, 2016). However, a detailed critique of these approaches, some of which confuse theoretical interest in material objects with materialism and ascribe mysterious activity and agency to these objects, cannot be provided here (for critiques, see e.g. Haug, 2016; Malm, 2018; v. Winterfeld, 2018).

7. Psychiatric diagnoses in the light of social constructivist views

A discussion of the concept of disability as a social construction would be incomplete if it did not also include approaches that, in contrast to those discussed so far, describe themselves as constructivist. From the family of constructivist theories, two will be selected here that are, on the one hand, relatively prominent and, on the other, interesting for disability studies and madness studies, because they deal with the ontological status of psychiatrically and psychologically diagnosable complaints. These are 'radical constructivism,' as advocated by Paul Watzlawick and others, and 'social constructionism,' as developed by Kenneth and Mary Gergen.

In an interview with Bernhard Pörksen (2001), Watzlawick suggests that cognition is only possible from a pragmatic point of view. To illustrate this, he

uses the image of a captain sailing through a strait in complete darkness and without navigational aids, and only afterwards being able to determine whether he has reached the open sea or not. According to Watzlawick, one must give up "the idea that science serves the knowledge of truth" (quoted in Pörksen, 2001, p. 222). It remains open, however, how he himself can know which of his own constructions in psychotherapy "prove to be the most useful and humane" (Pörksen, 2001, p. 222), if he does not have at least partial insights that can be described as true. We must agree with him when he points out that "The name is not the thing; the map is not the country" (Pörksen, 2001, p. 226). It is a mistake to believe that a mental illness exists simply because it has a name. One should not assume that "in the field of the psychological we are dealing with pathologies" that are similarly unambiguous "like appendicitis" (Pörksen, 2001, p. 227).

He gives two examples to illustrate this. The first is the removal of the diagnosis of homosexuality from the Diagnostic and Statistical Manual (DSM) in 1973; it was not removed from the International Classification of Diseases (ICD) until 1992. "This decision," says Watzlawick, "was the greatest therapeutic success in history. With the stroke of a pen, millions of people were freed from their alleged suffering" (Pörksen, 2001, p. 227). The second example concerns a visitor to a psychiatric ward who was mistaken for a patient diagnosed as schizophrenic by the nursing staff, who interpreted the visitor's resistance and alleged denial of her identity as symptoms of schizophrenia. However, this story does not prove, as Watzlawick admits in conversation with Pörksen, that schizophrenia diagnoses are arbitrary per se, but only that errors can have real consequences in the sense of the Thomas theorem. In contrast to the first example, people with 'schizophrenic' complaints would probably not be helped if the diagnosis were removed without replacement. There seem to be dimensions of schizophrenia which can be very debilitating and which are not included in the diagnosis. Dismissing it as a meaningless construct would amount to a "misconceived depathologisation" that can "lead to denial, ideological charging or romanticisation of the condition" (Boger, 2015, p. 272).

Kenneth and Mary Gergen (2009, p. 10) formulate the basic idea of their social constructionism as follows: "Everything that we consider real is socially constructed. [...] Nothing is real unless people agree that it is real." They did not mean to say that reality does not exist, but that one always speaks out of a tradition when defining something as real. This basic idea is not consistent, because if a reality exists independently of subjective perception, then there can be a difference between perception and what is perceived. This in turn means that reality cannot be dependent on the consensus of perceivers. Even if perceivers define reality from different traditions, there are objective insights into reality that can claim validity across all cultural boundaries. Insights such as the fact that the Pharaoh Ramses II died of tuberculosis and did not fall victim to a revolution will be discussed later.

From a social constructionist perspective, Gergen and Gergen continue, mental illness is not something that exists waiting to be discovered; rather, illness is constructed through action. If a sad person is given a diagnosis of depression,

he or she may become addicted to antidepressants for life. The authors advocate short-term narrative therapy to construct new stories. Although the criteria for diagnosis and the distinction between depression and ordinary grief are controversial (Frances, 2013), there is little doubt that the phenomena grouped under the diagnosis of 'moderate' or 'severe' depression are more than just sadness. The mood changes that cause people to lose the ability to be happy or to have any interest in the world at all cannot be explained or reversed 'narratively' alone. The claim that a diagnosis of depression puts people on drug treatment must be rejected in this sweeping way. A diagnosis can also be a prerequisite for medical leave or non-drug treatment. In the USA, Gergen and Gergen's home country, many people cannot afford psychotherapy because of the private co-payments required and are therefore dependent on psychotropic drugs (Olfson & Marcus, 2009). The social constructivist worldview, the sweeping and undifferentiated criticism of diagnoses and the plea for short-term therapies are problematically adapted to these conditions without Gergen and Gergen reflecting on this. Incidentally, one might ask whether the author and authoress also see drug addiction as a social construction that can be overcome through narratives – supposedly "everything" is socially constructed.

8. Political dangers of postmodern relativism

In the wake of the growing influence of social constructivist and postmodernist ideas in the 1990s, there has been an increasing theoretical relativisation of reality (Eagleton, 1997). A particularly blatant example comes from Bruno Latour. The philosopher once disputed the finding that the Pharaoh Ramses II died of tuberculosis with an absurd justification: Robert Koch had "discovered (or invented, or made up, or socially constructed)" the tubercle bacillus in 1882 (Latour, 1996, p. 248). And further: "The attribution of tuberculosis and Koch's bacillus to Ramses II should strike us as an anachronism of the same calibre as if we have diagnosed his death as having been caused by a Marxist upheaval [...]. Sure, if we want to respect actor's categories there must be in the Egyptian language a term or a set of hieroglyphs [...] that define the cause of Ramses' death" (Latour, 1996, pp. 248).

It is as if Latour has taken the Thomas theorem and theses by Foucault and Gergen and Gergen to extremes here and set them against scientific findings. He presents truth as something completely relative, dependent on the beliefs of those acting, on discourse and on traditions. Thomas Luckmann would have called this "gross nonsense" (Luckmann et al., 2015, p. 427). Similarly, Latour and other postmodern intellectuals have relativised global climate warming and questioned the existence of nature at all (critically, Malm, 2018).

Years later, Latour acknowledged parallels between postmodern and conspiracy ideological thinking, while attempting to defend his own earlier views. "I intended to emancipate the public from prematurely naturalized objectified facts. [...] Is it enough to say that we did not really mean what we said? Why does it burn my tongue to say that global warming is a fact whether

you like it or not?" (Latour, 2004, p. 227). Doubting scientific truth is no longer an exclusively postmodern domain. His neighbour considers him naïve because he believes that the attacks of 11 September 2001 were perpetrated by terrorists. "Of course, conspiracy theories are an absurd deformation of our own arguments, but, like weapons smuggled through a fuzzy border to the wrong party, these are our weapons nonetheless" (Latour, 2004, p. 230).

Latour would have been spared this unpleasant surprise, if he had taken seriously the earlier critique of postmodern philosophy and the warning that relativism, generalised scepticism about science and blanket critiques of the Enlightenment play into the hands of obscurantism and the extreme right (Eagleton, 1997; Evans, 1998; Sokal & Bricmont, 1999). When the conspiratorial right in the US today denies global warming and spreads its propaganda, its rhetoric is usually not overtly social constructionist, but it adopts the same cynical, instrumental attitude to facts as many postmodern intellectuals more closely associated with the left. That there are overlaps is shown by the example of the postmodern philosopher Giorgio Agamben (2020), who described the Corona pandemic as an invention of the state.

9. Conclusion and outlook: Is disability a social construction?

The aim of this study was to clarify what is meant by the claim that disability is a social construction and how viable the justifications for this claim are. A number of recurring problems run through the works discussed: These include the neglect of the question of the truth or falsity of statements, the short-circuiting of questions of truth and power, the emphasis on notions of disability at the expense of their subject matter, the absolutisation of language and discourse, the opposition of social construction and nature or objectivity, the stretching of the notion of construction to the extent that even bodies and nature are described as socially constructed. In its extreme forms, social constructivism leads to an epistemological relativism that is politically dangerous in that it abandons the claim to be scientific and thus paves the way for obscurantism, conspiracy ideologies, and an instrumental and power-oriented approach to questions of truth.

The thesis of disability as a social construction is by no means unambiguous or conclusive in all respects. Either the term construction should be abandoned or it should be explained exactly what is meant by it. This would involve answering questions such as: Who constructs and why? What is being constructed and is construction the appropriate term for the process? What is the medium of the construction process? Are statements associated with the process true or false, or appropriate or inappropriate?

The statement that disability is a social construction can be translated and concretised into non-constructivist language in a number of different ways, such as "The distinction between disability and non-disability has a history," "Medical diagnoses have a history," "Some impairments are caused by social processes (e.g. war)," "Different people have been involved in creating a situation where a

disabled person faces barriers in the past and is involved in the present," "A certain personal characteristic is generally considered to be pathological, but there are good factual reasons and it would be better for the person not to have it," "Some people have stereotypical and prejudiced ideas about disability."

If it is true that the construction thesis and the epistemological positions that usually underlie it are burdened with numerous inconsistencies and problems, then the question arises as to why they are nevertheless so popular in disability studies and in various other 'studies.' Paul Boghossian sees one reason for this in the fact that they allow us to simply reject "any claim to knowledge [...] if we happen not to share the values on which it allegedly depends" (Boghossian, 2006, p. 130). However, abandoning social constructivism would not necessarily mean compromising the academic and political programme of disability studies. Oppression, exclusion and prejudice can be critically examined from a non-constructivist perspective. At the same time, it would regain a standard for scientifically justifying and testing theories, rather than treating them as just one construction among others. Natural and medical aspects of impairments would no longer have to be set in hostile opposition to society and culture, but the different dimensions of impairment and disability would have to be worked out in a theoretically and empirically differentiated way.

In view of the difficulties outlined above, disability studies should not define itself through the construction thesis. Rather, there should be room in disability studies for other philosophical and epistemological positions, such as materialist or critical realist theories (Gleeson, 1997; Vehmas & Mäkelä, 2008). This would amount to a process of diversification from which disability studies should emerge stronger.

The political and social construction of the parental subject and the subject of juvenile delinquency through Greek institutional justice: A Foucauldian-Critical Discourse Analysis¹

Maria Perpiraki

Abstract

This paper is part of a master thesis, which aims to analyze the construction of the concept of juvenile delinquency through the comparison of the Scientific-Institutional Discourse and the Discourse of Volunteers. The broader epistemological context refers to the Constructionism of the Social Realism. Methodologically it contributes to the Foucauldian Discourse Analysis. At the macro – level a historical – genealogical construction of the concept is attempted, as well as a review of the dominant Scientific Discourses. At the micro level, website texts of institutions relevant to juvenile delinquency are analyzed and compared to the texts of twenty interviews from volunteers in the field of juvenile delinquency. The conclusive conversation shows – among others – that the two kinds of Discourse appear divergent as well as convergent and that juvenile delinquency is constructed as a hybrid subjectivity among identities like: victim offender, subjects in need of affection – surveillance. Here are presented the general aspects of the macro level analysis and the analysis of one institutional text named: “Parental guide for juvenile delinquents.”

Keywords

juvenile delinquency, subjectivity, Critical Psychology, Foucauldian Discourse Analysis

¹ Note: This analysis is an integral part of a broader master's thesis conducted in the Department of Psychology at the Aristotle University of Thessaloniki, under the title: "The Construction of Juvenile Delinquency: A Critical Discourse Analytic Approach to Scientific-Institutional Discourse and Volunteer Discourse."

1.Theoretical framework, purpose, methodological framework, and material of the analysis

This study analyzes the official "Parent Guide," a pamphlet distributed by Justice institutions (prosecution/juvenile supervision) in Greece to the parents of children involved within the criminal justice system. It does so from within the approach of Critical and Political Psychology and with the tools of Critical Foucauldian Discourse Analysis (Parker, 1990, 1992, 1999, 2002, 2005). The guide is a short illustrated booklet with "advice" for parents of "delinquents." Based on the Critical Discourse Psychology of Social Realism, the recommendations of the guide construct not only aspects of the subjectivities of juvenile delinquents and the way they are managed within the family, but also the type of parental subjectivity that the penal/legal institution "demands." Subjectivities are thus socially and politically constructed and regulated, while spontaneous ways of interaction between parents and delinquent children are pathologized and subject to political regulation by a primarily psychological discourse.

I first present a summary of the theoretical syntheses of Critical Discourse Psychology with Foucauldian theory and Marxism, along with the research questions and the methodology derived from them. Then, on the macro level, I show the first stage of the historical-genealogical analysis of juvenile delinquency, analyzing the dominant scientific Discourses of Governance of the concepts of "adolescence" and "juvenile delinquency." This is followed on the micro level by some indicative analyses from the "parent guide" of the Greek Ministry of Justice, accompanied by a relevant brief discussion.

1.1 Critical Discourse Psychology and Foucauldian Theory

It appears that the Critical Discourse Psychology adopted by Parker, while not negating a deconstructive dimension, does not deny that the framework of psychological research, the science of Psychology itself, and social reality, cannot be viewed apolitically. Moreover, the way they are viewed has a specific framework: "the real is constructed and mediated level by level by discourses, and always by Discourses that never escape the material conditions within which they are reproduced and transformed" (Parker, 1992: 38). Thus, Critical Discourse Psychology as both theory and method links every discourse-approach to its political dimension. This dimension concerns both the subjects-objects of study and the political subject of the researcher. Discourse, therefore, is never ideologically empty. This view of a representative of Critical Discourse Psychology is significant, since it chooses to incorporate Foucauldian theory into both ideological and Marxist analysis. Parker believes that Foucault's philosophy and analyses constitute the cornerstone of critical discourse analytic research (Parker, in: Boatzis&Dragonas, 2010: 295), as the deconstructive dimensions of Foucauldian work can highlight not only the dominant Discourses and power relations that Social Psychology investigates, but also the dominant Discourses

and power relations produced by Psychology and psychological research itself. Thus, the way in which the discipline (Foucault, 1987, 2011, 2016a) of subjects is achieved, it is examined not only within the internal discourse and its external reality, but also within the internal explanatory discourse that it analyzes/deconstructs. For Foucault, in every society, "the production of discourse is simultaneously controlled, selected, organized, and redistributed by a certain number of procedures, whose role is to avert its powers and dangers, to master the unpredictable, to avoid its heavy, formidable materiality. (...) these procedures are related to exclusion processes" (Foucault, n.d.: 7-8). Consistent with the social constructionism that followed historically, I argue that Foucault laid the foundations for Critical Discourse Analysis of a social constructionism that does not negate critical realism, when he writes: "Of course, the event is neither substance nor accident, neither quality nor process. The event does not belong to the order of corporeal things. Yet it is not immaterial at all. It acts, it has an effect only at the level of materiality" (Foucault, n.d.: 42).

1.1.1 Subjectivity in Foucault and Critical Social Psychology

The emphasis on the subject and its study is inextricably linked with Marxism and Post-Marxism. The extent to which discourse analytic research in Psychology concerning subjectivity and its construction can be combined with the ways of investigating subjectivity proposed by Michael Foucault is thus explored. Foucault established the view that subjectivity is connected to the social process: it is produced by and produces—constructs—the social through Discourse, seen not only as language, but as a broader verbal construction (Foucault, n.d., 1976, 1977, 1987, 2016 a, b). Thus, Discourse produces and is produced by power relations, contributing to the naturalization of ideologies and the reproduction of the dominant status quo. Subjectivity in this field, in its individual and collective dimension, appears destined to fail to reach "freedom."

In order to integrate this reasoning into the explanatory framework of Social Psychology, it should provide the possibility for both the analysis of the social and the conditions for its change. As Parker poses this issue, the use of different Discourses, even the production and (through psychological research) of counter-Discourses, cannot automatically lead to alternative social forms due to four factors (Parker 1992: 37-38):

- Direct physical coercion. The material conditions that objectively and naturally (according to Foucault) limit individuals and groups of social actors from producing new Discourses and thus new social conditions.
- The material organization of space. The institutional and deeply political structuring of spaces, where new Discourses can exist, be created, and articulated is a real force. There are specific sub-communities, where alternative and counter-Discourses have a foothold for existence.
- The habit of the individual (and therefore the researcher) to orient towards different – distinct - types of Discourse, making it difficult to radically 'break' the existing social structure.

- The pessimism about change reproduced by studies that view change through the "different subject positions" that subjects theoretically must or can (Parker 1992: 37) undertake. New subjectivities seem to depend purely on the narrow framework of Discourse.

According to my readings, this is reflected in Parker's works as a whole (where he often critiques other discourse approaches). No analysis based purely on, or predetermined by, rhetorical analytical concepts can itself enact change, except if it hypothesizes it. Parker's solution is clear: "The articulation of counter-Discourses will be achieved in material spaces" (Parker, 1992: 40). For the material space is part of Discourse.

Within this framework, it is recognized that the researcher should not be confined to these, but should dynamically incorporate analytical tools not only from dominant approaches, but also from approaches of other fields, when deemed necessary for research. However, it must first be clear that the analysis is ideological and operates in the political "arena." Thus, the adoption of a specific political perspective is deemed necessary.

1.1.2 Marxist and Post-Marxist Dimensions of Foucault's Thought and Their Relation to Discourse Psychology

The political commitment of social-psychological research is thus not only necessary, but inevitable. It is easily understood that Foucault's theory does not easily combine with many ideologies (e.g., neoliberal right-wing ideology). However, the question arises whether it can be combined with Marxism and Post-Marxism. The issue is not simple since Foucault himself seems to have denied any political designation, and his work has been fiercely criticized by Marxist analysts. Nonetheless, there are readings of his work that allow for the connection. Ping (2015) initiates a comparison between the two thinkers by juxtaposing the creation and goals of the traditional labor movement with those of the "new social movement" of "identity politics," with the latter, having Foucault's works as a basic theory, being accused (by the communist and broader left) of ignoring the oppressive power of productive relations and economic inequalities. Marxist and Foucaultian theory present similarities and differences, without implying that one excludes the other as a theoretical framework or method.

The similarities briefly concern issues of materialism, social processes, power, emancipation, and social resistance (Olssen, 2016; Ping, 2015). Foucault certainly does not consider that materialism dominates the social, but he admits that it overdetermines it, since Discourses have material consequences, and since material reality itself (which he does not deny) determines the production and function of Discourses. At the same time, economic relations of production have a place in his theory as they are part of the dominant power relations. Both Foucault and Marx consider that social practices are characterized by temporariness and transience and refer to the role of intellectuals and the

intelligentsia concerning social and productive relations (Olssen, 2016: 454). Both deal with issues of power, oppression, and emancipation.

This last observation, in its qualitative differentiations, is one of their main differences: for Marx, power always comes from economic relations of production and is oppressive, while for Foucault, it comes from other fields beyond the economic (cultural, intellectual, political) and is not necessarily oppressive, since it is combined with Knowledge and the concept of Discourse, which are inherent in every aspect of the social, whether oppressive or not. As Ping (2015) mentions, the concept of power in Foucault is not opposed to the Marxist one, but is simply broader, or – as mentioned in Olssen (2016) – overarching.

Another fundamental difference concerns the perception of history, which for Marx is determined by material relations of production and is imbued with the teleological victory of the working proletariat. In contrast, Foucault does not see an "end" (goal) in history, as this would contradict the dynamic notion of emancipation, resistance, and change. For him, history is characterized by the struggle of Discourses and Ideologies and by fragmentation (Ping, 2015). Finally, the concept of ideology, defined as "false consciousness" by Marx (Marx & Engels, 1974), is for Foucault a historical-cultural construction that is a plural (with post-Marxist influences), true based on social consequences, and dynamic while relating to the concept of the subject.

Therefore, as a method, as a historical approach, and as an analysis of social structures, the two theories present parallels (Olssen, 2016); thus a Foucauldian approach can be integrated into Marxist and post-Marxist frameworks of class struggle (Ping, 2015; Parker, 1992, 1993, 1999, 2002, 2007, 2010, 2015c, 2018). Moreover, Foucault himself had accepted the integration of Marxism into his work (Olssen, 2016: 454).

1.2 Theory of Juvenile Delinquency

The present paper constructs a "Theory" of juvenile delinquency through the study of the dominant approaches to childhood and adolescence, the dominant approaches to aggressive and antisocial behavior, the historical-genealogical critical presentation of the concept of delinquency and juvenile delinquency, and the dominant scientific Discourses governing the concept of juvenile delinquency. An attempt is made to briefly present how the dominant versions of these Discourses are articulated, constructing the body of knowledge that determines the theoretical, research, and practical reception of the collective subjectivity of juvenile delinquency in Greece. The main concepts related to juvenile delinquency and social control are also critically examined.

2. Research Questions

The specific research questions are as follows:

- What characteristics, processes, and Discourses appear to shape juvenile delinquency as subjectivity through the parental guide?
- How are classical scientific theories transformed through the psychological Discourse of the guide, and what power relations and ideologies do they seem to serve?
- In what subject positions are juvenile delinquents and their parents/guardians placed, and what are the consequences of these positions for theory and social and political practice?
- How and based on which systems of Discourse, are the causes and interventions for juvenile delinquency constructed? What consequences might this have for the social and political field?

3. Methodology

The methodological decisions pursuant to Critical Psychology and Critical Discourse Psychology, as well as to Social Realistic Constructivism, question the very existence of Psychology and its role in constructing reality, as well as see its socially and scientific existence in the admission of conscious political commitment (Parker, 1990b, 1992, 2002, 2005, 2015a, b, c, 2018). In the context of a proposed critical stance towards Psychology itself (both in general and integrated into psychological research), Psychology, may not be identified with ideology (in all texts), but it is considered to function ideologically (Parker 2018: 20) and thus constitutes a "pseudo-science" (Parker 2018: 21) that exercises social control.

For Parker (both in his early – Parker, 1992 – and later work – Parker, 2005), the project of emancipation and social change aligns with the project of Deconstruction in how current qualitative methods of psychological research can be used to deconstruct ideology and social control (Parker 2018: 89, 286). For Parker, this deconstruction has classic elements of deconstructive criticism, but also discursive analysis in terms of knowledge-power. As he writes: "The real is mediated step by step by Discourses that never completely transcend the material conditions within which they are constructed and transformed" (Parker, 1992: 38). In this context, the classic Psychological Discourse concerning criminality/delinquency promotes the neglect of the social and political factors that construct and determine it. These factors can be highlighted through the methodological coupling of Marx and Foucault, which promotes a Critical Anti-Psychology and emphasizes knowledge that will not a priori empower psychologists nor validate institutional processes under the guise of supposed psychological normality.

In agreement with Parker's view on the free yet documented choice of methodological tools for analysis), the present analysis constructs its the methodological tool for analysis as follows: Norman Fairclough's triple dimension for CDA was adopted as the general analytical classification, and specific elements of Foucauldian analysis, deconstructive criticism, and Bakhtinian method were selectively integrated into it.

3.1 Methodological Tool Construction

According to the above, the methodological analysis paradigm demands systematicity and flexibility and consists of a combination of methodological proposals from the writings of Foucault himself, and the interpretations for Foucauldian methodology expressed by Parker and Willig. Furthermore, the analysing tool is enriched with theories of Fairclough, Bakhtin, and Derrida, showing that a synthetical, systematic, but also critical Foucauldian approach to analysis is possible. Parker, Fairclough, and Jaeger themselves make clear references to their Foucauldian influences (Parker, 1992, 2005. Fairclough, 1994. Jaeger, 1993).

Taking as a starting point his own analyses in relation to psychiatric power, Foucault writes: "The aim is a genealogy of the contemporary scientific-judicial complex, from which punitive power draws its supports, rationales, and rules, and where it extends its effects and conceals its excessive peculiarities" (Foucault, 2016d: 316). He thus integrates the historical-genealogical method as the background for the analysis of bodies of knowledge, of governances that co-construct institutional processes and therefore the subjectivities produced by them. The concept of the "scientific-judicial complex" illustrates how the Discourses of the individual sciences (here: Law, Psychology, Sociology, Pedagogy, Psychiatry) have structured the philosophy and practices of the administration of criminal justice. They constitute a "complex," a Discourse with institutional power that co-constructs/is imprinted in practices (here: official texts/voluntary interventions by private entities) that adopt and often reframe the dominant individual scientific paradigms. Close to the genealogical approach, Foucault adds the necessity of the archaeological and linguistic approach, an "inside" of the text before the "outside" of it. In the above passage, the points of influence of the approaches developed in the previous three subchapters are evident.

There have been attempts by Social Psychology to systematize Foucauldian traditions to serve both the respective research purposes and the training of psychologists/analysts. Parker (1992, 2002, 2005, 2015c), for one, attempted to systematize Foucauldian imperatives, being consistent with the degree of freedom of ambiguity they entail, but also trying to transcend it, as seen above. Similarly, Carla Willig (2013: 318-324) presents six stages of Foucauldian analysis: 1) The 'Analysis of Discourse Structures,' essentially concerning textual analysis and exploration of explicit and implicit references in relation to the object of discourse (namely research). 2) The 'Analysis of Discourses,' identifying the ways in which the object of discourse is embedded within broader discourses and how this operates in its construction. 3) The stage of 'Action Orientation,' examining the functioning in practice of construction and which type of discourse benefits from it. 4) The stage of 'Positionings,' investigating subject positions. 5) The stage of 'Practice,' demonstrating how discourse constructions determine what can be said and happen in specific realities. 6) The stage of 'Subjectivity.' According to Willig, here the construction of social realities and subjectivities is explored through the combination of linguistic

constructions with consequences for subjectivity. Willis emphasizes that this stage has the highest degree of 'speculation' (Willig, 2013: 329) and that the stages do not constitute a complete Foucauldian analysis. Regarding the latter, the author refers to the methods of Parker and Fairclough (Willig, 2013: 330). Parker (1992, 2002, 2005, 2010) specifically argues that any methodological choice incorporating the historical-political and the deconstructive can be considered Foucauldian. Although Hook (2001: 2) criticizes Potter and Wetherell's approach as well as Parker, he argues that Parker and Fairclough have "come closer."

In "What is Critique?" (2016a), Foucault himself presents the steps of the critical-genealogical analysis he proposes: 1) Initially, the analyst takes sets of empirical elements and connects them with mechanisms of constraint and the contents of Knowledge/Reason. (Foucault, 2016a: 32) 2) At each moment of the analysis, he assigns specific contents corresponding to elements of Knowledge and mechanisms of power (there is no one knowledge or one power). (Foucault provides the example of the interweaving of scientific discourses: Legal, Psychiatry, etc.) (Foucault, 2016a: 34). 3) Researchers do not analyze the object as a universal concept but as a singularity. Thus, they develop a dense causal network through genealogy that reveals the conditions of the emergence of singularity. (Foucault, 2016a: 37). 4) The relative Reasons (e.g., scientific) operate in relationships involving subjectivities, for the analysis of which the analyst needs strategies that will reveal how the Reasons established as Power-Knowledge, on the one hand, construct singularities/subjectivities, while, on the other hand, make them open ("fragile") to change.

Thus, Critical Discourse Analysis consists in revealing the results of power in a sense-subject. In what sense "(...) is the knowledge of what are the results of power, if you will, of induction (...) which this theorem can have, on the one hand, within the scientific field, within which it is shaped by someone - mathematicians, psychiatry, etc. - and on the other hand, what are the institutional, non-discursive, non-standardizable networks of power with which it is connected and from which it is put into circulation" (Foucault, 2016a: 61). For Foucault, such criticism is therefore inevitably political. It is "(...) the art of voluntary disobedience, of profound disobedience. Critique in the service of de-subjectification, in the game of what we could call with one word, the politics of truth" (Foucault, 2016a: 16).

Parker (Parker, 1992: 4-20) proposes ten criteria (he calls the last three "auxiliary") for identifying Discourses; these are accompanied by twenty specific techniques (two for each criterion) that the critical discourse analyst must follow. Briefly listed the criteria are:

Criterion 1: Discourse is realized in texts; criterion 2: Discourse concerns objects; criterion 3: Discourse contains subjects; criterion 4: Discourse is a coherent system of meanings; criterion 5: Discourse refers to other Discourses; criterion 6: Discourse reflects its own way of speaking; criterion 7: Discourse has historical placement; criterion 8: Discourses support institutions; criterion 9: Discourses reproduce power relations; criterion 10: Discourses have ideological consequences.

As already mentioned, Parker himself (1992, 2005, 2015a, b, c) refers to Norman Fairclough's paradigm of critical discourse analysis, which, when combined with a Foucauldian method-interpretation of analysis, can constitute a systematic critical discourse analysis. At the same time, he mentions that the political-ideological element in the analysis does not negate its deconstructive nature, insofar as the researcher who deconstructs has already positioned themselves as a research-political subject.

Norman Fairclough adopts the Althusserian conception of ideology, accepting that ideology is inherent in institutions and social practices as "common sense," so as to naturalize them (Fairclough, 1989: 77-98, 102-109). This naturalization of common sense, that is, socially constructed knowledge and evaluations, presents itself as natural and contributes to the construction of the subject's identity, creating a variety of "subject positions" that are adopted through the manipulation of various kinds of discourses (Fairclough, 1989: 102-105). In his effort to establish a method for discourse analysis, he defines discourse as text, interaction, and social context, thus, based on this definition, he formulates three stages/dimensions of critical discourse analysis (Fairclough, 1989: 109-150, 1995: 98ff., Perpiraki, 2019):

1. Text analysis: This involves primarily a linguistic analysis of texts at the first stage, as it is based on Fairclough's position that the formal characteristics of texts are nothing more than choices (lexical and grammatical) within a range of possibilities. The choices are linked to ideology, just as the form of the text is linked to its content. Vocabulary, grammar, and textual structures are examined based on a tripartite system of linguistic values: experiential, relational, and expressive value.

2. Discourse practice analysis: This examines the interpretation between textual practice and discourse practice, the processes of production, distribution, and consumption of discourse, with emphasis on the concept of intertextuality. Additionally, the type of discourse is examined at the levels of content (what is happening, topic, purpose), subject (who is involved), relations (what relationships are involved among those participating in the discourse), connections (what role does language play in action), contexts, and schemata.

3. Sociocultural practice analysis: This focuses on the nature of discourse production (e.g., at the level of institutions such as education). It examines the relationship between discourse practices and sociocultural practices, i.e., how the former relate to analyses of power and ideology relations.

Next, I present those aspects of deconstruction and Bakhtinian theory that can be incorporated into the analysis connected to the peculiarities of the present research.

According to Bakhtin, the word is an ideological point both in form and content. It has a dialectical character (Voloshinov, 1998: 86) and never leads to singular representations, which led Bakhtin to express for the first time the view that "there are many ideologies." In a view that closely resembles that formulated later by Billig (1991), Bakhtin argued for the "ideology of everyday life" and the "ideology of constituted formations" (Voloshinov, 1998: 75). Interestingly, Bakhtin considers ideology and its exploration as the work of psychology, while

also providing a definition of Social Psychology: "Ideology is explained through Psychology, not vice versa, through the sign material of the soul: word, speech, enunciation" (Voloshinov, 1998: 95) and "Social Psychology is manifested primarily in the various forms of 'enunciation,' in forms of small kinds of speech, internal and external, which have not been studied until now" (Voloshinov, 1998: 80). He also takes a clear position on the analysis of Speech-Ideology: "Methodological position: the study of ideologies in no way depends on Psychology, nor can it be based on it. Instead, it is Objective Psychology that must rely on the science of ideologies. The reality of ideological phenomena is the objective reality of social points" (Voloshinov, 1998: 68). For Bakhtin, therefore, Language has material reality, is never neutral, and is organized into types of Speech that connect the history of Language with the history of Society (Bakhtin, 2014: 9, 37, 39, 71, 79. Voloshinov, 1998. Holquist, 2014).

The Bakhtinian conceptual tools that derive for the methodology of the present study concern the concepts "chronotope," "dialogism," and "enunciation." The "chronotope" is related to the genres of speech and the composition of stories and narratives. It focuses on the spatial and temporal indices of the text, as these - according to Bakhtin - can distort the sequence of events (Holquist, 2014: 203).

Here, it is necessary to refer to Holquist's (2014) view that Bakhtin and Foucault complement each other regarding the imperatives of discourse analysis: Both recognize that discourse has material consequences and constructs subjectivities based on power and capitalism, with the difference that Bakhtin thoroughly described the analysis within the text, and Foucault in the realm "outside the text." Finally, in relation Derrida's textual analysis theory, the deconstructive perspective dismantles the dichotomy of literal meaning and metaphor, stating that every naming of a thing, every signifying, is inherently a metaphor, since between the thing and what it signifies the point intervenes with its difference. Derrida associated this relationship with the issue of identity and the relationship between self and Other (Culler, 2003: 292). Thus, the critic does not stop by describing a metaphor in discourse and its function, finds the "metaphorical root" of literal propositions. Therefore, discourse is essentially metaphorical, and every text is, in a sense, a form of literature. As interpreted by their writings, Derrida himself, as well as biographies of Foucault, acknowledge that the two philosophers agree on the premise of critical analysis, with the difference that Derrida emphasizes the text more, Foucault focuses on what happens outside the text. In some way, they complement each other.

The use of these concepts and approaches is not only concordant, but also necessary for this research, especially for a critical Foucauldian analysis of discourse. On the one hand, it aligns with the viewpoints of Parker, Foucault, and Fairclough regarding a deconstructive premise. On the other hand, it challenges the methodological perception that demands Foucauldian analyses to neglect linguistic aspects and leave linguistic structures "vacant," which underestimates the role of the text as language.

4. Genealogy and Dominant Discourses

In this subsection, I present and explore the historical-genealogical and institutional formation of the concept of juvenile delinquency as a category in discourse and practice with Foucauldian terms, associated with the construction of the concepts of deviance in general and transgression. Initially, the formation of punishment and punitive practices was examined in a genealogical dimension. Since the political structure of the ancient Greek city-state, specific forms of control and regulation of the behaviour of certain individuals and groups can be identified and named "governance" in Foucauldian terms. These practices seek to regulate and guide the conduct and behaviour of those who evade or challenge authority, or ignore both written and unwritten laws. Foucault considers that the beginning of the study of the formation of punitive practices may include the study of the concept of exclusion, in its broad sense as a socially consensual rejection. Historically, specific linguistic-identitary characteristics were attributed to the excluded, such as "deviant," "maladjusted," "abnormal," etc., which were imbued with purely psychological content, introducing Psychological Discourse into social control informally. Thus, as Foucault says, this early Psychological Discourse aimed to "conceal the techniques, processes, mechanisms through which society excluded certain individuals to later approach them as abnormal, deviants" (Foucault, 2016d: 16). In this process, historically shaped punitive practices played a dominant role, which constructed the very concept and content of what is understood as "punishment."

Foucault himself analyzes the genesis and functioning of four punitive practices historically: exclusion (ostracism, exile, etc.), which imposed the break with any social bond an individual had with society; redemption/restitution (monetary compensation, etc.), which constructed a separate social network of obligations for the individual; stigma (literal and symbolic), which made the punishment visible, attempting to eliminate it by highlighting it; and practices of confinement (e.g., imprisonment) and death penalty, which evolved into practices of "correction" and "therapy." From a social constructionist perspective, and in accordance with Foucauldian theory, every punitive practice, both at the level of Discourse and in material terms, constructs and corresponds to criminal systems and the related social systems. Thus, the stakes are the historical and synchronic study of the power relations behind each punitive practice. In this way, "penal tactics are the analysts of power relations, not simply indicators of an ideology" (Foucault, 2016d: 26). The entire penal and social system that creates, imposes, and uses punitive practices is permeated by a series of discourses or "rationalities" that are transformed into scientific discourses (sociological, legal, psychological, psychiatric, educational). These, in turn, are historically related to the very formation of the subject that is to be regulated: the criminal, the transgressor, the delinquent.

4.1 The delinquent as a "Social Enemy"

According to Foucault (1976, 2016d), until the 18th century, prohibited criminal acts were characterized by individualization, while from the mid-18th century on, crime was considered an act that harms not only specific individuals or interests, but the entire society. Delinquents were thus constructed as individuals "waging war" against society, as social enemies. The framework of punishments and punitive practices imposed on them was thus considered a "counter-war measure" for the protection of society. The facets of the "social enemy" were and are intertwined with what was considered not only as a crime, but also as the cause of crime. In this dimension, Foucault presents historical analyses of the causes that generate crime and the delinquent/social enemy through Psychological Discourses. The emphasis is psycholinguistic since these Discourses primarily concern the semantic functions of linguistic terms. He therefore considers the psychological starting point for the construction of the concept of criminality to be the content attributed to the word "vagrancy." He identifies its construction around the analysis of psychological "dispositions" such as laziness, begging, and poverty. The concept of laziness is defined as the "basic matrix" from which the beginning of crimes originates.

It could perhaps be argued that Foucault distinguishes between the individual dimension of analysis in Social Psychology and a more "social" or group-oriented analysis, when he says that "later a new content appeared for crime, 'the set of tramps,' that is, a type of common life, a social group presented as an anti-society in contrast to laziness, which in Psychology was something like an individual sin" (Foucault, 2016a: 53). Initially, "vagrancy" as a characteristic of the social enemy was defined in psychological terms; later, in the 18th and 19th century, the analysis of criminality appeared also in economic terms of production/consumption. Thus, the social enemies were constituted through their relationship with the productive process, and the criterion was whether and why, and under what terms, they had employment. The notion of employment gradually introduced the concept of correction and the concept of "rehabilitation of the delinquent," which – as I will show – applies today. The very initial signification of correction was defined, in contrast to the unemployed/unemployed social enemy, as "the habit of work" (Foucault, 2016d: 71). Correction itself was based on work as the organization of the "working time" of prisoners as well as those under judicial supervision or care, which structures the subject transgressor within the relationship between lifetime and political/institutional power. In this process, the development of the capitalist economic system played a role in transforming time and its management into an economic and ethical measure (Foucault, 2016d: 82).

4.2 The Sociological and Psychological Construction of the Offender and the Research Dimensions of "Deviant" Subjectivity

Foucault distinguishes a gradual sociological construction of the criminal as a social enemy. This entails the formation of socio-psychological discourses that result, in penal practices, in the creation of new scientific fields of knowledge, such as the "psychopathology of deviance" and the "sociology of criminality." Thus, a "Sociology of minor and major criminality" is established, which concerns the study of the social mechanisms that underpin criminality and its management, as well as methods of suppression and intervention. This kind of a Sociology of deviance defines the offender both theoretically and executively, and the ambiguity as well as the conversation of these dimensions led Foucault to introduce the notion of the "mechanism of alternation": "The offender-criminal-enemy is an element that cannot be precisely located either in one framework (theory) or in the other (practice). He is a transcriber, a switcher, a mechanism of alternation (...) he ensures the coherence and relative systematicity of heterogeneous elements: penal practice, theory of criminal law, codes, psychiatric, sociological discourse" (Foucault, 2016d: 47-49 footnote). Here, Foucault makes it clear that research on the governance and subjectivities constructed by penal practices cannot be the subject of classical sociological and criminological theory. Likewise, he considers that the psychological construction cannot be understood only within the field of its articulation, that is, Psychology. He writes: "Similarly: to the extent that the sociology of criminality describes, in its vocabulary, the practice of criminal prosecution on the basis of the switcher (criminal-enemy), it becomes clear that psychological theory will never be able to deeply reassess penal practice, whatever criticism is levelled against it" (Foucault, 2016d: 49 footnote). Foucault appears to reject positivist-empirical psychological theory and research. He suggests analysing subjectivities constructed by the penal system: "The nature of the struggles surrounding power in society must be revealed" (Foucault, 2016d: 27). This process involves the analysis of the conjunction of the judicial-institutional model and the biopolitical model of power (Foucault, 2016d: 292). At the analytical level, the concepts of "Discourse" and "Civil War" are thus surfaced.

4.2.1 "Civil War" - Discourse and Socio-Psychological Practices for Understanding Deviance and Delinquency

Foucault elevates the concept of "Civil War" to an epistemological model consisting of individual and social dimensions. In this model, subjects are collective, and social processes reveal and construct new collective subjectivities through conflicts at the level of power struggles. Thus, the socio-psychological practice of studying punishment at the level of tactics and the construction of subjectivities must examine, "not who punishes (the system) and with what scale of values, but: how it punishes, whom, and with what tools" (Foucault, 2016d: 31), starting from the study of the conflict covered by the notion of "civil war,"

which - as explicitly stated - is the social war of the rich against the poor and equated with class warfare (Foucault, 2016d: 43 footnote). This war is a war against the dominant society, characterized by two dimensions: the theoretical production of how the social contract and civil war (class conflict) lead to crime; and the institutional production concerning the establishment of persons and laws that will assign the function of the "social enemy" to the subject. This, following Marxist assumptions, occurs through the dominant class. It transfers and naturalizes the function of excluding the offender into social consciousness, either through the judicial system or through the "epistemological transmitters" (Foucault, 2016d: 45) of dominant scientific discourses. In this process, the social enemy is constantly reconstituted according to penal practices. These may involve displacement, imprisonment, rehabilitation, or "new therapeutic measures," as will be seen later. Thus, punishment and the penal process are social constructions that are structured in two dimensions: relativity (what is socially and culturally defined as punishment) and gradation (the punishment that either "neutralizes" or reintegrates the offender into the social contract). This shapes a social "geography of crime," where one can be considered either a criminal, innocent, or victim, without an "intermediate" or simultaneous condition.

Foucault provocatively raises the significant dimension presented in socio-psychological theories regarding the causes of deviance, which concerns the extreme of the "innately" or "morally fallen" offender. Of interest is how the thinker wonders whether the offender/social enemy is simply a construction operating in the field of social representations: "Is it perhaps the establishment of a dominant representation or a dominant system of representation? Could the criminal be represented as an enemy?" (Foucault, 2016d: 65).

4.3 Genealogy and Construction of Juvenile Delinquency

The historical and social shaping of juvenile delinquency as a societal category and discourse category is a complex phenomenon with deep roots. Scholars (Abdella, 2013; Benveniste, 1994; Ritter, 1999; Shore, 2011) trace the term "juvenile delinquency" back to 18th century Britain (1776). It first appeared in British texts in 1815, describing concerns about the increase in criminality. Initially, the term seemed to refer to criminal, unlawful activities observed in "young men." Socially and informally, it did not seem to apply -at first- to women, and it did not exclusively refer to minors since it lacked clear age specification. It could also be argued that the term excluded accountability for children, as the contemporary notion of childhood did not include criminal responsibility. The broader term of "youth delinquent responsibility," according to Ritter (1999), is a construction that articulates reasons related to age and behaviour. It is a historical product of the Enlightenment, during which attempts were made to rationalize behaviour with a stake in its management. Initially, the emphasis was placed on the content of the term, focusing on "proper youth upbringing" and the "salvation of deviants."

Studies (Abdella, 2013; Ritter, 1999; Platt, 1969) concur that "juvenile delinquency was invented as a distinct social phenomenon in late 19th-century England" (Abdella, 2013: 51). This invention is part of a broader "turn towards utility" and the perception that state authority should intervene in anything that socially impedes the development of common interests within the framework of the early stages of capitalist ideology. The move away from theocratic modes of thinking and secularization mandated a society capable of "defending itself" (Ritter, 1999: 1). At the same time, the rise of liberal ideology emphasized, within the context of the penal state, the notion of individual characteristics, abilities, and rights within the social contract, guaranteed by the imperatives of laws. In this context, even before the establishment of official "Juvenile Justice," those with an interest in defending the social contract—credible civilians, government officials, social reformers, and philanthropists (Abdella, 2013: 52), who were mainly women (Platt, 1969)—began to show interest in behaviours characterized as "deviant" by children and adolescents. The interest of these individuals and groups had clear class characteristics and contributed to the initial construction of minors as institutional subjects.

As Abdella notes, "government officials and philanthropists changed the criteria and definitions of illegal behaviour and invented a new social category: juvenile delinquents" (Abdella, 2013: 52). This new category had to be invested with scientific explanations from the fields of Statistics, Psychiatry, Psychology, Pedagogy, and Sociology (Panagiotopoulos, 1998, 2013) in order to be established as "knowledge." Simultaneously, discourses about childhood and youth had already imposed some restrictions on this peculiar legal status for children. As early as 1908, the prohibition of the death penalty and imprisonment of children had been structured in the construction of various, often conflicting discourses. Ritter (1999: 1-5) identifies five dominant discourses regarding the emerging institutional-penal management of deviant children and youth, summarizing them as follows:

1. Deviance deserves reciprocation.
2. Dangerous actors require control.
3. Vulnerable subjects need protection.
4. Embryonic social subjects require love.
5. Public nuisances call for state intervention.

These discourses construct socially and discursively the juvenile delinquent subject, which would become the object of study for a plethora of institutional-governmental as well as private bodies (eg. philanthropic organizations) with the goal of finding techniques of "governance" permeated by common characteristics: prevention, deterrence, allocation of responsibility between the state, community, and family, and the pursuit of the "appropriate balance between moral reform and physical punishment, between care and control" (Abdella, 2013: 55). It is noteworthy that the management of juvenile delinquency followed the historical establishment of adulthood, in a context where the creation of "reforming" institutions for juveniles preceded the creation of juvenile courts and juvenile justice (Abdella, 2013; Foucault, 1976, 1977, 1987, 2011, 2016b, 2017; Panagiotopoulos, 1998; Ritter, 1999). These institutions were

created for children with clear class origins: from 1880, juvenile delinquents were described as a class that could potentially become dangerous and costly to society (Ritter, 1999), based on the behaviour exhibited by the subjects included in it.

Certainly, this class bias was initially observed within the urban environment of large cities. It was the groups of children from poor environments and city neighbourhoods who were to be controlled, not the "poor countryside." The aforementioned discourses and processes led to a series of consequences regarding the management of the issue. Until 1974, the use of the terms "reciprocation" and "retribution" led to the expansion of physical punishment of juveniles (mainly through whipping) in Britain and in other European countries. The concept of dangerous juvenile behavior was articulated with the management of private property, as a majority of juvenile offences involved theft. This initiated the creation of a "rhetoric of panic," which essentially expressed the concern of the urban class for a specific social class of children. This panic was invested with moral evaluations, so that it transformed into a kind of "moral panic" (Ritter, 1999). The discourse that wanted juvenile delinquents to be "objects in need of protection" (note the objectification and influence of Enlightenment ideas here) constructed the subjects of juvenile delinquency as "victims," "vulnerable," and "helpless" children. The immediate consequence was their removal from the social whole and their isolation, using arguments related to both their own future and the future of society. They would cease to come into contact with delinquent influences and society itself would be protected from the spread of "moral contamination" (Platt, 1969; Ritter, 1999).

These perceptions laid the groundwork for a scientific-institutional dialogue between welfare and judicial treatment, which continues to this day (Abdella, 2013; Kourakis, 2004, 2009, 2011; Panagiotopoulos, 1998; Ritter, 1999). As it did with adult offenders (Foucault, 1976, 2016b, 2017), the concept of "reformation" emerged here, which was associated with the age and developmental psychological category of adolescence. At the same time, the psychological and psychiatric discourse medicalized and pathologized behaviors attributed to the adolescent age category. Thus, "seen as a disorder, adolescence became the age at which the need for guidance and protection became crucial to avoid multiple risks, primarily the risk of moral deviation and criminal behavior" (Abdella, 2013: 60). In the late 19th and early 20th centuries, this discourse began to delineate "who has the right" to study and manage juvenile delinquency. Based on the dialectical relationship between welfare and justice described in theoretical and research texts, I argue that juvenile delinquency was constructed historically, institutionally, and scientifically through the scientific and institutional "representatives" of "two poles": Regarding "welfare" treatment, the sciences of Psychology, Psychiatry, and Pedagogy, along with urban philanthropic organizations, attempted to "cure" delinquent juveniles who, although having "good intentions" (Ritter, 1999), had deviated due to "vulnerability." On the other hand, criminal-justice intervention intervened to preserve the material and moral "good" of individuals (the offenders themselves) and society. This tension between justice and welfare contributed to the

establishment of "special juvenile courts." These two poles seem to have been particularly incorporated into the recognition of welfare as a means of dispensing justice, with the latter being considered to lead to measures that "reform." All this was integrated into the processes that accompanied the emergence of welfare states in Europe.

The "good intentions of children"-scenario played a significant role in welfare rhetoric and was linked to the discourse on vulnerable adolescents. According to Ritter (1999), the construction of children's vulnerability shifted moral responsibility to the realm of the family and social class background. As will be shown in the following subsections, this discourse also gave rise to the idea of rehabilitation as a therapeutic measure, counselling, family support, and the establishment of "Parent Schools." I argue that this discourse is connected with the generalization of providing "psychological support services." Later on, the discourse of vulnerability was framed within the philosophy of social determinism, shifting the problematic from the family to the broader social context, correlating juvenile delinquency with poverty and urbanization. As Ritter (1999: 8) argues, this discourse operates self-fulfillingly to objectify juveniles into the perpetrator-victim dichotomy. If they refuse the role of the victim, they are considered a threat. This construction coexists with discourses/constructions that portray juveniles as property of parents, as apolitical, asexual, economically dependent subjects in need of regulation through education. Ritter also refers to ideologies in the dimension of bourgeois and Marxist readings of juvenile delinquency. She argues that bourgeois views consider juvenile delinquents as "Others," while Marxist readings view them as victims. I consider this interpretation to be incorrect. In my view, a Marxist reading of the historical and conceptual trajectory of juvenile delinquency concerns the way in which the forces of production determine the social fate of children, which determines whom society chooses to construct as delinquent. In this dimension, the delinquent subject is not considered a victim, but a consequence of the capitalist mode of organizing production. This reveals the stake in the choice of words, as the word "victim" theoretically anchors representations on the axis of the individual and lack of responsibility.

In the conceptualization of juvenile delinquency, the 20th century saw the inclusion of both the religious mandates of Christian discourse and child-centric pedagogical views, as well as of psychoanalytic discourse, thus constructing juvenile delinquency as a collective identity of embryonic social subjects whose emotional needs for love were not met. This perception led to a series of reformatory programs emphasizing "love" and criticizing the strict punitive-judicial system of juvenile justice. This critique, during the last decade of the 20th century, resulted in the formation of two opposing views regarding the criminal management of juvenile delinquency and the application of juvenile justice: On the one hand, it was considered to violate the rights of children; on the other hand, it was seen as showing unjustified leniency and flexibility with serious offences (Abdela, 2013: 99).

It seems, therefore, that historically, the construction of juvenile delinquency in the Western world was both provoked by – and provoked changes

in – the relationships between the state and individuals, as well as changes in the dialectic between institutions and scientific theory, constituting, in my opinion, one of the first fields that “demanded” “specialized knowledge of specialists.” All of the above are not relationships and processes devoid of ideology. It has been argued, therefore, that juvenile delinquency is a cultural, social, and political construct (Abdela, 2013: 100, Panagiotopoulos, 1998). It, itself, is a construction in discourse with material consequences, but it has also shaped a wide field of discourse-approaches that have determined the formation of the body of knowledge and thus the construction of truth. As Abdela states: "Thus, an increasingly wider discursive field is formed where different processes for 'juvenile delinquency,' its management, and prevention intersect, with a common characteristic: that they are not formulated as opinion but presented as knowledge. They thus claim authority." (Abdela, 2013: 80)

4.3.1 The Historical Formation of Juvenile Delinquents in Greece

According to historians (Abdela, 2013; Karouzou, 2010; Benveniste, 1994), juvenile delinquency was not constructed as a specific social class/category, but rather as a category of disobedient children based on behaviors that caused problems. Initially, the main problem was the groups of children engaging in unlawful activities in the cities of Athens and Thessaloniki, similar to the rest of Europe. In Greece as well, mobilization for the interpretation and management of these groups began with women, who organized in philanthropic associations, and some state representatives, primarily legal professionals (Benveniste, 1994). Abdela (2013) discerns behind these actions the formation of bourgeois hegemony in the care of poor children, which led to the formation of the "domestic ideal" (Abdela, 2013: 103). According to this ideal, the "house," the home where the nuclear family resides, and where the first moral upbringing is given by the mother, constitutes the field for shaping the characters of those who will either become criminals or not. Both references to historical-sociological analyses (Abdela, 2013; Karouzou, 2010; Benveniste, 1994) and my contact with archival texts showed that in Greece, until relatively recently (the 1990s), the term "criminal" was used to describe minors referred to the criminal justice system. The prevailing terms seemed to be "young criminals" and "juvenile criminals." According to the data (Abdela, 2013: 108), institutions in Greece used these terms even though the internationally proposed term was "juvenile delinquent." According to Benveniste (1994), in the 19th century, Greece had not created a distinct judicial and correctional system for minors; however, minors were treated - depending on the offence - like juvenile delinquents in the rest of Europe. A key differentiating characteristic for the Greek reality was the overrepresentation of Legal Discourse on the issue (Abdela, 2013; Benveniste, 1994). It is striking that even contemporary research on the issue initially emanates predominantly from legal science and only subsequently from other fields.

The absence of the use of the term "delinquent" in relation to minors led to the Greek construction of the subject "youth at risk" (Abdela, 2013: 116), a collective subjectivity that did not only concern "delinquent minors," but also other young people considered to be "at risk" (Abdelah, 2013; Georgoulas, 2000; Pitsela, 2006, 2013). This shaped the framework for the construction of the concept. As will be shown later, legal discourse incorporated psychiatric discourse for juvenile delinquency. Today, the specialization and expansion of psychiatric practices lead to an increasing production of psychiatric discourse for juvenile delinquency.

In Greece, the management of juvenile delinquents was not only a state affair, but also a matter of private philanthropic initiative. In 1921, the "Association for Women's Rights" was the private entity that first advocated for the establishment of juvenile courts (Abdelah, 2013:118). The relevant law (5098/31) "on juvenile courts" was passed in 1931, but abolished during the Metaxas regime. The relevant law imposed by the Metaxas dictatorship was more punitive, and the linguistic choices indicate the regime's perception of juvenile delinquents, as the use of the word "crime" was reintroduced. During that period, according to Abdela (2013), scientific discourses of Psychology, Psychiatry, Pedagogy, and Theology were introduced into the dialogue, providing a range of classifications regarding the social and psychological characteristics of juvenile delinquents. These classifications emphasized the biopsychological interpretations of adolescence and the psychiatric-biological model. This led to the construction of the dominant scientific field of Positivist Criminology, which is a branch of criminology and legal discourse until today (Abdela, 2013; Georgoulas, 2000). These processes naturalized the identity of the "juvenile offender" within legal science, gradually forming the distinct branch of "Juvenile Criminal Law," initially referred to as "Juvenile Criminological Law," which, apart from punitive measures, also provided purely educational measures. Despite the dominance of the legal field, there is a need for educational and psychological regulatory principles for both juvenile delinquents and "at-risk" adolescents. As a result of this, in 1940, the operation of Reformatories was introduced in Greece by an Emergency Law (Anangastikos Nomos), while the provisions for the admission of children to them did not necessarily require a prior criminal offence. Many children were admitted to Reformatories because their behavior was observed to pose the "risk" of delinquency. In both discourse and in material reality, this concept of "delinquent risk" thus created the category of pre-delinquency.

The role of sciences, particularly Psychology, is not detached or innocent in this construction. According to sources (Abdelah, 2013; Kazolea-Tavoulari, 2002), during the academic year 1948-49, the first academic course that articulated Positivist Criminology and Psychology was taught at the University of Athens by a legal pioneer in the formation of Juvenile Law under the title "Criminological Psychology"; the course was later renamed "Psychology" by the same professor. Based on the above, I believe that in Greece, the construction of juvenile delinquency was initially a product of legal-criminological discourse, while its establishment as a field of knowledge was associated with both

Psychology and Psychiatry. The direct consequence was the naturalization of the legal-psychological discourse of Positivism in explaining, managing, and studying this new subjectivity. Legal Discourse required the assistance of traditional Developmental Psychology to lend credibility to the analyses, imperatives, and regulatory provisions concerning juvenile delinquents. Thus, I argue that these legal provisions never had purely punitive character but – from their inception – constituted discourses that sought to entirely control the so-called delinquent subjects. The articulation of these scientific discourses would subsequently dominate both in action and in the formal procedures of the institutions established to manage the subjectivity of delinquency.

The Juvenile Protection Societies (JPS), an institution that exists until today, were established in the late 1930s, with a branch in each court of first instance. They consisted of multiple, distinct departments that divided the terms of supervision and intervention for juveniles. Staffed by both paid employees and volunteers (predominantly women), who worked as juvenile caretakers, their main purpose was to conduct "psycho-biological" research (later renamed as "social research") to complete the "psycho-biological record" of the juvenile (Abdela, 2013: 135). These caretakers, as volunteers, were not required to have specific academic qualifications; most of them were either legal professionals or lacked academic training. As Abdelah's historical research demonstrates, in most cases, juvenile delinquency was perceived in terms of danger and "moral risk" by the JPS themselves, often linked to right-wing and conservative ideologies.

Sources also indicate that during the Civil War period personnel from the Child Protection Societies (CPS) undertook the "national upbringing" of children sent to the orphanages of Queen Frederica. These institutions had a clear anti-communist and nationalist ideology focused on "reformation." After the war, in 1954, the Youth Guardianship Service (YGS) was established as an institution to support judicial work. The duties of this service, as well as those of the youth guardians, have shown minor differences to this day, as they relate to the current legal framework surrounding juvenile delinquency. However, from a historical-ideological and critical perspective, it is noteworthy that their work was defined by a professional dimension and scientific rationale, distinguishing it from the purely voluntary work of the CPS. Since then, the institution has combined welfare and punitive care, mediating between judicial decisions and the determination of interventions for minors. The institutions, procedures, and ideological-political conflicts between institutions and volunteers are extensively detailed in the work of Abdela (2013). In very broad terms, the key institutions I have chosen to present here regulate the construction and the punitive and social fate of juvenile delinquents up to the present day. Their basic characteristics include the integration of scientific Discourses among the state and individuals, professionals, and volunteers, 'experts', and 'unskilled'. Finally, it is worth mentioning the pivotal shift from the 'moral danger' of the 'teddy boys' to the pathologization and condemnation of family functioning through the establishment of Psychology and Psychiatry as adjuncts to Legal scientific Discourses. Psychological explanations laid the groundwork for shifting from "delinquent behavior" to "antisocial behavior" (which was considered to breed

delinquency). As research concludes, the focus from the 1960s onwards shifted to the consequences of the "dysfunctional family" and "delinquent behavior" for the individual. According to this logic, the delinquent juvenile subject had to accept controls not only for the good of society, but for their own individual welfare. These factors historically shaped the ideological-political framework of interventions for juvenile delinquency, with legal interventions being predominant, ie. interventions within the legal framework.

5. The Dominant Scientific Discourses Governing the Construction of Adolescence

5.1 The Psychological Discourse

One could summarize the dominant perspective of Developmental Psychology on adolescence through the frameworks proposed by the theorists themselves. Thus, adolescence, for traditional-dominant Psychology, can be understood through a bio-social approach and a dialogue between "continuity and discontinuity," in which the influences of biology, society, and culture play different roles each time. From the perspective of Psychoanalysis and the "turn to Discourse," Erica Burman (2008) attempted to deconstruct the traditional principles and establishment of developmental psychology through an effort to "reveal the ethical-political issues shaping research in Developmental Psychology." Her aim was to deconstruct Developmental Psychology by recognizing and evaluating the Discourses that historically and theoretically constructed the dominant concepts and formations of this field. Starting from the exploration of discourses about childhood, she demonstrates that childhood is a culturally constructed category that was conceptualized in contrast to adults and specifically to concepts of "mother," "father," "family," and "state" (Burman, 2008:7/81-82). The latter, which is directly related to juvenile delinquency, manages to regulate citizens due to the development of the scientific concept of childhood and its connotations (Burman, 2008:73). Thus, childhood and its related Discourses, such as the Discourse on Adolescence, reconstructed those categories from which they were constructed. Therefore, at the roots of Developmental Psychology, Burman primarily establishes a political organization, as a material consequence and a consequence in Discourse. This consequence concerns the construction of child and adolescent subjectivity as developmental stages that are tgiven, ahistorical, ethnocentric, and culturally one-sided. Thus, a specific Body of Knowledge for these stages is established, which includes the concept of knowledge itself as negotiable by subjects, and their relationship to it. Children and adolescents are considered as possessing, or partially possessing, knowledge and as in need of protection and education (Burman, 2008: 82-85). This protection was primarily assigned to the family, which left the field open for Developmental Psychology to conceptualize it, resulting in the concealment of broader historical-social explanations and politics that shaped it - which, for Burman, are connected with capitalism (Burman, 2008: 85, 126). Thus, the

Psychological Discourse on Adolescence constitutes an ideological-political treaty that played a pivotal, but not unique, role in the psychological interpretation of juvenile delinquency.

5.2 The Psychiatric Discourse

The intriguing issue regarding the Psychiatric Discourse is that it constitutes a selective articulation of Psychological, Medical, and Sociological Discourses. The classic Greek textbooks of Child Psychiatry that I examined refer to adolescence as well as juvenile delinquency, essentially representing rehashed theories of psychodynamics, primarily psychology, psychoanalysis, and empirical pedagogy. However, through their texts, the concept of adolescence is defined in evolutionary terms that can lead to psychopathology. Adolescence, therefore, in psychiatric discourse, sometimes constitutes an evolutionary process in the form of discrete developmental stages. Characteristic is this definition of adolescence (Tsiantis, 1997: 44): "We call adolescence the developmental process in human life that begins 'biologically' with the changes in the physiology of puberty and ends 'psychologically' with the final organization of sexuality." This view is supported by Freud's definition of adolescence as a transitional period between the childish organization of the self and mature, adult personality (Freud, 1905). Within this framework, it is conceived as a period of "disturbed mental balance" and fluidity (Manolopoulos, 1987: 43). This view in the context of Child Psychiatry is enriched by the Discourse of the New Psychoanalytic School and Anna Freud's views on the mass defence mechanisms of adolescents, which lead to two dominant "images" (Manolopoulos, 1987: 46): the image of the "ascetic adolescent" and that of the "uncompromising adolescent." The latter is defined as one who "refuses any compromise between impulses and reality" and, as shown in research, usually constitutes the subject of delinquency. Adolescence in this explanatory framework is also related to immaturity, but also "the basis for engaging in homosexual relationships" (Tsiantis, 1997: 22), while its development is based both on the traditional function of the family in terms of physiology and pathology and on a superficial political level: "findings indicate that normal adolescents adopt their parents' basic values (...) The completion of adolescence is a political issue" (Anastasopoulos, 1997: 27/41).

6. Scientific-Institutional Discourse, Explanation and Governance of Juvenile Delinquency

This section outlines the historical-genealogical course and naturalization of the dominant scientific-theoretical discourses that constructed the concept of juvenile delinquency. Historical studies on juvenile delinquency and related research demonstrate that the Legal Discourse is dominant, while Discourses of Sociology, Psychology, Psychiatry, and Education serve as satellites. These

discourses constitute the fields of "official knowledge" (Apple, 2008), within which the scientific-institutional version of the subjectivity of juvenile delinquency is constructed. The critical presentation is often accompanied by excerpts for the reader's scrutiny from the official discourse, i.e. for interpretation. An effort has been made for a representative presentation of the "counter-discourse" (Gegendiskurs).

6.1 Legal Approach (Legal-Criminological Discourse)

The views and articulations that structure the Legal/Criminological Discourse regarding juvenile delinquency are naturally not devoid of epistemologies and their corresponding ideologies. According to Georgoulas (2000), the two prevailing and most significant epistemological trends in Criminology are "Positivist Criminology" and "Criminology of Social Reaction." Positivist Criminology, also known as the "Theory of Pre-Criminal States," is in discursive articulation with Psychoanalysis and Positive Clinical Psychology, which are based on causal-deterministic explanations; it shaped the theoretical approaches to the concepts of "dangerousness," "ethical risk," and "pre-criminal states." An attempt was made to theoretically link both individual and social approaches with the aim of predicting the likelihood of individuals/youths/minors committing criminal offences. Thus, "pre-criminal dangerousness" was defined as: "the psychosocial phenomenon characterized by certain indications, from which it is reasonably inferred that the individual is likely to commit a crime" (Georgoulas, 2000: 142). This concept, as a Discourse, is positively defined in two phases: the static phase of medical-psychological and social elements and the dynamic phase of conflicts between the psychoanalytic "Ego and Superego" and the role of unconscious tendencies. Thus, the interest of this Criminology extends from actions to the personalities of those minors who, although they have not committed a delinquent act, are in an "at-risk" situation for it. The analysis of personalities is conducted through typologies (structured tables of criminal prognosis), which essentially lay the groundwork for the construction of the "pre-delinquent" and "potential delinquent" minor (Georgoulas, 2000: 143).

In Positivist Criminology regarding juvenile delinquency, there are also more "societal" perspectives that, based on social processes, show how "personality types" are confirmed. Most of these theories (such as Matz's theory) simply recognize greater freedom in social subjects without negating the deterministic perspective that emerges from "measurement." According to Georgoulas (2000: 131), the "Criminology of Social Reaction" had its precursor in Marxist theory, although it does not depart from the theoretical framework of "transition to action." This epistemological trend in Criminology is derived from Engels' theory of crime, according to which individuals are always forced to commit crimes due to the social and economic conditions in which they live. Thus, for the Criminology of Social Reaction, criminal/deviant behavior constitutes a social reaction to oppression and social injustice; its primary cause is "social warfare" (Georgoulas, 2000: 131), while the criminal/deviant

individual is conceived as a product of the capitalist economic system. In the development of the Criminology of Social Reaction, post-Marxist analyses were also utilized, focusing on how emphasis on individualization and the pathologization of juvenile delinquency contributed to concealing society's failure (Georgoulas, 2000: 132).

At this point, one might argue for a double construction linking Criminological Discourse with Psychiatric (perhaps also Psychological) Discourse. This concerns the well-known—within Social Psychology—identification of madness with criminality. As Foucault (1976, 1977, 1999, 2016d) highlighted, historically, madness became endowed with a dynamic for committing criminal acts. Conversely, criminal acts were pathologized either individually or collectively. Thus, this is perhaps another example of the interplay between the construction of the offender (and the juvenile offender) within the intersection of the Legal-Criminological Discourse and the psychiatric-psychological Discourse. It is worth noting that the entire issue concerns not only the theoretical conflict within the epistemological trends of Criminology but also its scientific framing. Although Criminology is considered a distinct science with origins and influences from disciplines such as Anthropology, Psychology, Sociology, etc., its dominant framing and social representation for Greek data place it primarily within the legal Discourse. Its very existence as a scientific field was constructed in relation to Law; it also constructed its subject primarily based on the commission of the social contract determined by laws: "Criminality is a product of double construction: the construction of criminalization and the social construction of the conditions activating the law" (Georgoulas, 2000: 147).

The perception and construction of juvenile delinquency in the legal-criminological thought that embraces social reaction seem to share common elements with critical trends in psychology and pedagogy. Thus, juvenile delinquency is not perceived within an ontological framework, but within a dynamic framework explained in terms of conflict: "A large part of deviant behavior has a political character, or rather a character of conflicting values" (Georgoulas, 2000: 132). Within the framework of the Criminology of Social Reaction, therefore, Positivist Criminology is considered to select, through the mechanisms of criminal law, those subjects that will be stigmatized as offenders or as "potential offenders." However, according to the Theory of Social Reaction, not all laws result from conflicts at the level of power. Georgoulas mentions that criminal-deviant action may also result from "moral crusades," in deviant acts that do not have specific victims but constitute acts of "correction" within an unjust society, according to the logic of the subject or the group (2000: 149). Close to such a view is Turk's theory (mentioned in Georgoulas, 2000: 149), according to which juvenile delinquency can be explained as "intergenerational conflict." In this context, the behavior defined as juvenile delinquency does not constitute a separate characteristic of specific juvenile subjects, but of all subjects. Here, both psychological and sociological Discourses have had some influence. Furthermore, through research on self-reported criminality, together with officially recorded delinquency, the Criminology of Social Reaction sees

another dimension of constructing the deviant subject: the condition of involvement with agencies of official social control and Justice. Thus, a juvenile offender "is not" someone who committed an unlawful act that went unnoticed or unconfessed - in the sense that they have not been institutionally constructed within discourse.

The victimological approach to juvenile delinquency addresses two main dimensions: firstly, the notion of the "law-constructed victim" and secondly, the model of victimization-criminality. In the first dimension, it seeks to liberate the victim from the legal definition and the procedures of its criminal management. An example here is the common position that juvenile delinquents, drug users for instance, should be seen as "victims of their addiction," regardless of whether they themselves perceive victimhood. The second dimension concerns "victims who become offenders." Based on this, even before potential victimization occurs, the characteristics that predict victimization also predict criminality. The legal-criminological governance of juvenile delinquency, however, is not exhausted by the above. In summary, although this discourse has a critical-political counter-argument, it constitutes, at its core, a positivist model of explaining juvenile delinquency, which selectively uses the discourses of other sciences such as psychology, psychiatry, and pedagogy.

6.2 Sociological Discourse

The Marxist sociological discourse regarding the subject can perhaps be argued to originate with the work of Antony Platt (1969). Platt's theoretical foundations can be politically aligned with Marx and sociologically with Bourdieu. The latter attempted to explain the construction of juvenile delinquency through the description of the construction of what he considers the opposing social group of the social elite (Montlibert, cited in Panagiotopoulos, 1998). He created the concept of "establishment" to explain how naturalizing, stigmatizing, and classifying social processes shape both the elite and the delinquents. According to this theory, juvenile delinquents constitute subjects and objects of a "negative establishment" (Montlibert, cited in Panagiotopoulos, 1998: 9). They originate from socially and politically dominant groups and, having been established as such, fulfil the role prescribed for them by institutions:

In short, they are usually perfectly adapted to the demands of the institutions that receive them, giving the impression, to echo a concept of Merton, that they had already developed a kind of premature socialization in the realm of criminal repression. They will always be pushed to cross the border that separates the normal from the pathological and will be referred to the side of the 'hampered' and 'base substances' of the chaotic, the impure, the polluted, in a word, the barbaric (...) their coercion into experiencing common experiences, their submission to the same 'pedagogy of emptiness' by the institution that has chosen them, reinforces and multiplies investments in forms of faith and practices that are deemed condemnable. The process of negative establishment not only does not re-educate and reform, but with its rituals, its inscriptions, the organization of its time, it

stigmatizes those established in the certainty of unworthiness and barbarity, which accompanies their assignment to discredited social positions (Montlibert, cited in Panagiotopoulos, 1998: 9-10).

Thus, for Montlibert, juvenile delinquents are: "the product of social arbitrariness and not the result of any natural necessity" (Montlibert, cited in Panagiotopoulos, 1998: 10). Nikos Panagiotopoulos (1998, 2013) considers that the Sociology of (juvenile) delinquency is connected with the Sociology of Education and jointly analyzes the materially existing social structures that produce the stigma for juvenile delinquency. This perspective is placed in opposition to the dominant perspective that prioritizes the "applied" criminological-legal and psychiatric approach to juvenile delinquency. In the introduction to his research on juvenile correctional institutions, Panagiotopoulos references the research-methodological approach to the socially constructed subjectivity of the juvenile offender, with theoretical foundations in Marxism and the mode of symbolic production of negative establishment as an instrument of dominance (1998: 36). In this way, the sociology of juvenile delinquency should be "accompanied by an analysis of the formation of the field of agencies managing delinquency, deviation, and anti-crime policy" (Panagiotopoulos, 1998: 30, note 1), ie. by using Foucauldian theory as well as social constructionist perspectives.

Given that our perception of the criminal justice system for addressing delinquency is based on a general problematization, which consists, on the one hand, of demonstrating that the realistic representation of delinquency as a clearly defined field (i.e., questions of how many delinquents actually exist, from which classes they come, etc.) should be abandoned and, on the other hand, defining that these specific individuals are placed in a social space, that they are not everywhere, meaning they are not interchangeable, and therefore the objective probabilities of the appearance of delinquent activities are structurally determined - thus abandoning bureaucratic subjectivism from the moment that, in relation to the position occupied by the agents in this complex space, their logic of practice can be understood and it can also be determined the way in which they will be judged, evaluated, and possibly perceived as criminals and as stigmatized individuals.

The sociology of delinquency becomes part of the sociology of knowledge and also of the sociology of philosophers, social justice, and "criminologies" (Panagiotopoulos, 1998:38). So, it's understood that stigmatization is socially produced from the moment it introduces an objective definition of stigma, understood as having real substance at the level of the institution/state that circulates it.

Considering the analysis above, the psychological rationale for juvenile delinquency appears to be constructed along two dimensions, a direct and an indirect one. The direct dimension involves an explanatory principle within the framework of Social Psychology, which, by utilizing sociological theories as well as the theory of motives, attempts to interpret juvenile delinquency in terms of intergroup conflict. Conversely, the indirect approach utilizes the rationale of Developmental Psychology and prevailing approaches to adolescence, perceiving

juvenile delinquency based on concepts of moral development, aggressiveness, and antisocial behavior. However, beyond attempts to explain and define juvenile delinquency, Psychological Reasoning (in contrast to psychiatric and legal reasoning) is interested, within the framework of Social Psychology, in the repercussions of labelling subjects as "juvenile delinquents." Social psychological reasoning seeks to explain behavior along the axis of social attitudes towards it. Kaplan states, "Part of the explanation of social attitudes towards behaviors is their frequency. Therefore, explaining behavioral patterns indirectly contributes to explaining the nature of social attitudes towards behavior" (Kaplan, 1984: 15). Without delving into the critique raised by the above, it opens the door to a theoretical and research-based differentiation between labelled behavior and labelling processes (Kaplan, 1984: 16).

Social attitudes towards juvenile delinquency and juvenile delinquents themselves are thus related to cultural norms regarding ethics and they influence the formation and function of punishment. Kaplan's explanation demonstrates how socio-cultural and social concepts of ethics are involved with the criminal justice system: "Beliefs about the morality or immorality of specific actions may be influenced by the severity of the reactions an individual receives for those actions. Reactions symbolize the wrongfulness and immorality" (Kaplan, 1984: 137). A dominant trend in Social Psychology wants juvenile delinquency to function as reinforcement to social norms, but also, drawing from Sociological Reasoning, perceives delinquent behavior as a condition for challenging given social values and moving towards social change (Kaplan, 1984: 138). This social change, however, is not perceived through critical psychological terms involving the political, but through processes resembling intergroup contact theory: "Gradually, the increasing frequency and visibility of socially prohibited patterns of behavior mitigate the severity of negative social attitudes, sanctions. Thus, initially prohibited delinquent acts become acceptable, and initial violations of a rule indirectly lead to social change and acceptance of the pattern" (Kaplan, 1984: 139). For Social Psychology, juvenile delinquency thus constitutes a complex phenomenon, the interpretation of which must be sought in the network of relationships between individuals, groups, and institutions. It is also acknowledged that the very definition has social consequences and is influenced by the coexistence of culturally heterogeneous groups, rapid and uneven social change, and differentiated political influence (Kaplan, 1984: 144). The influence of sociological reasoning is evident here.

Within the attempt to formulate a "General Theory of Juvenile Delinquency," emphasis was placed on the function that delinquent acts have for the subject itself - the juvenile delinquent. It is mentioned that the delinquent juvenile who engages in such acts achieves legitimate goals through illegitimate means. Here, the reasoning is social with elements of psychoanalysis. It relies on the classic frustration-aggression hypothesis, noting that the lack of agreement between self-demands, demands by the Other, and the available material resources to meet those demands lead to delinquency. Additionally, the delinquent subject may use delinquency to avoid or attack the social norm that

rejects it, or even to replace it with new delinquent norms, in order to self-evaluate more positively (Kaplan, 1984: 145).

This explanation, although more socially and less developmentally formulated, still implies a non-historical, apolitical subject. According to Burman (2008: 296), the 21st century marked a controversial view of childhood aggression (and delinquency). The logic of frustration-aggression, as well as that of the intergroup conflict associated with it, become objects of the "contemporary self-help industry" (Burman, 2008: 274) and the contemporary imperatives of the mental health promotion system, which serves capitalism "in producing moral subjects for the maintenance of bourgeois democracy" (Burman, 2008: 285).

In conclusion, it seems that Psychological Reasoning often reproduced both sociological reasoning and aspects of traditional developmental psychology. Simultaneously, the traditional aspect influenced the Legal approach as well as the Psychiatric and Pedagogical approaches.

6.3 Pedagogical/ Educational Discourse

One trend in Pedagogical Reasoning defines juvenile delinquency as a special educational category, perceived as a continuum where, on one end, are simple issues of school disobedience (mainly of children diagnosed or suspected with learning difficulties), while on the other end are serious criminal offenses, which often may indicate psychopathology (Chartier, 2013). Pedagogical Reasoning also adopts explanations from Legal, Psychological, and Psychiatric reasoning. In its extreme confluence, it creates classification principles, such as the "Educational Classification System" for the "educational detection of juvenile delinquency" (Kourkoutas & Thanos, 2013: 197). The most radical view of this trend concerns the so-called "holistic" social approach (Kourkoutas & Thanos, 2013: 201/211), which integrates the school environment into the creation and management of antisocial/delinquent behaviors. Simultaneously, the school setting is considered "ideal" (Kourkoutas & Thanos, 2013: 211) for psychopedagogical inclusion and prevention.

A second, less widespread, trend of conceptualization and treatment of juvenile delinquency can be argued to involve the pedagogical approach from the perspective of Critical and Radical Pedagogy. In contrast to the first trend, Critical Pedagogy Reasoning, with main representatives such as Giroux (2010a,b,c), McLaren (2010), Freire (1977), Aronowitz (2010), Freinet, and influenced by the Neo-Marxism of the Frankfurt School, the work of Foucault (McLaren, 2010: 312), as well as sociological theories (especially those of Bourdieu), perceives every pedagogical-educational issue through a socio-structuralist perspective (McLaren, 2010: 295).

The educational discourse is conceptualized not merely as a venue for social and class reproduction or for solidifying hegemonic discourse, but as a form of "cultural politics" (Gounaris & Grollios, 2010: 27). Specifically, the framing of Special Education and the linguistic deficits of cultural Others as well as concepts of school violence and bullying are considered to be embedded

within the hegemonic Pedagogical Discourse, which bears clear ideological content: "In education, neoliberal-conservative forces exploit panic about illiteracy, declining standards, and school violence to shift the conflict to a favourable terrain of tradition, standardization, and productivity, thereby connecting with significant segments of the working and lower middle classes under conditions of wage decline, unemployment, and insecurity" (Gounaris & Grollios, 2010: 34). In this context, the Pedagogical Discourse has been "psychologized, technologized, and postmodernized" (Gounaris & Grollios, 2010: 40).

The Radical-Critical Pedagogical Theory of Resistance (Giroux, 2010a:113) views what other theories term "antisocial/deviant behavior" as "oppositional" behavior (which nevertheless constitutes active-conscious resistance) by the educated subjects who resist dominant regulation and construction:

The concept of resistance (...) rejects traditional explanations of school failure and oppositional behavior and shifts the analysis of the latter from the theoretical domains of functioning and prevailing educational psychology to those of political science and sociology. Resistance, in this case, redefines the causes and significance of oppositional behavior by arguing that it has little to do with deviant behavior and learned incompetence, but has much to do with moral and political outrage (Giroux, 2010a: 114).

This excerpt may be commented on as an inclination of Critical Pedagogy to move away from articulation with Educational Psychology towards a politicization of education. This view aligns with Parker's perspective on the necessity of an anti-psychological approach against the "distinctive development" favored by dominant psychology (Parker, 2018: 74). This stakes out a pedagogical domain that is approached differently in relation to deviance between Pedagogical and Psychological discourse, progressive education based on the principle of Child-Centeredness. Child-Centeredness was philosophically grounded in humanistic Existentialism, psychologically in Rogers' person-centered theory, and pedagogically in the principles of Progressive and Anti-authoritarian education, primarily through the New Education Movement. Both critical educators (Apple, Freire, Giroux) and radical critical educators (Aronowitz, Freinet, Hooks, McLaren) critically engage with the Progressive Pedagogy of Child-Centeredness, which - unlike Traditional pedagogy - directs its focus towards the child and their way of learning. From the perspective of Psychological discourse, Erica Burman offers a similar critique. However, the dimension of these two approaches between Pedagogy and Psychology is crucial and has consequences for the discursive and practical governance of the concept of juvenile delinquency. According to Burman (2008: 262ff.), the development of Progressive Pedagogy and Education was based on the imperatives of Traditional Developmental Psychology, which was interested in the technologies and practices of education that concerned the "turn towards the child" and their interests. Thus, she argues that Child-Centered Education (and correspondingly the Pedagogy that underpins it) is characterized by categories that are social

constructions. Some of the most significant ones concern the concepts of "school readiness," "student choice," "student need," "play," and "need for discovery." Specifically, the conception of "basic needs" of students, which, if unfulfilled, lead to individual and social problems such as delinquency, constitutes a dangerous construction (Burman, 2008: 263).

Similarly, the emphasis on "practice" and "doing" promoted by the Pedagogy of "learning by doing" constructed the role of the educator as being only responsible for building the appropriate learning environment and pedagogical processes. Burman extends her thought by explaining how this child-centeredness leads to multiple problems for both students and educators. The latter, attempting to reconcile the conflict between the pedagogical "command of non-guidance" (which aims at developing independence) and the institutional imperative of responsible organization of teaching content and methods, leads to ambiguity and guilt (Burman, 2008: 264). She considers - and this is directly related to the logic governing psychosocial and educational interventions in juvenile delinquents through agencies - that when there is no regulation and critique of children's actions, this is equivalent to authoritarian suppression and construction of individualistic subjectivities (Burman, 2008: 266).

As discussed, the Pedagogical Discourse becomes deeply hegemonic and leads individuals to uncritically accept the regulation imposed on them (Burman, 2008: 269). Critique is exercised by Critical Psychology also in compensatory education, which is related to special educational needs and cultural specificities in education. The logic is that the discourse on "equal educational opportunities" conceals the school's role in perpetuating middle-class norms and the inequality of the "starting point" of student life. Furthermore, the assumption that "something is wrong" in children's environment (in combination with the often pathologizing discourses of Special Education) creates the educational paradox where school success seems to result from "appropriate" Pedagogy, while school failure is socially attributed to the family sphere, which, in turn, provides grounds for intervening in and stigmatizing family life through Education (Burman, 2008: 269-271). In this way, both Pedagogical and Psychological Discourses contribute to social control. Thus, for Burman, although child-centered education is presented as a counterbalance to social inequality, and despite the fact that it extends to political and emancipatory programs, it still operates in a naturalizing way, promoting an individualistic model of understanding childhood and adolescence that confirms the characteristics of those already socially advantaged, while pathologizing those who are socially disadvantaged (Burman, 2008: 261). This critical psychological perspective concludes that Child-Centered Education is equally oppressive as traditional education and should be rejected (Burman, 2008: 269). It is precisely in this trend of wholesale rejection that the differentiation of Critical Pedagogy lies.

The Radical Critical Pedagogical Discourse agrees with the critique of Critical Psychology with an acknowledgment that is also related to juvenile delinquency: "Conservative educators analyzed oppositional behavior primarily through psychological categories that served to define this behavior not only as

deviant, but, most importantly, as disruptive and inferior, a failure of the individuals and social groups that exhibited it" (Giroux, 2010a: 101). Similarly, it is stated that the partial failure of Critical Pedagogy, which sometimes led to the rejection of Child-Centeredness, resulted in the reinstatement of traditional conservative views that ignore the dialectical understanding of the active intervention of subjects/students as well as the aspects of the hidden curriculum.

In relation to the Pedagogical Discourse concerning "juvenile delinquency" or "behavior of resistance" for radical Critical Pedagogy, it appears to consider that the outright rejection of Pedocentrism/Childcentrism (as possibly performed by Burman) leads back to the logic of "adequate capabilities" that promote an instrumental approach to the literacy of the poor - inferred based on sociological discourse: and juvenile delinquents (Macedo, 2010:446). However, for radical critical educators, this does not mean that Child-Centered Education and the Pedagogical Discourse that supports it are not affected by the problems raised earlier. Rather, Pedagogy is expanded to "accommodate" issues related to its role (and the role of education) in multiple cultural spaces (such as, for example, educational programs - primarily for incarcerated/juvenile delinquents), which "have become vital for the production of models of human nature through the pedagogical power of a 'capitalist imaginary'" (Giroux, 2010b: 589). In this context, the Critical-Radical Pedagogical Discourse acknowledges the contribution of Foucauldian theory to the understanding of the knowledge-power relationship, which plays a role in comprehending the socially constructed school/educational truth (McLaren, 2010: 312-315). Thus, "disobedient," "violent," "antisocial," "deviant," or "delinquent" behavior must be pedagogically seen as a response to the question: "What spectrum of identities is available in an educational system designed to produce, regulate, and distribute characters, to govern gestures, to dictate values, and to police desires? To what extent does strict adherence to the rules of the school mean that students will have to forfeit the dignity and status they have gained through psychosocial adaptations to street life?" (McLaren, 2010: 326).

Pedocentrism-/Childcentrism then does not inherently act as a hindrance. However, a pedagogical discourse that promotes reflexivity in constructing subjectivity and the active right to "choose not to know" (McLaren, 2010: 327) may lead to criticism, political emancipation, and the production, by the educated subjects themselves, of "their own class position through education" (Willis in: Aronowitz, 2010: 729), ultimately resulting in pedagogical-critical reflection on how "the absences that are considered 'knowledge' have transformed experience" for each individual (Aronowitz, 2010: 731).

It can be argued that critical pedagogical approaches indirectly "predicted" the articulation of Pedagogical Discourse with Psychology, Psychiatry, and Law regarding "juvenile delinquency" and the way it is pathologized (through Special Education) and psychologized in contemporary approaches. According to Paulo Freire (1977), not only the "disobedient," but every educated subject is oppressed: "The establishment treats them as individual cases, as marginal people deviating from the general profile of a 'good,' 'organized,' and 'just' society. The oppressed are considered pathological cases of a healthy society, which therefore

must adapt these 'incapable and lazy' individuals to its own standards, changing its mindset (...) The solution lies not in their 'incorporation' into the structure of oppression but in changing the structure (i.e., educational/social) so that they can become 'beings for themselves'" (Freire, 1977: 81). This "authentic transformation of the dehumanizing structure" (Freire in: Lechouritis, 2017) is linked to Celestine Freinet's approach, which complements the critical pedagogical perspective.

Educational and research work exclusively for juvenile delinquents has been produced based on Freinet's theory. Freinet's critical-pedagogical approach (known as "Institutional Pedagogy") was based on Marxist and communist internationalist origins and shares similarities with the approach applied by Makarenko in the Soviet Union for juvenile delinquents (Baltas, 2017: 79). It expresses a complementary relationship between Childcentrism and a Sociocentric pedagogical approach (Karakatsani, 2017: 29; Spyropoulos, 2017: 41). This relationship is based on a dialogic approach in which internal educational institutions become the means for conflict resolution and structural change (Karakatsani, 2017: 13-14). Fundamental pedagogical concepts include those of work and discipline (similar to those of Makarenko) but seen within a framework of pedagogical self-governance with principles of libertarian education (Karakatsani-Markantes, 2017: 19). This Institutional Pedagogy constitutes a Critical Pedagogy of Resistance, in which students are perceived as citizens, and educators as critical-social reformers within a political-social and emancipatory framework (Spyropoulos, 2017; Baltas, 2017).

7. Partial Analysis of Excerpts from the "Parents Guide for juvenile delinquents"

Contextualization of the text: The first five pages were selected to frame the text. This indicates their significance in determining the overall content and understanding it by the reader.

Continuity in analysis: The consecutive nature of the first five pages allows for coherence in analysis. This facilitates understanding the connections and ideas presented in the text.

Overall, the choice of these initial pages as excerpts aims at facilitating comprehension and analysis of the text.

Excerpt 1:

The text is titled "Parenting Guide," with the adjective literally indicating, even dimensionally, that it is a text that "can," "should," "is good," "is advisable" to be used by parents. The general repetition regarding the determination and the verb omitted constructs an indirect normative and simultaneous authority relationship between the impersonal author and the subjects it addresses. In the upper left side just below the title, there is an illustration representing a classic nuclear family with a dark skin colour. This last element might reflect an attempt by the authors to bring the text "closer" to the subjects it addresses. Such a position surfaces specific sociological assumptions that echo the results of dominant research approaches that want juvenile delinquents to be characterized by specific ethnic and racial characteristics. Right next to the image, the text begins, structured as responses.

The dimension of syntactic and dialogic interactivity is evident at this point. The questions are in bold font. In the first question, the object of the verb is placed in two genders ("who") and in singular number, addressing each parent of the gender dimension separately. Subsequently, the subjectivity of juvenile delinquency is constructed indirectly: on the one hand, as subjectivity

subordinated to parents, based on legal discourse, and on the other hand, as subjectivity that "concerns the criminal justice system." The choice of the verb and its historical connotations, as well as the normative use of it, refer to subjectivities - social "problems." The clarifications that follow concern cases when a juvenile is referred to the Prosecutor or the Juvenile Court, and they are neutrally worded.

The next question concerns the purpose of creating the document. There may be a general repetition of silence in the text regarding the subjects, as there is an absence of a pronoun that would personalize the necessity of the document (e.g., "why it is needed for parents/for you/etc."). However, the proposition of the document in the previous question, as well as what follows the second question, indicates that the real subject of "needs" is the parents. Right next to the question, there is another clipart-style image representing an adult man and a child reading a book and smiling. The book is associated with the question, presenting its joint reading by parents and juveniles as an ideal condition. The first period, using the case-by-case formulation "many times," engages in a series of constructions and psychologizations of parental subjectivity. However, it is - with the first question - specified in parental subjectivity of children - delinquents, implicitly defining the type of family and parents of juvenile delinquents. The construction is carried out on two axes of dominant psychological classification: cognitive and emotional.

Thus, parents cognitively "do not understand" and perceive the concepts and processes as "confusing," while emotionally they "feel embarrassed" or "afraid." The construction of the incomprehensibility of concepts and processes by parents implies subjectivities with inadequate education and converses with the data of dominant dimensions in the analysis of juvenile delinquency. The "intrafamily situations" are constructed as an incomprehensible field for them. The next question concerns the purpose of creating the document.

The first period, using a casuistic formulation "many times," engages in a series of constructions and psychologizations of parental subjectivity, which, however, with the first question, is specified in the parental subjectivity of children - delinquents, indirectly defining the type of family and parents of juvenile delinquents. The construction takes place on two axes of dominant psychological classification: the cognitive and the emotional. Parents must accept "encoding," "advice," and "handling," while the "guide" is impersonally positioned as the agent, rather than the subjects and the scientific specialties behind it. The ultimate aim of this clearly formulated regulation of subjects is stated as the prevention of "pointless conflicts," with this formulation serving a series of constructions: Firstly, the use of the noun refers to a psychological term.

The relationships between parents and children referred to in the criminal justice system are constructed as generally conflictual, with the former being portrayed as ignorant, implying an inability to handle situations. Furthermore, the choice of the adjective constructs the dimension of conflicts through the difference between "pointless" and "purposeful" conflicts. The concept of conflict, within specific family contexts, is judged as inherently "pointless," a product of parental incompetence. Indirectly, the subjective shortcomings of

juveniles reflect the dysfunction of an incapable parental framework. This view aligns with the majority of scientific discourses on juvenile delinquency (Perpiraki, 2019).

The paragraph then transitions, coinciding with the change in verb person from the third person to the second singular and first plural. The acknowledgment of conflicts is perceived as a "point," where there is direct address and invocation of a knowledge held by the parent subject. The "as you know" is typographically emphasized, functioning as an institutional and binding reminder/invocation of an unspecified knowledge, coming simultaneously into contradiction with the attributed "ignorance" earlier in the text. Syntactically, the choice and use of this verbal phrase are abstract. Its clear syntactic object is the subsequent "we should emphasize." Thus, the emphasis on the invocation of the subject's knowledge pertains to its acceptance, by the collective but abstract "we" ("we should emphasize"), behind which is implied a network of "experts" in intra-family relationships and psychology regarding delinquent behavior.

This passage continues from the previous excerpt with the sentence "...we should emphasize that the manifestation of any kind of antisocial or delinquent behavior..." Thus, reference is made to delinquent behavior, which, through coupling, is identified with antisocial behavior, echoing a dominant dimension of psychological, psychiatric, and pedagogical discourse. The parenthetical "examples" function as definitions of antisocial and delinquent behavior. Delinquency as behavior consists of "running away from home," "inappropriate socializing," "school dropout," and "suspected substance use." None of these acts is conceived as delinquency, but rather falls into dimensions of pre-delinquency (Perpiraki, 2019). Moreover, an identification with the dominant Sociological and Pedagogical Discourse is identified, which correlates juvenile delinquency with social interactions and school dropout.

This equation of the two behaviors and the reference to specific actions emphasize the "consequences of delinquency" for the juvenile subjects and their families. At this point, compared to consequences described in dominant research, a discrepancy can be observed in the consequences for the juvenile as described in the pamphlet (Perpiraki, 2019). In contrast to a majority of research discourses that emphasize social dimensions as consequences of delinquency, with social stigma being predominant, here a concept of individual psychology with psychoanalytic origins is prioritized: trauma. The juvenile, constructed as a delinquent, is conceptualized as a "traumatized" subject, which is primarily an emotional entity dominated by anger, shock, fear, guilt, weakness, or dominance. These concepts are described as "phases" through which the "traumatized" subject "passes." However, the traumatic is syntactically the act itself; the influence of the Sociological Discourse of Victimization is strongly evident.

The next paragraph begins with a contrast ("however") regarding the emotional reactions of adolescents with regulatory vocabulary ("must") and addressing the second person singular ("you should know"), while simultaneously invoking identity ("as a parent"). However, following are directives that have a regulatory and binding character, implying in parallel a general repetitiveness that what is proposed constitutes characteristics or behaviors attributed to parents and thus passed on to adolescents through a victimological approach. Consequently, delinquent adolescents are implied to be children of parents who abandoned them, neglected them, and did not stand as their "selfless allies" throughout their entire "life journey." Additionally, with the additive "Furthermore," the discourse becomes telegraphic with alphabetical enumeration, which although expressed through hypothetical propositions, constitutes a psychologization of parental subjectivity related to juvenile delinquency, while also constituting the familial framework within which delinquency is constructed.

The victimological approach intertwines here with the incrimination of the family. Thus, through the use of affirmative propositions, definitive inclinations indicating the real, and the use of the second-person singular verb for each parent separately the passage is permeated by a sense of anger and inability to respond to obligations. Through the difference in the adjective "clear," this parent is considered by definition to be permeated by and using vague, unstructured, and

thus ineffective conflict resolution methods. The orientation towards conflict itself shifts the socio-psychological stakes of juvenile delinquency into conflict with the parents. The last sentence invokes an "emotional availability" on the part of the parent, which, however, is not properly manageable in their relationship with their child. Consequently, the adolescent subjects are constructed through differentiation and the general repetitiveness of discourse that structures parental subjectivity as passive, traumatized, helpless subjects subjected to mismanagement of conflicts they have with their parents. Subsequently, the text employs intense writing to emphasize the non-coercive nature of the instructions/advice that follows.

The phrasing is again in the first-person plural, suggesting one or more authorities. Below the verb, there is an image - a sketch from the field of education, the function of which in relation to the text is not clear. Just below, between the image and the sections/instructions, a comment from the authors is interjected, appearing parenthetically in smaller font size than the rest of the text. The title concerns a concept from Psychological Discourse, that of "empowerment of the parental role." The note constructs its existence as a response to the "need for parental guidance." Thus, it seems that the behavioral guidelines that follow are those that will strengthen the quality and role of the parent, who is thus directly constructed in linguistic differentiation as "weakened" and inadequate, since their child has "issues" and has "engaged" the system. The sections on role empowerment involve emotional regulation (anger management), the biopolitics of daily life (schedule management), and techniques for managing relationships (negotiation).

The next excerpt pertains to emotional management concerning the juvenile subjects.

Excerpt 3:

1. Ακούμε τον άλλον (όχι ισχυρογνωμοσύνη), συζητώντας χωρίς προσκολλήσεις (κολλημένα).
2. Σκεφτόμαστε ποια είναι η αιτία του θυμού.
3. Εκθέτουμε επιχειρήματα προσπαθώντας να βρούμε λύσεις από κοινού.
4. Δεν κρίνουμε το παιδί μας χωρίς να το ακούσουμε.
5. Λαμβάνουμε σοβαρά υπόψη τις ψυχολογικές και σωματικές επιπτώσεις του θυμού.
6. Κατανοούμε και ενίοτε συγχωρούμε.
7. Δεν προβάλουμε τις δικές μας επιθυμίες στα παιδιά μας, απαιτώντας να τις ακολουθήσουν.
8. Κάνουμε το βράδυ απολογισμό της ημέρας.
9. Χαλαρώνουμε το σώμα. Κάνουμε βαθιές εισπνοές - εκπνοές (5 με 10 προσπάθειες).

Β. ΔΙΑΧΕΙΡΙΣΗ ΠΡΟΓΡΑΜΜΑΤΟΣ (βασικές ανάγκες ατομικής και κοινωνικής λειτουργικότητας, δηλαδή ανταπόκριση σε υποχρεώσεις)

1. Οργανώνουμε την ημέρα με κριτήριο τις υποχρεώσεις/ευθύνες.
2. Λειτουργούμε ως πρότυπα στο πλαίσιο τήρησης του προγράμματος που ακολουθεί το παιδί μας.

The first section, as indicated by the bold capital letters, deals with "Anger Management," followed by a definition of anger that likely derives from a lexicographic source and emphasizes the causes of anger, including both behaviors ("prohibition, insult, denial") and emotions ("disappointment"). The formulation of the title serves as both a distinction and a general repetition. The meaning remains open, hovering between the subject of anger, for which it is not clarified whether it is the parent's or the child's. Inserted between the definition and the text is a clipart-style drawing representing a well-known cartoon character ("Taz"), who is not just depicted as angry, but is the quintessential perpetually angry cartoon. His appearance differs and deviates from the human condition of previous drawings: his form resembles a monster, something threatening and frightening, thus indicating in a dialogical dimension with the text that anger "turns the other into a monster." The following text consists of a numbered list of instructions and recommendations. The tone appears ostensibly advisory, using definitive declension in the first-person plural, but its function is regulatory, intensified by the use of the verb in each "advice." Thus, the following identical constructions are performed based on enumeration:

1. Parents usually do not listen to the minor and are filled with arrogance and dialogical "attachments." Here, a more formal term is chosen, while within parentheses, a more colloquial, everyday term is used, reflecting the writer's perception of linguistic and cultural choices as well as the educational level of the parents. Also, the dialogical condition among family members is characterized as having these "attachments," which refer to incorrect representations of parents.

2. Parents are thus inherently placed in a guilt-inducing conceptualization, while minors as subjects are not "heard."

3. It is implied that parents do not consider the cause of anger, while the subject of anger remains ambiguous and can refer differentially to both parents and the minor.

4. The absence of a definite article and possessive pronoun as companions of the noun "arguments" implies a condition-hypothesis that the described situation does not occur. That parents either do not have or do not present arguments and do not attempt to find solutions together.

5. This suggestion for "finding solutions together" does not so much constitute a way or directive to strengthen the parental role as it does a theoretical assumption. There is a contradiction here, as words that are considered clarifying in relation to the cultural level of the parents (e.g., "hang-ups," mentioned earlier) simultaneously imply that parental subjects are capable of understanding the way to jointly find solutions. The formulation also suggests that this is something they do not actively pursue and perhaps do not know how to accomplish. With this "advice," hearing as a conflict resolution process is reduced to a discursive grafting, as a prompt similar to the first one is reiterated, but this time emphasizing that parents often judge the minor without "listening" to them. The

use of the possessive pronoun "our" contributes to the approach of guilt-inducement.

5. This directive implicates the subjects in orienting themselves toward the negative impacts of anger, which are mentioned to affect both the physical and psychological levels, but are not specifically named anywhere in the entire guide. Once again, the subjects are considered incapable of conducting a discussion, presumed to be ignorant of the parental role, while simultaneously being aware of the physical and psychological effects of the emotion of anger and even capable of recalling and "taking them into account" in practice.

6. The subject/parent is called upon here to "understand" and "forgive." The verbs are presented without definite articles or determiners, thus referring the significance of their utterance to a general principle. There is no specific object to clarify "what" exactly needs to be understood and forgiven. Thus, the verbs function as a "difference," potentially implying as objects: behavior, personality, the minor, the situation, the action, anything that can be perceived as belonging to the subject. The adverb "sometimes" specifies the temporal as well as the qualitative load of the verb "forgive." Here, the very concept of the verb, originating from the Christian-religious lexicon, is cryptic and may be connected both to the discourse of Child-Centered Psychology and to the dominant Psychiatric and Educational Discourse. Thus, diverging from the imperatives of "Child-Centered Psychology" (Burman, 2008), minors may not always deserve forgiveness from their parents, a fact that contradicts the imperative of "unconditional" acceptance. Furthermore, the content of "forgiveness" is not defined, nor is it clear whether it pertains to behavioral reaction or internal processing. It remains ambiguous.

7. As in the fourth directive/prompt, here, too, the formulation is made with a negative proposition ("Not") and with the use of a verb with clear references to psychological, but mainly psychiatric discourse, which has appropriated the psychoanalytic lexicon (Perpiraki, 2019). The parent is perceived as an incomplete subject who "projects" desires and "demands" from their children. Implicitly, the Victimological approach also dominates here, with minors being subjects who receive unreasonable demands - products of unresolved psychoanalytic issues/conflicts.

8-9. These prompts engage with the cognitive-behavioral therapeutic discourse of mainstream psychology by calling upon parents to perform the cognitive process of "apology," which once again implies a subject-knower of the process. Moreover, the suggested relaxation techniques are given in the form of medical advice with a specified number of attempts. Overall, beyond the constructions mentioned regarding the subjectivity of both parents and minors, the very construction of the dominant framing, namely anger, converses with subjectivities. Thus, the proposals yield a definition of adolescent anger that appears to emerge purely through negotiation with parents, is ahistorical, a-social in a broader context, and certainly apolitical.

Excerpt 4:

Απόσπασμα 10:

3. Φροντίζουμε ώστε τα μαθήματα να προηγούνται της διασκέδασης.
4. Καθοδηγούμε, ανεξαρτήτως πόσο κουρασμένοι είμαστε.
5. Φροντίζουμε ώστε ο χρόνος διασκέδασης να είναι όσο πιο οριοθετημένος.
6. Μαθαίνουμε στο παιδί να επιλέγει την ενδυμασία και περισσότερο με βάση τις ανάγκες και λιγότερο με τις επιθυμίες του.
7. Ανταμείβουμε το παιδί, όταν τηρεί τους κανόνες, συμφωνούνται από κοινού έπειτα από διάλογο.
8. Επιμένουμε στην τήρηση των κανόνων χωρίς να επηρεάζουμε από τη συναισθηματική πίεση που ενδεχομένως μας νιώθουμε το παιδί μας.
9. Ας μην παραμελούμε να παρατηρούμε τη συνέπεια των πράξεών μας όσον αφορά στη φροντίδα του εαυτού του (την υγιεινή).

Γ. ΔΙΑΠΡΑΓΜΑΤΕΥΣΗ (μέθοδος επίλυσης διαφορών)

1. Συζητάμε με μοναδικό κριτήριο τι είναι ωφέλιμο για το παιδί.
2. Δεν επιβάλλουμε εγωιστικά την άποψή μας.
3. Δεν επιβάλλουμε την άποψή μας με την απειλή ή τον φόβο.

This excerpt concerns the 'management of the program,' which is once again presented in a solely nominal phrase and abstractly, so as to apply to both parents and adolescents. Within parentheses, another definition seems to be offered, without the positive equality symbol ($=$) of the previous excerpt, so as to be perceived as clarification. Thus, the program is identified with 'individual and social functioning needs,' for which there is an explanation that they involve 'compliance with obligations.' The explanation may imply difficulty in understanding the term functionality, while at the same time, the latter is defined as compliance with obligations. Thus, the parent, but primarily the adolescent, is not considered functional if they cannot meet externally imposed obligations.

The instructions are presented numerically here as well. However, semantically, the sentences do not appear as "disjointed" as in the previous excerpt, but could form a structured text. Initially, parents are called upon to organize the day based on the semantic pair "obligations-responsibilities." This directive seems to contradict Directive No. 7 of the previous excerpt. Furthermore, adolescents are constructed as individualities that are not entitled to control and initiative in organizing their "day." However, if the proposition is perceived, within the framework of conflict, as referring to parents, once again their inability in this area is implied, while simultaneously the way in which they could be successful is not clarified. The second sentence calls upon parents to serve as role models within the "framework of following the child's schedule." The concept of the schedule seems to become even more confused at this point. It is neither syntactically nor semantically clear whether this statement negates the previous one or constitutes an indirect reference to one of the legal interventions, the externally imposed program within the framework of anti-crime policy. The instructions continue in the next excerpt. The presentation of the instructions continues to rely on the use of active voice verbs, with the next directive indirectly segmenting the adolescent's day into the dichotomy of obligation ("lessons") - entertainment ("fun"). In this way, and in accordance with the dominant Educational Discourse, learning is defined as an obligation, and indeed an obligation that must be enforced by parents.

Adolescent subjectivity is defined here as legitimately governed biopolitically in the dimension of the classification of time and activities. It is forbidden to self-regulate obligations and entertainment, while the two concepts must be clearly separated, a practice that aligns with dominant aspects of Special Education (Perpiraki, 2019) and institutional environments. Next, parents are recommended to "unremittingly guide." The verb cultivates an undisputed yet abstract meaning, as it is not accompanied by specifications, and the syntax between the two clauses is incorrect. The second clause of this directive implies a parent of a delinquent adolescent, who must be a tireless subject of guidance, with exaggeration evident here. Simultaneously, the delinquent adolescent is constructed as a subject requiring continuous and uninterrupted guidance, with a clear dialogical relationship with the notion of surveillance.

The fifth directive is permeated by internal contradiction between the concepts of "entertainment - limitation". The second term engages in dialogical (Bakhtinian) and discursive dialogue with Psychological Discourse. The entertainment of adolescent (pre)delinquents is governed by limitation, therefore it is accepted that it must be restricted in terms of time, duration, and type. The dialogue here with surveillance and institutionalization is also evident. Directive No. 6, besides not explaining how the parent can "teach" the child about types and manners of dressing and eating, comes into direct conflict with Directive No. 7 of the previous excerpt. Thus, the needs of a delinquent adolescent must be clearly distinguished from their desires, classifying the latter into the realm of inappropriate. The desires of adolescents are generally deemed inappropriate and not considered to meet their basic needs.

The next directive reveals that the above should be understood not just as indirect governance, but as clear "rules" established on the basis of common consent. The verb "reward" is preferred with clear connotations of behavioral approach, while "together" is partially countered by the subsequent recommendation regarding "persistence" in the rule.

In this recommendation, there is a contradiction with Directive No. 6 from the previous excerpt. Thus, underage subjects are sometimes perceived as subjects that need to be understood on an emotional level, and sometimes as subjects that exert "emotional pressure." The 9th prompt regarding the program essentially expands on what was mentioned in Recommendation No. 6, so the reference here serves as a dialogic graft that emphatically operates in terms of the concept of surveillance, highlighting the dimension of personal hygiene.

The third section, as depicted in this excerpt, concerns the concept of negotiation, which is clarified with a parenthetical noun phrase as "conflict resolution." The term interacts with Psychological Discourse. Here, there is also a clipart-style sketch portraying two "age-old enemies" of the comic world, the cat and the mouse, who are depicted embracing and smiling in a posture indicating that negotiation was successful even for them. The instructions in this section clearly relate to the use of language and dialogic conditions. In the first two instructions, parents are called upon to understand which contents and modes of discussion are beneficial for their children and adopt them without imposing their opinion. The adverb "selfishly" attributes characterization and psychologizes, while the entire sentence constitutes a logical contradiction with everything mentioned above (and especially in the previous) excerpts. The third directive essentially constitutes a prescriptive aphoristic phrase with elements of populist language usage, but also ambiguity.

The recommendations of the 4th directive regarding the avoidance of "emotionally charged words," in conjunction with the linguistic examples provided in parentheses, potentially contradict the imposition of boundaries proposed earlier; additionally, they attempt to strip parents of elements of emotional expression, while simultaneously implying juvenile subjectivities that must be approached with emotionally neutral, detached, regulatory methods in order to regulate and prevent them from becoming "issues." The function of the fifth directive serves as a graft, reintroducing the term negotiation. It could constitute part of the introductory clarification. Here, the ideological function of the first-person plural is very intense, placing parents in a condition of accepting "defeat" at the negotiation level, a fact that also contradicts many of the above "advice." The final prompt of this section contains elements of optimistic economic discourse, positioning negotiation within the dilemma "risk-benefit," so that the relationship with the minor is elevated to the dimension of general repeatability as a risk-reward relationship, measurable magnitudes based on behavioral standards to which the minor must adhere.

8. Discussion

As seen from the analyses, the Parent Guide recommends the political and socio-psychological dominant discourse that wants the parents of juvenile delinquents to be "dysfunctional subjectivities" of a family framework that "requires regulation and therapy." At the same time, the "delinquent" behavior is identified with the "antisocial" one, which stems from "inappropriate" parental subjectivities. Dominant aspects and perceptions from the fields of Law, Psychology, Psychiatry, Pedagogy, and Sociology are selectively used to construct the subjectivity of the "juvenile delinquent," who is considered to require surveillance and "therapy" from the framework of "specialists" (psychologists, educators, psychiatrists, representatives of the criminal justice system). The ethical and political dimensions governing this concept lead to technologies of control and family incrimination/culpabilization.

The analyses indicate that the guidelines for parents constitute the advisory role of "experts," which attempts to regulate the program, reactions, discourse, behavior, and daily life of the involved subjects in order to "correct" parental "mistakes" and to make the juveniles politically and socially desirable subjects. One of the pivotal issues emerging from the analyses of the text and the illustrations of the guide concerns the integration of governance of subjectivities within a positivist and neoliberal discourse that seeks measurable and acceptable social behavior, emphasizing compliance in regulation, constituting the social and economic "gain" of the subjects.

Maria Perpiraki is an educator specialized in psychosocial interventions in educational settings. She completed her studies at the Aristotle University of Thessaloniki (Department of Philosophy and Education) and continued her postgraduate studies in School Pedagogy in the same department, where she engaged with critical approaches, Foucauldian Discourse analysis, and issues concerning national identity and the ideology of school textbooks. She received further specialization in Special Education (AUTH) and completed postgraduate studies in the Department of Psychology (AUTH), in the field of Social Psychology of psychosocial interventions. She has worked both in the field and in research on issues of juvenile delinquency and the critical analysis and deconstruction of dominant diagnostic categories. She teaches secondary education students while also being an undergraduate student in the Department of Primary Education at Aristotle University of Thessaloniki.

Her research interests include Social and Political Psychology, issues of subjectivities and power relations. She is actively involved in political movements “from the bottom” for the defence of social and political emancipation of groups in education and society. Email: marperpi@hotmail.com

Production of life in times of death: Five schizoanalytic movements¹

Domenico Uhng Hur

Abstract

We are living in a period marked by death, hostility to differences and explicit authoritarianism which were largely spread by the federal government of Brazil itself (2019-2022). The politics and practices of death are exercised, total and generalized necropolitics, propagated not only by sovereign power, but produced, predominantly, by the axiomatics of capital. In this way, this article aims to reflect on clues for the production of life in current times of propagation of death, based on the theoretical referential of schizoanalysis. The method used was the selection of some concepts from Gilles Deleuze and Félix Guattari's philosophy of difference to operate this reflection about the contemporary. We seek to discuss possible movements to open pathways that escape from the politics of death. As a result, we discuss five schizoanalytic movements for the production of life: the transmutation of forces; adoption of territory as a starting point; potency of the *occursus*; appreciation of the infinitely small; and foster affection, becomings, as passage.

Keywords

schizoanalysis, schizodrama, Gilles Deleuze, Félix Guattari, psychology, politics

The coronavirus pandemic, the extermination of the black population, the peripheral population, the indigenous peoples, the prejudice against immigrants, and the practices of the Brazilian government (2019-2022), are all the expressions of the current spirit of the times, the *zeitgeist*. The politics and practices of death are exercised, total and generalized necropolitics, propagated not only by sovereign power (Mbembe, 2018), but produced, predominantly, by the axiomatics of capital (Deleuze; Guattari, 1972²). Families who suddenly lose a loved one, indigenous people who are expelled from the flat space of their territories centuries ago, the young black boy who walks cautiously down his street on his way home from work, fearing a stray bullet. We are all living with

¹ Published for the first time in Portuguese in Hur (2021c).

² In the works of Deleuze and Guattari we use the original publication date of the first edition, or when the lectures were delivered. Thus, the publication year of the translated versions only appears in the bibliographic references.

death lurking, in which the social body itself mortifies society. Thanatopolitics. We live in a wasteland, not deterritorialized. We are dispossessed, we have been subtracted and they subtract our territory, our lives, constantly and strongly. And we lament and resent it.

In this way, this article aims to reflect on clues for the production of life in current times of propagation of death, both individually and collectively, based on the theoretical referential of schizoanalysis. It seeks to trace lines so that we can escape from the reactive forces, from resentment (Deleuze, 1962), to the production of new possibilities. In short, to reflect on how to foment revolutionary becoming, and not to focus only on the future of the revolution (Deleuze, 2003).

The method used was the selection of some concepts from Gilles Deleuze and Félix Guattari's philosophy of difference to operate this reflection about the contemporary. We seek to discuss possible movements to open pathways that escape from the politics of death. The author of this article is a specialist and scholar of all the published work of Deleuze and Guattari and constantly publishes theoretical reviews on the pair's work, as well as articles, chapters, and books in Psychology, inspired and referenced by schizoanalysis. It is noteworthy that only a few concepts were selected in this article, and that obviously there are other deleuzoguattarian concepts that can contribute to this reflection on the production of life in times of death, and that have not been cited here.

We carry out our reflection in an unusual way. In the first topic, instead of personally "distancing" ourselves from the investigated theme, we implicate ourselves to the maximum, insofar as we start from our own singular, individual experience, and articulate it with the *zeitgeist* of death. We read the present from a vibrating gaze (Rolnik, 1997), a haptic dimension (Deleuze, 1981a), in which the gaze of the researcher is affected by the forces that surround him, in a modality of a 'tactile gaze' (Hur, 2020a; 2021a). Evidently, in the first topic, in constructing a narrative from a 'me', one seeks to articulate to a 'we', in an affective resonance between singular and collective experience. Next, we develop the clues in five movements that can contribute to the production of possibilities, of lines of flight that escape this diagram of death. Our main reference was the philosophy of Deleuze and Guattari, as well as the Schizodrama, invented by Gregorio Barenblitt (1998), besides brief quotations from Brazilian indigenous theorists.

A *zeitgeist* of death

My personal experience³ accompanies the same *zeitgeist* of death updated in the social field, but for other reasons. I do not suffer the ethno-racial and economic-social mishaps, even though I occupy the paradoxical place of possessing a 'yellow flesh', nor have I been hit by viral infection. But due to a chromosomal translocation, a molecular transmutation, there was a genetic alteration and my

³ Because this topic deals with a personal, singular experience, the narrative is written in the first person singular.

partner's bone marrow started producing blastic cells that "attack" the organism itself, causing the decline of platelets, leukocytes, and red blood cells. Acute lymphoblastic leukemia, Philadelphia positive. An auto-implosive reaction in which the organism mortifies its own body, and which is not located only in one organ, tissue, or stratum, but circulates throughout the whole body, navigating through its blood streams. It is not possible to tackle them in a specific territoriality, enclosing the pathogenic cells within the 'walls of an establishment', as the disciplinary logic of biopower operates (Foucault, 1975), because the cancer cells are propagated in the open field of the whole body. It is not possible to extirpate a part of the tissue, or to isolate it. It is in the hematopoietic system itself that the deadly cells are produced. One can draw the parallel between what occurs in this body with fascism, for it is the cellular agents themselves, endowed with reactive and destructive forces, that cause the social body to become mortified (Deleuze, 1986a).

The discovery of leukemia left us banished. We have been swept away by the flood of death. The chances of survival are 30-40% in the next five years. We were hit by the fall from the sky that Davi Kopenawa (2015) tells us about. We glimpse the end of the world, the end of our worlds, as Ailton Krenak (2019) and countless other indigenous sages warn us. Death and the razed earth were presented to us in an a-parallel fashion. Different origins of the causes of death, different forces, but the same affection (Deleuze, 1981b), updated in the personal and collective spheres, takes place. The result is an affection of sadness, of impotence, which subtracts the potency of the individual and social body (Deleuze, 1981c), and can lead to a situation of fatalism.

And the treatment of leukemia manages to be even more deadly than the disease itself. The chemotherapy is so strong that it burns all the tissues. To eliminate the cancer cells, it also extinguishes the 'healthy' blood cells: red blood cells, white blood cells, platelets, neutrophils; everything is destroyed. The 'security mechanisms', 'biopolitics' (Foucault, 1976), of combating the infectious agent use the scorched earth tactic. As warfare occurs in every open field of bodily space to eliminate the blasts, what remains of the 'healthy' body must also undergo this purification and abolition. An immune paradigm (Deleuze, 1986a) ensues, in which there is almost total destruction to ensure the life of the body, leaving it open to bacterial and viral infection.

However, even with the scorched earth strategy, there is no cure by medication, by any chemotherapy. Being Philadelphia positive, the 'cure' is achieved only by transduction of the hematopoietic system from an external being: bone marrow transplantation. That is, there must be the migration of a creation system of new cells, molecules, other peoples, that inhabit this body, the newly razed land, the desert, producing a new world, another desiring system and circuit. A new occupation by populations of creating cells, that germinate another body and a new living.

But what lives to produce? In our case, we will not be able to follow mainstream models of lifestyles, either in their disciplinary or capitalist mould. We will not update the traditional and 'normative' model of an arborescent family with children, due to the sterility caused by chemotherapy, nor the

neoliberal modulation of performing ever more intense physical and sporting feats. Even if we wanted to, due to the reduction of the body's motor power, it would not be possible to follow the neoliberal imperative, of the axiomatics of capital and body-capital (Hur, 2015; 2018), to always accelerate the productivity of any object, in which the body-machine must hypertrophy and produce as much as possible.

Finally, with death and the fall looming, what to do? Deny reality and curse? Accept fatality and cry? Hate and deplore the other and the difference? We are banished, with the shadow of death, and no presupposed models to follow. There are no transcendent ideals to anchor, no hope of state power to take, but the forest of immanence to navigate. As Krenak (2019) teaches us, to slow the fall, we must open parachutes, as colourful as possible, to produce deviations and other possibilities. There is no teleology, or ready-made recipe, but that in this fall we can create new trajectories, differential relations, deviations: *clinamen* (Deleuze, 1969; Baremblytt, 2019). Possibly Krenak's thought is closer to schizoanalysis than we imagined, even if both had a very distant conceptual-geographical genesis. And as Casé Angatu also inspires us, we have taken five centuries of beatings, but we keep fighting, laughing, 'whipping the enemy'. Active forces must break out of all the reactivity and nihilism we live in, no matter how much we die. We will all die. But here it is not an action towards death, of having a finite and limited time, such as a Heideggerian perspective. Rather, it is an action for life, for the production of other lives, intensive and infinite, even with the boundaries of their limitations.

We must create our own lines, believe in our own potency, and insist and re-exist in life (Fumiató; Santa Cruz, 2005). Even with the wasteland, we have a body, which we should map as much as possible, feel it, experience it, even if in many cases we are still unaware of its potency (Deleuze, 1981c).

Five movements for the production of pathways in times of death

To create lines of flight from the politics and practices of death, we seek to adopt some clues for the opening of new pathways. From the fountain of concepts, conceptions, and devices that schizoanalysis provides us, we derived five movements. Five clues, which, in this case, are not disposable, but indispensable for the production of new configurations of forces and another way of living in times marked by death. As mentioned above, countless other concepts, other processes, could be worked on. However, through our historico-geographically situated cartography (Deleuze; Guattari, 1980a; Rolnik, 1989), mediated by our haptic gaze (Deleuze, 1981a), we follow these five tributaries, as means to think about the creation of other modalities of life, subjectivations, and not reproduce the political hegemonic forces that disseminate resentment and generalized nihilism. They are: the transmutation of forces; adopting one's own territory as a starting point; working on the potency of the *occursus*; valuing the infinitely small; and fostering affection, the becomings, as a passage. These clues are not presented from an evolutionist point of view, in which one step would lead to

another. There is no order to follow, you can work on any of them, start with any movement, go through them at the same time, without a determinant order.

These five movements are inspired and based on Deleuze and Guattari's philosophy, in which we seek the power of their conceptions to deal with the challenges we face nowadays. It is a text-rizhome that tries to migrate its philosophical potency as a combat weapon to pursue and produce a life unmarred by resentment and reactive forces. These movements can be adopted in schizoanalytic and schizodramatic clinics⁴, in institutional interventions, by activists in social movements, as well as by people and collectives interested in the cultivation of another living, alternative to the *zeitgeist* of death.

First movement - Transmutation of forces

We live in a period marked by death, hostility against differences, explicit authoritarianism, and great diffusion of a type of discourse-practice denominated as Bolsonarism. And this configuration of forces is even incorporated in the State, updating to the maximum what Foucault (1976) calls the racist State. In all these contexts hatred, deploration of the other, and a lack of care for life are preached. As Deleuze (1962) would state, these processes are the symptoms of a certain mode of forces, the expression and actualization of nihilism, the crystallization and triumph of reactive forces and the will to nothingness.

Thus, there must be a new movement that does not reproduce this reactivity, however arduous and difficult it may be. How can one not be saddened and not react reactively to the state of affairs in which we live? How can we not hate those who hate us? If we breathe death, how can we breathe life? So, a fundamental movement must be the effectuation of a torsion, a bending, of forces (Deleuze, 1986b).

Regardless of which device (Deleuze, 1989; Hur, 2012) is adopted, we seek the realization of this bending, a folding of force, which results in the transmutation of reactive forces into active ones (Deleuze, 1962). In this twisting of forces, the experienced nihilism is encouraged to give way to the desirous production of life. The negativity of egoism and antipathy give way to the associativity of sympathy (Deleuze, 1953) and altruism, resulting in a rotation in which resentment and hatred are expelled by the device of eternal return (Deleuze, 1962), in a centrifugal movement that ejects the reactive and death forces, so that only the forces of life, which insist and build, return.

In the field of the schizodramatic clinic, we find that this transmutation of forces also produces a transition of affective modes, as Spinoza theorizes (Deleuze, 1981c). There is an affective fold that can lead to the transition from sadness to joy. This is why Baremlitt (1998) supports new devices, whether in the clinical field, in art, or in social movements, for the production of this other

⁴ Gregorio Baremlitt (1998) spells *klinica* with 'k' and not with 'c' to differentiate his practice from a traditional clinic. In the clinic, etymologically, there is the movement of the health agent leaning over the patient. In the klinic, inspired by the idea of clinamen, he seeks to produce deviations, differences and events from this encounter.

quality of forces and desire. And thus create new assemblages, apparatuses, machines. Escape lines and desiring war machines (Deleuze; Guattari, 1980c) in their different contexts of action for the actualization of a becoming-revolutionary and, who knows, even in the construction of a future of the revolution.

Second movement - Adoption of territory as a starting point

Schizoanalysis extols the production of rhizomes and the constitution of singular existential territories (Deleuze; Guattari, 1980a; Guattari, 1989a). However, the intellectual of the human sciences in Brazil is closer to the Sorbonne than to Capão Redondo (SP), Rocinha (RJ), or Setor Garavelo (GO). He dreams more of Paris and London than of the Amazon. Even though he knows his material and social situations, such contents do not usually appear in his reflections and publications. It is no wonder that Foucault called the Philosophy Department of the former Faculty of Philosophy, Sciences and Letters of the University of São Paulo (FFCL-USP) a French overseas department (Rodrigues, 2016), or Lévi-Strauss was surprised by the library of Brazilian intellectuals, which resembled the libraries of their French peers.

However, it is not enough for us to import philosophical knowledge produced in Europe and ‘apply’ it here without a geographical-historical modulation. Too often the human sciences become Europeanized in Brazil and forget their own context, such as what happened with mainstream Lacanian psychoanalysis in this country. Schizoanalysis must germinate and spread in Brazilian territory with all its hybrid, mixed character, and fight the prevailing challenges, which is currently the fight against the reactive and death forces, amplified by a right-wing political extremism.

Let us take an example of a singular assemblage that constitutes a Latin American schizoanalysis: the schizodrama. We understand that schizoanalysis is first of all a Philosophy. But in Brazil and in South America there was a migration of this philosophical content to the clinical field, as well as to others, such as arts, politics, education, etc. One of the most unusual creations of this philosophical-clinical transduction is schizodrama, created by Gregorio Baremlitt in the 1970s (Hur, 2014; Baremlitt, 2021). It is also worth pointing out that schizodrama is not a mere application of schizoanalysis, for with the performatization of its concepts in countless devices there is a fruitful production of other concepts and conceptions (Baremlitt, 1998; 2019; Baremlitt; Amorim; Hur, 2020).

Schizodrama establishes a clash of materialities, a whirlwind that produces a fissure, a crack, that makes flows of possibilities happen. It brings new clinical frameworks; it doesn’t use only the traditional private office. It is not closed between four walls; it is not a clinic in the strict sense. It is operated with the schizo walk (Deleuze; Guattari, 1972), and can be performed in the open field, in squares, in mental health psychosocial care centers, in student occupations (Hur; Couto, 2019). If schizoanalysis has a European origin, schizodrama is Latin

American. If Deleuze and Guattari have Nietzsche, Bergson, Spinoza, Marx, etc. as references, Baremblyt's schizodrama also has the popular knowledge of indigenous peoples and social movements as inspiration, or at least tries to learn from them. For here we are not only occupied by the French of the Champs Élysées of May '68, but also by the *xapiris*, *orixás* and *encantados* of the Brazilian soil. If the schizoanalysis developed in Vincennes, or in the Parisian cafes and libraries, the schizodrama arose in the lofts, full of pillows (from Rua Herval⁵), in the performances in basements full of people in Belém do Pará (Lima, 2014), in the CAPS, as the "Maria Boneca" (Bichuetti, 1999, 2000), in the public squares and, who knows, in the future, in the peripheries, in the crossroads, *terreiros* and *giras*.

Schizodrama is a clinic of forces and, therefore, it should also grasp the forces of the struggles of Brazilian social movements, be it the *Movimento dos Trabalhadores Sem Terra* [Landless Workers' Movement] (MST), the indigenous movements, all the minorities that are exploited and not listened to, but that have a lot of power and content to say and to teach, inspire and empower us. Thus, we cannot forget the revolutionary potential of our Latin American territory. Contrary to what the Marxist 'bibles' and their 'prophets' advocate, the first proletarian revolution did not start in Europe, it was not the Communist Revolution, nor the Paris Commune. The first proletarian revolution that is even racial and anti-racist takes place in Latin America, more precisely in Haiti (1791-1804) and was made by black and enslaved people (Alliez; Lazzarato, 2021). Enslaved people who updated their active forces and stopped being 'slaves', becoming warriors, constituting an incredible revolutionary machine long before the bastions of communist parties, such as the Soviet or Chinese Red Army. The "black army is the first proletarian force to profoundly revolutionize the art of war" (Alliez; Lazzarato, 2021, p. 109). They produce a hybrid revolution, singular, in a mix between European militaristic models of army, combined with molecular guerrilla tactics and voodoo rituals. There is a beautiful syncretism between military organization and religious rituals of the territory: "Using torches to point the way, the leaders of the revolt gathered in an open space in the thick forest of Mourn-Rouge, a mountain towering over Cap François, the largest city. So Boukman, the chief, after performing voodoo spells and drinking the blood of a pig, gave the last instructions" (James quoted by Alliez; Lazzarato, 2021, p. 109).

For, as the Colombian guerrilla group M-19 claimed, this is not the Soviet Union, but Macondo. And if one day we are going to make the revolution, it will be dancing *cumbia*, with maracas. Or, here in Brazil, singing samba, headbanging to rock, or for the younger generations, dancing funk. Therefore, our references should not only be Lenin and Rosa Luxemburg, but Marighella and Marielle. We need to apprehend and update all the instituting power of Latin American syncretism in our devices, in this action of resistance and *quilombozation* of minorities. Schizodrama is the Latin American actualization of a decolonial schizoanalysis.

⁵ Street where the Gregorio Baremblyt Institute is located. It is in the attic where schizodrama training and clinics are held.

In this sense, we must produce knowledge, and life, in diverse spaces. Not only to sacralize the altar of the Church-University, but to transit through the city in its different zones of intensity. Not only reproduce research and studies for the elites, but also constitute, in alternative ways, a favela Psychology (Gonçalves, 2019). To agency such powerful theoretical and technical devices to our context and realities, in a nomadic experimentation in which we will reap their results and ramifications. And, obviously, not ignoring our own territoriality of origin, no matter how much they have been abandoned lands, but that we still carry within us, as well as the margins we traipse and the dissents we provoke.

Third movement - Potency of the occursus

A fundamental movement to overcome the current state of affairs is to believe in the potency of what Spinoza calls the *occursus*, that is, of the encounter (Deleuze, 1981b), be it in the clinic, in social movements, in life. Encounters always bring the variation of potency, the transition of affections. In the encounters we seek the relations of composition of forces that form and result from concrete assemblages and machines. For, how to create agency and compositions with others? How to capture the irruption and potentiation of forces in encounters?

Spinoza discusses what a body can do, the potency of a body, from its movements and compositions. He provides us with the fundamentals to apprehend the forces related to affections, as well as an entire analytic of the composition between bodies. To do so, he performs a first inversion, in which he aims to leave the primacy of consciousness to prioritize the relations of affections between bodies. In these compositions there are relations of affecting and being affected by the other body(ies), in which the different combinations can increase or decrease their degrees of potency. If there is a combination between the forces and affections of different bodies, a compositional process takes place that leads to a potentiation of both bodies, resulting in a *good encounter*. On the contrary, if the relation with a body poison mine, subtracting it from its own forces, there is a decomposition characteristic of a *bad encounter* (Deleuze, 1981c). Thus, in the regimes of composition, affections of production of life are associated, such as joy and fruition, while in the relations of decomposition, affections of subtraction of its potency, such as sadness and resentment.

In this way, the affections result from relational processes and encounters between bodies, but not only between humans, but also between human and inhuman. There is a composition of (de)potentialization between bodies of heterogeneous materialities that produce events and affective modes (Hur, 2016).

In the cartography of the body, of the connections, it is necessary to find strengths where we think there is only weakness. Compose and not decompose relations. To add and not subtract. To take the forces and produce life in its various faces. To jump the blockages of the 'white wall'. Escape the centripetal forces of the 'black hole'. To generate and sow new worlds. Because the

connections and the assemblages that we carry out with other bodies amplify our potency.

In the composition of the relations of forces, we form new desiring circuits, more powerful, capable of the most unusual realizations (Deleuze; Guattari, 1975; Hur, 2020b). Therefore, in this outcast world, in order to achieve the maintenance of life, we must increase the connection, encounters, and fusion with other bodies. In the example of leukemia treatment, one way to guarantee life is the trans-fusion of red blood cells and platelets. A connection is produced of blood flows with a population of anonymous, mixed flows, in a diagram distinct from the current ones. Instead of a disciplinary diagram (Foucault, 1975), of control (Deleuze, 1990), or of an extremist capitalism, which configures the Bolsonarist *necroliberalism* (Hur, 2021b), the production of life is supported by a kind of diagram of care and solidarity, or better, an ecosophy diagram (Guattari, 1989b, 2013). A cell migration occurs between bodies, in a therapy that is based on deterritorialization and circulation, in an authentic production of a Body without Organs (Deleuze; Guattari, 1980b), with all its cruelty and forcefulness. In hemotherapy, scraping and demolition are accomplished by chemotherapy, while the circulation of new flows is provided by trans-fusion and the future creative activity of the hematopoietic system in reconstitution. It is curious that we can say that hemotherapy is schizoanalysis in action, and we risk saying that, unlike psychiatry, it is the most schizoanalytic medical discipline⁶.

It aims to operate in *occursus* a trans-fusion, not only of blood, but of dreams, affections, intensities, projects, realizations, that take our bodies to previously unimagined dimensions. The isolated body tends to a reactivity, but the body in composition tends to unusual activities, to an assemblage of a desiring guerrilla machine that turns the possible into reality. The production of new desiring outflows that aspire not to the constitution of norms, the arborescent bourgeois nuclear family, the reproduction of the fallacious model of the entrepreneur updated by the axiomatics of capital (Deleuze; Guattari, 1972), or of all the ideals of transcendence. The potency of the *occursus* enables us to escape from these *fictions* to create *affections*, other symbolic productions and affects. Escape from the constituted plans, diagrams, and beliefs to live constituting affections. And what is a great challenge: the encounter must be able to produce potencies and not power. Potency generates horizontal bonds, solidarity, and collective participation, while power often generates subjugation, domination, and impotence. And what is power if not the domestication of forces (Massumi, 1992), or, according to Baremblytt, the rotten, dead potency?

⁶ Another important debate is to reflect on the different diagrams of forces updated by the medical institution and its agents. Evidently there is a very intense updating of a disciplinary diagram, sometimes even the sovereign, feudal, but also, in some agents, minorities, the diagram of ecosophy or a care, alluded to.

Fourth movement - Appreciation of the infinitely small

We should not only apprehend the macropolitical transformation, the final result of the action, but also value the infinitely small (Deleuze, 1968; 1981b). Abandon the movement of transcendence, the habit of pursuing unattainable ideals and utopias, such as macropolitical changes that go far beyond our potential for action. For example, if we had a federal government (2019-2022) that saddened us, upset us, and produced the spread of hate speeches and the amplification of death policies, we should not feel depressed if in our political action we failed to remove it and produce another government. Because the Brazilian State is a concrete machine that refers to a population of about 215 million people, in a macro-political dimension that far exceeds our scope of action⁷.

It is necessary to abandon the ideal of transcendence, the instituted images of thought, in order to travel in the logic of immanence, valuing the transformations of the infinitely small. The infinitely small is not that which has little value, but it is that which refers to differential relations and to the variation of degrees of potency (Deleuze, 1968; 1981b). We have to focus on the forces, the intensities, which are only apprehended in the relations and differences they produce. Investigate the vectors, the speeds and slownesses at play. There must be an attention to the molecularity in which connections and vibrations are produced, changing the apprehension from equality and stability to difference and continuous variation. And to see ourselves no longer as watertight points, but as becoming in movement. To recognize that we are degrees of power in continuous variation, that create differences at every moment. Each expression of active forces, of desirous fluxes, is already a victory, in a moment when governmentality preached the opposite: sadness, fear, and impotence.

So we should not blame ourselves if our political action, or action in the world, did not succeed in saving women from the Taliban coup d'état in Afghanistan. But rather value what we have altered in the sex-gender power relations in our immediate sphere, in our community. How we deconstruct and scrape away the everyday machismo we reproduce, whether in our small social circle as well as in ourselves. Scraping away the Taliban of the couple, of the circle of friends, maybe even of the neighborhood, as well as demolishing the internal Taliban. To deconstruct our own microfascisms, resulting in small transformations, in lines of flight, that conform clearings for a new softness, another world, without being fixed in the duty with the Revolution. Each day in itself is already a combat and an infinity, regardless of whether we die tomorrow or fifty years from now. We do not live because one day we will die, but for the experience and production of possibles, infinities, all moments. The multiplication of potency and infinitude, or as Baremlitt puts it, an inventive dramatic proliferation (Hur, 2022).

To do so, it is not enough to live in a social movement, or to call ourselves socialists, or schizoanalysts: we have to produce movements, or rather, passages,

⁷ Unless we are at the head of a large financial conglomerate, a significant sector of the armed forces, an important media group, or a religious Institution with millions of followers.

trails, clearings, that refer not only to the overcoming of a certain social problem faced, as well as a crossing of oneself. In tips of deterritorialization that sprout from the surface itself, even if small, but that are perceptible by the differential relations that they establish. Affirming ourselves as minorities, dissentors, expressing our intensive potencies.

Fifth movement - Affection as passage

In schizoanalysis there is a double temporality expressed by Chronos and Aion. Thus, in its clinic setting there is the actualization of a singular metric and temporality. Its score is not written in defined bars (simple, binary, tertiary, quaternary), nor determined by the chronological duration of fifty or thirty minutes of a standard psychological consultation. Its duration is not extensive, chronological, but intensive, *aionic*. This is why Chronos loses its determinacy, opening to the whirlwind, or even to the abyss of chaos. So there is the primacy of temporality that Bergson calls *duration* (Deleuze, 1966).

In ‘Bergsonism’ duration is seen as the temporality that produces a block of intensities and coexistence between distinct temporal planes (Deleuze, 1966). But it is also the phenomenon of connection between two states, two affections. It is the lived transition, at the same time cut and connection, that is, the pure affection: the passage from one affection to another (Deleuze, 1981b). In this sense, the movement of duration implies the affection itself, which produces the passage, a path to another state. It is the affections that pass, that produce bifurcations and lines. It is the affect that provokes the movement, the crossing, making the connection between two states of things (Deleuze, 1981b). In its actualization, which refers to the passage of forces, the flow of desire, it results in an intermediate instance, *between*.

In this way, affect as a passage does not imply only a temporal succession between states of the same body, nor is it internal to a being. Far from being restricted to an internality, or to the logic of the private, it is what is most shared in a relationship between-two, in a group, or in a wider collectivity. Its irruption is related to the actualization of becoming, a flow between, which provokes a gap in the being for other configurations, promoting a connection between different bodies.

Affection works as a ‘wave’ that tunes different bodies to the same frequency. It is the constitution of a block of intensities, which creates a regime of resonance in common and passage between the actants. It is in the link between internality and externality, individuality and collectivity.

This place it occupies, of tuning and resonance between different bodies, can generate the aforementioned processes of composition and decomposition of relations. Every passage, every movement, implies an elevation or “decrease of potency” (Deleuze, 1981b, p. 170). Affection thus occupies a fundamental role for the production and management of life, and one that the State and Capitalism Mafia (Hur, 2018) use explicitly to generate relations of domination and

subjugation; but in our case, we pursue as the passage to the production of life and autonomy.

The management of affect as passage can result in the production of distinct affections, as regimes of forces. So, in the clinical realm, an interpretation that tries to make the passage, but breaks down the person, will produce sadness. In the same way, an authoritarian experience in a social movement also carries this depotentialization and resulting affect of subtraction.

On the other hand, in times of extremism we are closed to affections as passage; they are experienced in the individual sphere, we close ourselves to differences. In order not to access difference, one can close oneself off, or even come to hate the other. To try to avoid contact with otherness, there is the production of “a quantity of immobilized power” (Deleuze, 1981b, p. 177). In an attempt to prevent that which could break it down, it ‘armors’ itself. However, this rigid defense hinders the passages, manufactures a cloister that closes itself to the forces outside and to molecularity itself, and, consequently, the body’s power diminishes. This enclosure generates hatred as a consequence, for “to hate is to want to destroy that which threatens to destroy us” (Deleuze, 1981b, p. 174). Hate becomes an expression of an attempt at conservation, resistance to change. Therefore, depotentialization, sadness, is at the basis of hatred. This is why there are also the joys of hatred, a deploration of the other, which act as a kind of compensatory joy, which follows the same reactive forces and an enclosure to changes and passages.

Therefore, the schizoanalytic clinic, the schizodrama, or the social movement, should not only deterritorialize, demolish, the processes. For the production of life, it is necessary to apprehend how this dimension *between* happens, what occupies it, what produces the crossings. It is necessary to produce passages that can be traversed and not throw people recklessly into the abyss; otherwise they close themselves off and armor themselves, because each one has a singular existential territory and creates unique paths. We must produce the affect as a passage, as a transition, to new affects, vibrations, to the variation of the intensive degree, understanding them as the result of the flow of desire, of forces. In short, to operate in this singular temporality that propagates itself in the passages of duration and its resulting regimes of forces, constituting new connections and compositions, for the production of new commonalities.

Final considerations

In this article we have developed five movements, selected from a review of the schizoanalytic literature, that can arm us in the struggle for the production of life in times of death. If today there is a diagram that updates death and resentment in different spaces, our concern is anchored in the active utopia of daring to produce life in such arduous times.

From long schizoanalytic work we pinpointed clues and not ideals, or teleologies. The clues-movements refer to practices that can be actualized both on an individual and collective level. For this reflection we also carry out a

dialog with schizodrama, a theoretical-klinical field created by Gregorio Barenblitt.

Our reflection, inspired by schizoanalysis, proposes that for the production of life we have to reach the molecularity of being in order to provoke a torsion of the forces, its folding. The purpose is to expel their reactivity and for the forces to return only imbued with their affirmative characteristics; to finally accomplish *a transmutation of forces*. To constitute a plan, to agency processes, not only with foreignisms and international elitism, but, above all, to recognize, merge, depart from, and *construct one's own territory*. We must act through differential relations, abandoning the logic of transcendence and travel on the plane of immanence, considering ourselves as degrees of potency in continuous variation, that is, map and value *the infinitely small*, propagate the revolutionary becomings and not only be anguished by the future of the Revolution. To apprehend and accompany the flow of desire, of forces. To elicit the becomings and thus understand *affection as passage*; as a transition between affections, or even as a connection, an intensive block between two or more bodies, that produces compositions and a new commonality.

That is why we understand that schizoanalysis and schizodrama can operate just like a social movement, in its action of deconstructing capitalist subjectivity towards other sensibilities. Scraping away individuality on the way to the common, the multitude. Expel from anger, resentment, provoking a twisting so that the affection of joy is produced and the potentialization in the constitution of a connection between differences: a heterogeneous community. Shared and adequate ideas for a new living, for another world. The desirous outflow produces affective states, and, on a more extensive level, corporeities, associations.

Updating these five movements takes us to the path of producing differentiation from the variation of the degrees of potency, from the incitement of affections as passages. Producing and experiencing intensities and new existential territories incites a social transformation that is not only macropolitical. The mutation of the embodiments, the desiring transformation, which is the passage of the becoming: the guerrilla warfare of the active forces. This is why, especially in times of death, one must live and desire. Fight and experience. We end with the commander of the M-19 guerrillas, Jaime Bateman (1983), possibly another schizoanalyst who has never read Deleuze, but who knows so much about the relation of affections, potency, and becoming, and who inspires us for the production of new knowledge, other clinics, and politics: "One must dance and sing. And not only to death, nor sing only to defeats. One must sing to life, because if someone lives for death, he is already dead. People who live only on memories are dead, memories without becoming only bring sadness, and sadness never, never generates struggle".

Social Practices of Psychology

Opening Pandora's Box: The politics of the psychological clinic

Ilana Côrtes dos Santos & Domenico Uhng Hur

Abstract

This paper aims to discuss the policies within the psychological clinical device in Brazil. We performed a bibliographic cartography in the Brazilian academic literature regarding the key words "clinic" and "politics". The research resulted in the identification of psychopolitical characteristics of the clinic, which were categorized into four axes. In analogy to Pandora's box myth, these axes represent the evils released, as well as hope at the bottom: (a) colonizing practices, which move towards the maintenance of a hegemonic subjectivity colonized by European standards; (b) psychotechnocracy, practices that promote a universal truth about human beings and their behavior; (c) capitalization of care, a practice impregnated and guided by neoliberal logic; and (d) hope, proposition about a politicized and transformative clinical practice.

Keywords

clinic, politics, device, psychology

Introduction

What is produced through a traditional clinical practice, usually non-critical, that does not observe its origins and hegemonic tendencies? Being involved with the forces within our own professional performance requires a critical analysis concerning the discourses and practices that we may propagate. Psychology is not immune to or above these forces, it is not outside of power relations, or politics. In addition to being considered (or masquerading as) a practice of care and health, it can be a source of violence, exclusion and oppression. Since instituted as a field of knowledge, psychology is part of the massive network of social forces and configurations that entangle relations of power and domination. It is imperative that we, psychologists, are committed to analyze our theoretical and technical tools. It is a deception produced by liberal ideology to assume that our devices have a neutral positioning, apparently detached from political issues. Psychology acts intrinsically in the production of professed truths, traversed by several power relations, whose intention can be the maintenance of the *status*

quo, social control, silencing and obliterating the differences (Coimbra, 1995; Hur, 2013a). Therefore, we should be aware of the forces that intertwine our daily clinical practice and the resulting political positions.

The clinic itself originates from the medical practice, in which the practitioner observes and examines the patient to formulate the diagnosis and consequent possible treatment. Foucault (2014a) makes a critical analysis, pointing out the power relations present in this act, permeated by social, political and economic issues, in which the psychological knowledge exerts a direct power over bodies and population, in a government through biopower and biopolitics (Foucault, 2008).

In this framework, some produced norms transcend the individual. The norm and its deviation, namely disease, become entities themselves, characterized by a series of traits produced by these knowledge and techniques. Health, as a set of norms that are produced, is defined by the adequacy to what is instituted, that is, by the absence of deviations, "diseases" and "symptoms".

Psychology, in this scenario, is inserted in its articulation with medicine, as well as other normalizing knowledge. Psychological practice also presupposes, in principle, a range of normality as a reference. Deriving from the tests, evaluations and scales, the standard is established, and the deviations pursued. Between labs and analysis, the individual is leveled by one's average mediocrity. The focus is on the standard and on its deviation, the disease, to the detriment of the patient and his observations about oneself.

At the end of the nineteenth century, psychoanalysis seems to establish something new, inaugurating a clinic that focuses on the patient's discourse about one's own suffering, moving from the paradigm of observation of symptoms to listening. Through an individual, intimate and confidential clinic, the patient exposes the issues to an analytical intervention, which forms the classic image that represents psychology: a patient lying on the couch, the psychologist next to him/her listening with a notepad in the hand (Kahhale, Costa & Montreozol, 2020; Moreira, Romagnoli & Neves, 2007). However, it keeps reproducing the disciplinary, phallogentric and heteronormative logic (Hur, 2022).

In Brazil, Psychology, which was regulated by Law as a profession in 1962, maintains the same disciplinary logic. For example, one of its private attributions, standardized in Law 4119/1962, is to "solve adjustment problems", that is, to adapt people to norms (Hur, 2007). Following the intensification of neoliberalism, there was a significant increase in the number of courses and graduates in Psychology at the end of the 1990s, from which, in 2012, about 80% came from private institutions (Guzzo, 2018). Psychology formation focus mostly on the individual clinic in Brazil (Moreira, Romagnoli & Neves, 2007), despite the variety of professional activity possibilities. In spite of the increasing participation of psychologists in the public health system, companies, and several other sectors, their prevailing performance (Moreira, Romagnoli & Neves, 2007) still falls on the individual private clinic, corroborating the social imaginary that associates the image of the psychologist to the intimate clinical setting.

That said, this research seeks to analyze the private individual clinical device, understood here as "traditional clinic". Although nowadays the clinic can

assume several configurations, whether enlarged, group, or any other territory, we still find a large number of psychologists in the private individual clinic. According to the census carried out by Federal Council of Psychology (CFP) in 2022, the majority (73%) of these professionals is autonomous. What are the forces in this reserved space, and how to shed light on these problematizations and raise psychologists' personal implication? Is this practice necessarily individualizing and neutral? Does saying neutral necessarily mean producing a non-political practice? How do we observe the presence of politics in the clinic? From what practices does politics manifest itself?

As a knowledge that is supposedly neutral and detached from its social context, it's created the illusion that psychology and politics do not mix. This point of view reiterates a depoliticized practice, which deals with individuals alienated from their context, based on aprioristic universal maxims (Barros, 2005). It is appropriate, however, to problematize how much this supposed depoliticization is not a political positioning in itself. When considered neutral, psychology can support the silencing of suffering generated by social, race, gender and sexuality inequalities, emphasizing a decontextualized and individualized subject (Carneiro, 2020).

What do we call politics? We think politics not only from the state or partisan perspective. According to Hur and Lacerda (2017), politics happens in different spaces, in the exercise of the relations of forces that results in the management of life and in the processes of subjectivation. Thus, politics is exercised in all social spaces, whether in its macropolitical or micropolitical aspects (Guattari, 1981; Hur, 2009).

The psychological clinic, that is, the relationship that is established between the psychologist and the patient, is also a political relationship. By thoroughly analyzing it, we can observe the forces it comprises, the individuals positioning, the practices of power/knowledge, as well as the discourses reproduced and reassured, the investments of desire that are modulated and the produced subjectivity. Although the clinic is individual, it is still imbricated in the great social web that surrounds it, through which the person must be seen in one's plurality, as a historical, psychopolitical subject. This configuration of forces produces subjectivities, and affects the way we see and experience life. Forces that may evoke desiring production processes, which produce life and emancipation, or forces that activate limiting processes and block life (Hur & Lacerda, 2017).

This paper aims at discussing the politics within the psychological clinical device in Brazil. Thus, we conducted research to find out the discourses and practices that characterize the psychological clinic. How can the clinic conform or not to the broader political conjuncture? In this sense, we discuss the relation between the psychological clinic and politics, that is, the politics of the clinic.

To carry out this work, we used bibliographic cartography as method (Hur, 2016; Quadros, Moraes & Bonamigo, 2019). Cartography emerges as a possibility to follow the nomadic composition of heterogeneous elements. The researcher, being one of these elements, does not claim to be impartial (Passos & Eirado, 2009). The research, from this perspective, is not the representation,

interpretation, or discovery of fixed data about the object. It instead follows the processes that constitute the object and the subject, which "define each other, one in function of the other" (Barros & Barros, 2013, p. 374). Cartography is accomplished by deconstructing certainties and raising non-universal possibilities (Rolnik, 2006). The reality is denaturalized, which makes other perspectives possible concerning the same reality being experienced, while contemplating the coemergence of subject/world. By destabilizing what is already naturalized, enabling openings to be analyzed, we access and follow the composition of the reality in which we are also inserted as researchers (Passos & Eirado, 2009).

Cartography in bibliographic research, therefore, is not limited to data collection and subsequent interpretation. "Nothing to be interpreted, nothing to be represented. In cartography, writing is the intensity in transit. It is connected to the outside, it comes from the outside, it forms a rhizome" (Quadros, Moraes & Bonamigo, 2019, p. 88). It is intended to map not what arises as frequency, but irruption of intensities (Hur, 2021). It is, therefore, a process of experimentation and affectation by heterogeneous forces that transgresses individual and intentional limits, questioning norms and rules, problematizing and denaturalizing what is instituted. Junctions, disjunctions, connections and decompositions in the common plane of intensities that include the researcher and that connect as a rhizome in an infinite way, using criticism as an affirmation of difference.

This proposal of interventional and participatory bibliographic research makes speaking, seeing and writing, it makes evident investments of desire that are being operated, and copulates with the sociopolitical field through agency with other practices and knowledge in a movement of concatenation. If the bibliographic research produces records, these records will be consumed by other researches, which in turn will produce new effects, implying an ethical-political commitment that is at the same time an ethical-political-aesthetic investment. (Quadros, Moraes & Bonamigo, 2019, p. 101)

We researched the Brazilian academic literature productions on clinical and politics in order to identify the forces in the psychological device and how they act. Two important databases containing academic journals of Brazilian psychology were chosen, namely Scielo and Pepsic, from March to May 2022. We paired the following descriptors for the research: "clinic" and "politics", without specifying a time frame. We found a total of 257 papers. We excluded from our sample the papers focused on education, law, dentistry, medicine and public health, as well as the duplicated ones. Thus, 96 papers remained. From these, we performed a general analysis of the papers, excluding those that did not specifically address the politics in the psychological clinic device. So, we selected 54 papers, being the oldest from 2001. It is noteworthy that the analyzed papers address the discussion of the in-between aspects of the psychological clinic and politics, therefore, they talk through the facets of this device in a critical way.

In these remaining 54 papers, we map out the various clinical practices that point out the configuration of the forces in the psychological device, discussing

them from a critical perspective, referenced mainly by Gilles Deleuze, Félix Guattari and Michel Foucault. We have divided these characteristics into four axes. We used the myth of Pandora as a metaphor to our attempt to understand this configuration of forces. Pandora (the one who has all the gifts) is the first woman created on earth, at the behest of Zeus, punishing Prometheus for stealing the fire of the gods and giving it to men. She arrives on earth with a box that should not be opened. Moved by curiosity, Pandora opens the box, from which flew out over the earth all manner of misery and evil. Pandora's box represents the psychological clinic, from which we expect health and mental care, but may release several evils instead. The first three axes are considered the evils that flew out from Pandora's box, namely: colonizing practices, psychotechnocracy and capitalization of care. These axes act on the individual producing effects that reaffirm, reproduce and/or sustain power relations with different configurations of governing life. Pandora, realizing her mistake, tries to close the box, managing to keep the only positive gift in there: hope. Thus, the fourth axis maps out practices that can represent hope at the bottom of Pandora's box: hope, being the proposal for a critical political clinic.

Evils: Colonizing practices

From the perspective of the analyzed papers, we encountered some practices that reproduce a colonizing logic. Practices in which the movements are directed towards the maintenance of a hegemonic subjectivity colonized by eurocentric patterns. To colonize is to inhabit another space and impose habits and behaviors, in an imperialist way. It is not restricted to territorial domination, but rather in the transmission of values and production of a way of thinking, being and living, in which there is an indoctrination concerning the hegemonic morality perspective (Hur, 2013b). The colonized subjectivity sees itself from the perspective of the colonial domination and prejudice, thus nullifying its own potentialities and singularities.

Psychology in Brazil is structured from epistemological views that are based on the reproduction of models imported from Europe and the United States. Much of our academic output is directed to the understanding and reproduction of foreign thinkers (Hur, 2013a; Lanza, 2021). Colonized and colonizing psychology is based on a standard identity (Deleuze & Guattari, 1996), which is based on white and European production on mental health and psychic suffering, disregarding the reality of a large part of the Brazilian population, which is composed of an ethnic-racial variety (Veiga, 2019; Benedito & Fernandes, 2020; Oliveira, 2017; Rodrigues, Vêras & Teixeira, 2017; Tokuda, Peres & Andreo, 2016; Barros, 2005; Carneiro, 2020; Alves & Delmondez, 2015).

From eurocentric perspective of seeing the world, history and humanity, the clinical device creates a discourse that naturalizes the hierarchy between differences, organizing them into relations of power and oppression that are daily reproduced and reinforced, everywhere. It takes the colonial matrix as a

reference, covering up other narratives, which are made invisible to maintain patterns of power and subjection of individuals in society. History told from European perspective:

has taught all of us that there was a Classical Greece that originated Rome, that decayed and originated Middle Ages, that at some point became more flexible and originated Renaissance, opening the doors to Modernity. All this in Europe as a scenery, the radiating center of rationality and democracy to the world. We are so familiar with this discourse that we take it for granted, because Eurocentrism has established itself, throughout a series of historical processes, as the dominant paradigm in several spheres of human life and in the most diverse points of the globe (Alves & Delmondez, 2015, p. 654).

The naturalization of this belief also produced a standard representation of human being. The, white christian heterosexual property-owner educated civilized european man determines as another everything that is different from himself, enunciating what must be civilized, catechized and domesticated. This other is considered in the logic of the negative (Deleuze, 1997), being contemplated as inferior, marginal, and often criminal.

However, these discriminations are not always explicit and evident. They can occur in a subtler way, permeating actions of apparent care and protection, often silencing the suffering that these naturalizations may cause. Psychology can reinforce this in a number of ways. We identified in the analyzed texts some themes that refer to colonizing practices, among which we highlight eugenics, racism and patriarchy. Through an apparently neutral protective-controlling discourse, one can reinforce eugenic, racist and patriarchal beliefs, with controlling postures and silencing. By claiming to be neutral and scientific, psychological assumptions may be politically in favor of the colonial hegemonic discourse.

In this review, we come across a critical stand that the psychological device naturalizes biological and social traits, favoring the economic elites, but also white people and large cities, that is, who live in the urban space and not in the rural. It operates as an apparatus belt called by Foucault (2008) as the racist state.

Socially, the suffering produced by inequality, exploitation and lack of access is disqualified and minimized. The structural racism we see present in everyday institutions and relationships is ignored. In the clinic, the topic is often individually treated, emphasizing individual spheres of resilience and adaptation. It is suggested that the individual should be strengthened, learn to live with these situations, suppressing the social and political aspects involved. In this way, the therapeutic relationship can, and in fact is, another oppressive device on these lives. Races play roles of value defined by a hierarchy established by years of slavery and colonization, justifying the existence of the privileges of the dominating class, the white (Benedito & Fernandes, 2020). The naturalization of these privileges, the lack of opportunities and marginalization of black people is a great source of suffering. The clinic performing a colonizing practice can make invisible the suffering of the black body in the face of the inequalities generated by this perspective that places the white race as a standard and holder of

privileges. White is a standard of beauty, of superiority, it has access to opportunities and facilities. The black is considered as another, seen in the same negativity logic mentioned above, always in inferiority and deviation. "Eurocentrism and whiteness not only refuse that black people think about their own history, but also do not see themselves as part of it" (Benedito & Fernandes, 2020, p. 9).

The defined standards stratify social places to be occupied by individuals, as discussed by Benedito and Fernandes (2020). The memorization and reproduction of these patterns is assigned to individuals, who cannot even access the possibility of producing other ways of living. In the individualization of social issues, people are led to disregard the structural facet, personalizing racist behaviors. The discourse of resilience is used as a tool so the person can learn to "be strong", ignore these offenses and behaviors, suggesting greater personal effort and dedication to overcome the obstacles imposed by the lack of opportunities. This perspective silences the denunciation of structural racism, individualizing the issue and weakening collective agendas and resistance. It perpetuates the place of white people as superior, the one who will civilize the others. Thus, the race exercises

symbolic, evaluative and stratifying roles in multiracial and racist societies such as Brazil. The adoption of this concept allows the division between classes, in which the ideal status belongs to the white ruling class. These divisions and their consequences, racism, are not only the result of the historical process experienced in slavery, but are also the result of capitalist interests and, therefore, are maintained. (Benedito & Fernandes, 2020, p. 3)

Therefore, the clinical practice in this conjuncture must perform an analysis of its implication (Lourau, 1975) and the struggles it generates. The white psychologist must be aware of one's whiteness, recognizing how race may affect the therapeutic relationship.

the creation of the bond. Although this goal should be achieved in any therapeutic relationship, we highlight that among the repercussions of racism are the difficulty of establishing bonds and the representation of oneself as inferior, unpleasant, inadequate and a continuous sense of non-belonging, as well as the perception of the world as potentially violent (especially in the interracial relationship), which can influence the establishment of a bond with the therapist. (Tavares & Kuratani, 2019, p. 5)

Disregarding these aspects means perpetuating the reproduction of colonialism and the silencing of this suffering, which prevents the manifestation of the difference. The cynicism of the analyst and his whiteness can naturalize inequalities and ignore the privileges obtained through race, relegating to the fallacious discourse of meritocracy the social abysses that exist. "Whiteness operates as a device of power regulating the limits of analyzability. Therefore, a mechanism of colonialist power that gains materiality through institutional racism" (Apolonio & Verzman, 2022, p. 43). On many occasions the white

person does not recognize him/herself as racialized, seeing the white as a reference, turning the perception into the black body, which becomes the object of study and intervention.

The analysis of one's whiteness (Bento, 2002) is an essential step towards the deconstruction of a colonizing practice. Not only, though. The colonial bias of patriarchy is also reproduced in clinical practices, generating oppression as effect. Equally sustained by neutrality, the universality of androcentric thought is reproduced. Men is placed in a position of superiority, and women are subjugated in a place of submission and subservience. The gender hierarchy is often neglected by the clinical practice, where violence is reduced to dichotomies such as good/bad (Timm, Pereira & Gontijo, 2011). Without the psychologist ethical and critical commitment concerning the issue, in which said neutrality is sustained, clinical practice is reduced and:

based on individual subjective experience, privatizing people's pain and suffering. The history of this hegemonic practice atomizes, dissociates, fragments and *pathologizes* the subjective experience as if it was not related to its social context, as if everything was a matter of 'intimate forum'. [...] The critical analysis of patriarchy demands to rethink the impact of culture on the process of gender identities constitution and the consequences, such as individual subjectivities. [...] Women in this western patriarchal culture are constituted by men's perspective, feeling deeply helpless when they are not noticed and often conforming to a violent family or marital scene in order to prevent loneliness'. (Timm, Pereira & Gontijo, 2011, pp. 253-254)

Clinical device as a reproduction of patriarchy, therefore, repeats oppression thus disregarding subjectivation processes that break the cycle of submission and inferiority. It keeps women tutored and fragile, so they can be controlled. Such practice may be masqueraded as care and prudence. A male psychologist may listen to a woman performing the role of the protector, discouraging her from ruptures that may be necessary and urgent. A nuance easily perceived as care, which hides, however, the reproduction of social roles in which the man acts as the protector, and the woman is fragile and incapable, requiring a tutor.

both in the theories listed and in the reports by the women listened, the concept of family is still imprisoned in patriarchal, phallocentric and heteronormative structures and is reduced to the traditional model of the bourgeois nuclear reproductive family. [...] In this sense, Psychology itself (as well as other fields of knowledge – nursing, medicine, social work, etc.) needs to review its practices and concepts, considering its tendencies, often reductionist. (Tokuda, Peres & Andreo, 2016, p. 928)

Acknowledge colonizing practices is to remain in constant self-analysis, seeking other perspectives, questioning and problematizing the interpretations, observing the role we play in the therapeutic relationship, and its implications.

Evils: Psychotechnocracy

Technocracy is a term used to designate the use of scientific knowledge in the resolution of everyday problems and issues, that is, an administration made by specialists, a management of life carried out from fields of knowledge and technologies. Accordingly, we name as psychotechnocracy the attempt to manage life through psychology scientific and technical knowledge, that is, psychological expertise and techniques. These practices seek to promote a universal truth about human being and behavior. These regimes of statements, taken as truth, are guided, as Michel Foucault (1979) teaches us, by normalization, classification and pathologization. Consequently, psi practices can erase differences by adapting to socially accepted norms and standards.

Psychotechnocracy derives from disciplinary power, proposed by Foucault (1979). The french philosopher studies a new governmentality that emerge from knowledge regimes of techniques that articulate power relations that focus on life. Disciplinary power:

adopt new procedures, such as examination, surveillance, confinement in a space and time management. They describe traits of individuals, as well as they produce measures, molds, codes and statements in order to appropriate life, thus making it more effective and productive. Standardizing sanctions are used as interventions, which regulate behavior and correct deviations: body domestication. This utopia falls upon diagnose and correct, discipline and punish. The truth produced by these procedures is called 'norms' (Hur, 2018, p. 80).

Based on this, psychotechnocracy is the adaptationist and normalizing practices of psychological clinic, in which the psychologist is a kind of social orthopedist (Bicalho et al., 2009). For example, when we break a bone, we look for an orthopedist, who will put the bone back in place, plaster until it calcifies in the correct position. The orthopedic psychologist plays the same role: based on a norm, he identifies which bones are "out of place", that is, individuals with inappropriate, deviant behaviors, which must be put back in the correct position and plastered until they calcify. Norms that justify and update *status quo* values, that sustain logics in order to maintain domination and exploitation, reducing the production of individual differences, of multiplicity. Disciplinarization directly updates the forces diagram of discipline (Foucault, 2014b), in which knowledge and practices instituted by *psychology* create anatomopolitical and biopolitical norms to manage life (Hur, 2018).

The disciplinary clinical device reproduces psychotechnocratic practices. According to the papers studied in the literature review, psychotechnocracy is performed by vertical knowledge-power relations, permeated by neutrality, disciplinarization, adaptationism, medicalization, classifying and diagnostic homogenization, among other practices in which norm is preponderant (Barboza & Andrade, 2022; Safatle, 2017; Smith, 2005; Canavêz, 2017; Martins, 2008; Dettmann, Aragon & Margotto, 2016; Borba, 2014; Decotelli, Bohre & Bicalho, 2013).

Under the aegis of neutrality, Brazilian psychology went through the years of civil-military dictatorship (1964-1985) without being persecuted. Disregarding its political and social characteristics, separating politics and psychology (Hur, 2007), clinic is assumed as neutral, thus being disconnected from the reality that surrounds it, immersed in the inner world of the patient's self. Neutrality, objectivity and scientificity (characteristics of the positivist paradigm) describe the individual as a natural object that is not historically produced (Coimbra, 2004). This subject is seen as a center in conjunction with the dichotomy society x individual. These two realities are considered apart and separately analyzed, although they are intrinsically articulated (Barros, 2005).

During the dictatorship, taken as neutral, psychology penetrated the social sphere through a hygienist perspective of mental health (Oliveira, 2017). Assuming the discourse of neutrality implies decontextualizing and naturalizing power relations that have been historically built, taking them as given universal truths and individualizing issues. Hence, neutrality reinforces, often by omission, relations of oppression, depoliticizing and weakening people, whether at the individual or collective level. When a perspective is considered a universal truth, "it comprises a variety of blind spots, which will necessarily violate the perspective others" (Martins, 2019, p. 57). In other words, we consider that no truth is universal, it is always a point of view contemplating a specific reality, be it historical, cultural, social or economic. Therefore, neutrality as it is put does not exist. It must always be questioned, because it is permeated by the reality that surrounds it and produces it.

Neutral discourse, on that account, may corroborate situations of oppression, such as racism and sexism. In an unequal class society, it is necessary to analyze the roles we as well as our patients play in society. Psychology as a "neutral" discipline has already been used as a tool to pathologize physical differences (Benedito & Fernandes, 2020), justifying social domination. Currently, it can still be seen in the criminalization of black poor people, which associates social class and race with violence and drug addiction (Coimbra, 2006).

Psychotechnocratic practice widely contributes to body disciplinarization, where a norm to be achieved and maintained is established (Silva, 2005). By reinforcing norms concerning ways of living, classification and diagnosis are effective tools, as they standardize and quantify therapeutic relationships that should be unique. With respect to standardization, universal truths about humans are produced. The norm establishes the limits within which the individual must remain. In this sense, the clinical setting mingles with the hegemonic discourse that disregards multiplicity (Canavêz, 2017), which diagnoses, disciplines and regulates. Psychological techniques are used as a way of diagnosing, defining and limiting ways of being and living.

Another practice that characterizes psychotechnocracy is the production of diagnoses, which operate as a production of specific subjectivity: the discipline of subjectivity. As an effect, patients reproduce a limited discourse about themselves, embracing a high content of (self)codification, restricted by the identity affirmation of "this is me". This perspective limits the possibilities of

change, thus generating fatalism (Martín-Baró, 1998). Sadness to depressives. Lack of control to anxious ones. It consolidates normative stereotypes that are difficult to break through.

Along these lines, the creation and improvement of mental health diagnoses (International Classification of Diseases – ICD; *Diagnostical Statistical Manual - DSM*) imply the production of static norms and "a physicalist view of mental disorder. [...] As a consequence, the dialogue with the patients about their suffering loses importance, as well as the concern with their psychosocial context" (Martins, 2008, p. 332). These forces appear in the clinic from a social idealization of repairing what is not working: the pain, the symptom, the deviation. These forces appear in the attitudes of the patients themselves. There is a standard that rules and prioritizes certain ways of life. These norms establish an ideal pursued by individuals, who want to achieve them at any cost. Or yet, these forces may be part of the psychologist behavior, who may define the success of psychotherapy as the absence of anguish and symptoms, in search of immediate solutions and social adaptations to the patient's struggles.

Given what has been said, psychotechnocracy combines the diagnostic perspective with an intervention that aims to identify the symptoms to be erased and silenced through protocol techniques used to train and discipline people. Ultimately, the anesthesia of the insurgency, the suppression of anguish and the management of sensations are sought. These products are widely offered by psychology and psychiatry, in which behavior is standardized. It is a psychosocial hygienism whose purpose is analgesia as subjectivity (Martins, 2008).

Pain (symptom) or the lack of it as a reference for health (physical and mental) turns clinical practice into a protocol to accommodate and format certain models (Decotelli, Bohre & Bicalho, 2013). There is a multiplication of sickness roles, in which diverse behaviors are pathologized, resulting in the medicalization of health. Abnormality is attributed to what escapes the rules and norms set by work, school, church, family, discourses, etc. Deviations are recognized as pathological, they are medicalized and "corrected" (Martins, 2008).

In order to discipline bodies, childhood is also normalized through various diagnoses of learning and attention neurological disorders. Standardization of childhood establishes health and regular cognitive abilities. Those who don't fit are contained by medicalization. Life is regulated through the definition of an ideal behavior, learning and attention, which, in fact, sustains biopolitics, regulation and control of lives. In short, "monitoring of both efficiency and [...] existence in all their extension" (Decotelli, Bohre & Bicalho, 2013, p. 448).

We observe how psychotechnocracy permeates clinical practice. Supported by *psy* knowledge-power (whether from psychology, psychoanalysis or psychiatry), universal truths are established through classifying practices and normalization of behaviors, so certain ways of being in the world are reinforced. It is such a vigorous force that permeates daily practices. Even professionals self-acknowledged as critical end up being crossed by these forces, thus being psychotechnocratic.

Evils: Capitalization of Care

The bibliographic cartography revealed other characteristics present in the psychotherapeutic space, in the private practice, which we categorized as the capitalization of care. This category embraces neoliberal capitalist argumentation in mental health care practices and actions. Deleuze and Guattari (2010) affirm that capitalism must be seen as a semiotic machine that is updated in the most distinct instances, so they choose to call it as axiomatic of capital. Thus, from the intensification of neoliberalism, peculiar features of clinical device foster the production of a hegemonic subjectivity, whose manufacturing is serialized and international, encompassing the way the world is perceived and how it is articulated in society: capitalistic subjectivity (Guattari & Rolnik, 2006). In this category we observe the following characteristics: relationship between economy and subjective production, individualism, identity fixation, homogenization and massification of suffering, medicalization of health, psychology as a tool used to cover, naturalize and reproduce the exploitation guided by class inequality (Ceccim & Merhy, 2009; Cruz & Ferrari, 2011; Batista, 2013; Indursky & Conte, 2017; Moraes & Perrone, 2017; Sato, Martins, Guedes & Rosa, 2017; Kahhale & Montreozol, 2019; Kahhale, Costa & Montreozol, 2020).

Coimbra and Leitão (2003) highlight the direct relationship between economic relations and the productions of subjectivity; these are constituted by different social apparatuses, but they are articulated, since psychology is crossed by knowledge-power relations. The authors point out how much this capitalist territory produces, among other things, the "way-of-being-individual", a model that defines specific ways of being in the world to the detriment of others. This perspective is convergent with Guattari's statements that capitalism is primarily a factory of subjectivities (Lazzarato, 2014).

This way, individuality is exaggeratedly considered, taking precedence over collectivity. Self-identity is also emphasized, incited and modulated precisely in favor of the market imperative. The more categorizable, the more predictable, the more controllable and manipulable for the purposes of capital. There is the passage of a "technique of masses into [...] a machinery whose principle is no longer moving or motionless mass, but a geometry of divisible segments" (Foucault, 2014b, p. 160). In other words, the subject comes to be seen as a singular element to be articulated in a set that seeks greater efficiency and productivity.

In psychological clinic, one of the effects of this belief is the individualization of experienced vicissitudes. Care is instrumentalized to depoliticize and dismantle the political and social dimension of suffering, thus privatizing damage (Indursky & Conte, 2017). In other words, clinical intervention does not consider or associate collective facets of given suffering. It instead turns everything into internal and subjective scope. It displaces social issues to the individual sphere, that is, it discredits the social context as a way of blaming the person.

Considering capitalization of care, intervention proposals are fast and superficial. They follow a protocol as if they were a cake recipe, which promises

to solve anxiety attacks, panic disorders and *burnout* from individual perspectives that disconnect the person from immediate social reality. It ignores the entire cultural historical context, as well as the effects it engenders at the origin of certain suffering (Ceccim & Mehry, 2009; Cruz & Ferrari, 2011).

"Clinic is reduced to the imperatives of therapeutic efficacy and guarantee of short-term results" (Cruz & Ferrari, 2011, p. 162). The power of psychotherapy is reduced to symptom eradication by standard protocols, so the duration of the process is minimized as per the capitalist logic. One should also bring to this discussion the fee received by the psychologist, which is often disguised, not openly discussed, a "black box", however it is totally linked to the capitalization of care. As Baremlitt (1992) teaches us, it is an important analyzer of the process. In this context, psychology is another apparatus of neoliberal network, as a field of knowledge and practice that dictates truths about humans, based on its supposedly neutral expertise, but which continues with the bureaucratization of technical procedures in favor of productivism.

Poor classes cannot access therapy in many situations. Therapy is restricted to those who can afford it, considering that what is offered by the public health system is still insufficient for the demand. Social care offered by private professionals slightly mitigate this situation, although this practice is often guided by assistentialism and individualism (Silva & Bonatti, 2020). It is very common that clinical psychologists find their limit in the anguish arising from social inequality, which seems like a dead-end street, taking into account that some intervention devices do not problematizes these social and political issues.

Capitalization of care is performed through a productivist logic. Both by the financial bias, as by the results obtained. Patients are seen as "defective machines", so they must be "cured", "repaired", so that in the shortest period of time they resume their place in the great social productive gear. In short, we observe the therapeutic massification via the description of symptoms that silences violence in favor of the capital. This means that symptoms are homogenized and massified, encompassing increasingly large portions of people, and protocols are created and followed to managed life in a productive way. Thus, social violence resulting from exploitation and oppression is camouflaged with alleged care practices.

Some authors discuss the use of diagnosis-prescription procedures in behalf of longevity as the stagnation of singularity production (Ceccim & Merhy, 2009). With reference to consumption and capital, whose aim is maximum productivity, the symptoms are identified, the person is categorized, diagnosed and prescribed. Symptoms are silenced and, moreover, singularities are erased. What is unpredictable, and therefore uncontrollable, is nullified. This perspective occurs in conjunction with neoliberal individualist argumentation discussed above, which manages life via market-productivist viewpoint.

Another aspect that deserves to be highlighted is how psychological device becomes a drive belt of what has been constituted as health market. According to critical researchers, this market is basically focused on "medicalization of life" (Decotelli, Bohre & Bicalho, 2013). For such, the pharmaceutical industry of psychotropics, which moves immense profits, offers quick solutions in pills for

profuse emotional issues. In that regard, body and psyche are seen only in their mechanical dimension, in which certain medications would solve their adaptation problems, returning them to work. Ritalin is an emblematic example of what has been used for children, so they control their focus, attention, and increase production in schools. In other countries, such as the United States, amphetamines such as Adderal are prescribed to make workers and students increase production, thus corroborating hypertrophy of production. Health plans, permeated by this same logic, increasingly define and delimit the performance of professionals. "It is the criticism of the work captured by its management, by protocols, by its corporatization or by the rationalities in which it is inscribed or from where it unfolds" (Ceccim & Merhy, 2009, p. 532). Consequently, ways of acting, seeing, thinking and living are fostered, they are already outlined and standardized as per adaptation to capitalism and its demands. As Nikolas Rose (2013) criticizes, psychological devices are no longer concerned only with normalizing and encoding (psychotechnocracy) people, but rather with motivating the highest possible productivity of individuals taken as body-machines.

The papers reviewed show us how easily the clinic can be modulated by the hegemonic logic of capital. Practices that, by responding to capitalist demands, incite people into ways of living reduced and regulated by productivity and profit.

Hope: Proposition about a politicized clinical practice

Pandora's box was not all about evil. Hope was left at the bottom. Something that humans could turn to in order to survive chaos. Likewise, our bibliographic cartography indicates clinical practices that are capable of opposing the identified evils, politics of oppression, standardization and hyperproductivity. Among the evils, and in spite of them, there is hope. According to Paulo Freire, hope as a mobilizer of change, hope as a verb (2014). In opposition to immobility and fatalism, useful to groups of domination, hope incites action. It is a way of overcoming paralysis in face of difficult situations. The authors highlight how art, clinical friendship and autonomy can be an ally in this confrontation (Prandoni & Padilha, 2006; Martins & Peixoto Junior, 2013; Silveira, 2016; Cruz & Teixeira Filho, 2017; Safatle, 2017; Walter & Pine, 2017; Benedito & Fernandes, 2020).

Art helps producing differences in psychotherapy. In its interface, clinic and art activate other subjectivation processes, as per existential aesthetics. Art-clinical relationship may occur in two distinct ways: 1st in an instrumental dimension, in which art operates as an intervention device and 2nd the subjectivation process itself as an aesthetic experience.

Therapeutic and artistic processes are transversalized "through devices that enhance the aesthetic experience and its interferences in subjectivity and corporeality" (Santos et al., 2020, p. 69). That is, art is used as a way to reach oneself and a way of being in the world. Art in photography, painting, literature,

music, dance, etc., can foster life production. Art about everyday life may, for instance, help expressing beyond naturalized words and situations, promoting ruptures and movements that may guide someone into new possibilities to given situation. It can be a way of overflowing repressed and suffocated affections.

As an example of experiment, someone tries to access immediate reality through the lens of a camera, or by brushes, or by musical notes. It is possible that this produces displacements previously inaccessible by the automatism of everyday life. Reading poetry and short stories, or even their creation, can make room for the expression of affections previously repressed by socially predefined norms. There is no prefabricated recipe concerning our relation with art. Thus, psychological expertise is denaturalized, which enables attentive connection with the patient as well as space to new experiences.

As an illustration, Ernesto Neto believes on interactive art. This way of making art refuses contemplation, in which we only observe what was produced. It invites us instead to directly interact with the pieces of work, thus producing singular experiences. Cruz and Teixeira Filho (2017), when analyzing this artist, point out that

The signs that the artist creates by providing a differentiated atmosphere of interaction provokes the public's thinking and disorganizes it for a moment until thought recomposes it, however, not by reasoning, but by sensation, which transforms the spectators into artists themselves as they create ways of relating to the pieces of work. "Truth" becomes implied rather than absolute (p. 138).

On the other hand, some clinical practices visualize that subjectivation process itself is an aesthetic production, a self-reinvention. From the body composed of flow of affections and encounters, intensive states can emerge, which require the creation of something new. It is life that "takes place in the production of differences and their affirmation in new forms of existence" (Rolnik, 2015, p. 104). The author states art as a means of expressing the intensive differences that vibrate in people, or that make people vibrate. Not art in its formal dimension, permeated by rules and forms, commercially recognized. But intensive art instead: a venture against the deactivation of an experimental creation of existence process. The existence itself comprising non-predefined ways of expressing affections through experimentation, rejecting interpretation or reproduction. By experimenting, through aesthetic production, our relationship with the world and with others can activate creative processes and produce new forms of existence.

In accordance with Deleuze (1997, p. 139), "the conditions of a true critique and a true creation are the same: the destruction of an image of thought which presupposes itself and the genesis of the act of thinking in thought itself." So the interrelation between art and clinic provides us with the chance to leave the presumed representation of ourselves and the world to enable a rupture that can lead to creation comprising the body with its intensive affections.

In addition to art as a transmutation power, friendship was also pointed out as a clinical facet that increases one's potentia. Silveira (2016) believes that intervention in complex contexts comprises several resources and produces

different effects, among them the desire to create new networks of social relations, which may interrupt automatic processes in social life.

Alleging the psychotherapy political facet involves the understanding that dual or group relationships, in office or in the community, must comprise the whole complexity of contemporary subjectivity. The notions of individual and group need to be denaturalized, being understood as a particular effect of always collective subjectivation processes. (Silveira, 2016, p. 339)

For this author, the rupture of power relations enables different experiences, which allow singularities and new different ways of relating to others. The production of new social connections, as opposed to neoliberal individualism, is a possible clinical effect that refuses hierarchical privatizing normalizing practices. Thus, the affections that arise from a horizontal therapeutic relationship can promote the movements required to produce authentic ways of being in the world, in which the search for connections, new allies and friendship affections produce softness.

Another way of disrupting colonizing disciplinary pharmacological neoliberal psychology is autonomy. Autonomy refers to self-government, self-management, the opposite of heteronomy, which is a vertical, asymmetrical government (Castoriadis, 1982). So, the clinical device may foment processes to regain life regaining and potentia. To achieve this goal, Prandoni and Padilha (2006) believe in the importance of considering the uniqueness and history of each individual, refusing adaptationism, pursuing autonomy through self-care practices together with social and political changes. Working with singular subjectivities means operating transformations in one's life considering the specific history, affections and displacements. Using control as care or psychotechnocratic approaches only provides stagnation and immobilization when facing an identity that is assumed as deficient regarding an average. The production of autonomy encompasses creating new possibilities of life, as well as the recognition of basic rights and the possibility of managing your own life.

It is worth emphasizing how connected it is to intrinsically political and critical facets of the clinic. The individual cannot be analyzed apart from society. Relational dimensions of human being cannot be ignored, along with the forces that transversalize these relations (Coimbra & Monteiro de Abreu, 2005). So we believe in hope as an active clinical approach concerning the production and creation of different subjectivation, one that is not subjected, adapted nor disciplined, but instead categorically implicated in the production of desire. As Jô Gondar (2004) affirms: an insurgent desire., the act of creating inseparable from the experimentation of unprecedented ways of affecting and being affected.

The challenge of facilitating the emergence of creative processes in subjectivities crystallized in symptoms and excessive suffering now requires the constitution of an intermediate space of experimentation, in which the psychotherapist's body and affections is also claimed, so that transformation can take place in this aesthetic encounter. (Maciel Júnior & Kupermann, 2005, p. 8)

Hence, hope in psychotherapy is a rupture in politics of subjection, orthopedics and market logic identified earlier. It implies an ethical aesthetic political posture of the psychologist, which enables the emergence of inventive and desiring processes capable of displacing the individual from fixed identity. An invention process of other selves. Experimentation of other ways of occupying the world and the relationship with oneself, others and nature. Crystallized subjectivities die so that it is possible to become something else.

Conclusion

This paper, as unveiled by the bibliographic cartography, outlines the politics in psychological clinical device. An implication analysis is required so psychologists may ethically offer professional support, since clinics may produce or reproduce oppressive and excluding discourses. However, we believe how powerful psychotherapy could be if used as a way of promoting autonomy and transformation towards free and authentic ways of life.

The papers investigated cartographs four categories that psychopolitically characterize the clinic: colonizing practices, psychotechnocracy, capitalization of care and hope. The first refers to oppression, the colonization of subjectivities and the maintenance of a dominating hierarchy, whose target is the conservation of the privileges of part of society based on Eurocentric standards. The second is based on discipline, which frames life in norms and manages it based on universal truths about humanity and their behavior. The third is grounded in neoliberal logic, the axiomatic of capital, controlled by economic and production relations, massifying and serializing the ways of living and relating to others, acting in favor of the market and capital, reinforcing individualism, identity fixation and medicalization of life, instrumentalizing psychology in order to accelerate productivity in any instance. The fourth, which is the approach we believe in, unveils politicized practices, those implicated in singularities and production of differences. Hope is a way of opposing forms of oppression, domination and hierarchization identified in the previous axes. A way of fomenting changes by collectively strengthening resistance, as opposed to fatalism and immobility.

In conclusion, we believe in an ethical approach, which approximates individual and collective political forces. It works through an experimental and creative attitude towards the production of life, enabling processes of subjectivation that produce reality by denaturalizing what is stated by the hegemonic and dominant social order. A clinic based on deviation, which destabilizes the order taken as natural and dares to invent new ways of being, thinking and feeling life.

Care in psychology and social subjectivity: Representations, practices, and possibilities

Amanda Maria de Albuquerque Vaz, Valéria Deusdará Mori & Luciana de Oliveira Campolina

Abstract

Taking the Theory of Subjectivity and its critical-propositional, cultural-historical and complex perspective as a standpoint, this paper aims to discuss two different ways in which Psychology represents and practices care: as (re)directing and as treating people, both justified as intending to do what is “best” for them. We highlight how these representations and actions related to them match the dominant social subjectivity’s homogenizing, standardizing and pathologizing movement towards people, as well as its correction technologies. Overall, we discuss care in Psychology as the representation of a space of existential fabric and, therefore, as a necessarily ethical-political endeavor.

Keywords

care, Psychology, psychologists, subjectivity, dialogic

González Rey's Theory of Subjectivity, from a critical-propositional, cultural-historical and complex standpoint (Goulart et al., 2021; Mitjáns Martínez, 2022; Vaz & Mori, 2023), looks at subjectivity as the ontological foundation of the human, and thinks of it as a complex system whose distinctive quality is to integrate the emotional and the symbolic in the conditions of culture (González Rey & Mitjáns Martínez, 2017). This necessarily demands discussing what is meant by culture in this perspective. In the words of González Rey (2017), “Culture is a symbolic system within which various human practices and normative systems foster life for the persons who share one particular culture” (p. 182). The verb “to foster” has several definitions, which gain meaning depending on the context they are in. Among these meanings, we have “to create” and “to nurture.” When discussing culture, we understand that both of them have heuristic value, whether in more literal and concrete forms, or in more metaphorical and abstract ones. Taking this into account, it is our understanding that using the Theory of Subjectivity as a resource for representing and giving meaning to human processes in the various fields of human experience in which

the study of the Theory of Subjectivity has been developed, necessarily requires that one thinks about culture in the ways in which, in this system, people jointly produce ways of creating and nurturing life for each other; that is, in the ways in which care is a recursive condition of culture itself. We believe that reflecting on care within the scope of the Theory of Subjectivity is one of the most crucial breakthroughs yet to be set in motion from this/in this perspective.

In this sense, as we understand care as a dimension of culture, we also understand it as a subjective production, since, in the Theory of Subjectivity, culture itself is seen this way:

“Subjectivity configures cultural acts and processes per se; that is, culture is a subjectively produced system. Only the generative quality of subjectivity keeps the culture alive and determines the existence of a recursive process through which each of those acts and processes is intrinsic to the development of the other. This living process is impossible to capture in any static definition of culture as something given objectively” (González Rey, 2016, p. 11). Therefore, what we propose when thinking about care in this sense is to discuss it without approaching it from any *a priori*, universal, external, direct, linear and univocal cause-and-effect perspectives, but as being socially and historically organized. Nonetheless, this does not mean understanding care as devoid of an objective character, but reflecting on this character as subjectively constituted, insofar as “(...) individuals exist for a shorter time than the duration of cultural development. Therefore, each human generation is born within a well-established cultural world that creates the illusion of culture as being an objective world” (González Rey, 2017, p. 182).

We highlight that recognizing this objective character of care does not imply thinking of it as homogeneous, precisely because it is configured subjectively. In each generation of people – and several generations cohabit in each given historical moment of a society (González Rey, 2017) –, different paths of subjective conformation of care are and will be outlined, as each person, group and institution will subjectively produce different ways of living it.

Having made these considerations, for the purposes of this work, we discuss care by focusing our reflection on the social dimension of subjectivity. Nonetheless, we wish to reinforce that, in the Theory of Subjectivity, as subjectivity configures a new quality of process in its emotional-symbolic integration, it is simultaneously individual and social. Therefore, the emphasis on social subjectivity is not organized here as a dichotomy, but as a reflection prism to think about macro dimension processes that are a part of care. In this way, it is fundamental to include the theoretical category “social subjectivity,” which we use in our considerations. However, to do so, we understand that it is better to first present the theoretical categories “subjective sense” and “subjective configuration,” given that they are the ones that, when articulated, represent and signify the subjective processes.

In the Theory of Subjectivity, subjective sense is the most basic, elementary, and dynamic unit of subjectivity (González Rey & Mitjáns Martínez, 2017). In their genesis, emotions become symbolic and the symbolic becomes emotional, creating, in this union, and without establishing a linear and direct

relationship of cause and effect, the subjective nature of the experience (González Rey, 2005, 2015). Subjective senses emerge in every human experience, arising well beyond intentionality and consciousness, and they take shape in different forms amid different actions (Mitjáns Martínez & González Rey, 2017).

The subjective configuration, in turn, represents a stable formation of subjective senses whose aggregating principle is their high convergence (Mitjáns Martínez & González Rey, 2017). This stability does not mean that subjective senses and subjective configurations lose their dynamic attribute, or that specific subjective senses can only conform to a single subjective configuration, or even that only identical subjective senses are articulated. It means that, in the subjective configuration, by virtue of the convergence that leads to its organization, even if they are reorganized, certain subjective senses carry, in relation to one another, great importance in the subjective processes.

Therefore, when thinking about care in terms of its subjective conformation in social subjectivity, we are thinking about care in terms of its complex, dynamic, and procedural organization in the concrete history of a society in its culture. This organization occurs between subjective senses that converge with each other, and between subjective configurations thus formed – and due to the relationship of these senses and these configurations with what is experienced as care in different fields of experience, relationships and moments of people, groups, and institutions. That is, we are thinking about care, in its subjective conformation, in “(...) an integrated system of subjective configurations (in group and individually) that are articulated at different levels of social life” (González Rey, 1997, p. 133), which is precisely social subjectivity. As a matter of fact, this is one of the great values of the Theory of Subjectivity: to represent and signify human processes, and to advance theoretically in this direction, by allowing the articulation of what was experienced in its diversity and complexity in a configurational logic (Mori, 2020, 2021). Thus, social subjectivity involves the ways in which discourses, social representations, myths, beliefs, morals, ideology, language, symbols are subjectivized, as well as social productions that outline a culture in a given time of a society, such as religions, race, gender, constructions about childhood, old age, health and illness, among others (González Rey & Mitjáns Martínez, 2017), such as care itself.

In the next section, we turn our attention to what is called dominant social subjectivity (González Rey & Mitjáns Martínez, 2017), as well as to the type of psychology that, in our understanding, simultaneously supports it and is supported by it: mainstream psychology (De Vos, 2012; Parker, 2007, 2020). It is our understanding that the relationships that they maintain with each other have managed care representations and care practices of Psychology as (re)direction and treatment based on doing what is believed to be “best” for people; therefore, it is crucial that we detail these relationships.

Dominant social subjectivity, mainstream psychology and care

When discussing social subjectivity, it is always important to situate which sphere of analysis one is talking about. We emphasize that social subjectivity is characterized as a level of subjectivity by the distinctive quality of its processes, and not because it refers to a certain *a priori* scale of people sharing a specific culture. It is possible to think of social subjectivity, for example, when talking about a family, a group, an institution in its entirety, different groups within an institution, a group of institutions, a country or different groups within a country. It is even possible to speak of the social subjectivity of a continent or of the world, considering both the globalization processes and their impact on local cultures (Latour, 2017/2020a) and the cultural sharing promoted by the interweaving of digital devices and the Internet to existence and to life (Segata & Rifiotis, 2021). It is also possible to think of social subjectivity by discussing the interactive and recursive articulation of different social subjectivities configuring each other. In this case, when thinking about a subjective social conformation that involves several subjective social conformations in a complex relationship, it is reasonable to discuss the theoretical category “dominant social subjectivity” It designates, in the Theory of Subjectivity, a social subjectivity that comes to exert certain hegemony, due to its stability and strength, in the configuration of a configuration of social subjectivities. In a way, even when talking about the social subjectivity of a family, a group, an institution, etc., and even if the sphere of analysis is smaller when compared to a situation in which one talks about the configuration of a configuration of social subjectivities, this sphere of analysis is always liable to be referred to in relation to broader spheres of social subjectivity and, thus, of a certain dominant social subjectivity.

With that in mind, we clarify and emphasize that the dominant social subjectivity that we refer to in this work concerns a very broad, global sphere of analysis, whose domain was established in recursive feeding to mainstream psychology. We historically situate this dominant social subjectivity and mainstream psychology in social, cultural, economic, political, ideological, and institutional outlines organized from the 18th and 19th centuries (Danziger, 1997; Figueiredo, 1992/2017), primarily in the West, but whose presence, contemporarily, can be found all over the world. As discussed by two of us in a previous work (Vaz & Mori, 2022), this dominant social subjectivity notably derives from the establishment of the big four: science-technique-industry-economy (Morin, 2007/2011), in its links with governmentality and the inscription of subjectivity that both demand of Psychology (Foucault, 1991; Rose, 1998). It also has to do with the ways in which the processes of globalization and the digitalization/virtualization of existence and life have promoted and expanded both the psychologization of the human, engendered by mainstream psychology, and the spectacularization of the psychological and the psychologized (Vaz & Mori, 2022).

It is possible to argue that mainstream psychology concerns only one type of psychology, which questions why we choose to speak of Psychology as a whole when discussing it, taking into consideration that many other psychologies

were woven, even in order to confront it, overcome it and dethrone its hegemony. However, what we defend is that mainstream psychology, much more than a type of psychology, and due to the strength and stability that its relations with the dominant social subjectivity confer it, organizes itself as a privileged way to do Psychology, to the extent that what we call Psychology turns out to be, always, the subjective production of the people who dedicate themselves to it (Mitjans Martínez & González Rey, 2017). In this way, even the psychologies that aimed and aim to combat mainstream psychology, in many regards, ended up and end up identical or similar to it (González Rey, 2007; Neubern, 2004), precisely because of how present it is in the subjective constitution of people, groups, institutions and culture itself.

In articulation with the dominant social subjectivity, mainstream psychology comes to represent and produce care in Psychology as aimed at planning and executing psychological interventions on people and their trajectories – in the most diverse ways and in all fields of existence. It does so because it understands that the focus of Psychology is, *par excellence*, the universal, static, hermetic individual, which, in this perspective, is solitarily responsible and accountable for themselves and for their path. In mainstream psychology, Psychology is likely to predict and control individuals as a neutral and objective undertaking detached from history and culture. In this way, the care of Psychology as a necessarily interventionist practice focuses on individual and “social” (a psychologized social, taken as a mere agglomeration of individuals) “well-being,” “quality of life” and “health” (absence of disease). Here, well-being, quality of life and health are taken as the alignment and framing of people to the world “as it is”; that is, they are taken as the alignment and framing of people to the culture related to the dominant social subjectivity, experienced as given and unchangeable (as we previously discussed when considering the subjectively produced experience of culture to be “objective,” as if this objectivity meant that there is a single reality, consistently identical to itself, in spite of us and what we produce).

As operators of Psychology care as an interventionist practice, dominant social subjectivity and mainstream psychology generate two different types of subjectivity technologies (Rose, 1998), which are complementary: those of (re)direction and those of treatment. The first aim of diagnosing people is to put them on the “right path,” attainable by the adoption of prescriptions and interdictions made by Psychology. The second aim, in turn, is to diagnose people to “cure” them, also through prescriptions and interdictions, so it is likely they can eventually be put on the “right path.” Initially, the (re)directive and treatment interventions were configured subjectively from the need to separate the good, the proper, the right, the sacred, the pure, the normal, the moral, the civilized, the healthy and the sane from the evil, the bad, the wrong, the profane, the filthy, the abnormal, the immoral, the savage/barbaric, the sick and the crazy. They assume these molds based on modern dichotomous values constituted through institutions that organize existence, such as the law, the State, family, work, and religion (Bauman, 1997; Foucault, 1961/2010). As new and different processes were historically organized, new (re)directive and treatment interventions were

also engendered. They are based on the strength and stability of productivity, success, happiness (Birman, 2010; Cabanas & Illouz, 2019), resilience and later antifragility, positivity (Freire Filho, 2010), authenticity (Figueiredo, 1992/2017) and self-realization (Rose, 1998) as intrinsic capacities everyone has, and which work in the same manner for everyone (you simply must want it), acquired in the conformation of dominant social subjectivity and mainstream psychology in postmodernity.

These two groups – modern and postmodern (re)directive and treatment interventions – are not mutually exclusive, quite the contrary. These tight historical divisions are merely a theoretical resource to represent and signify reality (Delumeau, 1984/2007; Latour, 2010/2020b), especially considering what we already pointed out in relation to the heterogeneity of culture and the coexistence of different generations and different subjective productions in the same historical period. Thus, modern and postmodern (re)directive and treatment interventions coexist, interact and relate in the ways in which they are subjectively configured in people, groups, institutions and culture. They benefit enormously from the epistemological silence of Psychology (González Rey, 2013) and its consequent favoring of an ethical-political void (Figueiredo, 2004/2015) in the subjective conformation of care in this science and profession.

Care as an existential fabric

Based on what has been said, in this section, we look at care differently. The perspective from which we see it in this work, when thinking of it as the ways jointly and recursively produced by people to create and nurture life for each other at the level of culture, involves looking at it as an existential fabric. This means understanding care as a relational space in which paths and places to exist not only are organized but organize themselves – even though these paths and places, frequently and contradictorily, come to generate and/or aggravate subjective suffering, both on an individual level and on a social one. In the case of Psychology, this reflection demands that we problematize the ways in which people, groups, institutions, and culture itself suffer from favoring the terms of subjectivation engendered by the dominant social subjectivity and by mainstream psychology. Therefore, this reflection also necessarily incurs in questioning the ways in which people, groups, institutions, and culture itself suffer due to the directions and stances of care that constitute human processes through prescription and interdiction (Figueiredo, 2007), as the psychological interventions of (re)direction and treatment.

In our understanding, this happens, partly, due to the very definition of care as a psychological intervention, in which care comes to be understood and experienced by psychologists as the application of *a priori* and external knowledge to the other. This definition allows for the professional performance to organize itself as a technical and instantaneous action upon the other, which was prefabricated for them. Thus, the relationship with the other is hierarchical, and it is based on the premise that they need psychologists and Psychology to

guide and change them (Mori, 2019). This keeps the other in a position of passivity, dependence, and subjection, and configures the omnipotence and immediacy that we believe to define Psychology historically and contemporaneously.

From the perspective of the Theory of Subjectivity, care as a psychological intervention loses its heuristic and action value due to the generative, self-generating and multiply constituted and constitutive character of subjectivity in its dynamism, process and recursiveness. In this way, the knowledge of psychologists about the other can only take shape precisely from the relationship with this other, as well as the specific quality of this relationship (Vaz & Mori, 2023). Knowledge that is prior and external to them but present in their conformation does not appear as an *a priori* determination of what the other is and needs, as some sort of “copy and paste.” This knowledge, which psychologists possess due to their concrete trajectories, their studying, their experience, their paths, and places to exist, emerges as a tool to represent and give meaning to what is developed in the relationship and to the other’s subjective processes. It helps psychologists move forward in two ways. The first of these is in the understanding of what unfolds in the relational “in between,” so that this knowledge is not configured, therefore, as an applied knowledge, but as a continuously organized knowledge in the experienced and reflective path of psychologists regarding the relationship and the subjective processes of the other. The second way relates to authorial production, by the psychologists, of their action, a movement that involves creativity and creation in their positioning in their relationship with the other – and not only through the alterity that arises from being with this concrete other, but with the alterity that also emerges in the relationship of each psychologist with themselves (Figueiredo, 2004/2015).

Thus, in the Theory of Subjectivity, psychologists are not seen as interveners in the subjective processes of the other, but as facilitators (González Rey et al., 2016) – and as facilitators of the emergence of new subjective senses and of new and/or different subjective processes (González Rey, 2007, 2011a). Psychologists are seen, then, as facilitators of the subjective production, by the other, of new ways and places to exist. That is, psychologists are understood as facilitators for the other to subjectively produce their own existential fabric, their own care, with the implications, responsibilities and consequences that arise from this process. Therefore, the other takes on an active, autonomous, and leading role. In this perspective, psychologists do not care for the other by intervening on their behalf, by univocally directing them to the “right path,” or by prescribing and interdicting. They take care of the other in two ways. The first one involves seeking to facilitate the configuration of their relationship with the other as a dialogical space (González Rey, 2005; Mori, 2020, 2021), as a significantly distinguished communication space in which, due to the subjective engagement of the people involved, the spontaneous, the unexpected, the unpredictable, the uncontrollable, the contradictory, the experimentation and the reflection process appear, and, alongside them, the possibility of emergence of new subjective senses and of new and/or different subjective processes. The second way, in turn, involves psychologists seeking to sustain, in the other’s time and for as long as

the other takes, their mobilizations and movements, as well as their advances and “setbacks” – which are crucial for advances.

In this sense, we emphasize that when the understanding of care as a psychological intervention no longer stands, the same will happen to the understanding that the mere offer, by psychologists, of what they understand and experience as care does not necessarily mean that the other who seeks care is being cared for. We highlight that there is a very significant difference between making ourselves available, as psychologists, to care for the other, and between this other subjectively living the experience of being cared for by us. When we are willing to take care of the other, the forms and postures that we call care are thus taken by us from ourselves, in a way that our actions towards those who seek to be cared for are related to how we subjectively configure care, and to what we offer from that. Secondly, the forms and postures are taken as care not only by us, but also and mainly by the other, and from the ways in which, alongside them, we subjectively configure this relationship.

In this perspective, it is our understanding that care as an existential fabric demands both the willingness to care for the other and the continuous openness and restlessness to understand what it is that this other experiences as care, with the aim of shaping professional action in a way that is sensitive to the uniqueness of their processes (Vaz & Mori, 2023). We also understand that it is the recursive interlocution between such disposition, and such continuous openness and restlessness, which makes care necessarily ethical-political. This interlocution demands that we question, as psychologists, which postures we will adopt, how these postures will take place, and at the service of what, who, and what paths and places to exist. These questions permeate us in our trajectories as care professionals, also based on how we subjectively configure our stories and life projects, our culture and our citizenship. Thus, care commands us to constantly dedicate ourselves to understanding and taking responsibility for our own subjective processes, as well as the subjective processes of our culture, given that it is from them that we are willing not only to care for the other, but also to become sensitive to the other in their subjective processes.

Taking all this into account, finally, we argue that care as an existential fabric still requires reflection on the representations through which Psychology has given meaning to human processes in three areas: a) in the participation of the other in them, which we extensively discuss in this work; b) in the “rivalry” of preponderance, in the subjective conformation of care, between past, present and future, and c) in the logic of directing care to certain human processes to the detriment of others.

With regard to the participation of the other in human processes, when care is experienced as an existential fabric, it is necessary to re-dimension ideas such as introjection (González Rey, 2004) of care, in which the ways we are cared for speak, in an univocal and privileged manner, of the ways through which we will take care of other. We understand that, yes, they come to participate in the subjective configuration of care, but that, when considering it in its complex nature, this level of prediction and determination is necessarily put in check - because care, as a subjective production, configures itself conjointly and

recursively to the culture and the experience in its multiplicity. This also involves pointing out that, even in the face of the strength and stability of the dominant social subjectivity and of mainstream psychology in favoring the subjectivation of care as a (re)direction and treatment intervention, the emergence of differentiated care representations and practices does not become impossible, quite the contrary. If the other as a caregiver does not predict or determine who we will be as caregivers, then the dominant social subjectivity and mainstream psychology, as other with a broader dimension, cannot do this either. It is from this that alternatives arise, in relation to the hegemonic ones, in the scope of care. We also emphasize that the other that we talk about in this work is always a concrete other, socially and historically configured, be it a person, a group and/or an institution. Just as we do with care, we do with the other, stripping them of any *a priori*, universal, external, direct, linear and of univocal cause-and-effect perspectives. We also consider that care as an existential fabric (able to produce subjective processes of new and different qualities, as well as able to produce life alternatives and protagonism) can only happen when the other is experienced as a truly other: as someone different and, therefore, free in relation to what we are and what is ours as psychologists. Difference is the foundation of the dialogic and dialogue and, therefore, of the care we are talking about in this work.

In turn, the fight implemented by Psychology between past, present and future in the subjective conformation of care also loses its value – because, in the Theory of Subjectivity, the past and the future are integrated in the current subjective production, configuring a subjective temporality (González Rey & Mitjáns Martínez, 2017). This means recognizing that care as a subjective process, both in its historical dimension and in what is dreamed, fantasized, and projected as its future, is configured and configures itself in the procedural course of the current moment of people, groups, institutions and culture. Again, this is where alternatives are produced, in ways of caring, in relation to the dominant configuration.

Finally, we turn to the logic of separating human processes (González Rey, 2011b) and directing care to some of them to the detriment of others. This dynamic loses its heuristic and action value, along with the notion of psychological intervention, as we abandon the understanding that care happens magically from actions, on the part of psychologists, focused on human processes according to the division that Psychology created for them. Care does not magically happen because psychological interventions are directed to cognition, affection, thinking, feeling, language, behavior, development, learning, creativity, etc. We understand that it is people, groups, and institutions that should be cared for, and that proposing ourselves to take care of them involves recognizing them in the emotional-symbolic integration of their experience, and in its entirety. When care is fixed as a “function” of certain human processes to the detriment of others, care ends up incurring the same logic of psychological intervention, since this separation of human processes partly underlies the importance that the application has in this sphere.

Luciana de Oliveira Campolina has a PhD in Education and is both the Coordinator and a Professor in the undergraduate course of Psychology at the University Center of Brasília, Federal District, Brazil. She is also a Professor in the Psychology Master's Program of the same institution. She develops research on subjectivity in a cultural-historical perspective, learning and innovation. She is a member of ANPEPP's Work Group "Subjectivity: Teaching, Learning, Development". Email: campolina.luciana@gmail.com

From the fragmentation of the individual in the biopsychosocial model to a conception of totality: Theoretical-political implications

Flávia Gonçalves da Silva & Sandro Henrique Vieira de Almeida

Abstract

Most professionals in the health arena refer to biological, psychological and social aspects as part of a health process that is based on the biopsychosocial model. This model emerged in contrast to the biomedical model and tries to understand health and individuals in an integral form. The argument is that the attention given to health should be multidisciplinary to investigate the three aspects that name it, but that the individual is fragmented in order to try to sum the parts. Another aspect that shows this fragmentation is the dominance of one of the dimensions in the explanation of the individual's condition, seeing genetics and/or neural constitution as the main causes of disorders, while the social aspects are said to facilitate or provoke something that is already present in the individual, determined by biological aspects. The biopsychosocial model promotes the pathologization and medicalization of processes that are psychosocial and, therefore, must be understood in their totality. A conception of totality in health should start from the understanding that the individual is constituted in a historical-cultural way, considering their biological possibilities, which are also determined by social aspects. The aim of this article is to reveal the fragmentation of the biopsychosocial model based on Cultural-Historical Psychology, whose theoretical-methodological assumptions are based on historical-dialectical materialism. The understanding of health and the individual in totality allows for the investigation and/or intervention that strive for human emancipation, which necessarily requires breaking with political and economic positions that lead to repression and dehumanization.

Keywords

Cultural-Historical Psychology, biopsychosocial model, biopsychosocial unity

Introduction

The political dimension has always been part of the constitution and understanding of reality as a whole, whether in everyday interpersonal

relationships, in the way of understanding the world based on practical experiences, or in the more elaborate ways of producing knowledge, such as philosophy, art and science. From the scientific aspect, it means that every production and its uses answer to certain interests and aspects of reality, in order to attend to specific groups that hold power as well as to minimize human adversities, among other possibilities.

In a recent example, widely broadcast in the media, numerous health professionals defended and prescribed (doctors, in this case) the use of chloroquine and hydroxychloroquine to prevent and treat COVID-19, even when there was scientific evidence that the aforementioned drugs were ineffective. In Brazil, most of the professionals who prescribed the use of chloroquine and hydroxychloroquine were aligned to right or extreme right-wing political ideologies. Those who followed these ideological perspectives, including governmental officials, in addition to defending and prescribing those drugs, denied the seriousness of COVID-19, which led to the absence or delay in the elaboration and development of public policies that could have minimized the harm the pandemic inflicted on most of the population.

Although the example above refers to the use of a product based on scientific studies, the political dimensions also influence what and how it is studied. The experiments conducted by Nazi scientists during World War II demonstrate the seriousness of this situation. Another example is the construction of a eugenic science and the development of research involving participants that were considered sub-human, such as Jews, people with disabilities, autistic, homosexuals, gypsies, which caused serious ethical issues (Greco, Welsh, 2016; Sheffer, 2019; Rezende, 2019).

Psychology, as a science, is not exempt from the political dimensions, either in the professional actions of psychologists that work in diverse areas, or in the theories that guide psychological practices. The various texts that make up this collection show this, whether with evidence of professional practices such as theoretical-methodological analyses of specific theories in the field of psychology, or in specific knowledge areas. This text is an analysis of a hegemonic conception of health today – the biopsychosocial model – from Cultural-Historical Psychology, which has as its theoretical-methodological assumptions dialectical and historical materialism. Thus, the aim of this text is to present, based on the foundations of Cultural-Historical Psychology, arguments that highlight the fragmentation of the biopsychosocial model as well as the maintenance of processes of the naturalization and biologization of the subject as a whole and of the world they in. In order to present the arguments about the fragmentation of the individual promoted by the psychosocial model, this text is organized in two parts. The first part presents the model in general terms, highlighting the advances in relation to the biomedical model and the challenges that have not yet been overcome, either because of problems in its implementation or in its conception, which is the main object of analysis of this text. The second part highlights the theoretical-methodological aspects of Historical-Cultural Psychology concerning the understanding of the individual in a perspective of totality, using as its method of analysis the decomposition into

units to confront the weaknesses identified in the biopsychosocial model and highlight possibilities of overcoming them.

The biopsychosocial model

George Engel was a pioneer in discussions about the need to overcome the biomedical model. He argued that it was necessary to develop a model that considered diseases not only in the constitution of health, but a model that included the individual as part of the process. In an article published in 1977 in the journal *Science*, Engel, a psychiatrist who adopted as reference psychosomatic theory, presented the need for psychiatry and medicine in general to overcome the biomedical model in order to adopt the model he called biopsychosocial. According to Engel (1977), in the 1970's, psychiatry was going through a crisis as it could not understand if the types of psychic suffering it investigated, and in which doctors intervened, were in fact diseases. At the time, diseases were understood as a form of biological dysfunction that could be measured.

To Engel (1977) there were two groups of psychiatrists. On the one hand, there were those who understood that psychiatry was not part of medicine, as it was not possible to comprehend suffering the same way biomedical medicine did. The other group of psychiatrists were those who restricted illnesses to brain dysfunctions. The psychiatrists that belonged to the first group defended the idea that it was the role of medicine to treat diseases and that the behavioral problems caused by “problems of living” could be treated with educational processes. Therefore, they were not issues related to psychiatry.

Implicit in this argument is the premise that while the medical model constitutes a sound framework within which to understand and treat disease, it is not relevant to the behavioral and psychological problems classically deemed the domain of psychiatry. Disorders directly ascribable to brain disorder would be taken care of by neurologists, while psychiatry as such would disappear as a medical discipline. (Engel, 1977, p. 378).

On the other hand, the biomedical conception of mental disorders

assumes disease to be fully accounted for by deviations from the norm of measurable biological (somatic) variables. It leaves no room within its framework for the social, psychological, and behavioral dimensions of illness. The biomedical model not only requires that disease be dealt with as an entity independent of social behavior, it also demands that behavioral aberrations be explained on the basis of disordered somatic (biochemical or neurophysiological) processes. (Engel, 1977, p. 379).

Throughout the article, Engel (1977) reinforces the need to contemplate the biological dimensions, but affirms that they could not explain all the manifestations of the illness or suffering, as it was necessary to take into

consideration how the person felt that condition, what meanings the individual attributed to it, and if and how the individual considered themselves sick. Assuming or not the position and the engagement in the therapeutic process were factors that could not be neglected. To the author, it was not enough to identify the biological alterations that happened in a specific disorder, it was necessary to relate the alterations with the psychological aspects of each individual.

Diabetes and schizophrenia have in common the fact that conditions of life and living constitute **significant variables influencing** the time of reported onset of the manifest disease as well as of variations in its course. In both conditions this results from the fact that psychophysiologic responses to life change **may interact with existing somatic factors** to alter susceptibility and thereby influence the time of onset, the severity, and the course of a disease. (Engel, 1977, p. 385, our emphasis).

In addition to understanding the importance of social and psychological factors in illnesses and suffering, Engel (1977) points out the relevance of the relationship between doctor and patient, in particular the need for professionals to be able to evaluate factors that cannot be observed in laboratory tests. The biopsychosocial model would explain why certain experiences cause illnesses and/or intense suffering for certain people, while others see them as living conditions (Engel, 1977). It is the doctor's role to identify these situations and understand that he or she cannot solve everything, but it is necessary to work with other health professionals. Therefore, doctors need adequate training to develop skills that allow them to evaluate not only the biological, but also the psychological and social aspects (Engel, 1977).

In order to provide the basis to understand the determinants of a disease, its treatment as well as standard rational health care, a medical model should also take into account the patient, the social context they are inserted in and the complementary system planned by society to deal with the disruptive effects of the disease. That is the role of the doctor and of the health system. This requires a biopsychological model. (Engel, 1977, p. 386, free translation).

Engel's propositions are the foundation for the biopsychosocial model adopted until today. Even though his name is not mentioned in many studies, to those who defend the model, understanding it as taking into consideration the biological, psychological and social aspects of health and illness, allows health professionals to see the individual in a holistic form. This requires not only the action of doctors, but also a whole multidisciplinary team (Pereira, Barros, & Augusto, 2011; Greco, 2016; Rezende, 2019; Tripathi, Das & Kar, 2019; Leiva-Peña, Rubí-González & Vicente-Parada, 2021).

Concerning public policies, this conception guided the creation of multidisciplinary health teams, for example, in primary care that is characterized as a set of actions to prevent and promote health, control chronic diseases, and palliative care at the individual or collective level. In Brazil, one of the main health strategies at this level of care is the Family Health Strategy (*ESF*, in the

Portuguese acronym) (Brazil, 2012). Professionals that work with *ESF* are doctors with general training or specialists in family health; they can also be general nurses or specialists in family health, nursing assistants or patient care technicians and community agents. From 2008 to 2020¹, it was compulsory that Brazilian municipalities provided training to multidisciplinary teams related to the Expanded Center for Family Health and Primary Care (*NASF-AB*, in the Portuguese acronym). The teams included physiotherapists, psychologists, social workers, pharmacists, nutritionists and other professionals involved in primary care. These professionals were oriented by the *ESF* team and provided matrix support to *ESF*.

In terms of professional education, in addition to the undergraduate health courses theoretically emphasizing the biopsychosocial model as the guideline for professional practices in Brazil, in 2005, Multidisciplinary Health Residencies courses were created according to Law 11.129. These programs are *lato sensu* post-graduate courses aimed at in-service education of health professionals that can work at strategic levels of attention (that is, mental health, primary care, cardiovascular, among others) and with different target populations – children and teenagers, families, adults and senior citizens (Brazil, 2005).

As could be observed from the brief explanation about the biopsychosocial model and some of its impacts for the professional education process and its impacts on the elaboration of health public policies, its advancements in comparison to the biomedical model are undeniable. The fact that it does not restrict the individual to the biological dimension allows not only an understanding closer to the totality of its constitution – explaining what is not biologically possible – but also the diversity and quality of health services, both uni- and multidisciplinary.

Pereira, Barros and Augusto (2011) emphasize how the biopsychosocial model contributed so that health care in Brazil became more humanized; this was implemented by the National Policy for Humanization in 2004. These authors argue that the aforementioned policy and the conception of care it expresses provide the understanding that subjectivity, in particular emotions and affections, are part of the health experiences and, as a consequence, that health professionals should take them into account. Pereira, Barros & Augusto (2011, p. 531) affirm that,

health care as advocated by the biopsychosocial paradigm involves the continuous reconstruction of meanings about oneself, of others and of the world, including meanings about health, illness, quality of life and autonomy, which calls for the necessary creation of a relational space that goes beyond the scientific/technological know-how. This allows looking at people beyond their illness, considering the knowledge they have about themselves, about sickening

¹ However, in 2020, the Ministry of Health published Technical Note 3, excluding mandatory training of these multidisciplinary centers. Local managers should define which and for how long the professionals who are not part of the *ESF* team can act (Brazil, 2020). This was one of the many changes in health policies implemented by the administration of President Jair Messias Bolsonaro, which has led to the weakening and destruction of the Unified Health System in Brazil.

processes and health as essential focuses on the joint reconstruction of meanings towards a healthy life in its various aspects.

The biopsychosocial model demonstrates that although the symptomatological descriptors of disorders are common, each individual feels and lives them in a unique way. This means that in addition to a multidisciplinary team, it is necessary for each professional to develop a relationship with the person under their care by means of quality listening. Therefore, it is necessary that professionals receive not only training, but also adequate working conditions.

This is one of the setbacks for the appropriate implementation of the biopsychosocial model or any other than the biomedical model. The lack of working conditions, in particular quality time to listen to the individual that is suffering or ill, and the lack of contact with another health professional to share evaluations about the medical cases is the reality of many professionals. This is a common situation for most professionals who work in public health contexts.

Some critical aspects in health care contexts include the lack of professionals to deal with the work demands, the pressure to achieve productivity goals, and the inadequate and/or insufficient physical and material infrastructure of working places. These aspects limit and often prevent professionals from breaking with the logic of biomedical care; instead they end up focusing on patients' symptoms and prescription of treatment, which is predominantly pharmacological.

Another limiting aspect is the lack of skills observed in health professionals in how to evaluate individuals in other ways except by means of standard protocols/tests/anamnesis or by means of laboratory tests. Despite the fact that training courses in the health area advocate the biopsychosocial model, future professionals receive little training on how to evaluate individuals without the use of instruments mentioned above. The same is observed in relation to the development of qualified listening, which in Brazil is part of the humanization policy (Santos, 2019). In mental health, it is rare to observe professionals, including psychologists, who use any kind of instrument other than the standardized ones to diagnose patients.

It is important to highlight that these instruments have a role in diagnostic processes, but should be used as indicators and not as the only form of diagnosis. This is because standardized instruments can identify, quantify and sometimes describe the behaviors that can be considered symptoms, but they cannot explain them or understand the process of their construction (Silva, 2022). Smith *et al* (2013) affirm that this limitation in doctors' education (the same possibly happens to other health professionals), occurs because medical education has not adapted to the biopsychosocial model as many professionals still argue about its scientificity. Among the various questions raised about the model's scientificity is the fact that it cannot be tested, as the model takes into consideration the individual's particularities concerning the disease (Smith *et al*, 2013). According to the authors, this is the reason many critics of the biopsychosocial model do not see it as a model, but as a theory or a pre-scientific or metapsychological theory or logic.

Another criticism of the biopsychosocial model pointed out by Smith *et al* (2013) refers to the fact that the generalized description that all aspects of health are biopsychosocial is not applicable in practice, therefore providing little orientation for professionals. The model also lacks specific methods to investigate what it proposes (Smith *et al*, 2013). Based on the identification of such criticism, the authors reaffirm what Engel (1977) already mentioned, that is, that the biopsychosocial model requires a patient centered-approach, and propose a set of essential questions to be asked concerning the three aspects that make up the model.

Smith *et al* (2013) present two tables containing descriptions of questions that should be asked of patients; they also highlight how doctors should act during an appointment (what aspects should be investigated, e.g. complaints, the history of complaints, their development, the physical, social and emotional aspects of complaints) as well as habits related to complaints. The authors also suggest that patients should be called by their names and that doctors should start appointments with informal conversations and demonstrate empathy towards patients. According to the authors, their proposal follows “6 criteria to ‘operationalism’ (i) logically consistent, (ii) specific in behavior terms, (iii) empirically based, (iv) technically feasible, (v) repeatable and, (vi) directed towards the creation of a concept that will function as a more predictable theory/model” (Smith *et al*, 2013, p. 268). This way the proposal could be considered a protocol.

The observation of these criteria allows us to understand how the working conditions of most health professionals make it difficult or even prevent them from acting in a way other than that based on the biomedical model. The weaknesses in the professional training and the conception of science based on a positivist epistemology that searches for reality by means of verification and measurement seem to limit the implementation of the biopsychosocial model or any other model that breaks with the logic of disease understood solely on biological aspects, and on doctor-centered care. This is observed in research and in professional practice.

In addition, it is important to mention the tendency to explain the psychic causes of illness in terms of biological aspects, either neurochemical alterations or genetics. It could be said that almost all disorders mentioned in the Diagnostic Manual of Mental Disorders (DSM), 5th edition (APA, 2014), present as the main hypothesized cause of disorders the biological components that can be manifested depending on social and psychological aspects. This tendency is observed since DSM-III, published in 1980, when American psychiatry assumed that the comprehension of mental disorders should be non-theoretical, based on the testability and verification principle, the criteria being descriptive and quantitative aspects (Russo & Venâncio, 2006). It seems that the second group of psychiatrists identified by Engel (1977) gained hegemony.

Starting with DSM- III, the biological conception, which is typical of the biomedical model, caused a meaningful increase in the number of disorders and this continues at every review of the manual. Therefore, the production of medicine to relieve the symptoms of “old” and “new” disorders also increases.

Russo and Venâncio (2006, p. 475) affirm that “in addition to the obvious economical interest this situation causes, it is necessary to consider that the set of new classifications produces and responds to a demand not only of medicine and relief but also of meaning.” From the propositions of Almeida and Gomes (2014), it is possible to say that the demands mentioned by Russo and Venâncio (2006) are concerned with epidemiological profiles that are increasingly expanding as a result of the productive restructuring of capitalism as well as the intensification of work.

This context creates in society a process called pathologization and medicalization, in which certain forms of dealing with the world are considered pathological and as the pathological conception is mainly biological, even according to the biopsychosocial discourse, medicalization is increasingly more implemented in the different aspects of life (Almeida & Gomes, 2014; Freitas & Amarante, 2015; Martinhago & Caponi, 2019). According to Almeida and Gomes (2014, p. 166-167),

it will be the role of medicine and health services to address these manifestations from the new reality of the world of work which are expressed as suffering and obstructions in individuals' lives and concrete collectivities. Health services will answer from a hegemonic scientific-epistemological paradigm that provides their structure, locating the focus and the cause of manifestations in individuals, translating them as organic disorders of the body and mind and trying to treat them.

In line with the propositions of the aforementioned authors about the predominance of biological aspects over others, the review by Moraes and Barroco (2016) about alcohol addiction indicates that, although most studies suggest multi-causal aspects, the emphasis is on the biological aspect, followed by the psychological and environmental aspects. The authors believe that, despite the multi-causal discourse based on a theory that places the biopsychosocial determinants as the causes of illness, the mono-causal view is still hegemonic.

Studies that emphasize the psychological aspects highlight personality characteristics, cognitive processes, unconsciousness, feelings, habits and behaviors as multi-causes of alcoholism (Barroco & Moraes, 2016). On the other hand, studies that emphasize environmental aspects such as work, family, gender, ethnicity, religion, income, among others as multi-causes of alcoholism, point out that family and work relations are preventive factors or risk to consumption, as the determination of disorders is in the biological or psychological dimensions. In other words, despite the fact that the biological, psychological and social aspects (understood as the environmental dimension) are considered the causes of addiction, the functions of each aspect are almost independent of one another.

In many investigations, the empirical mono-causal method is still privileged and it does not provide the understanding of the other determinations of disorders (Barroco & Moraes, 2016). This corroborates some criticism identified by Smith et al (2012) about the lack of scientificity in the biopsychosocial model. Barroco and Moraes (2016) conclude their study pointing out that,

based on this understanding, the etiology of alcoholism should be understood through the Historicity of the present moment, on the individual history in relation to the history of humanity, of human collectivity. Therefore, it is not enough to analyze only the organic aspects of the subject, their cognitive mechanisms, personality and their social and family relationships; it is necessary to try to understand, beyond the present and immediate manifestation alcoholism as a process, a synthesis constituted of the life history of individuals, that is connected to the history of human productions and the social relations derived from them. (Moraes & Barroco, 2016, p. 235).

Although the authors refer to studies about alcoholism, in which the biological aspects prevail, the social and psychological aspects also exert influence. The same applies to other disorders as can be observed in the descriptions of the DSM-V (APA, 2014).

Another evidence of this biopsychosocial conception that gives greater weight to the biological aspect is that the main therapeutic indication for disorders are pharmacological treatments. In addition, the conception of the biological, psychological and social aspects favors the emphasis either on one or another aspect; the conception of these aspects are seen as factors or variables that influence, but are not determiners of a unit, that is the individual. It is important to point out that such a conception of the biopsychosocial model is not only identified in Engel's followers, but in his own work. In the quotes by supporters of the biopsychosocial model presented in this article the words in bold demonstrate this.

Words such as factors, variables, and influences/to influence are recurrent in the texts of those who support the biopsychosocial model. Engel (1977) states that, "grief clearly exemplifies a situation in which psychological factors are primary; no preexisting chemical or physiological defects or agents need be invoked" (p. 388). On the same page the author highlights that "a biopsychosocial model would take **all of these factors into account**. It would acknowledge the fundamental fact that the patient comes to the physician because either he does not know what is wrong or, if he does, he feels incapable of helping himself" (p. 388).

In the same text, a few pages earlier, Engel (1977, p. 384) says that,

by obliging ourselves to think of patients with diabetes, a "somatic disease," and with schizophrenia, a "mental disease," in exactly the same terms, we will see more clearly how **inclusion of somatic and psychosocial factors is indispensable for both**; or more pointedly, how concentration on the biomedical and exclusion of the psychosocial distorts perspectives and even interferes with patient care.

Pereira, Barros and Augusto (2011) demonstrate that the biological, social and psychological dimensions are understood in a complementary form allowing the investigation of each one separately, as they are understood as variables.

1. The human body is a biological, psychological and social organism, that is, it receives information, organizes, stores, generates and gives meaning and transmits

them, which in turn produce forms of how to behave; 2. Health and illness are conditions in a dynamic balance; they are co-determined by **biological, psychological and social variables, all of them in constant interaction**; 3. The study, diagnosis, prevention and treatment of various illnesses should consider the special and differentiated contributions of **the three sets of variables mentioned**; (...) (Pereira, Barros & Augusto, 2011, p. 526, our emphasis).

In doing so, this model ends up fragmenting the individual in an attempt to put the parts together, even though the word holistic – that reveals the aim of trying to understand health in an integral form – understands that the whole is not the sum of its parts.

The discussion above shows that the advances the biopsychosocial model brought to the understanding of health and the interventions related to it are undeniable. On the other hand, it is a fact that the real working conditions of health professionals aligned to public policies and/or the career plan that considers as references meritocracy and productivity, complicate the implementation of the model, in addition to professional education opportunities that do not contribute to the understanding of the biopsychosocial model. However, it is understood that even if such aspects are overcome, there is a limit placed by the biopsychosocial model itself, which is the fragmented comprehension of biological, psychological and social aspects, seen as factors or variables that interfere with or may influence the predominance of one over the other.

The biomedical model has not been overcome; on the contrary, it is the hegemonic model, especially in mental health. The biological aspects are protagonists, whereas the social and psychological aspects have supporting roles. In addition, this does not refer only to a conception of mental health, but of the individual that is explained as a set of neurochemical (re)arrangements or genetic predispositions, reducing the whole complexity of what the human being is.

In order to overcome the fragmentation, it is necessary to have a theory that understands the biological, social and psychological aspects as units that constitute a totality; aspects that have an interdependent relationship. It is understood that the Historical-Cultural Psychology has a clear conception that does not fragment the individual understood as a synthesis of multiple determinations.

From the fragmentation to the totality of the individual

The theoretical foundation of Cultural-Historical Psychology is the comprehension that the psychic develops from biological, social and cultural aspects in a dialectical relationship. The individual is born with a set of biological characteristics that change throughout the individual's social and historical development (Vigotski, 1995, 1996, 1997a, 1997b, 2018, Leontiev, 1978, 1988). To Vigotski (1997a; 1997b; 2018), development is not a linear succession of events temporarily determined by the biological development of the organism, but a complex form not in parallel with the individual's age; it

matches the environment conditions that intertwine with the individual's biological possibilities.

Such transformation is only possible through the mediation of activity and language. Activity is understood as “(...) a life unit mediated by psychological reflex whose function is to guide the individual in the objective world” (Leontiev, 1978, p. 66-7). In the initial stages of development, activities are simple, the motives that drive them match the activities' purposes; later-on activities are more complex because the breadth of mediations that constitute the activities and the psychic possibilities of the individual are also more elaborate. Language plays an important role in the transformation of activities at the same time that it allows radical changes in the psyche. This is because language is a set of codes that name objects, situations, feelings that allow human not only to communicate, but also deal with objects that are not present, that is, language allows men to abstract and generalize; two central characteristics of thought (Luria, 1979). Activity and language as mediators enable the individual to develop the process that goes from clumsiness to expertise, from involuntary behaviors to mainly voluntary behaviors, which allow the individual to master their own conduct. This form of behavior is possible because the psychic processes have a dimension that Vigotsky calls superior; the processes develop through the internalization of the cultural dimensions that constitute the reality in which the individual is inserted. That is, what is inter-psychological through the mediation of activity and language becomes intra-psychological, that constitutes the psychic and allows the individuals to guide themselves in the world in a planned and intentional form (Vigotski, 1997a).

The transformation from inter-psychological to intra-psychological changes the peculiarities of the whole psyche, allowing that determined functions psychic characterized by the involuntary and biological aspect acquire new possibilities of functioning and expression, in a superior perspective in comparison to the previous form.

This does not mean that the involuntary dimensions cease to exist; it means they are incorporated in an overcoming movement by the new voluntary possibilities, which are more complex and become more predominant as the individual develops.

Another important aspect in Cultural-Historic Psychology about the comprehension of the psychic refers to the relationship between the psychic functions. Vigotski (1997a, 2018) states that in the historic development of the individual changes do not necessarily occur in the psychic function or in its structure, but in the relationship between the different functions that did not exist in the previous phases of development. Vigotski states that “... from one level to another, the essential difference was not often observed in the intrafunctional change, but in the interfunctional alterations, in the interfunctional nexuses, in the interfunctional structure” (Vygotski, 1997a, p. 72-73). It is precisely these new inter-functional nexuses that constitute the psychological system. Understanding the development of the psychic from the psychological system implies not only the study of a process or function in isolation, as they are determinants as well as determining others.

The acquisition and development of language, as stated earlier, causes a qualitatively superior change in the psyche, allowing the individual to control their behavior gradually. However, the form as well as the activity that affect the transformations of each psychic function is different, keeping in mind the specificities of each of them as well as the individual and the activities they develop. Therefore, evaluating the development and the health-illness process does not imply quantifying what is present and what is not, but analyzing its peculiarities as well. The complexity of the development and health-illness processes calls for an evaluation method that takes into consideration the contradictory movement of human beings.

To Vigotski (2018), the evaluation/diagnosis method of development, whether regular or in the process of suffering and illness, should start in the decomposition into units and not in the decomposition of the whole into elements, as the fragmentation of isolated parts does not contain in itself the human being in its totality. Analysis by means of decomposition into elements is descriptive and reduced to the identification of symptoms that do not explain how they appeared, which is essential for an adequate diagnosis and intervention. The decomposition into elements means decomposing a phenomenon into parts, in which the study is isolated or carried out in a multilateral way; later-on the elements are put together to have an idea of the whole, understood as the sum of the parts. Vigotski (2018) exemplifies this process using studies about speech that can be done considering the physiological and or anatomical aspects of speech organs and the psychic dimension. In doing so, Vigotski (2018, p. 39) affirms that "(...) we would act like a chemist decomposing water into the elements that constitute it. We would take each aspect of speech as an independent element and study each one in isolation."

The study of speech by means of the decomposition of its elements implies the biological aspects that allow the production of sound, the sound dimension of speech (letters and words) and the characteristics of transmission of meaning. However, to Vigotski (2018) this form of decomposition does not show speech, but fragments of it, as in the example of the study of water, that fragments its chemical composition, it is not water any more, but oxygen and hydrogen in isolation. Vigotski (2018) affirms that the analysis that the child will develop language, if the environment in which they are inserted has a broad and elaborate vocabulary and/or if they have good memory and are intelligent, does not explain how language is developed. The explanation is in the relationship between child and environment; if they like to speak or not, how they react to language mistakes and how the context deals with such situations.

A water molecule is the smallest unit of water decomposition that reveals its totality, even in a primary form. The same refers to speech; it is necessary to find the smallest unit that reveals its totality, which to Vigotski (2018) is the meaningful sound that depends on the characteristics of the transmission of a meaning, of the biological aspects that allow the emission of sound and the sound dimension of speech.

To Vigotski (2018) the decomposition into units is what allows understanding the process in its totality. To the author, the need to analyze by

means of decomposition into units “... *is defined by the fact that it is part of a whole that contains, even in an embryonic form, all the essential characteristics of the whole*” (Vigotski, 2018, p. 40, emphasis in the original).

Vigostki (2018) proceeds the analysis about the importance of contextualized decomposition into units using the speech example, affirming that,

consequently, it is observed again that the unit is crucial, not the elements. That is, the relationship between the environment and the characteristics of the child himself. If we find this unit, it will preserve in itself what is characteristic of the development of speech as a whole - the relationship between the environment and the personal moments. In other words, what is rooted in the specificities of the child himself (Vygotsky, 2018, p. 47, emphasis in the original).

This way, when studying any process, it is necessary to consider decomposition into units. It is not enough to affirm that the individual and their process of development, both regular process and the suffering condition and/or illness, there are biological, psychological and social elements/variables. Vigotski (2018) highlights that no one denies that the biological and environment are determinants of development and illness. Therefore, to affirm that the individual and the process of illness have these two sources, does not reveal their specificities. In Vigotski's words (2018, p. 72, emphasis in the original)

(...) the heredity component plays a role in development; however small its specific weight is in the concrete case. The role of this component is never reduced to absolute zero and, likewise, the divergence is never equal to 100. It means that an aspect that develops is never determined only as a purely hereditary characteristic - the environment also participates in the development. Therefore, development always contains, in a unit, hereditary and environmental aspects. True, this unit is varied. We have seen that the role and specific weight of hereditary influences may be greater in relation to some functions than in relation to others, and less at one age than at another. Consequently, **this unit is mutable.**

It is understood that the biopsychological model studies mental disorders by decomposing them into elements, namely the biological, psychological and social aspects, in a multilateral perspective. This statement is possible because these elements are considered factors, elements or variables, as mentioned in the previous section. Consequently, they are understood in isolation in the constitution of the disorder and of the individual. The understanding by factors leads to the description of symptoms or at the most of processes, but not the explanation, as for this it is necessary to understand the inseparable relation of biological, social and psychological aspects, which mutually determine and transform each other, which the biopsychosocial model cannot do. The decomposition into elements see the biological elements as the cause of mental disorders, even if determined by genetic predisposition. In relation to the psychic, on the other hand, the specificities of the cognitive processes, personality and

feelings, the environment as well as the social relations favor or not the development of illness, as indicated in the studies of Barroco and Moraes (2016). In current neuroscience, the brain has a central role and it is understood as the origin/source of the psyche. Thus, it is in the brain that all pathology explanations are found, as a neurochemical (im)balance.

Cultural-historic psychology posits that the brain plays a central role in the constitution and functioning of the human psyche. Nevertheless, the origin of the psyche should not be sought in the brain, but in the set of social relations of the individual. Psychological aspects such as cognition, personality, emotions and feelings, generally understood as independent processes and separate from the biological dimension, are a consequence of a brain and neurochemical organization. Emotion, for example, is an internal regulating sign of behavior, a temporary sensation that reflects a relation lived by the individual (Petrovski *et al*, 1989). Maybe the emotional state can explain it better. For example, joy, “a positive emotional state related to the possibility of fully satisfying a current need [...]” (Petrovski *et al*, p. 380), or fear related to the real or imaginary possibility of the individual to suffer some form of damage, are either material or related to the individual’s well-being. Thus, fear is considered a negative emotional state.

Although emotional states can be physiologically experienced in a very intense form (tachycardia, tremors, dry throat, etc.), these states gain a qualitatively higher dimension throughout the individual’s development. These states change from involuntary to states intentionally controlled by the individual and predominant in their performance in the world. A person who becomes too stressed out with someone who committed an infraction or a mistake, for example, a mistake that was not so serious to justify such a dramatic reaction, may feel anxious and regretful. This emotional state of anguish and regret is in fact an internal physiological sign related to the individual’s attitude that may lead the person to apologize or treat the other person more cordially (the sign regulated the behavior of the person who was stressed out (Petrovski *et al*, 1989). The stable relationship established with a person or with an object mediated by emotions may change into feelings. Feelings are constituted of emotions in a way that reflect the individual’s attitude towards the object of a stable need. Unlike emotions that have innate roots, but that are historically and socially transformed, feelings are necessarily historical and ontogenetic, because they reflect the individual’s way of living by means of norms, values and demands. The state of anger that a person may feel after a diagnosis may become a feeling of hate and last for months or years. An emotional state that may be experienced every time the person meets the person who delivered the diagnosis; when they remember the situation or when they feel certain symptoms.

This way, the various forms that feelings and emotions can be experienced by the individual have a regulating and intentional behavior function, which improves throughout the individual’s development. This why Vygotski (1996, p. 299) affirms that,

affective impulses are present in each new stage of the child's development, from the lowest to the highest. Affection initiates the process of the child's psychic development, the formation of his personality, and ends this process, thus

culminating the entire development of the personality. [...] affection is the alpha and the omega, the first and the last elaboration, the prologue and epilogue of all psychic development.

In addition to the regulatory function of behavior, emotions are important dimensions in the development of higher psychological processes. What characterizes psychological processes is the possibility the individual has of controlling them in an intentional and mediated way. In the memorization process, for example, the individual does not store everything they experience, but only those contents or aspects that have been somehow meaningful in that particular experience. This is possible because of brain structure and organization.

Based on the above explanation, it is possible to understand that all psychic processes, despite being different in terms of genetics and functioning, as well as emotions, maintain an interdependent relationship in order to develop and to constitute the psychic reflex, in which the external reality is internally recreated in the psyche.

This recreation is not a mere imposition from the external to the internal plan, but a re-signification of what has been appropriated, that is, it is recreated according to the historical and socially shared meanings about a specific situation, that has a particular meaning for the individual (Leontiev, 1978). The personal sense is a form of meaning with the same genetic root, but it represents reality in a unique way (Vigotski (2001), affections are central in this process. Vigotski (2004, p. 126) states that,

the way of thinking, along with the system of concepts imposed on us by the environment also includes our feelings. We do not simply feel: we perceive feelings in the form of jealousy, anger, outrage, and offense. If we say we despise someone, the fact of naming the feeling causes them to vary, as they maintain a certain relationship with our thoughts. [...] Just as it is impossible to distinguish where superficial perception ends and where understanding begins in relation to a given object. In perception, the structural particularities of the visual field and understanding are synthesized. The same happens at the affective level as we never experience jealousy in a pure way as we are conscious of its conceptual connections.

In another text the same author affirms

the connection between **intellect and affect**. Among the most basic defects of traditional approaches to the study of psychology has been the isolation of the intellectual from the volitional and affective aspects of consciousness. The inevitable consequence of the isolation of these functions has been the transformation of thinking into an autonomous stream. Thinking itself became the thinker of thoughts. Thinking was divorced from the full vitality of life, from the motives, interests, and inclinations of the thinking individual. Thinking was transformed either into a useless epiphenomenon, a process that can change nothing in the individual's life and behavior, or into an independent and

autonomous primeval force that influences the life of consciousness and the life of the personality through its intervention. (Vygotsky, 2001, p. 24-25, our emphasis)

There is no doubt about Vigotski's criticism of the dichotomous forms in understanding cognition and affection, that is unfortunately still present in psychology and in the health area even after a century (the passage above was originally published in 1934).

As has been said, the biopsychological model comprehends its three dimensions in a separate way, therefore expanding the fragmentation of the individual and of the health illness process. Some of the political implications of this fragmentation is the fact that it does not see the existing model of society as structurally sickening; a model that imposes situations that cause suffering, with the expansion of epidemiological profiles as highlighted by Almeida and Gomes (2014) and the normalization of pathology as discussed by Ratner (2019). According to this author,

the idealized and conventional medical model no longer reflects the social, psychological and biological reality as in the past. It should be understood that the current conventional medical model works as an ideological tool that promotes an idealized conception of society, biology, psychology and ordinary treatments. The conventional medical model legitimizes society by ignoring its pathologies. This model exacerbates its pathology by ignoring it and by trying to incorporate people into it rather than transform it (Ratner, 2019, p. 287).

It is understood that both the biomedical and biopsychological model fragment the individual and the health illness process into factors. To overcome this fragmentation, in addition to analysis by unit, another important aspect of the method used to investigate development is the comparative genetic character. It is genetically related to the genesis of the processes, which cannot be known from the symptoms. It is comparative because it evaluates the development of the individual with themselves, in different stages and in shorter intervals of time and allows evaluating what has been developed (Vigotski, 1997b), highlighting that comparison implies observation of equalities and differences of what has been analyzed. Thus, it is possible to say that the tests and inventories quantify the symptoms, in addition to identifying them, but they do not evaluate the development of processes or psychic functions in situations of illness. An evaluation of this form implies identifying symptoms and describing them, but these have to be understood as indicators of the development that should be evaluated according to the method proposed by Vigotski.

Vigotski (2018) argues that symptoms reveal what is common and recurrent in the disease process and not the particularities of its expression in each unique individual. Therefore, it is not enough to quantify them; it is necessary to know their qualitative processes, as well as to identify and evaluate qualitatively what still is undamaged despite the illness process. In summary, it is necessary to explain the reality beyond its description by trying to analyze not only the product, but also the formative processes.

Still considering the symptoms, it is important to treat them as expressions of how the individual appropriates the world based on values and current social norms. When analyzing psychosis, Ratner (1995, p. 229) points out that “(...) the great ideas about the capacity of the self, only slightly exaggerates the individualist, ambitious, competitive, cruel, anti-social, opportunistic and materialistic ethics which is the foundation of western society.” Based on this understanding, Ratner summarizes that “(...) symptoms are not arbitrary expressions of psychological disorders. They have their roots on values, beliefs, auto-definition, emotions and motives. The whole experience with illnesses is filled with cultural meanings and expresses the social character of conscience (Ratner, 1995, p. 234).²

Rubinstein (1999) agrees with Vigotski's understanding of symptoms and affirms that,

many psychopathological phenomena occur when a patient gets in touch with demands of the surrounding reality, with its effects. Consequently, the determining cause of each symptom can be very different, not specified, not pre-determined by the brain lesion itself (...) (Rubinstein, 1999, p. 17).

Considering what has been said about symptoms, only an understanding of the individual in their totality that should be investigated by the decomposition into units and not into elements, as established by the biopsychosocial model, provides such understanding. The construction of the illness process, even the one caused by biological aspects, has its social and psychological determinations in an inseparable form. The brief presentation of the understanding of Cultural-Historic Psychology about the development of emotions, feelings and symptoms reveals the dialectical relationship between the psychic processes that form the psychological system, which in turn is constituted by the unity of the biological, psychological and social.

Final considerations

Health professionals, especially psychologists who work directly in the field, should be aware of the current conceptions of the area, in particular when they support various political strategies. In this case, the biopsychological model guides numerous health public policies in various countries, including Brazil. In the scientific field, it is not different, in the diverse areas that constitute health.

In addition, in almost all training courses for health professionals, psychology is part of the curriculum aiming to help the future professional to understand specific stages of human development and some psychological processes (in their regular expression or in the process of disease) for the development of intervention practices, taking into consideration the professional specificity. In this case, psychologists who work in these training courses need to

² It is relevant to observe that this proposition about symptom is consistent with the proposition of symptom by Luria, as mentioned in many studies. For example, Luria (1981).

be involved in the discussions of the health area in general and of the professional specificities taught in the course in order to contribute to the training process, whether corroborating the current conceptions or presenting their weaknesses.

The biopsychological model explains health based on the conception of what the individual is, including biological, psychological and social aspects, in addition to the health and disease conditions that should be analyzed considering these three aspects, as argued by several authors presented in this article. However, despite the intention of this model to understand the individual and health in a comprehensive way, the biological, social and psychological dimensions are understood in a complementary way; this allows the investigation of each one separately, understood as variables. Thereby, this model fragments the individual by trying to sum the parts, even though the word holistic (or integral), which is often used by advocates of this model, understand that the whole is not the sum of the parts.

Another aspect that reveals this fragmentation, which is the result of understanding the biological, social and psychological dimensions as factors, is the fact that there is always the predominance of one dimension in the explanations about the individual's condition, the biological being the most used. This happens in explanations in mental health that have genetics and/or neural constitution as the main causes of disorders. The social aspects facilitate or promote something already present in the individual and determined by biological aspects.

It is imperative to consider and understand advances in neurosciences about the organization and brain functioning in general, as well as the processes of suffering and illness. However, the way the brain is organized also suffers psychological and social determinations that are expressed in the same phenomenon, as we tried to demonstrate with some propositions of Cultural-Historic Psychology. Thus, it is understood that only a comprehension of the individual in their totality, as well as a method of investigation (research or clinical) will provide the understanding of the process of health illness in the same way, without fragmenting their constitutive aspects, or the individual.

It is common knowledge that theoretical, experimental and other types of studies about the contributions of Cultural-Historic Psychology for the health area need to advance, in particular in relation to intervention in processes of suffering and psychic illness. In Brazil, this task has been faced successfully by many psychologists that work in the health area and by researchers, especially with their master's theses and doctoral dissertations, even though there not have been many so far.

As presented in this article, it is not enough to theorize that the individual and the illness process are constituted of biological, psychological and social aspects; it is necessary to understand how they are organized and determined inseparably. Symptoms, especially those related to psychic disorders, are social constructions based on culturally established meanings, conscious or unconsciously, considering the individual characteristics as well as those of a particular social group. Therefore, if illness is a construction, its overcoming is

also a collective construction and collective strategies should be constructed. Maybe this is the biggest challenge of the present time, in which individualism and competitiveness by means of meritocracy are intensified. These are some of the many aspects that hold up possibilities of collective actions. Collective actions should have a clear direction in relation to what kind of individuals and society are aimed for; that is why psychology is also political. Overcoming the fragmentation of the understanding of the individual and the illness processes to an understanding of totality is based on the understanding of the need of theories and practices that actually promote human emancipation and not the adaptation of the individual in a sick and sickening society.

Flávia Gonçalves da Silva is Associate Professor at the Federal University of the Jequitinhonha and Mucuri Valleys (UFVJM), Diamantina campus, in the Physical Education course. She has a degree in Psychology from Universidade Estadual Paulista (UNESP – Bauru campus), a Master's degree and a PhD in Education: Educational Psychology from the Pontifical Catholic University of São Paulo (2033 and 2007 respectively). Post-doctorate in the Collective Health Programme at the Faculty of Medicine of Universidade Estadual Paulista (UNESP – Botucatu campus). She has experience in the field of Education, with an emphasis on Educational/School Psychology, working mainly on the following subjects: human development and learning, play activities, educational psychology, Historical-Cultural Psychology. From the perspective of Historical-Cultural Psychology, she also develops studies on the health/suffering/illness process.

Sandro Henrique Vieira de Almeida is Adjunct Professor at the Federal University of the Jequitinhonha and Mucuri Valleys (UFVJM). He graduated in Psychology from Universidade Estadual Paulista Júlio de Mesquita Filho (2000). He holds a Master's and doctorate in Education: Educational Psychology from the Pontifical Catholic University of São Paulo (2004 and 2008 respectively), with research into the Soviet Historical-Cultural Theory's investigations into memory and the history of psychology in that country. She has experience in the field of Psychology, with an emphasis on History, Theories and Systems in Psychology and basic psychological processes, working mainly on the following subjects: cultural-historical psychology, history of psychology and educational and developmental psychology.

Psychotherapy with children in the context of justice: A social space for education, learning and subjective development

Vannúzia Leal A. Peres

Abstract

The way psychotherapy with children constitutes a social space for education, learning and subjective development has been discussed from the perspective of the theory of subjectivity in commitment to the generating capacity of individuals. Continuously immersed in this space, I have been building theoretical models explaining the uniqueness of this development process – especially the development of children whose parents dispute their custody in court. The interpretative constructions of these children's actions and relationships with their parents take place in individual and joint therapeutic sessions, enlivened by multiple ludic scenarios, without any previous theme or methodological coercion. While engaging in these sessions with the children and their parents, we dialogue about their experiences and provoke their unfolding in dramatic scenes and actions or the experience of the “as if” game with spontaneity and creativity, to the point of recreating them with their fantasies and imagination. During this constructive-interpretive process of dialogic character, engaging in this social space with their subjective productions and without suppressing their contradictions related to the conflicts of their parents, children learn how to create and recreate their relationships in the family and beyond, indicating that there is subjective development or qualitative changes in their subjective organization. The result of such experiences suggests that psychotherapy favors the original process of constituting subjective configurations compatible with the emergence of the agent or the subject to subvert the instituted order in favor of the development of society. Therefore, psychotherapy with children is representative of the political aspect of the theory of subjectivity or it is a resource for the process of subjective development of children in which the individual and the social are contradictory and recursively interrelated.

Keywords

psychotherapy with children, education and learning, subjective development, politics in psychology

Introduction

I really wish to share some of my ideas on the value of psychotherapy with children in the process of human development. I have immersed myself in this field since 1977, first, from the perspective of Jacob Levy Moreno (1889-1974), the creator of sociometry, the theory of social relations, and recently, based on the cultural-historical theory of subjectivity¹, developed by Fernando Luis González Rey (1949- 2019).

Initially, inspired by the thoughts of Levy Moreno (1997) on human relationships, I integrated psychodiagnosis and intervention, in practice, involving both the family and the child in joint therapeutic sessions, in which the child demonstrates to be active in their development process (Peres, 1983).

Later, guided by the theory of subjectivity, I understood that the child is active in this process by generating “subjective sense”² of communication and emotional climate in their family relations and outside of it (Peres, 2012).

I am aware that family is the “social placenta” for children, in which they learn to play social roles, that is, where they begin their development process, whose key factor, according to Levy Moreno (1997), is the emerging spontaneity in an “open universe”, in which they can move and make a stand in relation to other people who also surround them.

I agree when Levy Moreno (1997, p. 99) states that the infants are “pure spontaneity”, “potential geniuses”, that they “[...] warm up and sustain themselves from the moment of their birth”. For the author, spontaneity arises when the infant freely comes up with a need to act. However, standing by the philosophy of the encounter by the humanist Martin Buber (1977), the author affirms that the infant depends on the state of spontaneity of others such as the therapist.

Based on the theory of subjectivity by González Rey (1997, 2003, 2004, 2005, 2007) I believe that spontaneity is a subjective resource³ produced by children themselves and it emerges in their relationships with others, enhancing their capacity to creatively act. For psychotherapy, a universe open to the emergence of spontaneity, the therapist is the significant other to the children, from whom they are detached and position themselves creatively in relation to their families and other social spaces.

For González Rey (2004), the children can generate subjective senses in relation to their significant others and these senses may be the source of their development.

I think that these subjective senses involve spontaneity which emerges while enhancing the children's capacity to act freely and creatively express their affective needs, conflicts and suffering. It is worth mentioning that the children's

¹ “The Theory of Subjectivity, from the cultural-historical perspective, is a way of understanding the specificity of human processes in the conditions of culture”. (Mitjáns Martínez & González Rey, 2019, p. 15).

² “Subjective sense” is the processual unit of the symbolic and the emotional that emerges in every human experience [...]” (González Rey, 2002, p. 31).

³ Goulart and González Rey (2019, p. 268) exemplify how the subjective resource “is generated in a therapeutic process” of a group that “generates new positions and forms of communication” [...].

spontaneity emerges from their emotionality and fantasies in the ongoing therapeutic process, a process that involves the therapist's actions and the interactions between them.

In Levy Moreno (1997), the children's spontaneity and creativity, imagination and fantasies in relation to the experience, represent the development of psychodramatic roles, the roles of the “psyche”. From my point of view and in accordance to the theory of subjectivity by González Rey, these roles are integrated in their process of subjective development⁴, favoring or not their emergence as agents or subjects⁵ of the social process.

Levy Moreno (1997) states that roles are the smallest “cultural unit of conduct” which allow us to understand the quality of human relationships and they can be continuously developed. The idea that the individuals (actors) can break with the social role, move freely to transform themselves and the society, suggests some proximity to the theory of subjectivity by González Rey (2003), regarding the categories of agent and subject.

It is noteworthy presenting the thought of Morin (2003a, pp. 131-132) on the “psycho-sociology of social roles” and how it evidenced the social crystallization of the roles experienced personally, “a ritual of characters in everyday life” [...] “ambassadors of the self in relation to the other, but also images of the self in relation to itself”.

Thus, I think that the value of Levy Moreno's theory of roles (1997), as elements of the “formation of the self”, comes from his idea of subjectivity, interrelated to spontaneity and creativity. It is important for the author to understand that the individual can break with the “cultural conserve” (norms and values of the institutions) and develop psychodramatic roles, the roles of emotionality and fantasies about the experience, representing an idea of subjectivity that integrates the social, individual and psychodramatic contexts into the action.

Calvente (2002), an Argentine psychodramatist, concludes that Levy Moreno failed to explain how the affective learning of roles occurs in the first universe of the identity matrix, which is “the origin and nourishment of subjectivity”.

I understand that Levy Moreno failed to develop his definition of subjectivity, especially on childhood. Even having stated that children are capable of reversing roles and understanding others in their singularity, he does not explain how they develop a “certain degree of initiative” in their actions and address bonds or relationships with different quality.

Therefore, the idea that childhood is a special moment in life, which can brighten the individual's subjective development process can not be ignored. I know that in psychotherapy the children position themselves by expressing their

⁴ “Subjective development is a singular and non-predictable process that implies emergence of individuals and social groups as subjects and, therefore, the development of new subjective resources that impact different spheres of their lives” (Goulart & González Rey, 2019, p. 263).

⁵ The agent would be the individual – or social group – located in the course of events in the current field of their experiences. The subject represents the capacity of individuals and groups to position themselves, whose limits are in the very symbolic production of culture and in the subjective resources to assume the challenges of the existential spaces of experience (González Rey & Mitjans Martínez, 2017, p. 73).

needs and affective motivations more confidently, and that this requires them to generate new subjective senses regarding their relational experiences. The way children experience these relationships in the first universe of their development processes, a universe that Levy Moreno called the “social placenta” or, in other words, the emotional climate of relationships in the family “where everything begins” is yet to be clarified.

As previously mentioned, the family is involved in the children's therapeutic process, in their learning about themselves, on how to relate to differences, with the game rules and also the unexpected. I delve into the study of this learning that is a source of subjective development. Therapeutic sessions are an opportunity for children to demonstrate their ability to act with spontaneity and creativity. In that sense, I remind that children engage in the game and in the dramatic action that are “emotional initiators” or “inductors” of the dialogue about their conflicts, which tell us a lot about their emotionality and subjective development.

From González Rey's theory of subjectivity, I observe that the performance of roles, which are both individual and collective, integrates the unique processes of children's subjective development. These processes are complexly inseparable from their families' processes of subjective development. Everything points to the fact that the children and their families are also, simultaneously and recursively, involved in the processes of subjective development of the society they live in (Peres, 2012, 2014, 2022).

With the theory of subjectivity, I seek to broaden the knowledge on the dynamic and recursive interrelation among the subjective development of children, the subjective development of the family and the subjective development of the society. Immersed in the field of psychotherapy with children, understanding that there is no direct and linear relationship in the development of these systems (the child, the family and the society) has been quite challenging. So, I try to explain how children and their families, with their subjective specificities, are mutually and recursively constituted in a cultural-historical process; how these interrelated systems simultaneously constitute the individual and social subjectivity of the therapeutic space, a subjectivity that, according to Mitjáns Martínez and González Rey has a “significant force” in the expression of the actions of individuals (Mitjáns Martínez & González Rey, 2019, p. 15).

González Rey (2004) believes that the source of the complex development process is the individual with his subjectivity in relation to his experience in different complexly interrelated social spaces.

As far as I'm concerned, the author means that the subjective development of the individual is a complex process of organization and qualitative reorganization of “a complex network of subjective configurations” generated by him in the course of his history. This history is constantly updated, from birth to death, through his continuous subjective productions in relation to their experiences in different social spaces (González Rey, 2003).

The author means that the subjectivity produced by the individual in relation to what he has experienced, at any moment of his life, in different social

spaces, enables him to continually reorganize himself and achieve a new “formation” that does not depend on any universal or that this process is singular, that is, it is not subject to categories *a priori*.

Considering all this, I present a brief discussion about the value of psychotherapy with children for the processes of subjective development of individuals and society, simultaneously. My intention is to highlight the unique processes of development of the agent and the subject, subjective conditions that represent, among other categories, the political aspect of the theory of subjectivity.

Psychotherapy with children as a social space for education, learning and subjective development

The idea behind psychotherapy sessions with children, a social space for education and learning as a subjective production, of complexly interrelated dimensions, is free of linearity. The therapeutic process in childhood, a sensitive moment in life, is favorable to the subjective development of the individual. In this process, without being immediately aware, children learn to take action in the creation and recreation of the social space of their relationships. If past and future are inseparable, as stated by González Rey (2007), I have no doubt that the children's subjective development favors the emergence of the agent or the subject at any other moment in their lives.

Immersively working with children, I have built theoretical models that explain the uniqueness of their development processes, especially the development of children whose parents dispute their custody in court. The interpretative constructions of these children's actions and relationships with their parents take place in individual and joint therapeutic sessions, enlivened by multiple ludic scenarios, without any previous theme or methodological coercion. Engaged in these sessions, in the dialogue about their experiences, the children are provoked to unfold them in dramatic scenes and actions or to experience them in the “as if” play, with spontaneity and creativity, to the point of recreating them with their fantasies and imagination.

In this process, antagonistic subjective senses emerge, generated by children in relation to communication with their families, conflicting subjective senses, dynamically and recursively implied with the disorder in this system. It is possible that they emerge as an expression of their processes of subjective development, of their singularities, which, as stated by Morin (2003b), carry “the entire form of the human condition”. Morin (2003b) assumes that the expression of emotions, at this moment in life, can mean the universality of the “affective unit” of human beings, the cultural sense of intersubjectivity and communication.

Considering the theory of subjectivity, I suppose that at this moment, subjectively configured emotions guide the children's actions and may emerge at any other moment in life. In the study of multiple singular cases, I recognize that there is an unlimited diversity in the quality of the expression of emotions, depending, during the ongoing dialogue, on the subjective implications of the

children and the therapist (González Rey & Mitjáns Martínez, 2017). So, in addition to what Morin (2003b) states, I would say that the quality of expression of children's emotions in psychotherapy depends on the subjective senses that they generate in relation to communication with their families and that these subjective senses carry the social subjectivity and the subjectivity of the entire humanity, its antagonisms and contradictions.

In psychotherapy with children, I seek to interpret these subjective senses and how they enable the development of agent and subject conditions. That implies making them understand how they are located at the center of the world and occupy their spaces in the systems in which they are living and developing themselves with creative actions. How does this happen? I understand that they learn to experience themselves as agents or as subjects of these spaces, including and distinguishing themselves from other characters in the “as if” play. Through action and interaction with these other characters, imaginary or not, they can, at the same time, experience opposing affective forces and recreate them with spontaneity.

The children's action in the “as if” play and outside of it can motivate new subjective senses in relation to what has been experienced; the development of their subject condition, ensuring the quality of the relationship with themselves and the quality of the relationship with the other. In the action, children can update themselves in relation to the significant other, in relation to the mothers, for example, and take a stand for them in the face of an unfair accusation, as this child did: “I like you [...] you lied and that's what I don't like”. This qualitative moment took place in the joint session, a space for reflection in the midst of the “as if” play, in which the child and the mother engaged in an authentic dialogue about themselves, defining themselves. With their fantasies and imagination, they created in the “as if” play and outside of it new ways of living together in their daily lives which were more pleasant and committed.

That child taught us that taking a stand in relation to the other does not mean excluding, nullifying, or annulling oneself, but differentiating oneself. It means learning to live dialogically, which, in theory, favored the development of the quality of her subjective organization and differentiated her from her mother. Motivated by this action, it is likely that she has generated new subjective senses in relation to the litigation and a subjective configuration⁶ favorable to the development of the subject condition of their family as a social space. It is likely that the child has emerged as a subject in this specific circumstance by “subverting an established order”, favoring the development of her family and indirectly the development of society.

Just like this one, our other interpretative constructions of singular cases seek to make the subjective senses that guide the child's actions in the family and in other social spaces, such as school, intelligible. These constructions guide the actions we use to tension the therapeutic dialogues in which the subjective senses

⁶ “The subjective configuration is a self-generating formation that arises from the diverse flow of subjective senses, producing, from its generating character, converging groups of subjective senses that are expressed in the most stable subjective states of individuals in the course of an experience”. (González Rey & Mitjáns Martínez, 2017, p. 63).

are generated by the children in relation to what is experienced in the family. In this complex process, subjective senses of multiple experiences emerge, which can be reorganized.

By engaging in psychotherapy without suppressing their contradictions in relation to their parents' conflicts, children develop the ability to create and recreate their relationships in the family and outside of it, suggesting that there is subjective development. The result of these experiences suggests that psychotherapy favors the original process of constituting subjective configurations favorable to the emergence of the agent and the subject. So, I can say that psychotherapy with children is representative of the political aspect of the theory of subjectivity or that it is a resource for the process of subjective development of individuals suggesting, as I see it, a permanent reorganization of antagonistic and conflicting subjective senses.

My curiosity is about how antagonistic and conflicting subjective senses are permanently reorganized in the course of life, which leads me to reach for the principle of complexity - disorder - as thought by Morin (2003c). This author teaches us that permanent reorganization enables human beings to be original and singular.

As yet, I understand how subjective development is an original and unique process. For González Rey (2004), it is involved with the subjective senses that individuals generate in relation to multiple social and cultural experiences, in different contexts. Although he does not deny the place of the other in this process, González Rey (2004) emphasizes "the active and specific place of one's self-organization processes in the initial stages of development and their permanent presence as the subject of their interrelationships" (González Rey, 2004, p. 3). His criticism about the emphasis given by other theories to the place of the other in human development makes sense for psychotherapy with children from the perspective of subjectivity which, as we propose, includes spontaneity as a resource generated by children which enhances their creativity. I understand that this resource emerges in the therapeutic process, from the children themselves, from their emotionality in relation to the other.

González Rey (2004, p. 4) states that "human relationships are organized, from a very early age, as a system in which emotional expressions play a very important role, including the most important one for a newborn". So, it implies that emotion has a central place in subjective development processes. In accordance with González Rey's thinking, I try to understand children's subjective development from their emotions as affections initially produced in the communicative process and in their relationships with his family (Peres, 2001, 2012, 2013).

González Rey (2004) discusses how children generate subjective senses in the communicative process in the family and produces complex emotions that define the quality of their relationships in this space. Meanwhile, he points out that development is a process of qualitative change in the subjective organization of the individual and that it implies a variety of emotions. For the author, in this process, the individual's tensions and actions, always involved with their subjective productions, guarantee the development of their subject condition.

In the therapeutic process, I focus on the subjective senses that children generate from the communication in the family. During the “as if” play, I provoke them not to lose sight of their freedom to dialogue and to transit spontaneously between the experienced and the imagined, or to express themselves about their fantasies to their parents who embody different characters in this game. The make-believe play, the “as if” play, is a symbolic space in which the children experience reality and fiction, learn about themselves and about the other in a dialogic constructive-interpretative process. As in children's psychodrama, this takes place without a prior and delimited stage, without any regularity or pattern. Playing make-believe or “as if” encourages children to explore their possibilities of dialogic communication and creative actions, in the course of which they can generate new subjective senses in relation to their experiences.

Since nothing is previously organized, at that moment, the children experience their histories integrating past and future, or as Morin says, (2003b, p. 18), they experience the unusual in a unique way, that is, “the entire form of the human condition”.

In the piece, *The game and the child*, Jean Chateau (1987, p. 18) details how in each new experience, in each game, the child learns to provoke the new, to experiment with his possibilities, to have the pleasure of producing. In his words: “what pleases the child is less the result itself than the fact that he produced that result”. For the author, it is in make-believe play, in the creative game that “the child asserts his powers, proves his worth”, and I would say, with reference to the theory of subjectivity, that it is in this space that he can generate new senses, subjective aspects of communication and family relationships. I can say that in the therapeutic session there is a dialogical communicational process, which, as Morin (1998, p. 48) would say, “introduces pluralities, separations, oppositions, retroactivity and warmth” [...].

I know that in each therapeutic scenario there is a dialogical communication process in which there are unforeseen events, contradictions and paradoxes. I also know that each child, as a unique individual, “carries the entire form of the human condition” (Morin, 2003b, p. 18). I recognize that during the therapeutic process the singular child, in addition to carrying the entire form of the human condition, shows that his subjective development has a specific quality that is a condition for emerging or not as an agent or subject of his social process.

Psychotherapy with children as a social space for the development of the agent and subject of the social process

From the perspective of the theory of subjectivity, it is possible to build theoretical models that explain the uniqueness of the subjective development process of children. Since 2005, I have been building explanatory models of the development of children whose parents dispute their custody in court. The dialogic interpretative constructions of these children's actions and relationships with their parents take place in individual and joint therapeutic sessions,

enlivened by multiple ludic scenarios, without any prior theme or any methodological coercion. Our job is to think and build indicators and hypotheses about convergent subjective senses involved in the “as if” play that induces the therapeutic dialogue and the emergence of the organization of a subjective configuration.

Psychotherapy with children is a social space for communication and production of subjectivity. In the sessions there is dialogue about how their experiences are heightened in scenes and dramatic actions in the “as if” play. In this ludic space of dialogue, they tense up to the point of recreating their experiences with their imagination and fantasies, leading us to believe that they generated new subjective senses in relation to the problem.

Children engage in therapeutic dialogue with their subjective productions, without suppressing their contradictions in relation to their families and the conflicts of their parents. It is likely that in this process they learn to create and recreate their relationships in the family and outside of it, suggesting that there is development or qualitative changes in their subjective organization, which indicates that psychotherapy encourages the original process of constituting subjective configurations favorable to the emergence of the agent or the subject that subverts the established order enabling the development of society. As far as we are concerned psychotherapy with children, from the perspective of the theory of subjectivity, is a social space for education, learning and subjective development.

With the concept of subjective development, González Rey and Mitjans Martínez (2017) offer new knowledge for psychotherapy with children and challenge us to expand it considering the infinite possibilities that children have to emerge as agents or subjects of the social process. Motivated by this knowledge, I recognize that psychotherapy in childhood can favor the subjective development process of individuals in the course of their living histories, so that they can emerge as agents or subjects of their social processes. I therefore understand that the agent and subject categories represent the political character of the theory of subjectivity, having a special value in psychotherapy with children. As I suppose, this psychotherapy opens possibilities for the development of the quality of the children’s subjective organization and a continuous development of their condition as agents or subjects of the social process, which, recursively, brings possibilities for the subjective development of society.

While dealing with children, I privilege the development of the subject. In this process, children can learn about themselves and the other, develop the quality of subjective senses and subjective configurations that guide their actions, and emerge as subjects in a specific circumstance and at any other moment in life.

Agent and subject are categories that represent subjective processes of development, of which individuals are not immediately aware. From what González Rey and Mitjans Martínez (2017) say about these categories, I inferred that they have different qualities of engaging individuals to action. I understood that the quality that surrounds the subject makes it possible for him not only to be

active and participative, like the agent, but to subvert the established order favoring the development of society, which demonstrates the political aspect of the theory of subjectivity.

González Rey and Mitjans Martínez (2017) state that individuals are always active in their development processes, that is, they are never passive. As I see it, they mean that individuals can emerge as agents or subjects in different ways, with different expressions, in different circumstances.

From my point of view, children are active in their processes of development. During the litigation of their parents, they are often active and can emerge as subjects. I observe that they suffer and complain about the separation of their parents, who take a stand on the conflict generated by them in the marriage and, sometimes, even with actions that subvert the order of the dispute, transgressing its normativity. I have several examples of how children subvert the order of litigation by revealing the secrecy of the accusation to the therapist, even putting the accusing parent at risk, for not having evidence. We are going to comment on the case of a 6-year-old child, compulsorily separated from her father accused of abuse, who reveals the secrecy of the accusation, defining her subjective experience of the litigation, in which past and future emerge integrated in her living history. The constructive-interpretative dialogue of the information took place at different times, in individual and joint sessions involving all family members in a complex process.

We have built indicators of subjective senses and hypotheses about the “subjective configuration of the action”⁷ of this child when confronting her father and mother with questions about the conflict, the separation of the couple and the secrecy of the accusation without evidence. In the process of engaging in the constructive-interpretative dialogue, the child expresses her emotions and reveals the secrecy of the accusation, kept “under lock and key”, to protect the mother from punishment by the Justice: “my mother lied about my father, but the chief police cannot know otherwise he will arrest her”.

In the individual sessions, I emphasize her spontaneous and creative engagement in the dialogue about her parents' conflict through “intermediate objects” (cloth dolls that represent the family characters), as in this fragment: “I will tell you a story: the father arrived to see the children and played with them [...], the father gave the mother some money and she left [...] the father slept and when he woke up he asked: where is the money? The mother: I forgot it at the store”... The father got angry [...].

Dialogue is provoked through the intertwining of indicators and hypotheses about multiple subjective senses generated by the child in relation to her experiences in the family.

These subjective senses are involved in the organization of the child's speech at different moments of the therapeutic process and they are different from the social representation, which according to González Rey (2003) is a

⁷ “Self-generating formation, which arises from the diverse flow of subjective senses, producing, from its generating character, convergent groups of subjective senses that are expressed in the most stable subjective states of individuals in the course of an experience” (González Rey, & Mitjans Martínez, 2017, p. 63).

known reality and does not have a singular character, such as the subjective sense.

It turns out that, often, in a situation of separation or divorce, the permanent parent builds a representation of the other for the children based on their current needs and motivations. In this case, at various times the child shows commitment to the representation of a “bad” father and the need to protect her mother. The reality that the child knows about the separation and the father is the one that the mother presented her with and even if it sounds distant and confusing the child assumes it as real.

In the joint session, this child presents contradictory movements of distancing and approaching in relation to the father while looking at the family photo album. In this act, the tensioning of historical and current subjective senses transforms the quality of the dialogue between them.

The therapeutic dialogue is made possible by intertwining the indicators of these multiple subjective senses. Impacted, the child takes action and defines herself: “I’m suffering a lot [...] I don’t know what to do, should I stay here or should I stay there, one pulls me here and the other there [...].”

The fact that she interacted with her father in the dreaded joint session (monitored by the police and the police chief) and that she revealed the secrecy of the accusation is an important element for the interpretative construction of the subjective senses that she created from her experiences with him, not represented in a conscious way. Also, when she expressed herself about love, suffering, loss and guilt, she brought up the contradictory subjective senses that she generated in relation to her father and of which she is not aware.

Other excerpts, from other moments: “it’s my fault, it’s everyone’s fault” [...] “I can talk, but there are things I can’t” [...] “I’m good, but sometimes I lie a little (...) so as not to hurt my mother (...) I feel sorry for her (referring to her mother). I lie because sometimes I want to impress my mother. Everyone makes mistakes, right? I lie a little. But, if I speak, something very bad can happen, my mother can be arrested, she told me (...) “I lied because I don’t like my father and because he is mean”.

The “guilt”, however, may be implied in the subjectivity produced by her in relation to what she experienced while her parents separated, which she does not even remember anymore, “a long time ago, it was in the past” [...].

Although it comes from something very distant, from a story that she doesn’t even know for sure, subjectively configured, guilt acquires a unique form for her in her current suffering, that is, the parents’ litigation. That’s why she questions them, seeks explanations for the separation or perhaps seeks to understand their explanations about it, sometimes allowing herself or not to express them.

Then she seems to reflect: “you know, a very difficult decision had to be made, you know? The separation (...) very difficult (...) my mother (...) if I speak my mother can be arrested (...) the separation (...) very difficult. My mom [...]”.

In this dialogue, the child’s imagination emerges from the legal consequences of her mother’s action, enabling the construction of indicators of subjective senses generated by her in relation to the dispute.

The mother, in turn, by constructing a current representation of the father, makes it possible to interpret the subjective senses that she generated not only in relation to the couple's conflict or in relation to the father's impulsive affective expressions, but also regarding other experiences, perhaps, those which affected her own childhood.

As I understand it, the therapeutic dialogue made it possible for the child to develop subjective resources to position herself in relation to the father. It is possible that in this process she generated subjective senses that allowed her to take on the challenge of breaking with the social representation of “bad” (the father), created for her.

Therefore, I restate that the child can emerge as an agent or subject of the social process, depending on her subjective development or the quality of her subjective organization. On the other hand, not having their own ways of subjectivating their experiences in interrelated systems, such as the family and the judiciary, it is possible that they feel oppressed and present the most diverse symptoms. Psychotherapy can be an opportunity to open up their own subjectivation pathways in relation to these interrelated systems, to break with inappropriate names for childhood, traditionally attributed to adults, like bipolar disorder.

According to Vasen (2011), an Argentine psychiatrist and psychoanalyst, an epidemic of inappropriate names indicates that there is a wrong use of language for children's symptoms. This is the hegemonic language of the biomedical model, which dominates science and professional practice. I point out that this model makes it difficult to understand subjectivity, which “has no intelligibility in the visible and immediate”, and enables us to recognize “a generative, active subject, creator of realities (González Rey, 2014, p. 36).

The theory of subjectivity thus inaugurates a new framework for reflecting on health-disease processes, which I seek to make intelligible in psychotherapy with children. I seek to make the uniqueness of the cultural-historical process of children's development intelligible, without excluding the interrelated systems in which they live from this process: the family, the school, the child care network, the health care system, among others. Psychotherapy, in this perspective, offers children during the process of litigation between their parents the opportunity to realize their spontaneity, to open their own ways of subjectivation and to develop the condition of agent or subject of the social process. They can develop the quality of their subjective organization and creatively position themselves on the norms of the family, the judiciary and other interrelated systems, such as the school, for example.

With this, we reached in psychotherapy with children what González Rey (2004, 2005) supposes about the dynamic and recursive interrelationship between individual and social subjectivity that represents a complex system. Briefly, we have achieved what González Rey and Mitjáns Martínez (2017) assume when they state that in the micro and macro, individual and social spaces, a set of subjective configurations of multiple interrelated systems emerge.

In the therapeutic process with children who experience their parents' litigation, their subjectivities articulated with the subjectivity of the family and

the subjectivity of the legal institution emerge. The subjectivity of the family, in relation to the children, integrates a multiplicity of shared symbolic productions. For example, symbolic productions about human development, about health, about learning and others. We can say that in the therapeutic process with children symbolic and emotional productions or multiple subjective senses generated by them, by their families and by the judicial system emerge, forming a “symbolic-emotional chain” that guides their actions in the dispute.

At this moment, psychotherapy, as education and learning, can be a differential in the subjective development process of the children, the families and the judicial system. It is possible that the symbolic productions (beliefs, values, myths) of these interrelated systems reach a subjective level, which, for González Rey and Mitijáns Martínez (2017, p. 63) would be necessary for the “definition of a new quality in the subjective organization” of these systems.

Certainly my history working with children and their families from the perspective of Levy Moreno (1997), an author who made “an alliance with human health”, makes it easier for me to engage in this psychotherapy perspective, understanding that there is no determinism in the configurational system of subjectivity, that individuals can open “new ways of subjectivation” in relation to social meanings and that this opening favors the generation of new subjective senses and new subjective configurations in relation to what they experience.

I understand that, from this perspective, psychotherapy favors the development of individuals' subjective configurational systems, to the point of developing the condition of agents or subjects in the social process.

The emergence of new subjective senses and new subjective configurations in the therapeutic process

Our hypothesis about the example presented above is that the child generated new subjective senses during the therapeutic process in relation to the separation of her parents and emerged as a subject of her own development when she transgressed the legal norms, revealed the legal secrecy and defined herself in relation to her closest ones.

This explains how the two interrelated concepts – subjective senses and subjective configurations – guide the individual's actions, without them being immediately aware of them (González Rey, 2002).

Like this one, many other examples encourage me to discuss the value of psychotherapy with children for the development of individuals as agents and subjects in the social process. This practice integrates past, present and future processes of subjective development, and makes us understand that “the complete vitality of life” integrates dynamically interrelated moments. As stated by González Rey and Mitijáns Martínez (2017, p. 63), “this new type of process emerges in culturally organized social life, allowing the integration of past and future as an inseparable quality of current subjective production”.

I even dare to confirm that in psychotherapy with children and also with adults at different moments in life, the past, present and future unit is organized in a subjective configuration (“a self-generating formation”).

According to González Rey and Mitjáns Martínez (2017, p. 63) this configuration “arises from the diverse flow of subjective senses, producing, from its generative character, convergent groups of subjective senses that are expressed in the most stable subjective states of individuals in the course of an experience”.

In addition to this, I would say that the most stable states of individuals appear in different circumstances of life, for example, in the legal litigation of ex-spouses for the custody of their children. Apparently, these states are part of a group of subjective senses generated throughout their lives and which, subjectively configured, emerge in this circumstance. I mean that they emerge in a subjective configuration that predominates and guides their actions in that circumstance (Peres, 2014, 2022).

This dominant subjective configuration in the dispute, complexly interrelated with the subjective development processes of the ex-spouses, challenges me to think about the value of psychotherapy with children as a social space for education and learning, as a social space that can favor their subjective development processes or the emergence of a subjective configuration, whose quality allows them to emerge as agents or subjects at this and other moments of life. So, I think that, even with great emotional burdens and suffering, these children can manage, at different times in their lives, to integrate past and future into opening new ways of subjectivating their current experiences.

Nevertheless, there are cases where this does not happen. I can give an example of an adult whose suffering is a subjective production of what he experienced in childhood. He is unable, in his current experiences, to integrate his past and future, and for not opening new subjectivation pathways nor generating new subjective senses from his past experiences, he does not generate new subjective configurations, constituting a pathological process.

González Rey (2007) states that it is the flow of historical and current subjective senses that allows individuals to always generate new subjective configurations, qualitatively different, and “new significant subjective resources for their relationships”.

I recognize this flow in the dynamism of the children's and adults' stories and that psychotherapy is the opportunity for them to generate new subjective senses of their relational experiences and emerge as agents or subjects in their social processes. I acknowledge that psychotherapy, in both cases, integrates the historical and the present, and it is sensitive to the possibility of dynamic reorganization of their experiences. I observe that in the therapeutic process with children subjective senses of different experiences emerge and that in psychotherapy with adults subjective senses of different moments of life emerge. With this, I confirm that in the theory of subjectivity there is no separation between past, present and future.

Past and future are inseparable qualities of the current subjective production. Past and future form a subjective unit marked by the imagination

(and fantasies) of the individual in relation to the experience (González Rey, & Mitjáns Martínez, 2017), representing the procedural and dynamic character of subjectivity.

This inseparability between past and future makes it possible to understand how multiple historical and current subjective senses integrate the most stable subjective configuration of ex-spouses in litigation, a formation that guides their actions in this life circumstance. While working with ex-couples, the interpretative construction of supposedly more stable configurations makes it possible to understand the interrelationship of different configurations and how they differ in the circumstance of litigation, even with the subjective configurations of the children (Peres, 2022). I recall that building up an interpretation of these configurations requires complex thinking, processual thinking, which interrelates historical and current subjective senses (Peres, 2022), that is, it requires understanding and explaining how the agent and the subject are gradually constituted throughout life.

This means that, even without being aware of it, individuals constitute subjective processes of development that allow or prevent them from emerging as agents or subjects of the social process (González Rey, & Mitjáns Martínez, 2017). According to the authors, both the agent and the subject have an active character; they think, act and organize themselves, generating a multiplicity of subjective senses and subjective configurations of which they are not immediately aware.

It is also noteworthy that Vygotsky (2001), in his work *Psychology of Art*, as analyzed by González Rey (2013), defines consciousness as a system, which for the author is a procedural organization, certainly a subjective organization of lived experience, a more complex system “and that it transcends what can be considered as cognition” (González Rey, 2014, p. 41).

In psychotherapy there are times when individuals, without being immediately aware of their actions, accuse the other of being responsible for the problem. At other times, when there is tension between emotional and symbolic productions, they own their actions, dialogue and reflect on them, repositioning themselves. I think that this ownership (Peres, 2022) represents subjective development, the quality of a subjective configuration that leads them to act or to emerge as subjects of the social process by subverting the order of litigation and the organization of the legal institution.

As González Rey and Mitjáns Martínez (2017) explain, emerging as an agent or subject depends on the quality of the subjective configuration that causes the individuals to turn into subjects, which is different from the subjective configuration that causes them to emerge as agents. According to the authors, the subjects transcend the normativity of the contexts in which they live, opening their own ways of subjectivation with their creativity, while the agents act according to the normativity of the contexts.

Thus, the process of subjective development, according to González Rey and Mitjáns Martínez (2017), is a continuous process without any regularity. In this process, individuals generate new subjective configurations, qualitatively different. In other words, the emergence of new subjective senses and new

subjective configurations, with new qualities, enable individuals to carry out the necessary changes to new forms of actions and relationships.

Indicators show that the therapeutic process with children enables qualitative changes in their subjective organization. As in other moments of life, in this process they can, for example, generate new subjective senses in relation to the conflict between parents and a configuration that leads them to reorganize their experiences in the family, at school or in other social spaces. I think that this process in childhood favors the emergence of the agent and the subject at any other moment in life.

I give the example of another adult, for whom psychotherapy in childhood favored his subjective development process. At that moment, he committed himself to his therapeutic process, which I suppose generated new subjective senses in relation to the family's disorders and new subjective configurations that made him free himself from the oppression of a deterministic diagnosis and the constitution of a pathological process. There are indicators pointing that the subjective senses he generated from this childhood experience were favorable to his emergence as a subject of the therapeutic and social processes. We conclude that he emerged as a subject of these processes by making “a revolution” in his subjective organization and in the quality of his life process, subverting the order of illness processes of other members in his family. The fact is that he managed to subvert his way of life and his relationships, no longer isolating himself and “consciously” positioning himself in the interrelated systems in which he lives and develops himself. The most interesting thing was that the subjective configuration of the pathology, relatively stable in childhood, and represented by behaviors of non-interaction or social distancing, did not define his subjective development. His subjective configurational system, in ongoing development, enabled him to generate new subjective senses and new subjective configurations in relation to the family disorder, illness processes and, probably, to have remained engaged in the therapeutic process. Probably his continuous engagement in this process, since childhood, made it possible to generate other subjective configurations, without any regularity, but qualitatively different and favorable to the development of his condition as an agent and subject of the social process.

By questioning about how the individual achieves these conditions in their subjective development process, I recognize the value of psychotherapy with children, and occasionally, those who experience the legal dispute between their parents.

Psychotherapy with children, subjective development and the emergence of the agent and the subject of the social process

Children's emotional, active and creative engagement in the therapeutic dialogue suggests a possibility for them to emerge as an agent or as a subject of the social process. Their engagement in the dialogue about the “subjective-relational plot”

of parents in legal litigation expresses their subjective development processes, involved with the process of developing their emotionality.

Regarding the development of emotionality, I observe what González Rey (2005) states, when he says that in this process children express their needs and fantasies before any sort of reflection on their actions and relationships. Before understanding their relationships, they generate subjective senses about the emotional atmosphere of these relationships and these subjective senses integrate the subjective configuration that guides their actions, which sometimes represent pathologies of the biomedical model.

Once again, resorting to Vasen (2011), I suspect that the “inappropriate names” that children receive are representative of specialists' lack of knowledge about singular processes of emotionality development.

That is the case of children diagnosed with Attention Deficit Hyperactivity Disorder (ADHD) or with Autistic Spectrum Disorder, whose emotionality precedes their understanding of the conflict and litigation between their parents. I do not discuss what those children present (their symptoms?): restlessness, lack of attention and aggressiveness in the family context, but how this is their way of expressing a set of emotions from the subjective senses that they generated in relation to the conflict and parental litigation. I infer how these emotions, imaginatively associated with social meanings, are subjectively configured and guide their actions. At this point, I find it interesting to spot some of the imagination concepts by the philosopher Riccoeur (1913-2005). For the philosopher, imagination is “the arbitrary invocation of absent things”, of fictions that make the individual “believe in a reality that is misleading”. From his point of view, the imagination can be deceptive or serve criticism, reproduce or produce. (Riccoeur & Castoriadis, 2016, p. 76).

There is much evidence that the symptoms presented by children in the process of separation between their parents are emotional and symbolic (imaginative) productions, which justify psychotherapy at this moment in life as a space for learning and subjective development. It can be argued that it is a space for transforming the quality of the imagination, which, if not pathological, can be associated with complex fantasies of the child about the experience with the parents and complex emotions.

González Rey (2007) states that emotion is a form of expression of the individual in relation to an experience. As he exemplifies, children's irritation can be implicated with a combination of emotions that “do not correspond to a structure of meanings”, but express their “psychological state”.

In the case of a child diagnosed with ADHD, or with autism spectrum disorder, I understand that he is sensitive to the conflicts between his parents and the symbolic consequences of this conflict in the family system. The indicators suggest that he generated subjective senses and subjective configuration that led him to act. However, his action compromised the quality of his relationships with his parents and the possibility of the emergence of new subjective senses and new emotions. Psychotherapy was the opportunity to express his emotionality in relation to what he had experienced in the family and to understand how this emotionality was involved in his relationships. Like this example, others have

inspired me to think about how psychotherapy allows children to express their “emotional state” in relation to an experience (Peres, 1983) and generate new subjective senses in relation to it.

In this example, my hypothesis is that this child's emotional state is implicated with subjective senses of a subjective configuration that evokes various emotions like fear, insecurity and rejection, all of them committed with symbolic manifestations, such as attacking the father, distancing himself from the father and continually requesting the mother, among others. It is likely that these symbolic manifestations form a complex subjective network, inaccessible to the comprehension of parents and specialists. I understand this to be the current form of expression for this child, probably guided by a relatively stable subjective configuration, which favors the perpetuation of the emotional climate in family relationships and hinders the emergence of new subjective senses in relation to the conflict between parents.

According to González Rey (2007), if the subjective senses do not change, integrating the individual's relatively stable subjective configuration, there is no therapeutic change.

As for the above-mentioned example, we found that for a long time there were no significant changes in the child's family system, in the relationships between his parents, in their relationships with the child, who increasingly distanced himself from their expectations for his development, how to be well-mannered and attentive to their commands, and know how to conduct himself simultaneously. I believe that the change implies that the parents would generate new subjective senses in relation to the child's manifestations.

Translating the thought of González Rey (2007, p. 138) on examples like this, it is possible to understand that the child “does not live the experience in a neutral way”, that he “expresses a set of expectations and subjective states” related to the subjective configuration that guides his actions.

Still in our example, my assumption was that the child expressed the expectation that the parents would not fight and that his subjective state was related to a subjective configuration that represented the beginning of his subjective development process, a process that will define his differentiated expression, such as the case of the adult, previously presented.

As for the hegemony of a subjective configuration in a given context or life circumstance, I agree with González Rey (2007) that it requires further studies. Although this theme has been approached by me in the study of the legal litigation between ex-spouses for child custody (Peres, 2022), I still have many unanswered questions, mainly about how the cultural history of individuals, since birth, can be understood in psychotherapy.

As stated by González Rey (2007, p. 138), “the subjective configuration is fed and developed from a variety of subjective senses generated by the individual in the context of his actions”, but it maintains “stable nuclei of subjective production” that must be identified in the varied forms they assume in human behavior”.

Children expressing the quality of their emotional systems in the therapeutic space draws my attention; how this quality enables them to act in

difficult life circumstances. In this regard, we have the example of a child who expressed his emotionality in the circumstances of his parent's death, even before understanding the meanings of his action in "trying to save him", or how this action was implicated with his needs and affective motivations, or his expectations and his emotional state.

For González Rey (2005, p. 21), the development of emotionality "is the result of the convergence and the confrontation of meaning elements constituted in individual subjectivity, as an expression of the subject's history [...]".

It is possible that the development of the child's emotionality in our example is the result of the convergence and the confrontation of subjective senses in relation to his experiences with his parents, before and after separation. It is possible that, by positioning himself with his subjectivity in relation to the parent, he has emotionally transcended the linear and direct influences of the family system. Also, these subjective senses may be at the basis of his subversion in the order of the family system. With this subversion, I can assume that his subjectivity was unfolded and developed amid objective processes of his family's social organization. I suppose that the subjective senses that he generated from his parent's separation and death experiences may represent, as González Rey (2007) explains, another way in which this complex reality affected him.

In order to expand this thought, I continue to practice the interpretative construction of multiple singular cases or the understanding of the object of psychotherapy with children, their subjective development. As I say, the social space of psychotherapy with children enables the interpretative construction of a set of indicators on the subjective senses that they generate from communication and family relationships, subjective senses that are dynamically interrelated in a configuration of their developing subjective system.

Subjective senses emerge in this space in a disorganized, chaotic way, especially in the dialogic scenarios of make-believe plays in the "as if" simulation. They are not directly explicit in children's speech, narratives, or behaviors. The psychotherapists build indicators of subjective sense, based on hypotheses, inferences and their knowledge about the theory of subjectivity, childhood, family and others. By establishing an interpretation of the subjective configuration that guides the actions of a child, the therapist finds elements to develop the explanatory theoretical model of this unique process of subjective development and produce knowledge about the value of psychotherapy for this continuous process.

When working with families in litigation processes (Peres, 2022) it occurs to me that children are guided by subjective configurations in continuous development. I understand that they generate subjective senses related to their relationships with their parents, as well as the daily communication between them, and that these subjective senses form the subjective configuration that guides their actions. This moment of life – childhood – is of great sensitivity for the constitution of a subjective configuration involved with subjective senses generated in relation to what is lived in the immediate social space, the family. Including, in this space of great sensitivity for educational communication, there

can be learning favoring their subjective development, and their condition as agents and subjects of the social process.

Educational communication, as discussed by Tacca (2019, p. 139), “always accompanied by speeches, gestures, glances” [...] offers “many interpretative possibilities” that, as I think, may or may not result in significant learning for the subjective development of individuals. By being inserted in a new subjective configuration, with a new quality, it can cause individuals to emerge as agents or subjects of the social process. Therefore, I say: the subjective senses generated by the child in relation to this communication can emerge in different ways, at different times of his subjective development process, that is, involved with a new subjective configuration, which has a new quality. This requires the family to value the child in the communicative process, instigating this child to be active, reflective, and to freely express his fantasies and conflicts in relation to what he has experienced and to create alternatives to it with actions in the course of which he can generate new subjective senses in relation what he has lived.

Furthermore, in González Rey (2007, p. 29), I understand that the subjective senses that the individual generates from their experiences “are inseparable from the subjective configurations of their historical-social condition”, a condition that generates both individual and social subjective senses, generator of subjectivities.

I only have indicators about this. For example, the indicator that the historical and social condition of the child previously mentioned, an unstable and unpredictable condition, is inseparable from the subjective configuration that guides his actions in the family and at school, interrelated systems and producers of subjective senses. I am aware that in these interrelated systems, childhood is a time of “openness to the new”, of curiosity, but also of conflicts and contradictions. From the perspective of the theory of subjectivity, conflicts are a source of subjective development, which justifies psychotherapy with children who experience parental litigation. The therapeutic dialogue about their conflicts, as I propose, takes place in the midst of a play, which is how children originally express their emotionality. I propose the therapeutic dialogue about contradictions and conflicts to happen during an “as if” play.

I understand that this resource opens “zones of senses” for the children's learning about human values and principles, such as respecting themselves and others; being fair to themselves and others. In this social space of education, learning and subjective development, the children and their families dialogue about their conflicts, embodying different characters, who assume different features, with their own principles and values. I understand that this space generates new subjective senses of what the children experience in interrelated systems, certainly inseparable from the subjective configuration of their historical-social conditions.

In this social space, which is different from other spaces, children can open their own ways of subjectivating their experiences and parents can understand the development of their emotions and come up with new subjective senses about their manifestations.

Here's another example: a nine-year-old girl, who even contrary to her mother's expectations, takes a stand on her need and motivation to live with her non-custodial parent. Apparently, she generated subjective senses and configuration that led her to open up her own ways of subjectivation about her parents' litigation. The dialogue on this theme, in the "as if" play, was enough to express in a playful way her emotionality, which we assume is susceptible to the emergence of the agent or the subject in the process of the parents' litigation. Regarding the mother, we have indicators that she understood the child's emotionality and no longer embarrassed her with threats of abandonment, for courageously expressing her intention to "live with her father".

However, considering the theory of subjectivity, I still have many questions about these processes and about the value of psychotherapy in childhood for the subjective development of individuals and that, according to González Rey and Mitjáns Martínez (2017), is the development of resources that allow them to bring about "qualitative changes in different areas of life". The authors state that these changes originate in individuals "an ever deeper personal involvement in the area in which the subjective configuration of development is organized" (Mitjáns Martínez & González Rey, 2017, p. 23).

Considering this statement, I continue to study how the subjective configurations of development are organized in children who live the experience of their parents' litigation. Even nowadays, immersed in this field, I keep studying multiple cases and seek to build explanatory theoretical models on how different subjective configurations of development are organized in children and also in their parents.

With my hypotheses on the historical development of the agent and the subject, I follow the organization of the past, present and future unit in the therapeutic work. I try to understand how it organizes itself in new subjective configurations, qualitatively different, in each singular case. I keep track of how an adult, for example, without losing the original power of therapeutic learning in childhood, emerges as the subject of his social process, by subverting the order of an oppressive, pathologizing marital relationship. I interpreted that this is the result of his subjective development or that it represents the dynamic flow between multiple and diverse past subjective senses (originated in childhood) and current subjective senses, some of them developed in the ongoing therapeutic process.

This is my starting point when situating the value of psychotherapy with children for the emergence of subjectively configured qualities, in a continuous process of development. My hypothesis is that these emergences indicate that children have subjective resources or that they act guided by the quality of their subjective organization and not just by influences or impositions from the family system. As in the aforementioned case, these resources can emerge at any other time in life, with a new quality. Explicitly bringing the concept of Morin (2003c, p. 139), that "emergence is a new quality in relation to the components of the system", a concept that defines the objective of psychotherapy with children who experience parental litigation.

What happens is that the child emerges in the family system and sets all its components in motion. She tries as hard as she can to express her grief and take a stand against the system. I suppose that in this movement she develops new subjective senses of her communicational and relational experiences in the family and outside of it (Peres, 2022). This assumption is my guiding thread. I have indicators that the child, even though she can not communicate clearly through speech, does not subject herself to the social representations constructed for her.

As Morin (2003b) would say, she does not subject herself to the limits that speech imposes on communication. I have examples that, even when speech is incipient, children manage to communicate about their affective relationships. They signify them through the emotional tone of the scenarios they create for the make-believe play, for the “as” simulation. As noted (Vygotsky, 1996), even before speech, “children signify more the 'emotional nuance' of their social spaces than their objective aspects”.

This nuance allows the therapist to interpret the subjective senses they generate from communication and relationships in the family (Peres, 2001). I know that the subjective senses they generate from communication and their relationships in the family have an emotional nuance or that they carry a set of contradictory, conflicting emotions that affect their “body and mind”, but sometimes, to the point of developing the most diverse symptoms (Peres, 2022).

Under this perspective psychotherapy is the opportunity for children to be heard, embraced, understood and to create, with their spontaneity, alternatives to their own suffering embroiled with conflicting subjective senses. In a previous work (Peres, 2001), about “street children” and their families, I developed the hypothesis that conflicting, antagonistic subjective senses (historical and current) generated by them in relation to communication in the family, motivate them to “flee to the street”. I think they motivate them to break with the normative space of the family and to choose the street or the street group as a new social space for development. With the construction of several theoretical models to explain this process, I meant it as a singular process of subjective constitution of the subject, the one that, according to González Rey (2003), at some point in life, is capable of subverting the social space in which he lives, with options that go against the normativity of this space.

At that moment, this knowledge brought up a new “zone of sense” for understanding the cultural-historical process of subjective constitution of the so-called “street child”, but, above all, a new zone of sense for understanding the cultural-historical process of constituting the subject from the perspective of the theory of subjectivity. At that time, the knowledge about the unique processes of development of these children makes the theory of subjectivity legitimate for it surpasses the determinism and the simplification of classical science. Nowadays, with this knowledge, it is possible to discuss the value of psychotherapy with children for the process of subjective development of individuals.

Final considerations

I reinforce that psychotherapy with children is a social space for education and learning, and that it is sensitive to their affective needs. The psychotherapist is the significant other, with whom children communicate about their actions and relationships, and to whom they express emotions imaginatively associated with the family's social representations of them, and from which I think they can emancipate themselves. Certainly, psychotherapy with children is not an imposition and needs to reach the idea of complex causality present in the theory of subjectivity, defined as a generating system, in constant organization and reorganization.

From my point of view, this social space for education and learning favors the spontaneous and creative expression of emotions, conflicts, imagination and fantasies of the children about the experience and the constitution of a relatively stable subjective configuration, with quality for them to take action as agents or subjects at that time and at future times. The construction-interpretation of the information allows me to confirm that the past, present and future unit is organized in qualitatively different subjective configurations in different moments of life. I dare to infer that the "most stable subjective states of individuals" represent multiple and diverse subjective senses generated throughout their histories, without any regularity, and that there is a dynamic flow between them, whether they converge or not.

Some indicators point out that in the actions that impact parents in litigation and destabilize the judicial process, children can generate subjective senses of a more stable subjective configuration. It is likely that in these actions children are under tension, enhancing emerging qualities of their developing subjective configurational system.

This process may represent the possibility of developing the subject condition, that is, the possibility of differentiating oneself from the normative processes of the family, even implying tension and antagonisms. So, I reaffirm the definition of the subject by the theory of subjectivity, which involves the definition of development as a subjective process, interrelated, dynamically and recursively, with what is lived in the tension of social life. I also reaffirm Morin's thought (2003b), that the subject emerges, that is, it is not an imposed condition.

With these ideas, I suggest that the therapist's actions, not even a constructive-interpretative dialogue, impact the children by straining their social processes; that these actions favor the original process of constitution of subjective configurations allowing them to emerge as subjects, to subvert the instituted order favoring their development and the development of their families. Thus, I reiterate that psychotherapy with children is a social space for education and learning and is sensitive to the children's affective needs. The psychotherapist is the significant other, with whom they communicate about their actions and relationships and to whom they express emotions imaginatively associated with the family's social representations of them, and from which I think they can emancipate themselves with spontaneity and creativity.

So, I can confirm that learning to emancipate oneself is not easy, it requires creating “one's own path of subjectivation”, which implies suffering when facing difficult life circumstances. I have several examples: that of ex-couples who, despite suffering, choose to become subjects of marital conflict; that of children who break with the desired family life and, contradictorily, assume the street as a social space for development; and the example of children who experience the dispute of their parents and who, even afraid of being rejected or abandoned, position themselves before their parents about their affective needs and their conflicts. Even with suffering, there are children who sometimes subvert the order of litigation, probably emerging as subjects in their social space.

Finally, I would presume that, especially in the context of parental litigation, new qualities may emerge in children's subjective organization. This emergence opens up a new intelligibility about the value of psychotherapy at this moment in life, and about its value for the development of the agent and the subject as defined in the theory of subjectivity. I can say that, from this perspective, therapy with children gains a political status, because it “inverts the sovereignty of command” in the game of power, both in the “as if” simulation and outside of it. For this, the therapist needs to act from the children's perspectives, that is, to get involved with them in make-believe plays, so that the communication about differences, antagonisms and complementarities of relationships in the family is expanded.

There is strong evidence that this inversion allows children to set their generating capacity to motion, emerging new subjective senses in tension with historical subjective senses. Everything indicates that this may be the root of the individual's subjective development, of their condition as subjects of the social process.

Why we need to consider agency to understand traumatization: A critical psychological approach

Lena Schwaab

Abstract

Traumatization is not a purely personal and isolated experience of acute threat, loss of control or disempowerment. From a critical psychological perspective (following Klaus Holzkamp), traumatization is political in several respects: it is embedded in a social context and therefore, in addition to considering the personal factors of those affected, social, economic and political conditions that allow and reproduce the contributing violence in the first place must also be analyzed. It is important to understand the involvement and entanglement of those affected in the traumatizing processes from the perspective of their change. The critical-psychological basic category of agency, understood as the socially mediated possibility of the subject's disposal over their living conditions, opens up these political dimensions of traumatization and provides a new perspective on the frequently-made distinction of traumatization solely according to its "trigger situation" in natural disasters (e.g. earthquakes, floods) and man-made disasters (e.g. torture, rape). The latter show a higher risk of developing post-traumatic stress disorder, without providing a convincing explanation as to why. A critical psychological approach further suggests not only looking at the initial situation, but also understanding the traumatic process as both an exclusion from participation in social provision and as a denial of the possibility of extended disposal over the conditions of life (generalized agency). In this article, after a brief introduction to the core concepts of Critical Psychology according to Holzkamp and the resulting understandings of mental disorders, I would like to demonstrate the extent to which traumatization must be understood as political. Subsequently, I would like to discuss previous critical psychological discussions on traumatization, as well as show how agency expands the understanding of traumatization, how this can be illustrated by examples of man-made and natural disasters, and why generalized agency is particularly relevant in this context.

Keywords

Critical Psychology, traumatization, agency, man-made vs. natural disaster, psychotherapy

„Du fielest, aber du fällst nicht
Augen fangen dich auf“
Hilde Domin

Introduction

During my studies in psychology, I was repeatedly frustrated by the single-factor reduction of the context in which individuals live. My understanding of traumatization was initially shaped by a clinical psychology lecture during my bachelor studies, in which trauma was described as a particularly strong stressor that exceeds the processing capacities of the affected person and is thus to be understood in a stimulus-response scheme. Some time later, during an internship in a psychiatric-psychosomatic clinic, I experienced how truncated this view of stimulus-response is. For a patient who had been in a Soviet labor camp, the prevailing power and dependency relationships in the clinic led to repeated experiences of powerlessness and disempowerment. After that, the question arose for me: What can actual support in the sense of empowerment processes look like? Critical Psychology with its version of the close interconnectedness of society and the individual can be helpful in understanding the multi-dimensional sources and impacts of trauma. In the following article, I will first discuss how traumatization can be grasped and why it should be understood politically. Then I will outline the basic concepts of Critical Psychology according to Klaus Holzkamp, and here I would like to introduce in particular the concept of agency, which makes psychopathological symptomatology easier to understand and also offers new perspectives in the case of traumatization. This will be explained by means of practical examples, which can be differentiated into *man-made* and *natural disasters*. Natural disasters include disasters of a natural cause such as tidal waves, tsunamis, or major storms, whereas man-made disasters tend to refer to interpersonal violence such as in wars, in rape, and in torture. The latter are often attributed a higher pathological potential for the development of post-traumatic stress disorder (Kessler et al., 1995), but without psychologically elucidating this difference. The category of agency, especially generalized agency, may contribute to a better understanding of the concept of traumatization. It should be noted that in order to understand individual traumatic processes, cooperation with the affected subjects is necessary. Thus, my remarks cannot speak to individual cases, but rather offer suggestions as to what extent the contextualized understanding of trauma can be expanded by adding the generalized agency, so that the suffering of those affected can be better understood, and the necessary support that results from this can be derived.

What is traumatization and why is it political?

Traumatization is often understood in the context of the clinical diagnosis of post-traumatic stress disorder (PTSD). Trauma, according to the ICD-10

definition, is "a stressful event or situation (of either brief or long duration) of an exceptionally threatening or catastrophic nature, which is likely to cause pervasive distress in almost anyone" (World Health Organization, 2016). The development of PTSD is a possible subsequent reaction, which is characterized by the core symptomatology of re-experiencing in the form of intrusive, distressing thoughts and memories of the trauma (intrusions), hyperarousal, emotional numbness, and avoidance behaviors in relation to trauma-associated stimuli (Flatten et al., 2011). However, diagnoses may not reflect a person's difficulties in the context of their personal outlook and life management (Pedersen, 2019). Although a diagnosis can also lead to relief by classifying the suffering, at the same time, affected individuals are pathologized and defined as "sick people." Further criticisms of the classification of mental disorders should be referred to at this point (see Davies, 2021).

Diagnoses are not purely objective categories, since they are also shaped by present political and social factors. The extent to which the view of traumatization and trauma research have been significantly shaped and influenced by the aforementioned factors is described by Judith Herman (2003) in her historical analysis of trauma research. It is thanks to the political demands of self-organized veterans' groups after the Vietnam War that the diagnosis of PTSD was included in the catalog of the *Diagnostic and Statistical Manual* (DSM) for the first time in 1980 and thus scientifically recognized. The women's movement ultimately contributed to the recognition of domestic and sexual violence and to the understanding of all rape as an act of violence.

Trauma is often viewed from a biomedical perspective (Becker, 2014; Brensell, 2014), which portrays the traumatic situation as an extraordinarily powerful stressor that results in the inability to properly consolidate memory content. Consequently, the focus in therapy is on strengthening individual coping strategies and reintegrating the trauma through exposure to the memory of the triggering situation (Brensell, 2014; Flatten et al., 2011). Here, the focus on neurobiologically oriented therapy fits into a neoliberal approach aimed at short-term symptom reduction. Also fitting into this picture is the rise of pharmacological and neurocognitive research, in which certain medications such as propranolol and hydrocortisone, as well as cognitive tasks following trauma exposure, are thought to influence memory consolidation to reduce symptoms (Astill Wright et al., 2021; Steckler & Risbrough, 2012). The inherent shift therein transfigures the affected subject's response as disturbed and changeable, leaving untouched the external conditions that led to such a traumatic situation in the first place. Thus, the actual causes and sociopolitical dimensions of traumatization are disregarded (Mlodoč, 2017). This allegedly apolitical attitude is, according to David Becker (2014), extremely reactionary, and an exclusive fight against symptoms in trauma work thus completely loses its *raison d'être*.

The idea of adding the social context to the understanding of traumatization is not new and was mainly implemented in the concept of *sequential traumatization* developed by Hans Keilson (1979). This understanding of trauma emphasizes "that traumatizations are not simple sequential reactions to events that overwhelm the psyche but must be seen in their entire course in relation to

the surrounding milieu" (Becker, 2014, p. 18). In his long-term study of Jewish war orphans in the Netherlands, Keilson elaborated on different sequences of traumatization that focus on both the time before and after the traumatic event. Of particular significance here is that the last phase after the war was "described by many respondents as the most intrusive and painful of their lives" (Keilson, 1979, p. 58). During this period, when the actual processing of the experience was supposed to take place, attempts at rehabilitation and reappraisal often led to a reinforcement of the trauma suffered. With his work, he conceptualizes trauma as a socially mediated process and thus not only focuses on the question of how society deals with trauma victims, but at the same time examines the living conditions before the onset of the actual traumatic situation. David Becker expanded this conceptualization to sociopolitical trauma processes and emphasizes a psychosocial version of trauma (Becker, 2014, p. 18). This is followed by a contextualized understanding of trauma, which includes "knowledge of social conditions, life contexts [...], power and dependency relationships, myths and prejudices towards trauma victims" (Brensell, 2014, p. 124) in order to make the complex, psychological reactions understandable. Consequently, a classic psychiatric conception of trauma falls short of grasping the complexity of the socially mediated process of traumatization. In her article "What is traumatization? A Critical Psychological critique and reformulation" Pedersen (2019) formulates a subject-scientific approach to the conception of trauma, in which she understands trauma as a process of a personal and overwhelming sense of loss of control embedded in the concrete time and place of everyday living. In doing so, she makes references to Holzkamp's Critical Psychology, which will be discussed in more detail below.

Introduction to some core concepts of critical psychology according to Klaus Holzkamp

Based on the critique of science of the student movement around 1968, and especially influenced by the work of Klaus Holzkamp (esp. '*Grundlegung der Psychologie*' from 1983), Critical Psychology rejects the attempts to objectively record subjective experiences of classical experimental psychology (Holzkamp, 1988). In contrast, Holzkamp calls for research with subjects rather than about them within the framework of subject science (*Subjektwissenschaft*), which implies taking a standpoint of the subject. This is directed "against psychology as a science of domination and adaptation and against the psychologization of social contradictions" (Holzkamp, 1983, p. 25), and thus formulates a coherent view of critique of psychology and society. Here, an "exclusionary juxtaposition of the 'nature' and the 'sociality' of man" (Holzkamp, 1988, p. 304) is criticized, since this disregards an active, formative influence of the subject on its living conditions. The subject is in a double relationship to social, objective conditions, because on the one hand they live under them, but they also create and shape them themselves (Holzkamp, 1983, p. 354) and are thus involved in the reproduction of the conditions. These conditions, however, do not determine

action nor are they based on a subjective creation of meaning. Rather, subjective actions are "'grounded' in the conditions of life" (Holzkamp, 1983, p. 348). *Subjective reasons for action* (or reasons for short) thus form the "mediating category [... in which] contexts of justification in the 'medium' of structures of meaning and their representation in forms of thought and language are grasped as a 'subjectively'-action-relevant aspect of the contexts of conditions" (Holzkamp, 1983, p. 348). This is described as a meaning-justification context.

Every subjective justification of action is based on the individual need situation and thus it can "contradict my objective life interests, but not my human needs and life interests as I experience them as my situation" (Holzkamp, 1983, p. 350). From this assumption Holzkamp concludes that human beings cannot consciously harm themselves (*a priori of individual science*). Every action is subjectively functional with respect to the satisfaction of needs. Moreover, they must be "intersubjectively comprehensible," which means that if actions are grounded in the needs and life interests of the subject, these reasons must also be comprehensible to others. Even in the case of behaviors that occur in the context of a mental disorder, the justifications of these are, in principle, reconstructable.

The role of agency

The possibilities of the subject to relate to their conditions of life come to bear especially in their agency (*Handlungsfähigkeit*). The critical-psychological conception of agency is a "disposition over one's own living conditions that is mediated by society as a whole" (Holzkamp, 1983, p. 239), which results from the subject's participation in the provision of society as a whole. Agency can be viewed in two ways: the subject can "aspire to an extended disposition over the conditions of action" (Meretz, 2017, p. 94) or "accept the existing conditions as a framework for action" (Meretz, 2017, p. 94). Accordingly, a distinction is made between generalized and restrictive agency.

A generalized agency strives for an expansion of the agency by changing the conditions of action, which is only possible together in cooperative association ("the assertion of general interests in the joint disposal of one's own living conditions against the ruling partial interests" Holzkamp, 1983, p. 373). This can also be understood in reference to a slogan of Karl Marx and Friedrich Engels, in which the free development of each individual is the condition for the free development of all. However, this perspective of subjective action is associated with the risk of endangering the existing agency, since a rebellion against the existing relations of domination is necessary here, and there is also the possibility of failure (Holzkamp, 1983).

In contrast, restrictive agency involves securing the ability to act, accepting existing power relations and acting in one's own interests. Central to this perspective is an "individual- immediate satisfaction of needs" (Holzkamp, 1983, p. 2), in which "the opposition of different partial interests" (Holzkamp, 1983, p. 374), results in the subject asserting its interests at the expense of others. By attempting to maintain their agency through an arrangement within existing

power relations, the subject's renunciation of conditional disposition simultaneously contributes to the opposite result, namely: the subject actively participates in their own oppression and, in the long run, reduces the basis of its own capacity to act (Holzkamp, 1983). This contradiction, that by restrictively renouncing its own disposition of conditions in order to maintain its own agency, the subject endangers it in the long run by being at the mercy of existing power relations, is also called self-enmity (*Selbstfeindschaft*).

Thus, the subject has a double possibility to dispose of their living conditions: restrictively under recognition of the existing power relations for the immediate satisfaction of individual needs or generalized, in which the disposal of the living conditions is extended by joining forces with other subjects. From the external point of view, the two possibilities for agency cannot be judged for an individual subject; rather, they serve as terms of orientation in the discourse within which the subject is concerned.

Critical psychological perspectives on mental disorders

According to Holzkamp, agency has a decisive relevance for our well-being, "because agency is the most general framework quality of a human and humane existence, and non-agency is the most general quality of human misery of being at the mercy of circumstances, fear, bondage, and humiliation." (Holzkamp, 1983, p. 243). Significant here is the closer examination of the core contradiction of restrictive agency, since it "provides the categorical prerequisites for an adequate theoretical-actual-empirical grasp of all that is negotiated here today as *psychological difficulties, disorders, neuroses*, etc." (Holzkamp, 1983, p. 376).

Accordingly, this core contradiction or self-enmity is the cause of the development of psychological problems. All aspects of reality where the involvement of the subject in their own oppression and the rejection of the alternative to cooperate with others to extend their agency (restrictive agency) must, according to Holzkamp (1983), be repressed and denied.

At this point, the documents prepared by Ute Osterkamp (1976) to which Holzkamp's considerations tie in should also be mentioned. According to Osterkamp, conflicts arise through "threatening non-agency" (Osterkamp, 1976, p. 280), which she attributes not to the demands of the Id, as Freud does, but

by the lack of anticipation of the success of action in the attempt to abolish dependency relations through the extension of conscious influence on the general and thus individual conditions of life, or - as the other side of the same process - from the anticipated effects of the omission of actions subjectively recognized as possible and necessary on the individual existence and the existence of others affected by one's own behavior. (Osterkamp, 1976, p. 280)

This observation corresponds to the contradiction of restrictive agency. Osterkamp also introduces the role of emotionality, which is inherent in a critical readiness to act to expand the conditions of life, and which is normally repressed by means of defensive functions (cf. Freud). The formation of symptoms

represents the attempt to suppress "threatening cognitions [...], anxiety as an emotional reflection of the lack of direction in behavior, and helpless being at the mercy of others" (Osterkamp, 1976, p. 341) in order to make them manageable in random, current conditions of life.

Holzkamp and Osterkamp's view that restrictive agency and self-enmity are central to the development of psychological problems, and thus to "every subjective life problem" (Holzkamp, 1983, p. 376) should certainly be critically observed. Markard (2009) argues that it is quite possible for people to come to terms with conditions in a psychologically healthy way or to fall into despair in the common struggle for a better society, and that it is therefore questionable whether Holzkamp's considerations are empirically tenable (Markard, 2009, p. 193). As an example, a person is cited here who, in the struggle against the rulers, has been banned from his profession and consequently becomes depressed. To elaborate on this Küpper (2016) points out that direct or structural violence can also be the cause of psychological problems, in which no arrangement with the rulers can be assumed, but rather the recognition of these conditions is forced upon them. Küpper (2016) then explains an extended view of Holzkamp/Osterkamp's basic conception: psychological suffering is closely linked to the restriction or obstruction of subjective satisfaction of needs. In violent situations, a resolution toward dispositional expansion would either fail, be immediately impossible or loaded with too much risk, or not be suggested, targeted, or structurally prevented. If there are no possibilities to overcome these limitations of agency, if the accessible options are limited to a minimum, and if those affected by structural violence are systematically cut off from far-reaching social participation opportunities, it is necessary to seek other ways of dealing with the experiences of violence, limitation, and exclusion. Küpper (2016) describes this phenomenon with the concept of *psychization*, whereby the subject creates possibilities for action to cope with problems in the social close-range or in their own inner self, since they are cut off in their life possibilities by situational or structural restriction. This can sometimes lead to "far-reaching mental distortions, displacements, helpless impulses to act, and emotional borderline states" (Küpper, 2016, p. 58). As an example, Küpper cites, among other things, compulsive acts, which can be understood as "automated substitute actions in overwhelming and threatening situations in order to indirectly gain control over slipping living conditions and associated anxieties" (Küpper, 2016, p. 59). The goal here is the creation of security in the subjective experience, which does not exist in reality.

Agency in case of traumatization

I will now elaborate on the extent to which the previous remarks on agency can be applied to traumatic experiences. A traumatic experience is a violent situation in which a rapid response and action by the affected subject are required, while at the same time the scope for action is massively curtailed and restricted (Pedersen, 2019). That the need for safety, for physical and psychological integrity, is

extremely limited and curtailed here is undeniable, and the subject is unable to fulfill this need in reality due to the situation experienced as an acute threat. To what extent are the core symptoms of PTSD, i.e. intrusions, avoidance behavior and hyperarousal in the sense of Küpper's (2016) psychization understandable as substitute actions and avoidance mechanisms for coping with problems in the social close or psychological interior?

At this point, I would like to point out again that for an understanding according to the subject-scientific approach, one should assume a first-person point of view, and the following explanations should only represent possible starting points to make the specific "symptoms" understandable. It is striking that the symptoms are seemingly not in harmony, but rather in opposition. This could be due to the fact that a traumatic experience leads to splits, so that the affected subject tries to fulfill several contrary needs at the same time: on the one hand the need for security, which the avoidance behavior tries to meet. By avoiding places, people, smells, aspects related to the traumatic situation, supposedly safer situations tend to be sought out. Constant re-experiencing or hyperarousal, on the other hand, could follow the need to have actively defended oneself in the past situation or to react and be prepared differently in future situations. Pedersen (2019) interprets a repeated replaying in the mind of the affected person, which can be associated with feelings of shame or guilt for outsiders, with personal attempts of the affected person to deal with the experience and to actively learn from it.

In my opinion, a central element in the development of psychological problems is that the possibility to expand agency in the sense of the generalized agency is experienced as limited. Here, the association with others would lead to a change in the conditions that have only allowed such a situation to arise and the security of the subject to be curtailed. Holzkamp's thesis that the psychological state of mind is closely linked to the disposal of objective conditions of life can be applied again here. The subject who has experienced the traumatic situation suffers not only from the experienced psychological and physical violence, but also from the conditions that made such an act or circumstance possible in the first place and from the perspective that it can happen again. The experience of being at the mercy of others and of fear is not satisfied by the fact that the subject subsequently finds themselves in a safe situation, but they must be heard and acknowledged for what they have experienced and must themselves have an influence on not getting into such an extreme loss of control again. How this can differ between a *man-made* and a *natural disaster*, I will explain in the following section.

Agency in man-made and natural disasters

In July 2021, very heavy rainfall led to a catastrophic flood of the Ahr River in Germany. The extreme rise of the river Ahr's water levels as well as that of other smaller rivers, led to immense flooding. This event received significant media attention. Herman (2003) states that it is easier to feel sympathy for those

affected by natural disasters and events of force majeure. A large number of donations were acquired and volunteers from all over Germany traveled to the area to support the cleanup efforts. Local residents reported immense solidarity and support, in which social differences seemed secondary as every helping hand was needed. Kaniasty und Norris (2004) refer to this period as "heroic post-crisis benevolence," which leads to great mobilization and social support. This can be understood as a healing period that follows the experience of acute threat and disempowerment during the flood. This period of collective cleanup and solidarity has elements of Holzkamp's generalized agency. Here, the focus is not on individual needs, but rather the joining together of all participants leads to the improvement of everyone's subjective quality of life. Based on Holzkamp's conception of the social nature of human beings (Holzkamp, 1987), affected subjects perceive that their respective experiences have a place in the collective, that the community catches and supports them, and that they can recover from states of helplessness, meaninglessness, guilt, shame, and isolation. However, because this usually only lasts for a short time, social support drops again (Kaniasty & Norris, 2004), which can be explained in part by the overload of support systems and the saturation of networks. Social differences, marginalization and privilege can also become more pronounced again, and those affected also report resignation due to the fact that state's financial assistance has still not been paid out and they feel abandoned.

In contrast, reactions to *man-made disasters* such as rape can be quite different. This becomes clear in the revision of a verdict of the Basel Court of Appeals in August 2021, which reduced the sentence of an already convicted rapist due to a "complicity" of the woman concerned, since she had consensual sex with another man before the crime (statement of the judge: "One must conclude that she was playing with fire"). Here it becomes clear how not only the psychological and psychic violence emanating from the perpetrator influences the affected woman, but also the patriarchal violence, sexist prejudices and rape myths that deny the experiences of the affected woman, and even blame her for the act of violence. At this point, the concept of *spirals of disempowerment* by Pedersen und Stormhøj (2019) should be mentioned. In their study with victims of sexual assault, they report subsequent difficulties resulting from this experience. For example, women report subsequent financial losses and dependencies, a reduction in freedom of movement, isolation, absence of institutional acknowledgements of the act, feelings of guilt and shame while denying these from the outside ("What were you wearing?" vs. "It's not your fault!"). These specific disempowering experiences are interwoven and thus form a spiral of experiences of disempowerment, which play a central role in the traumatic process. In this context, the consideration of gender-specific constellations is indispensable in order to understand the problematics of those affected in a contextualized way.

When considering the situation of refugees, who have sometimes experienced sexualized violence in the context of war or displacement, it becomes clear how an insecure residence status, marginalization and experiences of racism further contribute to the suffering of victims. Trafficked persons are not

only confronted with the immediate psychological and physical consequences after an act of sexualized violence, but also suffer significantly from the social consequences (Nesterko & Glaesmer, 2020).

In an interview conducted as part of my master's thesis, a treatment provider reported that, from her perspective, it was not the act of rape that was significant for many of those affected, but much more the subsequent feeling of being ostracized from the community. This can be understood within the concept of "Ethical Loneliness" by Stauffer (2015) which describes the experience of being abandoned by humanity, compounded by the cruelty of wrongs not being acknowledged. Recognition and support for affected persons is lacking, their experiences are partially negated, and they are exposed to institutional and societal stigmatization, which leads to a perpetuation of their isolation (Nesterko & Glaesmer, 2020). Exclusion from the community can be additionally painful for the subject, as it also reduces the perceived opportunity to dispose of conditions and negates the possibility for generalized agency. Here, exclusion from participation in social provision can occur directly through social ostracism, being cast out of the family/community, or through denial of support, or more indirectly through negation and tabooing of the experience or silencing of those affected. This should be viewed intersectionally and therefore marginalization by gender, age, education, class, disability and ethnicity can compound the effects. The frequent response of the environment with solidarity to natural disasters tends to keep the reference and possibility of generalized agency for the subject.

From a critical psychological perspective, it must be noted that the differentiation between "man-made" and "natural" disasters must be viewed critically. On the one hand, this does not follow the perspective of the subject's point of view, but is rather derived from the outside by the supposed causal connections of the traumatic situation. On the other hand, this view follows a juxtaposition of nature and sociality of the human being, which is vehemently rejected by Holzkamp and the critical-psychological approach. Against the background that the flood catastrophe at the Ahr, just like many other catastrophes of this and similar kind, are to be seen as consequences of the present capitalist-industrial mode of production and the climate change triggered by it (World Weather Attribution, 2021), the division into "man-made" and "natural" disasters is fundamentally questioned. Even if the division is baseless, it is fruitful for understanding the different response of the social environment to the two types of disasters. It also raises the question of whether the contradiction of restrictive agency, in which one's own contribution to climate change is often repressed and denied by the subject through the support and maintenance of the conditions that contribute to it, is playing out here once again.

Conclusion

Traumatic processes of subjects with concrete experiences of natural or man-made disasters are neither comparable to each other nor understandable without the addition of the subject's point of view. The aim of this article and the analysis

of the division between man-made and natural disasters is to show that the consideration of generalized agency, and thus the disabling of subjects to participate in social provision and the exclusion from the possibility of expanding one's own agency in association with others is a central moment in the traumatic experience. Holzkamp and Osterkamp's focus on restrictive agency in the development of psychological difficulties is extended to generalized agency. This makes it clear that traumatic processes are not determined solely by the trigger situation and the individual, but are above all significantly embedded in and shaped by society. This also implies a responsibility on the part of society toward those affected, which must be aimed at restoring their agency. In a society in which patriarchal structures have been pushed back, how could the court case in Basel have proceeded? What is the likelihood that the crime itself could have taken place at all? What would support for the residents of the Ahr have looked like if their motivation also included complicity in the flood disaster itself?

This article does not claim to cover all aspects of traumatization in their entirety and to explain them in the context of Critical Psychology. Thus, some aspects remain open and need to be further considered. It is questionable, for example, how the aspect of symbolization or meaning that victims attribute to the crime can be included here. It is also unclear how a delayed trauma reaction with a latency period between traumatic experience (usually in childhood) and development of psychological difficulties can be embedded in the conceptualization. Also, this article aims to provide an initial starting point to explore how generalized agency using the example of trauma can lead to a better understanding of psychological distress experiences. The question as to how this can be applied to other psychological problems or "disorders" requires further thought.

The addition of generalized agency to the understanding of the suffering of victims in traumatic experiences makes societal demands for dealing with victims. But can implications also be applied to psychotherapeutic practice? What emerges is that effective support for those affected cannot lie solely within the framework of strengthening individual coping strategies for adapting to prevailing conditions and must not be limited exclusively to supposed areas that can be influenced by the individual. For this transfigures the possibility of the subject to be able to influence the conditions. Therapists need a political attitude that understands the suffering of individuals in their social embeddedness and therefore recognizes that effective support for those affected goes hand in hand with social change. This should be a political stance where solidarity does not get stuck in proclamations, but rather ends in a collective fight to dissolve violent structures that limit agency. In addition to these more theoretical considerations, we need further practical approaches that illustrate what critical-psychological psychotherapy can look like in concrete terms. However, the critical-psychological perspective also makes clear that the responsibility for reducing the suffering of people with mental health problems and supporting them in expanding their agency is not borne by therapists alone but must be addressed collectively.

Acknowledgements

I would like to thank all reviewers, whose comments and ideas were a great enrichment for my discussions and further work, Sebastian Sevignani, my former lecturer, who encouraged me to develop my ideas further and publish them in a paper. My friends, who actively supported me by sharing and correcting my work, and especially Marc, for always believing in me.

Lena Schwaab is a Clinical Psychologist (M.Sc.) and Psychotherapist in training for cognitive behavioral therapy, currently working in a psychiatric clinic. She is interested in C/critical psychological approaches and how they can be integrated in a psychotherapeutic practice in order to expand the agency of clients. Email: lena.schwaab@posteo.de

Everyday politics of educational psychologists

Maja Røn-Larsen

Abstract

This article contributes to theoretical discussions on politics of everyday life as a concept that enables greater understanding of the dialectical and transformational subject-structure relationship in order to grasp – theoretically, empirically and practically – otherwise hidden and poorly articulated political dimensions of our everyday practices. An analysis of the participation of educational psychologists in collective processes of reproduction and transformation of structural problems related to inequality, marginalisation and categorisation of individuals, as well as other problematics related to the contradictory societal matter of education, illustrate development of the theoretical concept of politics of everyday life. Educational psychologists play a significant role in the conflictual and contradictory processes in the field of education in a Danish context. By analysing the conduct of everyday work life by psychologists in schools, in addition to the collaboration, negotiation and conflicts that occur among various parties, the article attempts to understand their active participation as transformative political contributions to the development of the school and conditions for the educational system. Using a theoretical framework that involves a critical psychological, social practice perspective, everyday politics is analysed as a central and inherent aspect of the conduct of everyday life.

Keywords

conduct of everyday life, corridor casework, educational psychology, everyday politics, politics of everyday life, situated inequality, black box of inequality

Introduction

This article contributes to the theoretical debate on how to develop the concept of politics from the perspective of the social psychology of everyday life. By further developing the concept of everyday politics, the article addresses the transformation of institutional arrangements of conflictual societal matters (such as education) as dialectic subject-world relationships. Throughout the history of education, schools have been a battleground for political struggles between various parties with conflicting views on content, user groups and resources that address what education should be about and for whom. The field is characterised

by ongoing discussions about issues such as inequality, marginalization and individual categorisation, in addition to how to overcome these types of problems. Anchored in the micropolitics of education, sociologist Stephen Ball (2012) states: “I take schools, in common with virtually all other social organizations, to be arenas of struggle: to be riven with actual or potential conflict between members (...) I take it to be essential that if we are to understand the nature of schools as organizations, we must achieve some understanding of these conflicts” (p. 19). The question is: how can we explore and understand these conflicts, and what theoretical understanding of human agency and subject/world relations does an investigation of this nature require?

This article analyses conflicts in the field of education as everyday politics from the perspective of educational psychologists in a Danish context. I focus on their intentional engagements in the creation of relevant interventions in relation to school problems together with the other parties involved, and in relation to structural conditions related to mandatory legislative requirements and to professional expectations.

Historically, educational psychology has been associated with schools as a sorting mechanism, where psychologists assess children to determine who is fit to attend school and who needs special educational support (e.g. Mehan et al., 1986). Thus, educational psychologists play a central role in the conflictual processes in the field of education as gatekeepers to special education resources. Moreover, in recent decades, educational psychology has expanded to cover a wider range of tasks directed at schools, such as consultancy and supervision for teachers and other pedagogical staff, as well as facilitating multi-agential conflictual processes within and around schools and daycare centres across general and special education. Currently, these other tasks are under pressure, and the tendency to attribute school problems to the individual psychological or biological disposition of the child or social family backgrounds seems prevalent (Farell et al., 2006; Graff et al., 2021; Szulevicz & Arnfred, 2022; Szulevicz & Tanggaard, 2017). However, when we look at situated everyday life in schools, this tendency is not unequivocal; it is entangled and challenged in complex and contradictory social practices.

To understand and learn from this, we need to look more closely at the local, situated processes of collaboration, negotiation and conflicts in schools. We need to overcome the tendency to focus on recurring problems as concerning issues regarding either blind reproduction of structural inequalities or as a result of the insufficient professionalism and standards of psychologists understood as neutral experts. This article examines how theoretical discussions on the concept of politics of everyday life can enhance our understanding of the practice of educational psychologists in order to overcome the often-deadlocked theoretical struggle between structural determinism and utopic professional standards.

The work that educational psychologists do can be seen as immanently political, anchored in the intention to create meaningful and relevant opportunities for all children to participate in the educational system with others. An opinion piece published in a large Danish newspaper written by two educational psychologists (Mølgaard & Jensen, 2022) and signed by more than a

thousand psychologists illustrates this. Referring to the increasing inability of children and youth to thrive in daycare and at school in a still more financially pressed pedagogical practice, they state:

As psychologists we have become caretakers of a house where the roof is on fire, there is water in the basement, mould in the walls and a dead body on the first floor. At this point, the best we can do is to help limit the damage.

If the entire field [of education and childcare], both general and specialised had better conditions, educational psychologists could actually make a real impact in children's daily lives. We could do what is both professionally meaningful and ethically justifiable: supporting a good life for the child through preventive interventions in collaboration with management and staff in day-care facilities and schools as well as with parents.

However, we are currently under pressure to spend a significant amount of our workday on written assessments of children facing social, emotional and academic emergencies. This is happening despite our knowledge that it means that we make the least difference for a large group of children and young people who are not thriving when we work behind a desk. (Mølgaard & Jensen, 2022 – my translation)

In this article, I suggest that political aspects of the work that educational psychologists do are not limited to contributions to the public debate, however convincing they may be. The politics of educational psychologists are an integral aspect of their everyday work life in terms of the problems children and youth face. They do politics inside the burning house every day. To understand and develop concepts for the conflictual societal matter of education and schools, we need to examine the everyday political concerns and everyday practices of educational psychologists.

The theoretical framework for this study is a critical psychological social practice perspective (Dreier, 2008a; 2008b; Lave, 2019; Schraube & Højholt, 2016). Drawing on this tradition, politics of everyday life can be conceptualised as central and inherent aspects of the conduct of everyday life, where subjects in assorted positions and with a variety of engagements participate in a common matter in relation to contradictory historical, structural and institutional conditions (Holzkamp, 2013; Højholt & Kousholt, 2020; Højholt & Røn-Larsen, 2021; Schraube & Højholt, 2019; Stetsenko, 2008; Stetsenko & Arievidt, 2004; Røn-Larsen, 2019). The point is that conducting everyday life together entails actively relating politically and responding to the world (i.e. the school) and its transformation.

These theoretical stepstones form the basis of understanding the work of educational psychologists as everyday political activities related to contradictory matters of the school as a historical practice in a struggle field. This conceptualisation of educational psychology emphasises how the everyday work life of educational psychologists inevitably involves continuous personal and collective process of interpretation and experimentation in relation to complying with, maintaining and transforming the often-contradictory institutional conditions and demands related to the school life of children. In light of this, the

situated actions of the psychologists are understood as both constrained by and transformative of certain institutional and structural conditions for working with the difficulties children have within the organisation of the school. These processes, which I term corridor casework (Røn-Larsen, 2019), are inherently political since they evolve from a positioned engagement in a common, conflictual matter ultimately involving reflections on and negotiations of what school life is and should be for all children.

In the following I outline the concept of politics of everyday life and its current relevance to the practice of educational psychologists. I will then illustrate these processes with examples from my research, contextualised by aspects of the historical struggle field around educational psychology. I draw on empirical material from projects examining the practices of educational psychologists through participatory observations, interviews and documents from various municipalities in Denmark. Finally, I consider the implications of politics of everyday life for understandings of (inter-)professional work and action in institutional arrangements and for the further development of theoretical understandings of concepts like politics and conduct of everyday life.

Politics of everyday life

Politics of everyday life can be conceptualised as an aspect of subject's conduct of everyday life directed at collective negotiation and the transformation of common life conditions. This perspective is anchored in cultural historical research traditions emphasising the dialectical relationship of the individual and the social – more specifically drawing on the German-Danish tradition of critical psychology (Dreier, 1997; 2008b; 2011; Holzkamp, 2013; Schraube & Højholt, 2016; 2019), Jean Lave's (2011; 2019) practice theory and Anna Stetsenko's (2008; 2013; 2017) transformative activist stance. These interrelated approaches share an interest in human practice as inherently political in the sense that people participate with engagements in the world – and through this participation dialectically transform themselves, their possibilities and the conditions of the world they inhabit.

Understanding that people lead their lives in and across various societal arrangements, Klaus Holzkamp (2013; 2016) originally suggested conduct of everyday life as a concept for addressing the complexity of everyday life and how persons pursue a variation of different concerns across a plurality of contexts and together with others (Dreier, 2008; Holzkamp, 2013; 2016). In relation to the complexity of everyday life, people need to conduct their lives to navigate and get things done that need to be done and are important to them (Dreier, 2011; Kousholt, 2016). Ole Dreier (1999; 2008b) continues this line of thinking into discussions on the participation of subjects and their personal conduct of everyday life across institutional arrangements. With this concept, he goes beyond the understanding of structural conditions as abstract determinants of subjective agency. Instead, he underlines conditions as produced and reproduced in conflictual processes of collaboration between subjects acting with

different interests developed in their trajectories of participation across a variety of contexts affected by, for example institutional divisions, divisions of labour, legislation, administration and professional requirements and standards (Dreier 2006; 2008a; 2008b). Sociologist Dorothy Smith (2005; 2006) has been an important source of inspiration in this regard in terms of how to organise research and its analysis of structure/institution while avoiding the risk of adopting a mechanistic understanding of structure and subject, just as she suggests that an analysis must always begin based on the specific *work* that people do together and the multiple conditions that affect this work.

Hence, the personal conduct of everyday life is also always collective, i.e. people's engagements and activities form conditions for other (Chimirri, 2013; Højholt & Røn-Larsen, 2015; Nielsen, 2013; Røn-Larsen & Stanek, 2015). Furthermore, through their daily activities people are also engaged in transforming and reproducing the conditions of their common world as well as themselves. In this way, the concept of politics of everyday life attempts to extend the conceptual endeavour of conduct of everyday life in relation to understanding people's activities as both personal and societal – and as engaged in collective transformation of the social world.

The political aspects of human life have been a recurring motif in numerous scientific fields since the time of ancient Greece – with Aristotle's claim of human beings as political animals and societal beings whose nature is to enter into communities with other human beings, directed at changing it for the common good (e.g. Carriere, 2022; Hansen, 2013; Irwin & Fine, 1995). Still, from a variety of perspectives, it is widely disputed how to go about grasping the political aspects of human life, i.e. how to understand the relationship between public and private politics that eventually connect politics to the lived everyday life. In relation to these issues, feminist thinkers within psychology and sociology have pushed the limits between the public and private life spheres in an important direction (e.g. Smith, 2004). Psychologist Frigga Haug's (1992; 2016) discussions about politics and memory work highlight how we must analyse how we produce and reproduce the world and ourselves to transform the society we live in.

Hannah Arendt's 2005 book, *The promise of politics*, states: "At the centre of politics lies concern for the world (...) Wherever people come together, the world thrusts itself between them, and it is in this in-between space that all human affairs are conducted" (p. 106). The philosopher Toru Mori (2003) underscores the collectivity of political agency when discussing the political aspects of Arendt's concept of acting in concert. Politics relates to the process of people creating together, and political power is related to the plurality of the actions of various people (Mori, 2003). In continuation of this, psychologist Ernst Schraube (2024) describes politics as a worlding practice, the processes through which the reciprocal relationship between human communities and their societal conditions are developed (Schraube, 2024).

This resonates with Stetsenko's (2008; 2013) transformative activist stance, where people as subjects are always already situated in and directed at transforming the world into a better place (Røn-Larsen, 2019). Stetsenko unfolds

the theoretical base of Vygotsky's work, accentuating how subjects and the world are inseparable. People can be understood as neither a mere product of culture and social practices, as reacting or adapting to what is given in the world, nor as autonomous, free-floating agents creating or changing the world as something separate from themselves. Stetsenko (2013) insists that the individual is always inherently social and cultural, i.e. part of the world while simultaneously forming and carrying out future-oriented agendas that contribute to collaborative projects of social transformation.

Drawing on these diverse perspectives, I suggest that from the standpoint of each subject in the collective social practice, subjects are always engaged in the world in the making and processes of transformation towards a better future. In accordance with Schraube's interpretation of Arendt, one could say that the collective worlding practices of subjects are always already political.

Culture psychologist Carriere's (2022) book, *Psychology in policy – redefining politics through the individual*, explores the relationship between politics and people's daily lives by challenging the common perception of politics as a matter reserved for politicians. He points out political doings as a myriad of actions conducted by many different people happening more or less unnoticed, illustrating this by analysing the unrecognised *pre*-legislative work that the staff who support politicians conduct behind the scenes that is an inextricable part of the values and meaning-making processes of people's everyday lives: "...what matters is (...) understanding the process that occurs when the individual is engaging with policy in their daily life" (Carriere, 2022, p. xiii). His analysis of these processes as political, indicate how people forming the administrative foundation for politicians also play an important part in policymaking, just as he shows how their diverse perspectives and agendas play into political transformations. Taking his perspective a bit further and in accordance with Stetsenko and Schraube, I would note that the political processes of transformation continue in the conflictual everyday processes of people's collaborative *post*-legislative processes, i.e. in the policy processes through which the legal acts play into conflictual practices where people struggle and navigate together in relation to contradictory conditions and requirements.

In Lave's (2019) critique of the idea of concepts of standards as a neutral knowledge tool for settling or solving complex and contradictory problems – such as how to handle school problems – she stresses how contradictions, problems and dilemmas do not have definitive or stable solutions; they can always "only be resolved for now" (p. 156). Lave's assertion changes the perspective away from identifying the right professional procedures and standards for implementation once and for all and into an analytical investigation of how people are constantly participating in conflictual processes of (temporary) trouble solving.

In relation to the specific topic of this article, the categories and concepts professionals use to understand the difficulties of children must be understood as developed and negotiated among a variety of participants acting with common but also various interests and purposes, positioned in concrete collective institutional arrangements (Dreier, 2008b). Furthermore, according to Lave, the

analytical concern should focus on the everyday political contributions of educational psychologists to transforming the (school) world. Such a perspective sheds light on the practice of educational psychologists as an ongoing process that cannot be sufficiently understood by describing definitive legal requirements or procedural standards (see also Røn-Larsen, 2019; Røn-Larsen & Højholt, 2021). The contradictory demands that educational psychologists, as well as other participants, face in their everyday work life cannot be settled once and for all; they need to be explored and handled in a situated manner that differs, depending on changing conditions in the institutional arrangements. In this way, the politics of everyday life are not a definitive set of ideological standpoints but instead express ongoing processes of exploration of situated relevant possibilities entangled in complex and conflictual institutional conditions.

Politics of everyday life in the practice of educational psychologists

This section describes and explores key historical, contradictory relationships in the field of educational psychology and the school in Denmark to provide a steppingstone for the subsequent empirical analysis, which focuses on engagements and dilemmas in the practices educational psychologists employ to handle contradictory demands and to transcend managerial instrumentality. After the analysis, a discussion will be presented of their everyday politics in relation to develop relevant strategies in specific contradictory situations and, through this, to contribute to the maintenance and transformation of institutional conditions.

The ongoing historical struggle field around schools and educational psychologists in Denmark

The everyday political contributions of educational psychologists play into a historical struggle field of education, where many diverse, conflictual and sometimes contradictory perspectives are at stake in the collective processes of reproducing and transforming the institutional arrangement of the school.

The 1994 Salamanca Statement and Framework for Action on Special Needs Education issued by UNESCO marked the advent of an international effort to develop practices for inclusion and equal access to school for all children. This was also the case in Denmark. Since the beginning of this century, legislation on the Danish school system has centred on the aims of the Salamanca Statement. However, many attempts to fulfil the promise of universal inclusion have been inextricably linked to various approaches to the inner inadequacies and dispositions (e.g. diagnoses or handicaps) of the children or to their troubled family background, often resting on an understanding of intergenerational transmission from parents in a variety of vulnerable positions – either socially or economically. Scholarly analysis of historical practices concerning schooling in Denmark (and internationally) indicates that there is a preponderance of

individualising and decontextualising understandings of children and their difficulties within the educational field (e.g. Larsen et al., 2019; McDermott & Varenne, 1998). Multiple research perspectives draw attention to how understanding problems often seems to focus too heavily on either individual psychological and biological dispositions or on the intergenerational transmission of the child's family background, at the expense of more contextual matters within the institutional setting, such as the school (for an overview see, e.g. Røn-Larsen, 2011). Practice currently primarily focuses on early interventions and discovering problems before they arise, which again has led to a variety of preventive programmes, such as special education directed at specific diagnoses or parental training and compensatory programmes for specific groups of families and children (Juhl, 2023).

Inclusion goals can be identified in a diverse array of practices involving the institutional arrangement of educational policy – from national politics and legislation to local management and assorted interdisciplinary meetings involving a variety of professionals, to the specific classrooms and children's communities and parental involvement. Hence, multiple governmental resources are channelled into the attempt to create a more inclusive and equal educational system. However, these efforts have shown to be less effective than expected. In Denmark, the rate of diagnosis and resources spent on special education is increasing steadily but the educational system still struggles with inequality among children in various life situations (Karlson & Landersø, 2021).

Inequality in children's lives is typically explored related to family background and often understood in terms of social inheritance or intergenerational transmission (e.g. Barnes et al., 2012; Bird, 2007; Karlson & Landersø, 2021). A new perspective on inequality based on the social situations children face across their life contexts is supported by statistical research indicating that about half of children and young people in vulnerable positions in the education system come from homes that are not characterised by so-called risk factors (Benjaminsen et al., 2015). Other analyses show that more Danish children with a vulnerable social background surmount their social inheritance than children who reproduce it (Ejrnæs, 2003). In line with this, research suggests that social inheritance thinking often becomes dominant in the understandings of professionals, which in itself can limit expectations toward children, inhibiting their potential for development (Ejrnæs, 2007; 2019). Both research and educational practice indicate a need to open 'the black box of inequality' to study institutional processes, and everyday political processes, one might add, in addition to professional interactions that concretely affect the opportunities children have for participation in everyday life. Hence, there is a need to examine the processes of situated inequality (Højholt, 2016; 2022; Højholt & Røn-Larsen, 2021).

The conditions children have for participation, development and learning largely depend on their access to having a sense of belonging and social resources, such as interaction and cooperation with adults and other children (e.g. Højholt & Kousholt, 2018; 2020; Morin, 2019; Røn-Larsen, 2016; Stanek et al., 2021). However, children face unequal conditions for taking part in social

communities in their everyday lives in daycare, school, and leisure time institutions. These unequal conditions have an impact on their development, learning, well-being, and future opportunities.

As a result, professional contributions to the development of relevant participation opportunities for all children may represent a key lever in addressing inequality and well-being issues in children and young people's lives. Yet, in Denmark, children's communities and participation are rarely part of educational psychological assessments (EPA) or explicit problem-solving strategies designed to address key societal and personal challenges such as inequality, absenteeism, disadvantage, drop-out and learning disabilities (e.g. Røn-Larsen, 2011; 2016).

Accordingly, the tasks of educational psychologists have developed into new arenas, resulting in a wider focus on consultation methods, supervision and facilitation of inter-professional work. However, they are still positioned as gatekeepers in relation to the line between general and special education for children in need of special education more than nine hours a week. In this regard, educational psychologists are legally bound to conduct an EPA, which is the only mandatory "must-do" task they are required to do in Denmark (Graff et al., 2021). The Danish Ministry of Children and Education website states: "being referred to special education must be based on the individual pupil's educational needs" (BUVM, 2023 – my translation). The appeals board for complaints concerning special education also uses this criteria. Recent research indicates that psychologists spend most of their workday writing on statutory reports (Szulewicz & Arnfred, 2022), which the opinion piece quoted earlier also reflects.

Earlier studies of processes of professional work and decision making in relation to children in the border between general and special education point out that a gap exists between the knowledge presented in statutory reports about the school problems of children and what the children experience in terms of difficulties in their everyday lives (Røn-Larsen, 2011; 2016). The statutory reports and the EPA focus primarily on aspects within the child, at the expense of knowledge about the institutional context in which the child participates in its everyday life (Braden, 2017; Buck, 2015; Røn-Larsen 2018; Smyth, 2000; Szulewicz, 2021). In this way, knowledge on how opportunities for participation are constituted in everyday school life is left in the shadows. Although this knowledge is crucial in relation to understanding and helping the children, the EPAs and the processes of decision making tend to obscure this knowledge (Røn-Larsen, 2011; 2018). Combined, legislation on special education, economic scarcity and the requirement that the children's individual level of functioning must be accounted for in relation to prioritising resources establish conditions that seem to continually prompt educational psychologists to adopt an individualistic understanding of children's educational needs, despite of an explicit intention to do the opposite (Røn-Larsen, 2011; 2018; Røn-Larsen & Jørgensen, 2019).

The everyday politics of educational psychologists in organisational contexts

Educational psychologists and the psychological categories for children's difficulties have repeatedly been criticised for playing a key role in relation to individualisation and marginalisation. For decades, individual testing and categorisation anchored in educational psychology have been the target of criticism (e.g. Conoley & Gutkin, 1995; Mehan et al., 1986; Stetsenko, 2017). Many voices from both within and outside the field of educational psychology have discussed the need to further develop the tasks and positioning of educational psychologists in relation to the school, as well as their training and the overall institutional organisation of schools (e.g. Braden et al., 2001). A question that remains is how to understand this – and even more importantly – how to reach an understanding of how to change it. Often, we approach the quality of the work psychologists do with children having difficulties in school as a matter of following certain standards and procedures; however, when participant observations and interviews are conducted with the psychologists, other aspects enter the foreground.

According to Braden and his colleagues American school psychologists are generally locked into a reactive and individually centred focus, causing them to overlook the social aspects of children's everyday lives as an important aspect of school problems. From Braden et al.'s perspective, this dynamic relates to a strong professional history as well as insufficient training for educational psychologists that almost solely focuses on individual behaviour, learning and mental health, ignoring more comprehensive knowledge on, for example school culture and social processes within the school. Furthermore, they point to the organisation of school and the position of the psychologists within this organisation as contributing factors to this situation, stating: "Reconceptualising the role of the school psychologist requires more than just shifting how school psychologists enact their roles: It requires organizational changes in the ways schools and districts utilize and deploy psychologists in the schools" (Braden et al., 2001, p. 216).

This corresponds with the empirical findings in my research, where psychologists seem to struggle with restrictive institutional conditions in relation to gaining access to working with the children's social communities at recess. My empirical analysis draws on a variety of empirical material from practice research projects on psychological work in relation to children with difficulties, for example: participatory observations, interviews and documents from the everyday lives of the children, teachers and psychologists in and across general and special schools, including interdisciplinary meetings and processes of assessment, referral and decision-making (Røn-Larsen, 2011; 2019; Røn-Larsen & Jørgensen, 2018). The material was developed and explored together with psychologists from various local authorities to develop knowledge on their practice and politics of everyday life.

My examination of the everyday work life of educational psychologists shows how they are invested in much more comprehensive tasks that relate to investigating and changing the underlying social processes for creating relevant

opportunities for participation for all children in school. During interviews, the psychologists often explain why they do what they do as part of a common and conflictual social practice due to the institutional arrangement of prioritising school resources and addressing the overall political issues concerning what education should be about and for whom (Højholt & Røn-Larsen, 2021).

In this way, educational psychologists indirectly play a central role in relation to the various opportunities all children have to participate in the education system since they describe the children's problems as related to their individual level of functioning in statutory EPA reports. However, as we shall see in the forthcoming analysis, educational psychologists continuously struggle to overcome individualising and categorisations to create relevant opportunities for all children to participate. This work, which is often invisible in relation to their job description and the professional standards defined, tends to be confined to the in-between spaces of their everyday work life. During an interview, one psychologist describes how she believes that how the support system is organised causes it to fail to achieve its objectives:

I'm at a school where many children have social and relational difficulties, but the support system is mainly directed at academic difficulties inside the classroom. However, the difficulties of the children are primarily related to children's communities outside their lessons. (...) So, something in the way the support is organised plays a crucial part in how we can actually meet the children.

In a discussion with colleagues from other municipalities, another psychologist describes how the organisation is interchangeable with local conditions, that it cannot be understood as a definite framework or structure:

I'm concerned about the importance of how things are organised. What's possible and how does it work locally? What's possible in one collaborative relationship is impossible in another. What's possible is incredibly local. Both cooperation between child and youth workers and teachers, but also school management and cooperation between local authorities and all the people involved with your children. It's scary to think about how huge an impact the way we collaborate and the local underlying conditions have.

Thus, the organisational structure do not merely depend on overall policy procedures. The organisation or the institutional arrangement are related to the enactments of the various participants within the organisation, especially the psychologists. In the previous quote, the psychologist points to local differences – that the organisation is apparently not established once and for all. It unfolds in a variety of ways in numerous places according to a diverse array of collaborative relationships and negotiations. Moreover, the everyday politics of the various professionals affects these processes in relation to specific institutional conditions that work as a guideline or an institutional framework for decision making on the one hand but are widely dependent on local interpretations and variations on the other (Røn-Larsen, 2011; 2019; Højholt & Røn-Larsen, 2021).

In the empirical data, the psychologists describe how they work with contradictory demands in relation to the underlying processes of inequality and inclusion and exclusion. In one respect, they are expected to contribute broadly to processes of inclusion in school as a sounding board and as a mediator for children, parents, teachers, and principals in supporting the opportunities available for all pupils at school. In another respect, they are required to participate in individual assessments that sometimes lead to processes of exclusion that involve segregation into special education. As one psychologist explains:

We need to pay constant attention to the fact that there are so many different interests at stake at the same time – and so many vulnerabilities. And we need to be able to constantly explore and navigate in relation to these many expectations – to find the opportunities for development in every single situation.

The psychologists experience dilemmas related to conflicts between the demands of inclusion, social approaches to school problems and pressure of individualised problem understandings, which ultimately leads to restricted opportunities for participation for some children.

Many of the psychologist point out that their concrete possibilities depend on many more contextual relationships than the individual child's behaviour or level of functioning. They assert that, in each case, assessment and decision making often depend on other factors, such as a conflict-ridden interdisciplinary climate, a strong group of parents who insist on the exclusion of a single child, a frightened children's community struggling with the dynamics of exclusion when there is a change in teachers. According to the psychologists knowledge about these types of organisational complexities is necessary to navigate and collaborate in order to develop relevant interventions and opportunities for all children to participate. The psychologists describe their continuous exploration of and work with widely differing contradictory aspects as a central but often overlooked part of their work.

Facilitating interdisciplinary collaboration through corridor casework

Many psychologists describe collaboration with other parties as crucial to creating opportunities in the various situations. They explain how these collaborative processes involve what we have described elsewhere as corridor casework, to be able to participate in relevant ways connected to making a difference for the children and their families (Højholt & Røn-Larsen, 2021). This work consists of the many unnoticed processes of everyday work life related to making things work for children, families and various professionals (Røn-Larsen, 2019).

The psychologists mention how a central part of their work is related to the many conflictual relationships surrounding a single case or child and how they need to examine a problem's context and what is involved to facilitate relevant interventions. They highlight the need to address multiple processes besides the

mental processes of the individual child. The concept of corridor casework reflects an attempt to pinpoint these unheeded aspects of professional work, which often take place, for example as quick encounters in between meetings and test situations in the corridors or as phone calls in parking lots, and that are necessary for exploring and relating the many diverse and sometimes contradictory interests of the involved parties. These aspects do not appear in the descriptions of professional requirements and standards for psychological casework but they are essential to preparing and facilitating collaboration around complex and conflictual matters. Corridor casework requires exploration, flexibility and the courage to examine conflicts and relate perspectives in new ways.

Psychologists find it necessary to invest much time in building mutual trust and familiarity among the various participants to make things work. They talk about finding ways to be accessible as a part of the teacher's everyday work life by hanging out as much as possible in the teacher staff room or by talking to parents before and after difficult meetings to prepare or debrief them. As one psychologist explains: *"It kind of helps to develop a culture, a working community, where we continuously draw on each other"*.

Especially the head of school is described as a very central partner in terms of gaining access to preventive interventions in the classroom. The more experienced psychologists often advise newcomers to become acquainted with school management as quickly as possible (also noted by Graff, 2021) since *"That makes everything so much easier"*, also because the school leadership often acts as a gatekeeper in terms of the school's practices and as the one who requests EPAs. As one psychologist reiterates: *"The first thing you have to do is to build a relationship with the headmaster. To set the agenda and demonstrate how you can contribute. From there, you can start negotiating your access, position and possibilities."* In this way, the psychologists underline their mutual interdependence with other participants in practice. At the same time, however, they experience that this part of their job becomes invisible and unheeded, which means it is often the first aspect of their work that is neglected when they have a heavy workload.

From conflict escalation and lack of corridor casework to problem displacement

Corridor casework is at one and the same time described as highly complex and as constantly at risk of being deprioritised. Many of the psychologists describe it as risky since they are unable to continually maintain these in-between processes. At times the situation becomes so conflictual that the collaborating parties move further apart, rather than closer together, resulting in counterproductive consequences for the very children the collaboration is designed to help. As one of the psychologists points out:

Particularly in situations with a large amount of frustration, we often have different perceptions of how to handle the problem, and what is needed in the specific context. Then you often tend to think that someone else should have done something different. The harder it gets, the harder it seems for us to collaborate and work together. (...) I often think: 'Wow, here the organisation is pulling us away from each other instead of making us join forces to create a dense safety net'. For strange reasons, we withdraw from each other, and the parents and children fall through at their very worst.

Across the observations of procedures surrounding children in difficult situation, we notice a strong tendency for problem displacement to the individual child or the family background as related to broader deadlocked problems, where the parties end up in opposition. In other words, the escalating level of conflict and the feeling of powerlessness in a certain situation do not necessarily relate directly to a specifically low level of function in a specific child. Nevertheless, it sometimes leads to putting pressure on the educational psychologists to deliver individualising descriptions of a child to achieve replacement rather than the facilitation of the collaborative processes. One psychologist states:

When I'm invited into a process that has already gotten off track, and where there's a very high level of conflict, I'm met with a demand from the teacher: 'I want him out of here, and I want you to provide description that will make it happen.'

This psychologist touches on another feature, i.e. that these types of expectations toward psychologists are largely supported by special education legislation, which stipulates that EPAs are a mandatory part of the referral process (Graff et al., 2021). Although the psychologists are also in charge of processes related to inclusion and the facilitation of interdisciplinary collaboration within the general area, in deadlocked situations where there is a high degree of powerlessness, they are often under immense pressure to do individual assessments, making it increasingly hard to navigate between their various roles.

It's about different political agendas and perspectives on children. There's a conflict about whose psychologists we are. Who are we here for? Are we the school's psychologists or are we the child's advocate? And where do we place ourselves in that? What are we willing to stand up for? Why are we organised in this particular way and with what consequences?

Many of the psychologists describe restrictive options for conducting observations in the classroom before the level of conflict leads to an impasse, both because they feel pressured to conduct the mandatory assessments and tests in relation to emergency cases but also because other professionals have specific expectations toward their expertise on the individual child's difficulties and possible diagnosis. In this way, the expectations toward receiving certain contributions from the psychologists can also act to restrict the options available for analysing and working within the broader context of schools.

Mandatory reports – An EPA is not just an EPA

As described earlier, EPAs are legally a mandatory part of statutory reporting in relation to the allocation of special education resources of more than nine hours a week (UVM, 2023). This practice is an extreme case in relation to the expected “beforehand” and neutral expert knowledge (criticised by e.g. Edwards, 2010) but is simultaneously paradoxically illustrative of the dilemmas, possibilities and restrictions that educational psychologists face in relation to participating in a relevant way in a field with contradictory institutional conditions and requirements.

Several psychologists point out multiple strategies for bending the rules and creating possibilities in ways they sometimes feel are in spite of the planned procedures. They talk about the problems that arise due to the demand of following prefixed procedures and standards in relation to for example developing the statutory educational psychological assessment (EPA), or when they are limited to obtaining specific knowledge using specific standards and tests, no matter how relevant it might seem in the local situation. Such standards might restrict the opportunities available for adapting procedures and interventions to the concrete situations. They wish to determine what is relevant and when it is relevant to vary from process to process. What happens depends on the analysis of the concrete situation but the psychologists often feel that the analysis is restricted due to conflicting demands and a lack of time and flexibility.

In a discussion during a practice research meeting a group of educational psychologists discuss the strategic work behind an EPA:

I’ve sometimes been asked to do EPAs specifically because something was going to the appeals court. An EPA is not just an EPA. It’s written with a specific purpose and in relation to a specific recipient. There’s no specific conclusion, but there’s definitely a specific recipient and a specific focus.

One psychologist comments in a manner that emphasises the political aspects of doing what is supposed to be a neutral assessment of an individual in a statutory report:

You’re often commissioned to do a specific task, and it’s our job to keep that in mind. For example, I’m asked to deliver a progress report for the visitation council. There’s a specific request from whoever calls me in that we aim at a certain conclusion. So it always comes back to what I’ve been commissioned to do.

This leads us to considering how EPAs may appear as blind reproductions of the individualising positions when looking only at cases and EPA documents. However, empirical analyses of the educational psychologists overall practice point to the many considerations concerning how to navigate concretely to find the best possible paths to take by simultaneously complying with rules and breaking them.

What determines the content of the EPA? You have to think about the actual possibilities already when you decide what makes sense to write. Here political agendas will also play in (...) Inclusion changed the whole organisation of school, and as a consequence it has become relevant to write differently in your EPA because it can change the options that are available for what you can do.

So already in EPAs, the psychologists consider what possibilities the descriptions they write about a problem might open or close in relation to a specific child:

Our system puts a lot of emphasis on what has already been done in the school. You have to justify that an effort has already been made in relation to the problem. In the EPA, I turn the descriptions of these efforts up and down in relation to all sorts of other factors: the state of the teaching team, how collaborating with management is going – in relation to what skills and resources will be available for this child. There are so many aspects that affect what issues I choose to emphasise. I might exaggerate a minor effort that was made if I think it's crucial for a child to get support if they're going to succeed in that specific context. In that way, I really think that we have a great deal of power in terms of pushing our management in terms of the allocation of their resources. I use it [EPA] very deliberately.

As many of the psychologists above indicated, corridor casework requires working with their very position as a psychologist, expectations toward their interventions and with the constitution of problem understandings. The various statements from the psychologists clearly show that they put a great deal of effort into reflecting on and working with changing their position and expanding their possibilities for contributing and collaborating because they have found that doing so makes a difference in relation to what can be arranged for the children within the bounds of certain legislation. As one psychologist states:

Schools in a municipality with the exact same policy differ greatly, and this has a huge impact on the differences in the opportunities that children and their parents encounter.

The everyday political efforts and corridor casework done by not only the psychologists but all the involved parties make a difference in the situated practice together with other participants. They intentionally carry out the politics of everyday life in collective, complex, and contradictory contexts to negotiate, transform and make sense of the structural conditions in the institutional arrangements of education.

Toward an understanding of the everyday politics of educational psychologists

In my analysis of the educational work life, I see many attempts to expand the perspective from the individual child to a broader perspective on the many different participants and relationships influencing the conditions the children

have for participation. However, I also see this happening in spite of their working conditions. These conditions and the demands put on the psychologists seem to prompt the exact opposite of a wider view – due to the legal requirements regarding EPAs measuring the functional level of the individual child. In combination with limited financial resources in the general education, this seems to lead to a sense of powerlessness among the professionals surrounding the child, which ultimately leads to conflicts and a greater risk of exclusion.

The interviews with the educational psychologists and observations of their everyday work lives show that they put a great deal of effort into avoiding gridlocks. They reflect heavily on these situations resulting from the larger political environment and multiple local differences since they must constantly navigate everyday political work. The corridor casework they do shows that they are flexible in relation to following and bending rules and requirements, building alliances, preparing, and facilitating collaboration among various parties to develop interventions relevant to the children and their contexts. The burning house metaphor mentioned earlier is an apt representation of the professional and political engagement their efforts require. Furthermore, the analysis of the everyday work lives of educational psychologists shows that their practice of navigating in and contributing to transformation of the conditions delimits their efforts.

The aspects of educational psychological practice that take a strong political effort in everyday work life are often undescribed and rendered invisible, leaving it unrecognised. The historical and current conditions the psychologist operate in are restricted due to their traditionally contradictory role as gatekeepers for special educational support. The legislative requirements for EPAs on the individual child's level of functioning make it more difficult to do the necessary corridor work to change the conditions for the child to participate. These aspects of the work of educational psychologists tends to become obscured since engaging in this type of work is not delineated in the legislative requirements. This indicates that corridor work is not as highly valued as mandatory EPA task. As a logical consequence these aspects are largely overlooked and deprioritised.

To acknowledge and further understand how local efforts among educational psychologists and the restrictive conditions they endure contribute to not only transforming but also maintaining and reproducing the existing problems of inequality, individualism, and marginalisation, researchers must conceptually draw their efforts and corridor work into the light, especially if the goal is to develop better practices for inclusion and equal access to school for all children. We need to acknowledge their efforts in theory and practice as an important and inescapable part of working professionally with fundamental, common issues involving educational institutions.

In term of research, it is necessary to further develop concepts that address the work of educational psychologists and other professionals as related to the common and conflictual matter of expanding the access of all children to relevant possibilities for participating in educational institutions. Hence, it is also essential to embrace a new focus on educational psychology by expanding the traditional

focus of assessing and working on the functional level of the individual child in isolation to incorporate a new and broader perspective that centres on the educational psychologist's everyday political work on the context and conditions for the participation of every children. The concept of politics of everyday life can contribute to this new focus and implies transcending the traditional expert status of educational psychologists on the functional level of individual children and acknowledging the transformative collaborative activities of educational psychologists in relation to changing the concrete possibilities and institutional conditions. The theoretical development of everyday politics suggested in this article is not limited to the practice of educational psychologists and can be expanded to also support researchers and practitioners in terms of grasping the hidden political aspects of professional work in other complex societal organisations.

Maja Røn Larsen is a Researcher at Roskilde University - <https://forskning.ruc.dk/da/persons/mrl> . She holds a PhD in Socialpsychology of Everyday Life – with a specific focus on children’s everyday life and professional collaboration and conflicts in the borderland between general and special education. She is currently head of the research project “Participation and situated inequality” concerning childrens’ unequal possibilities of participation in their everyday life in different institutional settings.

Social character, sexuality, sexpol: The transgression of psychology by Marxist psychoanalysts

Peter Schulz

Abstract

Psychological treatment in general and psychotherapy in particular approaches the individual. In societal conditions that systematically produce physical and psychological suffering, it is therefore necessarily oriented toward adaptation to the demands of these social conditions. Sigmund Freud's concept of the normal, which is not normatively charged, but merely means the ability to function within the existing, emphasizes this.

In the 1920s, a small group of psychoanalysts tried to break through this limitation of psychology's focus on adaptation. They were convinced that Freud's psychoanalysis was compatible with Marx's critique of capitalism, and as socialists and communists they sought answers to the question of why the majority of the oppressed did not rebel against their oppression. On the one hand their attempt to combine the critique of capitalism and psychoanalysis proved fruitful: it led to the concept of the authoritarian personality. On the other hand, the attempt to politically lift clinical psychology in political practice came too late to slow down the rise of National Socialism in Germany.

This paper will present the attempts of the Marxist psychoanalysts Erich Fromm and Wilhelm Reich, as well as Siegfried Bernfeld and Otto Fenichel, in four steps: 1) it shows how the combination of psychoanalysis and Marxist theory led to the question of why the majority of the oppressed did not rebel. 2) it presents the extension of the psychoanalytic concept of character from pathological cases to the normal case as the basis for the development of the authoritarian personality. It shows how this theory focused on the role of sexuality in domination and oppression, offering for the first time a theory of the relationship between gender and capitalism. 3) it will discuss the programmatic point of an abolition of individual psychology through political practice concluded from this, especially by Reich.

The article thus aims 4) to recuperate the political core of the work of the Marxist psychoanalysts and to make it possible for a discussion in the light of changed social conditions during a new rise of political authoritarianism 100 years later.

Keywords

psychoanalytic social psychology, psychoanalysis, Freudomarxism, Critical Theory, political psychology, authoritarian personality, sexuality,

1. Introduction

It requires some explanation to study psychoanalysts like Wilhelm Reich, Otto Fenichel, Siegfried Bernfeld or Erich Fromm today, if one wants to explore the relationship between psychology and politics. Both psychoanalysis and the form of Marxism these authors embraced have been thoroughly criticized in the last 90 years - and societal conditions have changed more than superficially. Nevertheless, this article follows the intention that one can learn something from the efforts of the 'Marxist psychoanalysts': About the difficulties that the relationship between psychology and politics offers, and about the productive effects that a transcendence of mere psychology can or could have for theory and political practice. This assumption is grounded in the fact that Marxist psychoanalysts in their time, through their attempts to connect psychoanalysis and Marxism, came into opposition both to the psychoanalysis of their time as well as to Marxism and the prevailing political practice of the communist parties. Their attempted connection thereby ignited a dynamic for theory and practice as well as for psychology and politics.¹

The paper will reconstruct how this connection between Marxism and psychoanalysis was attempted. On the one hand, it will be shown how theoretically productive the connection was, and which practical approaches for the political change of the conditions stood alongside or in place of the individual therapy, in order to make it accessible for the present. To this end, I proceed in four steps in the paper: In the following section, I present the conceptual foundations of the connection between Marxism and psychoanalysis. This connection between psychoanalysis and Marxist theory led to the question why the majority of the oppressed do not rebel. In the third section, I then provide a reconstruction of how this linkage was theoretically productive. To this end, I elaborate the extension of the psychoanalytic concept of character from pathological cases to the normal case as the basis for the development of the authoritarian character. In addition, I reconstruct how the theory focused on the role of sexuality in domination and oppression and thereby offered for the first time a theory of the relationship between gender and capitalism. In the fourth section, I reconstruct the politically productive consequences of this connection, expressed in Reich's program of sexual-political enlightenment as a political *Aufhebung* of psychology. Finally, in the fifth section, I will discuss the reconstructed theoretical and political elements of Marxist psychoanalysis, consider its theoretical as well as political failure, and formulate theses regarding the potentials of the theories of Marxist psychoanalysts to be recuperated.

In order to achieve this goal, the paper follows the argumentation of the Marxist psychoanalysts without pointing out the critical revision of positions of psychoanalysis, Marxism or other underlying theories that has taken place in the

¹ The Marxist psychoanalysts were by no means the only ones who dared to try to connect Marxism and psychology. In the Soviet Union, a 'dialectical-materialistic psychology' and with it the activity theory around Alexei N. Leontiev and Lev S. Vygotsky was developing at the same time, as well as in West Germany in the 1970s, for example, Klaus Holzkamp's critical psychology.

last 90 years. The aim is thus to make their positions and theoretical movements comprehensible in a summarized way, in order to make them accessible to today's rescuing critique.

2. 'Why the Starving Man Does Not Steal and the Worker Does Not Go on Strike'

The term 'Marxist psychoanalyst' appeared as an oxymoron in the 1920s. In the first years after the Russian Revolution, it initially looked as if psychoanalysis might gain recognition as a materialist science in the young Soviet Union (Dahmer 1973: 276). By the end of the 1920s, however, the position of Abram Moiseyevich Deborin prevailed, which interpreted Freudian psychoanalysis as bourgeois and anti-Marxist 'Freudism' (Dahmer 1973: 285, Schneider 1973). On the other hand, although the psychoanalyst Paul Federn, in a 1919 publication, understood the Russian Revolution as a successful emancipation from authority, the majority of psychoanalysts rejected the workers' movement and communist parties (Dahmer 1973: 277).

Against the dominant positions on both sides, 'Freudomarxism' (Abl 2007: 128) or the 'Freudian Left' (Dahmer 1973: 9) emerged in the German-speaking world in the 1920s. Its main figures were Siegfried Bernfeld, Wilhelm Reich, Erich Fromm, and Otto Fenichel (Brunner et.al. 2013; Dahmer 1973: 9). Their starting point for combining Marxism and psychoanalysis was the question of why the international workers' movement failed in World War I and why the revolutions outside Russia collapsed, even though, in line with Lenin's and Rosa Luxemburg's theories of imperialism, the objective conditions had been ready for revolution (Reich 1980a: 1-2; Bernfeld 1973: 81). The answer to this question lays, in their perspective, in the answer to the question "why the 'ideology of the rulers,' i.e., bourgeois ideals and, particularly, the nationalism that obscured class relations, entered the (unconscious) emotional lives of the ruled" (Brunner et.al. 2013: 424).

Reich, Fenichel, and Bernfeld adopted this perspective because their psychoanalytic-therapeutic or pedagogical practice directly confronted them with the effects of capitalism on individuals' lives. All three studied in Vienna, came into contact with psychoanalysis there, and became psychoanalysts in the 1920s. The slightly younger Fromm studied sociology and became an analyst in Berlin, a place where all four worked in the meantime. Reich, in particular, encountered non-bourgeois patients as part of his work at the Vienna Psychoanalytic Polyclinic, and hence reflected on the class bias of Freudian psychoanalysis. This reflection led to the character theory, which will be discussed in the subsequent section.

At the center of their work was the question of why the majority of people, instead of rebelling, submit to conditions that are not to their advantage. The famous phrasing of this question, why the starving man does not steal and the worker does not go on strike, is found almost word by word in Reich (1980b: 34), Fromm (Fromm 1989a: 14), and Fenichel (1998a: 282), while Bernfeld

simply asks why the majority of the oppressed do not simply annihilate the oppressing minority (Bernfeld 1973: 68).

Other Marxist theorists, such as Georg Lukács and Karl Korsch, simultaneously addressed this question. Unlike them, however, the Marxist psychoanalysts did not refer to the fetish chapter of *Capital* and thus tried to renew Marxism. Instead, they adopted the dominant form of Marxism at the time, as it was also taught in the Soviet Union (Dahmer 1973: 309). They also did not connect Marxism and psychoanalysis internally – as Herbert Marcuse, for example, did later – but their "efforts to integrate Freudian insights into Marxism" (Brunner et.al. 2016: 424) remained external. They understood Freud's theory of man as a *Triebwesen* as a special theory for the psyche that had no effect on the theory of the capitalist mode of production (Fromm 1989b: 3). They conceived both theories as complementary dialectical materialist theories with different realms of concern (Reich 1972a: 8). However, their work is definitely an effort to integrate Marxist insights into Freudianism. In reference to Marx's theory of class rule and exploitation, they both historicized and localized the drive structure that Freud described as general-human.

Freud's psychoanalysis was for the Marxist psychoanalysts on the one hand their practical working basis and as such for them a critical theory. Psychoanalysis began with the thesis that hysteria and other clinical pictures were completely psychic syndromes. Freud opposed a biologization of this suffering and concluded that the distress-free discharge of affects was instead prevented by psychological reasons grounded in the life situation and upbringing (Freud 1957: 18). Thus, psychoanalysis took a step toward recognizing patients as subjects and replaced violent medical treatments with conversations. At the same time, it allowed a focus on social and family circumstances as a source of suffering.

Following the goal of individual treatment, however, psychoanalysis was (and is) radically a-normative. This becomes particularly clear in Freud's concept of the 'normal': normal for Freud is that which is adapted to society without suffering. Abnormal, and thus pathological, is that from which the individual suffers under the given societal conditions (Ipperciel 1998: 40-42). This definition commits psychoanalysis to individual therapy and presupposes societal conditions as given and unchangeable. Consequently, Marxist psychoanalysts opposed this definition. However, they did not do this against psychoanalysis, but rather within its framework. They followed the theory of the genesis of the individual psyche through the relationships in early childhood, but understood these early childhood relationships as the product of a historically specific form: the patriarchal nuclear family in class society. Taking Marxism as their point of departure, they grasped this form itself as the source of necessary suffering, and thus attempted to overcome the conformist orientation of psychoanalysis on its own ground.

At the same time, the Marxist psychoanalysts directed themselves against the conception of subjectivity as a mere derivation from economic conditions, which was dominant in Marxism in their time (Fenichel 1998a: 276). In contrast, through psychoanalysis they sought to understand the psyche of the human being

as the product of the individual's reflexive reference to societal conditions. They thereby supplemented Marx's productive 'toolmaker' with Freud's 'pleasure-seeker' (Dahmer 1973: 162) and saw both as grounded in human neediness. This essential neediness leads to productivity as a necessity of human existence in the first place (Fenichel 1998a: 278).

Marx understands man as a needy being, who produces his metabolism with nature in a division of labor. This necessary division of labor establishes man as a social being, who is therefore prone to social domination because he is dependent on other people. Under capitalism, man is expropriated from his productivity, and this expropriation also reverberates as alienation on man's subjectivity (Marx 1977: 68). Marx also portrays this alienation as a loss of sensuality, since under conditions of socially maintained scarcity, the world tends to be conceived only in terms of necessity. The dominant sense of man under capitalism thus becomes the sense of having (Marx 1977: 101), whereas what is actually human about man is that, according to Ludwig Feuerbach's (2014) example, unlike the caterpillar, he can comprehend the world universally and freely (Marx 1977: 74).

Just as for Marx, Freud's starting point is man's neediness. For Freud, too, man is dependent on social division of labor, which Freud calls 'culture' (Freud 1930: 49-50). Freud, however, adds to this anthropological assumption a theory of the socializational genesis of subjectivity, and places sexual drives alongside the drives of self-preservation considered by Marx. The specificity of these sexual drives is that they have to be socially satisfied, but their satisfaction is not necessary for survival. While Freud describes the self-preservation drives such as hunger or thirst as relatively rigid, the sexual drives can change the object from which they seek satisfaction more easily. A central thrust of Freud's psychoanalysis was that although the sex drives are usually coupled to the genitals as organs of their satisfaction, this is not yet the case at birth. Therefore, with psychoanalysis, desires and affects that are not directly sexual in character and content can also be analyzed as fed from the sexual drives.²

For Marxist psychoanalysts, this variability of the sex drives explains the gateway for social domination into human life. Social reproduction in the short term depends less on the realization of sexuality and other satisfactions of pleasure than on people eating and drinking. A state also depends on the sexual reproduction of its population, but unlike a strike against wage labor, a strike against this reproduction would not result in an immediate crisis of population policy. At the same time, the flexibility of sexual drives allows for their shaping in early childhood. This shaping takes place imprinted by the patriarchal nuclear family, by professional education, and by religion. All three authoritarian structures are, from the perspective of Marxist psychoanalysts, not models but images of social authority (Fromm 2020: 19).

² Freud developed several versions of his drive theory; in his last version he divided the drives into Eros and the death drive as two fundamentally opposing variants. Within psychoanalysis after Freud, the drive theory was not followed up seamlessly, and alternative models developed, for example, with Melanie Klein's object relations theory. The account given in this article serves to reconstruct the starting point of Marxist psychoanalysts who were Freudians on this point. For a critique of the abandonment of drive theory, see Herbert Marcuse (1961: 217ff.); for a critique of his position from the perspective of object relations theory, see Nancy J. Chodorow (1985).

This drive-theoretical theory of authority simultaneously opens up a perspective on the relationship between social domination and gender for Marxist psychoanalysts: in authoritarian structures, the child learns a repressive form of coexistence that is at the same time gendered. This is true for the patriarchal nuclear family as well as for its extension in professional education, but also for patriarchal monotheistic religions - the three main fields in which Marxist psychoanalysts criticize social domination. One's gender is understood as a factor in one's position in relations of domination and is accordingly significant: as a promise of participation in domination or as a naturalization of one's oppression.

Regarding their methodology, Marxist psychoanalysts understand both theories as dialectical materialism and present these commonalities in programmatic writings respectively.³ In the following, these methodological commonalities will be reconstructed briefly according to Fenichel's (1998) account: Fenichel distinguishes Marxism and psychoanalysis from idealism and a false materialism (Fenichel 1998a: 276). Only the combination of both theories allows a complete materialism, since only in this way the psyche and the societal structure are understood as material and active (Fenichel 1998a: 277-278). Both Freudian psychoanalysis and Marxism not only describe their respective subject matters, but scientifically unfold them and their regularities. Both do not criticize morally, but expose reality through their analysis and work 'historically-genetically' for this purpose (Fenichel 1998a: 287). They show the present as something that has developed and is contradictory in itself. Psychoanalysis is thereby suited to investigate how ideologies anchor themselves psychologically and, in this way, complements Marxism, which lacked a theory of intrapsychic processes (Fenichel 1998a: 283). With that they offered the historically first attempt on a Marxist basis to jointly reflect on the conditions of social production and reproduction on both the individual and the societal level. By combining these two sides in this way, they capture the capitalistically shaped production of needs in a theoretically specific way, rather than merely naming it.

The Freudian concept of relatively variable and shapeable sexual drives opened up the possibility for Marxist psychoanalysts not merely to grasp the relationship between capitalism and needs in terms of the denial of material satisfaction and the expropriation of productive needs, but to formulate a more differentiated theory of formation, which for the first time complemented the concept of ideology intrapsychically. From this, the generalization of the concept of character from psychoanalysis and its transfer from the description of pathological cases to the description of social normality formed the basis of the answer as to why the exploited and dominated do not rebel: Because their (sexually based) needs have, by family and social upbringing, found their satisfaction in submission to domination and the substitute satisfaction in resentment against inferiors. Their connection of Marxism and psychoanalysis is thus based on the idea of a complementarity of the two theories, which cover

³ Bernfeld in a section of "Sisyphus or The Limits of Education" (Bernfeld 1973: 45ff.), Reich in "Dialektischer Materialismus und Psychoanalyse," Fromm in "Psychoanalyse und Soziologie" and "The Method and Function of an Analytical Social Psychology", and Fenichel in "Über die Psychoanalyse als Keim einer zukünftigen dialektisch-materialistischen Psychologie."

different subject realms. They then tried to theoretically catch up with the interaction of the two areas - society and the individual - primarily through an adaptation of psychoanalysis.

3. The normal character

The key theoretical innovation of Marxist psychoanalysts, resulting from the linking of Marxism and psychoanalysis, was the concept of the 'authoritarian character'. Its development and its core elements will be reconstructed in the next paragraphs. This concept and its close connection to the analysis of sexuality in the patriarchy formed the basis for the necessity of the political abolition of psychoanalysis, which was understood especially by Reich.

In psychoanalysis, the concept of character initially describes the form that a part of the psyche assumes in the course of socialization in order to be able to meet social requirements. The concept was developed in order to be able to capture certain behaviors of patients in the analysis. Reich and Fromm developed it into a category of social theory. They stated that every society shapes the psyche of its subjects in a functional way, i.e., favors a specific character that fits it (Reich 1997: 13). The basis for this was first the observation that the majority of people in interwar capitalism were brought up in authoritarian family structures and, in accordance with this upbringing, tend to be submissive also to social authorities out of fear of punishment and deprivation of affection (Fromm 2020, Reich 1972b: 225). This servility leads subjects to deny themselves the fulfillment of their needs when punishment might follow. As a substitute satisfaction for these unmet needs, they instead develop sadism against inferiors who are not protected by any social authority.

From this formative violence in socialization and the fear of its repetition, a psychological structure emerges which they first call 'sado-masochistic character', later 'authoritarian character'. It is more prevalent the more society demands renunciation and promotes misery (Fromm 2020: 43). According to Fromm, the authoritarian character is by no means irrevocably fixed in childhood. Rather, the identification of internalized paternal authority with social authority must be continuously reproduced in order to stabilize the authoritarian character (Fromm 2020: 12). This also requires the persistent ideological or overt threat of social violence mediated through fear, guilt, or hopelessness.

The basis for the violence of authoritarian family structures was thereby their patriarchal structure, or more precisely the crisis of patriarchy caused by industrial capitalism. „Fromm had discovered a certain and widely common ‚sado-masochist character structure‘ that he deemed the result of a patriarchal family with a father who tries to restore his authority, which has been delegitimized by his actual social powerlessness, by authoritarian behavior. The tormented children submit to the father, develop a rigid and punitive super-ego, and project their massive aggressions, once directed at the father, at outer enemies“ (Brunner et.al. 2013: 435) In the nuclear family, the man can repress and thus endure his social powerlessness by experiencing power over other

family members (Fromm 1989c: 197). Instead of rebelling against social domination, he is upwards masochistic, downwards sadistic, i.e. against wife, children and social marginal groups. For Marxist psychoanalysts, patriarchy thus forms the starting point and basis for the acceptance of class domination (Fromm 1970a). The authoritarian character is therefore, for the Marxist psychoanalysts, at the same time a masculine character. Their view thus remains, like Freud's, androcentric and they hardly say anything about the situation of women (Umrath 2019: 160).

Referring to the social anthropologists Johann Jakob Bachofen (whose historicization of patriarchy already played an important role for Friedrich Engels) and Bronisław Malinowski (Umrath 2019: 85-153), Reich and the other Marxist psychoanalysts explain the historical emergence of patriarchy as a result of the emergence and increased economic importance of dowry-gifts based on increased productive forces. According to Reich, the necessity of the regulated distribution of the historically new surplus product led to the possibility and necessity of heredity (Reich 1972c: 188). With it, the sexual exclusivity of marriage asserts itself among the owning and, at the same time, it establishes social differentiation into classes and thus social domination (Reich 1972c: 141). Thus, "sexual oppression" (Reich 1972c: 101) is rooted in paternal heredity and monogamous marriage and is intergenerationally mediated first through violence like genital mutilations (Reich 1972c: 168) and later through education. With monotheistic religions, this regulation of sexuality becomes generalized, and in the context of the development of bourgeois society, workers also increasingly adopt bourgeois norms of behavior for their private lives. According to Reich, the sexual oppression within nuclear family becomes "among the ruling class's key ideological resources in holding down the working population" (Reich 1972c: 101), since it and the authoritarian upbringing that accompanies it "requires children to obey their parents, and prepares for the later obedience of the adults to the authority of the state and capital by producing fear of authority in all individuals in society" (Reich 1972c: 245).

A repressive sexual morality accompanies the patriarchal family, since control over female sexuality and, by extension, control of (female) sexuality outside of marriage was key to ensuring an orderly heredity. According to Reich, in order to control sexual needs, particularly in women and adolescents, it is necessary that they be dampened. This dampening requires a persistent repression of sexual needs. At the same time, this sexually hostile sexual moral comes with the split between sexual sensuality and loving tenderness (Reich 1985: 139; Bernfeld 2010: 252), which is projected onto women as a split into "the harlot and the unattainable, idealized 'holy' woman" (Reich 1983a: 93, translated by the author). It results in a brutalization of (male hetero)sexuality that springs from the splitting of tenderness from sexuality as much as from shifted sadism (Reich 1980a: 143-144).

The authoritarian character is thus linked to patriarchy as a basic structure of modern societies. Therefore, Marxist psychoanalysts generalize the concept of character gradually, and in relation to their clinical, empirical observations: Initially still in the spirit of Freud, Reich uses the concept of character in the

early 1920s to describe clinical pictures (Reich 1983b: 150.; 1983c), but analyzes different characters as dominant in different class situations. He and Fromm eventually conclude that "every form of society [] has not only its own economic and political, but also its specific libidinous structure" (Fromm 1989d: 34, translated by the author). Society, by means of its educational structures, specifically shapes individuals, as it "creates for itself those characters it needs for its existence" (Reich 1997: 13, translated by the author). The concept of character is thus transformed from an instrument for the analysis and therapy of abnormal individuals to a concept of critique of a false normality. In this normality, the psyche of the majority of people was characterized by permanently unstable submission to authority, repression of sexual needs, in return necessary positive occupation of renunciations (social masochism), as well as a sadism against inferiors such as women, children, and outsiders.

4. If the normal case is the problem, therapy cannot be the solution.

The heart of their theory of the authoritarian character as the normal case is thus its education in family and society to submission to domination and exploitation and to a mental attachment to and dependence on domination. This attitude is achieved by a specific shaping of the sexual drives, which is accompanied by their weakening and dampening and at the same time by sexist violence. This led Marxist psychoanalysts to ask whether psychoanalysis could play a practical role in overcoming this character and its sources, domination and exploitation. Fromm and Reich rejected this. Fromm sees no possibility of a 'politico-social therapy' (Fromm 1989d: 35); instead, the change of economic conditions must be the starting point and the authoritarian character can only be overcome by a reasonable and planned regulation of social life (Fromm 2020: 57). Likewise, Reich assumes that only the end of its societal basis, i.e., the patriarchal family (Reich 1972a: 47), means the end of the authoritarian character. For both, the function of psychoanalysis for the workers' movement is to contribute to the enlightenment and destruction of ideology (Fromm 1989d: 36) and thus to reduce its repressive power. As such, it should increase the explosive power that (according to Reich and Fromm) libidinous needs inherently have (Fromm 1970b; Reich 1980a). Reich "started from the assumption of a natural 'sex-economy' and, celebrating genital sex, equated it with 'orgiastic potency.' He assumed that this sex-economy was repressed by present society with its hostility toward sexuality. Accordingly, his political-practical activism centered on the liberation of this self-regulation principle" (Brunner et.al. 2013: 425).

It was Reich who finally attempted a political *Aufhebung* of psychoanalysis practically and, in the essay 'Was ist Klassenbewusstsein?' published in 1934 under the pseudonym Ernst Parell, theoretically. The essay first ties in with Lenin in order to challenge him critically (Reich 1972d: 284). To this end, Reich introduces a differentiation by distinguishing between the class consciousness of the revolutionary leadership and that of the mass of workers (Reich 1972d: 289). Unlike this leadership, the class consciousness of ordinary workers is not

characterized by a theoretical penetration of societal conditions, but proceeds from everyday hardships (Reich 1972d: 288-289). Workers are initially interested not in questions of value theory but in their everyday needs, "in food, clothing, fashion, family relations, the possibility of sexual satisfaction in the narrowest sense, in sexual play and entertainment in a wider sense, such as the cinema, the theater, amusement arcades, parks and dance halls" (Reich 1972d: 290). Reich agrees with Lenin that these interests do not become revolutionary on their own, and therefore he also agrees that there is a need for some kind of vanguard with a leadership function. However, in contrast to Lenin and the communist party of his time, according to Reich, it is not discipline that needs to be taught to the workers. On the contrary, the basis for revolutionary consciousness and revolutionary deeds is everything that contains "a germ of rebellion" (Reich 1972d: 295). Reich therefore does not reject individual acts of rebellion, but understands them as the starting point of revolutionary practice. In this context, Reich centers sexual needs alongside immediate material needs and accordingly links "sexual inhibitions" (Reich 1972d: 297) to the inhibition of revolutionary sentiments in his theory. It is precisely in this field that he sees the task of the party, which on the one hand must "attach the masses to us by feeling" (Reich 1972d: 341), but on the other hand must break these inhibitions down rather than promote them.

Reich therefore criticizes every form of bonding that corresponds to authoritarian education: Soccer as well as the pub and workers' social clubs as gender-homogeneous places of male workers (Reich 1972d: 314), the wearing of uniforms and any cult of the leader (Reich 1972d: 302) as reproducing authoritarian symbolism.⁴ In addition, Reich calls for the practical critique of the patriarchal family and its violence over women and children (Reich 1972d: 313, 316) as part of party work.

For Reich, therefore, a key method of the avant-garde party was to be proletarian „sexual policy" (Reich 1980a: 157), that is, the political enlightenment and organization of sexual needs against their sexual moral inhibitions. In practice, Reich realized his "SexPol" in the early 1930s in the surroundings of the KPD, in the context of which educational brochures and a magazine were published, sexual-political demands were articulated, and discussion was sought especially with young workers. The goal of the "SexPol" was to "transform sexual rebellion [...] in a revolutionary way, to lead it further to proletarian sexual revolution" (Reich 1980b: 200, translated by the author)⁵ and

⁴ This was a minority position in the discussion at the time: not only the KPD practiced a leader cult around Ernst Thälmann, Bernfeld also advocated mass festivals, leaders, and the establishment of tradition as elements of his socialist mass pedagogy (Bernfeld 2016); likewise, Fromm refers positively to proletarian leaders (Fromm 1970b).

⁵ The editors of Reich's English translations wiped its communist perspectives „This rebellion inevitably takes pathological forms. It is a matter of recognizing the fact that it is healthy forces which try to break through in these pathological forms, and of guiding this rebellion into rational channels, to a sex-economic regulation. Here, too, the freedom of life is born out of the convulsions of life." (Reich 1980a: 121) The German original from 1933 sounds quite different: „Aber sie bleibt zunächst bürgerliche sexuelle Revolution, vor der mancher Revolutionär oft mit Recht flieht. Es gilt aber, sie revolutionär umzugestalten, zur proletarischen Sexualrevolution weiterzuführen, nicht anders wie sonst aus den Erschütterungen des bürgerlichen Lebens die Zukunft des Sozialismus geboren." (Reich 1980b: 200)

thus to make clear the incompatibility of uninhibited sexuality and capitalist society that Reich had presupposed. In contrast to Lenin, for Reich, revolutionary sentiment does not arise from the collectivization and disciplining of the factory, but from the rebellion against (sexual) disciplining, because the goal is not work, but the free development of each individual. For Reich, a completely different form of subjectivity is on the horizon. With the overcoming of capitalism and the patriarchal nuclear family, the Oedipus complex, central to psychoanalysis as a key moment of socialization, also disappears (Reich 1972a: 47; Fromm 1970b; Fenichel 1998b: 232-233), and with it the gender characters linked to it.

5. Failure and potentials of Marxist psychoanalysis

Following the theoretical and political impulses offered by the linking of Marxism and psychoanalysis in the 1920s and 1930s, which the article has reconstructed so far, the historical failure as well as the salvageable potentials of this attempt will now be discussed.

To attribute the failure of Reich's "SexPol" only to the victory of National Socialism in Germany is abbreviated. As early as 1932, the KPD restricted Reich's possibilities, stopped the distribution of brochures on sexual politics, and finally expelled Reich from the party in 1933 (Dahmer 1973: 400-401). At the same time, Reich was expelled from the International Psychoanalytic Association in 1934 because of his political activity. This was followed by a split between Reich and Fenichel over the question of an independent Marxist psychoanalytic organization (Dahmer 1973: 363).

Overall, the discussion context of Marxist psychoanalysis broke down as a result of the exile situation, but was reinforced by the loss of organizational platforms. Reich himself fled to Denmark, where his residence status was revoked in 1934 for political reasons. He fled further to Sweden, where he was also under public political pressure. This isolation, as well as the low hope of being able to therapeutically or politically counter the rise of National Socialism, can be seen as one of the reasons why Reich distanced himself from psychoanalysis and Marxism. From the mid-1930s, he advocated a vitalistic theory of healing, first with 'vegetotherapy' and later with 'orgonomy' (Dahmer 1973: 374), in which he attributed psychological suffering to energy flows that could not be scientifically proven. Reich was legally prosecuted for his orgonomy in the USA after the war, arrested and died in prison in 1957.

Fromm also turns away from Freudian psychoanalysis after his separation from the Institute for Social Research in 1938, to which he had belonged since 1930, and from 1941 on, he advocates a theory that is no longer based on the theory of drives, but on a theory of harmonious social coexistence (Fromm 1969: 26). Bernfeld worked in exile on a Freud biography and died in 1953; Fenichel continued his largely orthodox psychoanalytic work and organized contact between exiled psychoanalysts by circulating newsletters - he also died in the USA in 1946. Bernfeld and Fenichel worked on the preservation of the endangered psychoanalysis and suspended their Marxist positions for this

purpose, while Reich and Fromm left the ground of psychoanalysis. Remarkably, their respective starting points are complementary and already evident in their psychoanalytic works. Both first implicitly reject Freud's concept of sexuality: Reich narrows successful sexuality to a supposedly natural genitality in which other things have their place only as *Vorlust*; Fromm, on the other hand, expands it to human love and criticizes Freud's focus on sexuality (Fromm 1969). This development is already apparent in both of their works before their break with Freud. In Reich's case at the latest in 1927 in 'Die Funktion des Orgasmus' (The Function of Orgasm), in which he opposes a natural and wholesome genital sexuality to socially conditioned inhibitions or congestions (Reich 1985: 23). In Fromm's case, the turning away becomes apparent at the latest in 1932, when he criticizes the Freudian focus on erogenous zones in 'Psychoanalytic Characterology and its Relevance for Social Psychology' (Fromm 1970c). They both have in common that they focus on the repression of natural drives. Both are motivated by a focus on human nature as the foundation of their critique and at the same time as the foundation of revolutionary potential (Dahmer 1973: 404; Abl 2007: 131). Unlike the Freudian theory of drives, which in all its variants emphasizes the primary asociality of man and thus opposes a natural harmony of human nature and the social, both Reich and Fromm formulate theories that assume a natural harmony and explain the non-harmonious reality through social repression.

Coupled with this, Reich and Fromm have a restrictive notion of successful heterosexual sexuality as penetration of the vagina with a penis, which is based on the one hand on the pathologization of clitoral sexuality (Reich 1983a; Fromm 1989e: 8, 365) and on the other hand of homosexuality (Reich 1983d: 223; Fromm 2020: 10). They follow Freud's pathologizations and even exceed them, since they place against his a-normative concept of normality the normativity of social liberation and thus of the genital (hetero)sexuality of a liberated society. Furthermore, they display suggestively difference-feminist positions: Reich and Fromm criticize the women's movement of their time, countering it by arguing that feminist politics actually needed to develop positively occupied feminine qualities such as motherliness (Reich 1983c: 273; Fromm 1970a).

On the one hand, "[t]heir emphasis on social relations [] allowed them to come up against psychologisms and to conceptualize human thought and action as deeply historical" (Brunner et.al. 2013: 424), on the other hand, unlike Freud, they naturalized a sexuality they perceived as successful. With this "simple contradistinction between biological drive structure and social deformation, the basis for deviation and resistance needed to be sought after in the drives and when the critique of biologism was driven further it evolved into a rather idealistic recourse to ethics" (Brunner et.al. 2013: 424-425). Despite and also because of this failure, something can be learned from the attempts of Marxist psychoanalysts for current matters. In doing so, the preceding reconstruction hopefully makes clear that their attempt to transcend psychology politically reveals potentials both theoretically and politically: theoretically, it made clear the connection between psychic constitution (character in the vocabulary of Marxist psychoanalysis), gender, and social domination; politically, it made clear

the relevance of psychic interests for the politicization of the lifeworld. Moreover, it became clear that every political practice has to reflect its concept of liberation and its implicit (or explicit) naturalizations.

Four theses on these points will follow and conclude the paper: Firstly, for Marxist psychoanalysis, as presented, there was a close connection between the authoritarian character, patriarchy and its repressive sexual morality. Under the condition of "repressive desublimation" (Marcuse 2002: 59) and the observation of psychoanalytically oriented social scientists that the socially dominant character changes and is nowadays less oriented towards renunciations (Schulz 2020: 204-205), this thesis needs a revision. However, the concept of social character need not be discarded for this purpose, and the persistence of existing societal conditions in the very subjects themselves continues to require an explanation for which an updated concept of social character can provide a basis. At the same time, the role that masculinity, sexual oppression, and the authoritarian character play in contemporary political authoritarian movements is hard to overlook, whether in the phenomenon of incels and their linkage to U.S. Trumpism, or to anti-woman and anti-queer positions of right-wing actors around the world.

Secondly, Reich's critique of the communist party of his time was based on a key argument, namely the thesis that politicization must start from everyday experiences and subjective needs. The reference to Freud's drive theory allowed him to identify sexual needs in addition to the needs of life support, food, housing, and so on. The assumed high variability of sexual needs makes them a key battlefield for social domination. This is also reflected in the aforementioned identity and cultural-political struggles of right-wing movements. At the same time, it is evident from these authoritarian movements and their concepts of cultural political work, so-called meta-politics, that right-wing activists today grasp and in part successfully occupy Reich's approach of making 'cinema, the theater, amusement arcades, parks and dance halls' the starting point of political practice. The connection between acceptance of social domination and psychological needs, as elaborated by Marxist psychoanalysts, makes it clear that this 'metapolitics' is by no means a pre-political activity, but a direct attempt to reproduce the legitimacy of domination structures. Thirdly, Reich understood the basis of domination primarily as the suppression of a naturally invested sexuality. Accordingly, his concept of liberation consisted in the idea of breaking open the armor of character (Reich 1972). In the course of the revolts around 1968, the concepts of Marxist psychoanalysts were rediscovered. Fromm was read primarily in terms of the authoritarian character, Bernfeld primarily for his critique of professional pedagogy. Reich's writings, in particular, gained importance in inspiring specific concepts for collectively overcoming the authoritarian character. His ideas combined with concepts from other sources during the student movement: The sit-ins, which originated in the civil rights movement, were further developed by the American SDS into teach-ins, in which political action through blockade and political education work were directly linked. One step further was the concept of creating situations, which was developed by the Situationist International (SI) in France, and which was

mediated via the Munich action art group SPUR, which was for a time a member of the SI, to the German student movement and from there to the United States. The goal was to create political actions and spaces in which those involved could directly overcome their authoritarian character. The critique of this concept formulated as early as the 1930s, which pointed to the danger of accompanying psychological trauma (Fenichel 1998c: 333), was barely received in the 1960s and 1970s. Accordingly the dangers of targeted confrontations with the police as an educational technique, as in the German student movement or, for example, in the protests against the 1968 Democratic National Convention in Chicago, were reflected on just as little as those of the deprivatized practice of living together in the emerging communes. The theories of Marxist psychoanalysts - in their failure - thus form a mirror for the understanding of liberation and its own potential for violence.

Fourthly, the concept of mere liberation through the breaking of the armor based itself on a naturalization of an intrinsically good sexuality, which at the same time presupposed heterosexual genitality. This naturalization is by no means necessary in the combination of Marxism and psychoanalysis, as the renewed attempt at combination in the works of Herbert Marcuse shows. In 'Eros and Civilization' Marcuse reanalyzed the connection between gender character, sexuality and capitalism. The pivotal point of his theory is that the formation of genital sexuality is to be understood as a de-eroticization of the remaining body, which becomes necessary so that it can be instrumentally handled as a means of labor (Marcuse 1961: 45-46). Accordingly, unlike Reich, Marcuse's perspective on a subjectivity beyond capitalism is not the perspective on a liberated (heterosexual) genitality, but on a sexuality beyond genitality and the suspension of gender characters in "androgynism" (Marcuse 1974: 287). This also provided a starting point for the critique of the repression of homosexuality and a radical critique of gender and monosexuality in general, as formulated in the 1970s in the U.S. gay and lesbian movement (Altman 1993; Firestone 2015; Umrath 2019: 45), but also in Europe, for example by Mario Mieli (2018) building on Marcuse's theory. Looking at Marxist psychoanalysis therefore allows us to understand this naturalization as a failure that, once understood, enables us to reflect on our own theoretical and political positions.

These four tasks, sketched here merely as theses, by no means require the use of psychoanalytic (or Marxist) theories, although I suspect that their critical reading is useful. But a look at the history of psychology's attempts to cross over into politics, as attempted in this article using the example of Marxist psychoanalysts of the 1920s and 1930s, can serve as a lens for contemporary theoretical and political concepts-to learn from their failure rather than repeat it.

“Only You”: Neoliberal responsibilizing through a public health campaign in the Norwegian welfare state

Salman Türken, Erik Carlquist & Joshua M. Phelps

Abstract

One of the pathways through which psychology may function as "politics by other means" is when scientific knowledge from the discipline is used to inform and influence the public on issues of health and well-being. To illustrate this point, we explore "Only You," a Norwegian public health campaign composed of psychoeducational videos and web resources and aimed to promote well-being in the general Norwegian population. By drawing upon critical psychological literature on agency, neoliberal subjectivity, responsibilizing and neurogovernance, we critically analyze promotional and instructional videos that explicitly targeted individual behavioral change. We demonstrate how these campaign videos appropriate psychological knowledge and conceal societal contexts in order to responsibilize subjects and thereby perpetuate neoliberal ideas and practices in the Norwegian welfare state. In this sense, they provide illustrations of how psychology can be a tool for restricting agency under the guise of encouraging autonomy.

Keywords

neoliberal subjectivity, psychologization, responsibilizing, neurologization, agency

Introduction

Today the function of psychiatry, psychology and psychoanalysis threatens to become the tool in the manipulation of men [sic]. (Fromm, 1955, p. 163-164)

In *The Sane Society*, Fromm (1955) raised a critique of psychologizing tendencies in Western capitalist societies, warning against the risk of psychology becoming a tool for manipulating the public and “the apologist for the status quo” (p. 71). In particular, he criticized the widespread understanding that “the problem of mental health in a society is only that of the number of ‘unadjusted’ individuals, and not that of a possible unadjustment of the culture itself” (Fromm,

1955, p. 6). Although Fromm's critique was directed at US capitalism and society in the 1950s, it is useful for interpreting how contemporary Western capitalist societies draw upon disciplinary psychology in order to understand and intervene in public mental health. Fromm maintained that an individual's ability or capacity to achieve mental health is never solely determined by individual factors. Instead, it relies largely upon what specific local and societal contexts enable or make possible. However, more contemporary critical psychological literature has problematized how increasing psychologization has contributed to obscure contextual factors and support neoliberal ideology (e.g., Arfken, 2018; Madsen & Brinkmann, 2011; Marvakis, 2019; Parker, 1999). In this paper, in light of critical psychological concepts such as subjectivity and agency, responsibilizing, and neoliberalism, we discuss elements of a Norwegian public health strategy aiming to improve mental health and well-being amongst citizens.

Norway has generally been recognized to be a well-functioning welfare state (UNDP, 2021-22) and has consistently ranked at the top of surveys comparing well-being across nations (e.g., Helliwell et al., 2022). Indeed, the Norwegian state has invested heavily in public mental health care and promotion during the last decades (Office of the Auditor General, 2021). The number of psychologists and the funds allocated to mental health services has increased considerably, and authorities have expanded low-threshold services by employing psychologists in local municipalities nationwide (Ose et al., 2018). Despite these efforts, self-reported mental health problems have increased during the past two decades, as have the seeking of professional psychological help and the use of psychotropic medications, both in youth and adult populations (Reneflot et al., 2018). Advocacy groups have therefore pointed to the need for further investments in prevention and treatment of mental health problems (e.g., Mental Helse, 2022).

In this paper, we explore the psychoeducational videos and web resources of the recent large-scale Norwegian governmental health campaign, "Bare Du" (Only You). This campaign drew upon psychological research and the notion of "five ways to well-being" (Aked et al., 2008; Prydz et al., 2022) and aimed to promote mental health and well-being amongst the general Norwegian population. We ask what kinds of subjectivities and forms of agency are offered or made possible to citizens through the "Only You" campaign, and how the campaign might have *responsibilized* individual subjects for their own mental health. Hence, we illustrate ways psychology works *as politics by other means*, allowing us to explore how psychological theory and practice may be used to the advantage of neoliberalism (Arfken, 2018).

Theoretical framework

Our theoretical framework emphasizes how neoliberalism may constitute and constrain subjectivity in societies such as Norway. We draw upon Holzkamp's (1991) distinction between restrictive and generalized agency, critical psychological perspectives on subjectivity, neoliberalism and the welfare state,

and the concept of responsabilizing (Lemke, 2001; Rose, 1996, 1999), including "governing through the brain" (Rose & Abi-Rached, 2014).

Neoliberal subjectivity and agency

Subjectivity emerges in relation to and exists through ongoing situated participation and conduct of everyday life, as continuously interwoven between the inner resources of individuals on the one hand, and external societal conditions on the other (Holzkamp, 1991; Parker, 1999; Teo, 2015). Societal meaning structures, such as neoliberal ideology, lay the foundation upon which individuals act, becoming premises of each person's subjective reasons for action. Mainstream psychology can be criticized for limiting these action possibilities, in that one major role of psychological science is to equip people with strategies for mentally adjusting to already existing inequality-generating and illness-producing conditions, rather than altering them (Holzkamp, 2013). In this paper, we explore how mental health campaigns which explicitly draw on mainstream psychological knowledge might stimulate, offer, and limit subjectivity and action possibilities. Human agency is ultimately always political, as our actions may maintain, reproduce, challenge or create alternative social relations (Marvakis, 2019). However, societal changes under neoliberalism have affected psychology in ways that demand a redefinition of its functionality for a new historical form of subjectivity (Arfken, 2018; Marvakis, 2019). The neoliberal form of subjectivity (Teo, 2018) entails that persons act on the premise that change is primarily possible in the sense of changing *oneself*, or one's immediate surroundings. Wider social and societal relations are taken as given or understood as undesirable or impossible to change. Starting from Holzkamp's (1991) distinction, we will explore whether and how the "Only You" campaign might stimulate a *restrictive agency*, where subjects are poised to pursue action within the confines of socially given possibilities and limitations, or in contrast might stimulate a *generalized agency* by which subjects transcend those limits and can control and change societal conditions.

Neoliberalism and the welfare state

Neoliberalism has radically reshaped the relationship between the individual and the state (Arfken, 2018). State bureaucracy has been increasingly transformed into business-like enterprises designed to move people off "entitlements" and into the labor force regardless of their individual circumstances, reproducing market relations (Esping-Andersen, 1990) and hence the capitalist system at large by ensuring that there is a supply of healthy, educated and disciplined workers for the economy (e.g., Gough, 1979; Moncrieff, 2022).

Neoliberalism does not imply a shrinking or weakened state, despite a number of functions having been privatized or outsourced. Rather, the state becomes a central instrument for the advancement of neoliberal agendas (e.g.,

Wacquant, 2012). As Davies (2018) argues, this involves a redistribution of power away from the conventional political and bureaucratic spheres, which are implicitly understood as corrupt. Instead, agency increasingly flows to actors viewed as unpolluted by politics. As a result, ‘non-political’ actors such as consultants, auditors, contractors, and experts perform a greater role in the functioning of the neoliberal state. Neoliberalism not only enables particular ways for society to be organized, but also demands that social scientists deliver expert knowledge in order to bring about necessary compliance within the population (Marvakis, 2019). As Arfken (2018, p. 4) argues, living in neoliberal societies implies being “transformed into a malleable and disposable appendage of advanced capitalism.” This implies that bureaucratic use of psychological knowledge or services may effectively serve to maintain the status quo of neoliberalism, since psychology may be used to bring about the required adjustments among individuals. Such scientification legitimizes the political will and activities of the bureaucracy and works to bring about compliance (Harding, 1992). The practical consequence of such dynamics is the proliferation of scientifically based programs, not “corrupted” by politics. Thus, when state agencies and bureaucracies initiate large-scale interventions such as public health campaigns, the content of such measures are based on allegedly neutral scientific, empirical knowledge (see Marvakis, 2019; Harding, 1992).

Responsibilizing in neoliberal societies

Critical social scientists have been concerned with how individuals in Western societies are increasingly understood to be responsible for their own health and well-being. For example, Crawford’s (1980) *healthism* concept critically refers to “the preoccupation with personal health as a primary – often the primary – focus for the definition and achievement of well-being ... (which) treats individual behavior, attitudes and emotions as the relevant symptoms needing attention” (p. 368). Similarly, resonating with Fromm’s (1955) warnings against psychologization in capitalist societies, it has been long recognized that psychotherapy has become an available answer to almost any crisis encountered in an individual’s life. Indeed, the language of therapy has increasingly infused popular media and self-help literature (Illouz, 2008; Madsen, 2015), and it is now commonly recognized amongst critical psychologists that neoliberal developments have led to profound changes in societal as well as individual health practices. Social, structural and political problems have been conveniently psychologized, and thus transformed into personal matters (De Vos, 2008; Madsen & Brinkmann, 2011), a development which has also been construed as a form of structural violence in critical health psychology (see e.g., Hodgetts & Stolte, 2017). Structural violence, to use Farmer’s (2004) understanding, refers to an indirect social machinery of oppression where the very structure of society systematically causes harm to or disadvantages individuals and groups. Adverse outcomes such as subjugation, psychological terror, stigmatization, illness and

death, stand at risk of being erased from the historical memory, and instead individuals can be praised or blamed for their suffering.

Illustratively, Rose (1996, 1999) argues that workings of neoliberalism are strengthened by the psy-complex, where psychology and its related disciplines diffuse in society a certain type of psychological knowledge and practical techniques of self-control, self-esteem, self-awareness etc. through which individuals understand and conduct themselves in ways consonant with neoliberalism. Crucially, individuals are molded (Teo, 2018) into self-monitoring subjects who employ those practices to improve and optimize themselves. Consequently, individuals are increasingly understood by the state and themselves as solely responsible for their own well-being and fate, for their successes and failures. Hence, they are required to accept responsibility for managing every sphere of life, and for tackling the risks and uncertainties created by changes in the structural elements of society. Indirect control by the state is enabled by responsabilizing individuals as agents who "would produce the ends of government by fulfilling themselves rather than being merely obedient" (Rose et al., 2006, p. 89). Neoliberalism reshapes subjectivity in such a manner that explanations of concerns or problems caused by external (societal) forces are ascribed to the self, with appeals to "personal responsibility" and "self-care" (Lemke, 2001, p. 203). Such neoliberal responsabilizing "respond[s] to the sufferer as if they were the author of their own misfortune...the disadvantaged individual has come to be seen as potentially and ideally an active agent in the fabrication of their own existence" (Rose, 1996, p. 59).

Welfare state retrenchment is enabled through the transformation of citizens into autonomous, self-steering, economically independent, responsibility-taking agents who must manage and develop themselves in order to survive and succeed in neoliberal societies. Living as 'entrepreneurial selves' at the intersection of neoliberalism and psychology, subjects are required to continually rework themselves to become masters of self-invention and innovation (Teo, 2018). Contemporary psychological problems may indeed result from the demands of an increasingly psychologized neoliberal society, perversely through its allures of happiness and well-being (Adams et al., 2019; Ahmed, 2010; De Vos, 2008; Greco & Stenner, 2013; Schrecker & Bamba, 2015) and concealing structural violence (Farmer, 2004; Hodgetts & Stolte, 2017). Within such societies, mainstream psychology has been understood by critical psychologists as legitimizing neoliberal policy through its insistence on psychologization (e.g., Arfken, 2018; De Vos, 2008).

The increasingly pervasive neuropsychological paradigm adds to this trend of discounting social context and responsabilizing the individual, but also complicates it (e.g., De Vos, 2016; Rose & Abi-Rached, 2014). First, the personal mind is frequently reduced to the brain and its neurological workings or components, potentially impoverishing the perceived agency of the subject (e.g., popular sentiments such as "I feel depressed, so there must be something wrong going on in my brain"). Secondly, the contemporary academic and popular emphasis on the brain enables additional ways of social control, as subjects are made responsible for caring for their brains, keeping it adaptive and productive

(De Vos, 2016). Subjects thereby find themselves as agents in relationships with their own brains, which sometimes are portrayed to have agentic qualities superseding the mind (Broer & Pickersgill, 2015). Hence, not only psychologization, but also neurologization can be co-opted as an ideological tool or apparatus of the neoliberal state (see De Vos, 2008, 2016; Madsen & Brinkman, 2011; Marvakis, 2019; Moncrieff, 2008).

Public health and neoliberalism in Norway

Contradictory impulses within Norwegian society make this country an interesting case for examining a specific configuration of neoliberalism and how the state approaches public mental health. The shaping of the post-WW2 welfare state included a considerable emphasis on public health work (Schjøtz, 2003). Nevertheless, approaches to mental health were of a largely curative nature, rather than addressing the prevention of mental health problems, or the root causes of mental suffering (Ramsdal, 2013). Although mental health was repeatedly prioritized in governmental planning, advocacy groups pointed out that public sector funding for mental health grew less than for somatic health (The Norwegian Council for Mental Health, 2004), and in any case continued to be channeled largely towards treatment rather than contextual or structural change.

Since the 1980s, Norway's extensive system of public services has been increasingly influenced by neoliberal policies (Carlquist et al., 2007). Many sectors of Norwegian society were subject to market reforms. Health and care services were scrutinized for cost-effectiveness and increasingly governed by principles of New Public Management. It hence makes sense to describe Norway as currently signifying a *neoliberal welfare state*, in that such a term illustrates the state's fundamentally ambidextrous quality (Bourdieu, 2000), with the capacity to move resources and manpower between its paternalistic, coercive, disciplinary, and punitive "right hand" and its assistive, caring, and protective "left hand" (Bourdieu, 2014, p. 368; see also Wacquant, 2012). According to Nafstad et al. (2007), such policies have contributed to a shift in values among the population, from the collective to the individual. For instance, while the importance of social inequalities for mental health is acknowledged by health authorities, not only have inequalities been rising (Arntzen et al., 2019), but there also has been, as Madsen (2020) notes, an intensification of individualization in governmental white papers on public health.

From the 2000s, public mental health literature has increasingly emphasized preventive work and the promotion of well-being, reflecting an understanding that costs for providing treatment could rise endlessly, given the considerable and maybe even rising prevalence of mental health problems (Newton, 2013). Although psychotherapeutic specialist treatment is still a dominant approach in the Norwegian mental health field, emphasis has gradually shifted towards principles of early intervention and prevention, especially in local municipal community contexts (Ose et al., 2018). During the 2010s, low-threshold

municipal psychological services were established nationwide (Elstad & Eide, 2017). It is acknowledged in governmental white papers that challenging life contexts are crucial determinants of mental health problems, and effective preventive work therefore necessitates addressing and changing these contexts (Meld. St. 2018-2019). Nevertheless, the recently developed municipal services still tend to target individual rather than community needs, such as by offering psychoeducational or coping courses or even therapy sessions to service users (see e.g., Helland et al., 2021). In sum, despite governmental recognition of contextual determinants of public mental health, the individual mind remains as the key site for intervention.

Following Parker's (1999) statement that “ideology works not because it simply offers an account that can be willingly adopted or easily refused, but precisely because it saturates commonsense” (p. 14), our analysis highlights ways in which mainstream psychological science penetrates common sense and thus takes on ideological functions. By critically examining elements of the “Only You” governmental health campaign – a result of collaboration of social actors such as civil servants, scientific reference groups of academics and practitioners, (hired) consultants, a psychological interest organization and advertising agencies – we demonstrate how psychological knowledge might function as social control of individuals, who are ideologically shaped to become self-regulating responsibilized agents, i.e., neoliberal subjects.

The «Only You» campaign

Figure 1. The campaign logo: “Only You ...can say yes to changes”

The Norwegian Directorate of Health launched the “Only You” public health campaign in 2019. It involved multiple communication strategies for motivating Norwegian citizens to make small adjustments to their everyday habits by engaging in healthier life choices, specifically related to alcohol and tobacco consumption, nutrition, mental health, and physical activity (Helse Norge, 2023a). The campaign existed across multiple platforms and included promotional “Only You” videos, multiple resources interlinked directly on the Health Directorate’s website and the “Go me” (“Heia meg”) digital app, consisting of digital exercises and advice. Our analysis focuses predominantly

upon elements drawn from the mental health theme of the campaign. We first describe and briefly analyze the “Only You” mental health video¹ and the campaign’s mental health launch page entitled “Five recommendations for increased quality of life and stronger mental health” (Helse Norge, 2023b). Thereafter, we investigate the subsequent “Everyday Happiness” (“Hverdagsglede”) informational videos, which constitutes the main part of our analysis.

“Only You” campaign video and launch pages

The “Only You” campaign videos were televised as infomercials on nationwide TV channels, promoted on social media platforms and posted on the Health Directorate’s YouTube channel. The videos consist of either a 50- or 30-second clip and follow a near-identical structure and format. A recognizable Norwegian actor plays a character who is overtly engaged in a particular health problem, including inactivity, eating junk food, smoking, drinking and social withdrawal. In each video, significant others soon appear, attempting to help the person change their unhealthy behavior, but with no success. Following this failure, a doppelgänger of the person appears, played by the same actor, and manages to successfully convince the person to make the necessary lifestyle change. The video ends with the song “Only You” by The Platters.

In the mental health video, we see a young woman alone in her apartment, displaying nonverbal signs of sadness, appearing disheveled and, by implication, depressed. Her doorbell rings and three concerned friends stop by to cheer her up. They unsuccessfully attempt to convince her to join them for a yoga session in the park, but the young woman persuades them to leave. Next, another friend comes by with two tickets for a show, again to no avail. Finally, a new person rings the doorbell. As the woman opens the door, to her surprise, her doppelgänger appears with two cups of coffee (see Figure 2). The protagonist and her double both smile and then leave the apartment together as the “Only You” song ends the video, with the added textual message “Only you can say yes to changes. Learn to strengthen your mental health at helsenorge.no².”

Figure 2

The “Only You” videos provide examples of restrictive agency (Holzkamp, 1991) and how healthism (Crawford, 1980) and neoliberalism (e.g., Teo, 2018) have permeated a Norwegian public health campaign. They illustrate how agency may be restricted in the Norwegian welfare state, because of how they frame choices for improving one’s health. They all suggest that there is no possibility of help beyond one’s own actions. Significant others who clearly care and attempt to help are framed as utter failures. Moreover, the videos offer no possibilities of systemic solutions to each individual’s problems. In the mental health video, for example, the depressed woman is confined to a highly restrictive form of agency because seemingly her only choice for resolving her mental health problems is to change herself via her *doppelgänger*. The protagonist’s actual and caring social network has no effect and is rejected, even though her friends are clearly aware of the fact that she is struggling and are willing to help. What is perhaps surprising from a critical psychological point of view is that the videos are neither subtle nor careful in their state-sponsored, healthist attempts to responsabilize subjects for their own health problems and choices. In our view, the portrayal of significant others as irrelevant further serves an ideological function in which a “social form of life” is colonized or suppressed by neoliberal subjectivity (Teo, 2018, p. 583). By promoting a self-reliant, autonomous subject who can resolve mental health issues entirely alone, the video also stands in contradiction not only to established psychological and sociological research (e.g., Cacioppo et al., 2014; Umberson & Karas Montez, 2010), but even to central ideas of the “five ways of well-being” which the Directorate promoted, and to which we now turn.

The launch webpage for the wider “Only You” campaign was modified in 2022 to a new campaign, which at the time of writing was called “Live” (“Lev”). However, the content of the webpage remained largely the same. The campaign aims are immediately presented, as providing “free and knowledge-based tools and advice if you want to change a habit, or just need information about small steps you may take to improve your health.” When it comes to mental health,

users are told that there are “Five recommendations to strengthen your mental health” using the key phrases “Be mindful” (“Vær oppmerksom”), “Keep learning” (“Forsett å lære”), “Be active” (“Vær aktiv”), “Make connections” (“Knytt bånd”) and “Give” (“Gi til andre”). The user is then directed to a new webpage where the Directorate introduces its evidence base for the mental health part of the campaign by referencing the “Five Ways to Wellbeing” report contractually produced for the UK government by the British think tank New Economics Foundation (Aked et al., 2008). The online resources provide definitions of key concepts and additional advice on the five recommendations, including both text and short digital videos belonging to a wider mental health and well-being program entitled “Everyday Happiness.” “Everyday Happiness,” a registered trademark, refers to a package of public health measures developed by The Norwegian Council for Mental Health (NCMH) in cooperation with the Norwegian Directorate of Health, the Norwegian Institute of Public Health, municipal Healthy Life Centres and the psychology research group Promenta at the University of Oslo (Prydz et al., 2022). The NCMH is an umbrella organization encompassing major interest and user organizations, labor unions, ideal/humanitarian organizations and educational institutions in the field of mental health. The broader “Everyday Happiness” program has become widespread in Norway, used by municipality psychologists in treatment, offered as part of psychological services to university students, and introduced to marginalized groups such as refugees (Prydz et al., 2022).

“Everyday Happiness” videos

The Directorate has promoted six videos produced by the “Everyday Happiness” program, one general and five specifically related to each pathway to well-being. The “Everyday Happiness” videos contain more complexity than the “Only You” video. The activity involved in realizing these pathways is referred to as a ‘grep’, a Norwegian term connoting embodied action and etymologically similar to the English ‘grip.’ A voiceover narrator identically introduces each video with a message that there are five ways to increased well-being, supported by research. Thereafter, the narrator provides more specific information about each of these pathways and practical instructions for how the user may ‘get a grip’ in order to achieve well-being. The central character in all videos is a cartoon figure of a hand, which takes on an anthropomorphic form, walking around on its legs and displaying various facial expressions. The hand is seen engaged in multiple activities and states such as suffering problems, being lazy, feeling lonely, or meeting other hands. At key points in each video, it achieves happiness.

We will now describe and analyze selected narrator utterances and images from each of the five videos. Specifically, we show how the videos construct neoliberal subjectivities through different routes, some of which are subtle and others more explicit.

Be mindful

The general message of this video is that subjects can attain everyday happiness by exercising control of where they direct their attention. We are first introduced to the upset hand which has cut itself while slicing a cucumber because it is unfocused and inattentive in the actual moment (Figure 3). The narrator informs us that:

When we are unaware of where our attention is directed, we might easily go through life on autopilot. Rushing around in our own little bubble, where we risk missing out on what is happening to us right here and now. We are often more present in ruminating over what has happened, or worrying about the future... in fact, not much is required for you to notice the effect of becoming more mindful. Simply becoming aware of where you direct your attention, will make a great difference... It requires a bit of exercise. The more you work on it, the stronger you get.

Figure 3

Here, the inattentive subject is depicted as distracted by ponderings about the past or concerns for the future, which makes them miss out on what is happening to them in the present. Suggestions for what the viewers should do to become more attentive are trivial. For example, we are told to “become aware of “sounds, smells”, or “the color of your local shop attendant’s hair.” Ultimately the aim, according to the narrator, is to “become aware of what you think and feel.” From a critical perspective, urging subjects to solely focus on superficial features of their environments and the here-and-now of their sensations arguably contributes to ideologically concealing contradictions and injustices of everyday life. Attention is deflected away from, for instance, job insecurities, homeless people on the streets, or worrying about the climate crisis. Paradoxically, then, we might become *less* aware of “what is happening to us” in our lived lives.

The call for working on mindfulness, and a consequent promise of happiness and strength, is backed by referring to research:

Research shows that mindfulness training improves our immune systems, increases feelings of joy, and can prevent stress and depression. We get better at focusing, which again can improve our memory.

While mainstream research might support such conclusions, the video ignores scholarly controversies and research pointing towards potential harmful effects of mindfulness practices (Ng, 2016; Van Dam et al., 2018). Hence, the campaign does not simply provide research-based objective knowledge to its audience, but rather molds individuals into certain types of subjects. Individuals are encouraged to concentrate on themselves in the here-and-now. Although presented as a technique, this message here occupies a key role in public health communication of how to attain well-being, and even what constitutes well-being. Towards the end of the video, the narrator recommends the following:

Let yourself be absorbed by an activity so that you forget both time and place. ... It doesn't have to be complicated. Do what works for you.

The video's call for self-centered mindfulness limits critical attention, most definitely of collective awareness toward structural inequalities, systemic conditions or imagined futures, hence reducing possibilities of generalized action potency. Furthermore, it may result in victim-blaming in the sense that potentially highly legitimate concerns in subjects' lives become individualized (Smail, 2005): Stress resides inside the subject and it is the subject's own fault that they are stressed out. This attributional logic is a key feature of neoliberal subjectivity (Teo, 2018; see also Prilleltensky, 1999). It responsabilizes the subject for attending primarily to superficial aspects of the present and ignoring, among other things, contextual conditions that produce the subject's worries in the first place. This attention-diverting process, in our interpretation, results in restrictive agency for the subject (e.g., Holzkamp, 1991).

Keep learning

In this video we are introduced to the hand lazily watching TV on its sofa (Figure 4). The narrator expresses:

It is an easy thing to meander around familiar paths. When did you last push the limits of your comfort zone? It is actually only at the limits of this zone, or in fact a bit outside, that we can develop. When we learn something new, we have to go beyond what we are used to, and push ourselves outside what feels one hundred percent safe.

Figure 4

Together, the first images and the narrative construct an irresponsible subject in need of improvement. The notion of having to *push* oneself reflects a neoliberal subjectivity in which an ever-changing self takes risks to acquire new skills, in order to increase its marketable value (Adams et al., 2019). From here, the narrator suggests that one reason to keep learning is that it,

...enables the brain to keep active and quick. The human brain is built for learning. Therefore, it needs to be challenged. Everything you do and learn, changes the brain. That is because new connections are created every time you learn something new. New knowledge offers new possibilities. And when we make new connections, new traces are made in the brain, allowing you to break old habits.

Figure 5

This segment presumes a duality between the brain and the subject (see also Figure 5). Subjects are compelled not only to manage and change themselves, but

also their brains. The excerpt provides a striking example of “governing through the brain,” as it responsabilizes subjects to care for their neural connections (Rose & Abi-Rached, 2014, p. 16). This neurological turn reflects post-Fordist production and modes of consumption within neoliberal capitalism (e.g., Boltanski & Chiapello, 2005), as the educated brain is construed as providing surplus value (“new possibilities”) ready to be extracted by the market (De Vos, 2016). To challenge the brain in this way, the subject is then explicitly instructed to create value by challenging itself:

Become aware. Do something you have not done before, big or small. Everything has value. In fact it makes no big difference what you learn, as long as you learn something. Today, it may be enough to have seen this film. And tomorrow, go out and explore something else.

This excerpt demonstrates a strong imperative to be innovative and on the move, which are prerequisites of neoliberal entrepreneurial subjectivity (Adams et al., 2019; Teo, 2018). This obligation is temporarily softened as the narrator states that it makes no difference what one learns, but the imperative rapidly returns, “Tomorrow, go out and explore something else.” Although this imperative seemingly opens up endless (action) possibilities, learning is always an activity of contradiction, containing not only opportunities to develop, possibly leading to increased self-determination, but also coercions to acquire existing knowledge resulting in the subject reproducing the social order (Marvakis, 2014). Whether learning leads to restrictive or generalized action potency depends on the organization of society (Holzkamp, 1991). The insistence on continuous learning in the video resonates with a lifelong learning paradigm, which, according to Olssen (2006), constitutes a form of neoliberal control, operating through market discourse and the entrepreneurial subject (see also Vassallo, 2015). Rapidly increasing societal heterogeneity and complexity entails new complex problems to be solved through new technologies, new forms of work and modes of production. The individual subject’s readiness for change therefore becomes imperative for neoliberalism. If individuals accept this subjectivity as implored in the video, pursuing constant learning in search of better well-being and full realization of their potentials may become a form of voluntary self-exploitation (Lee, 2022). Ironically, individuals can then construe the demand for lifelong learning as an “opportunity,” as they voluntarily and willingly pursue self-betterment within the logic of neoliberalism (Lee, 2022). In this way, neoliberalism transforms social and political problems into learning problems that need to be tackled by individuals and their brain-governing efforts, rather than solved through collective efforts and structural approaches (Biesta, 2016; Rose & Abi-Rached, 2014).

Be active

This video starts out more positively than the previous two. We initially find the hand rather happily standing in its living room and then subsequently engaged in

physical activity as the narrator provides the viewer with a broad, optimistic promise of well-being:

Imagine if there existed a cure that could prevent most lifestyle illnesses, provide lots of energy, and reduce stress, anxiety and depressions. Please welcome... physical activity. Being physically active simply does wonders for body and soul.

This one-size-fits all narrative about how the relationship between physical activity and mental health may act as a "cure" to multiple potential health problems is soon used to justify healthist ideas (Crawford, 1980). We see the hand actively running through the park, wearing a headband. However, there is a twist to this video: We find out that the hand has actually been daydreaming. We are returned to the reality of its living room, as we see that the hand has been lazily and sadly imagining the physical activity (see Figure 6). Thus, the hand is subtly responsabilized for a lack of physical activity as the narrator asks, "But why is it so difficult to be active when we know it is good for us?"

Figure 6

Posing this question implicitly reveals a contradictory feature of the campaign. Public psychoeducation, here conveying to the public what they already know is good for them and implicitly responsabilizing them, does not necessarily lead to the expected outcome. However, the video attempts to address this problem through a neurological turn:

The reality is that the brain prefers to be lazy. It is indeed programmed to save energy and will therefore instinctively choose to be in the state it already is, because new challenges require a lot of energy. That means that you have to take action and override the brain's impulses. Get yourself up off the sofa and begin! Make up your mind!

Here, by referring to qualities of the brain (cf. Rose & Abi-Rached, 2014), the campaign justifies several imperatives: Take action, get up from the sofa, fight

your lazy brain. The neuroeducational approach taken here demonstrates once again how subjects should discipline their brains to provide surplus value (De Vos, 2016). The narrative continues:

Our body is made for movement and it will reward you each and every time. When you exercise, endorphins are induced, which increases well-being and reduces stress. Exercise can also result in better memory, learning, sleep and less psychological suffering. Make up your mind! Experience the good feeling of having defeated the doorstep.

As this quotation illustrates, working on oneself as a tool for achieving happiness involves and rewards both the mind and the body (Teo, 2018). By conquering the brain, the mind-body subject is constructed as defeating barriers. The implicitly conveyed idea of becoming a resilient subject through choosing to be active aligns with the individual responsibility lying with the neoliberal subject (Joseph, 2013). Immediately following the above excerpt, the video then ends:

Do it for the most important person in your life – yourself! Go you, and good luck.

Here, in prioritizing the self, this video unabashedly promotes a fully neoliberal subjectivity (Teo, 2018). In seeming contrast, the final two videos, to which we now turn, appear to emphasize more relational and collective aspects of well-being. However, as we shall illustrate, they continue to construct neoliberal subjectivity through individual responsabilization and neurogovernance.

Connect

After the standard introduction, we find the hand standing at the entrance of a cave as an outsider, observing a primitive tribe of ‘cave hands’ in harmony inside the cave. The protagonist hand is framed as lonely. It does not join the other hands and is not invited into the cave. Instead, the hand quickly returns from this scenario to its own everyday reality, sitting alone on a park bench, sad and imagining the tribe (Figure 7). The narrator informs the viewers:

Humans are herd animals. Having good relationships with other people is high on the list of our basic needs. And even though our needs to be social differ, it is important for all people to feel belongingness and to be part of something.

While it is uncontroversial that relationality and belonging are important for people’s well-being, it is of note how the opening statement and subsequent imagery draw on evolutionary psychology. The reference to primitive times and a tribal metaphor for belonging are clearly intended to illustrate a ‘fundamental human needs’ argument.

Figure 7

Then the narrator makes it clear that benefits of social connections for the subject are confirmed by science:

Research shows that belonging and togetherness yields more happiness in everyday life. Good relationships can make you more prepared to cope with the more difficult periods of life and can improve your health. That means that you will probably live longer. Also, it is through interacting with others you can get to know yourself better, and experience happiness and togetherness. Make connections to others ... Coziness and closeness induce chemicals in the brain, and the joy emerges regardless of whether the closeness is provided by a friend with or without fur.

There is indeed ample evidence linking poor mental health with loneliness (e.g., Cacioppo et al., 2014), lack of strong ties to community and lack of friends (e.g., Haslam et al., 2018; Hayes et al., 2022). Nevertheless, we critically question the function of reminding individuals who might suffer from lacking social connections that it would be good for them to have some. The narrator underlines that for the individual who follows the imperative to make connections to others and invests time in them, there is longevity and joy to be obtained. Such forms of self-management are hence motivated by the promise of health and long life (Crawford, 1980) as well as happiness (Ahmed, 2010; Cabanaz & Illuz, 2019). Yet, without taking into consideration the social location of the individual, who might be psychologically suffering exactly because of being othered and excluded, e.g., due to sexual orientation, social or economic status, religion or culture, the subject of this message is given undue responsibility for connecting; precisely as expected of a neoliberal subject (Teo, 2018). Such responsabilization effectively diverts viewer's attention from a complex modern world full of inequalities and exclusions. The modern state and the dominant neoliberal capitalist system, which to a large degree regulates the type of connections possible to individuals, are nowhere to be found at this point.

Two further and interrelated points are relevant here: First, human relations are depicted as substitutable, even by non-humans ("with fur"), in contrast to the initial emphasis on connecting to other *people*. Second, even though the image of

the brain does not appear in this video, relations are explained and justified in passing by brain activity and chemistry. The neurological argument further obscures the economic and social embeddedness of the individuals and thus may serve to further the neoliberal project (Moncrieff, 2008).

Critically, throughout, the video depicts an individualistic or self-centered subject, who is predominantly concerned with how they benefit from the connections. Others are constructed as important only insofar as they serve one's own interests in achieving joy and happiness.

Give

This video emphasizes how giving causes positivity and can benefit both the giver and the recipient. It underlines that giving does not necessarily entail gifts or material things:

When you hear the word "giving", you might think of gifts and other material things, but that need not be the case. There is so much you can give away, which is both simple and free. Such as smiling at someone you walk past, or giving a compliment, a favour or an encouragement.

Further on, subjects are described as “a resource in others’ lives” with the possibility “to make both them and oneself happy...by doing something nice for others.” Despite this emphasis on mutuality, the video demonstrates clear tendencies of individualizing and neurologizing:

Many people say they feel stronger and more energetic when they have helped somebody. Others say they become calmer and get an increased feeling of self-worth. Now that is fantastic, but how come? To give activates areas in the brain that are responsible for happiness, rewards and well-being. Research indicates that when we move attention away from ourselves, negative thoughts and stress can be lessened.

These statements emphasize the psychological benefits of giving for the giver, rather than for the recipient. While it can be argued that this focus follows logically from the self-help aim of the overall campaign, we nevertheless note that the benefits of giving are located not only in the mind, but also the brain, again backed by research. Caring for others is a means of caring for one's own brain (cf. Rose & Abi-Rached, 2014). The goal of caring for others becomes an egocentric motivation for individual well-being and happiness. This interpretation is further strengthened by the following excerpt.

Of course, one can also imagine that this creates positive chain reactions. Imagine that the smile you give away one day goes from person to person, in the shape of good deeds and words, and in the end reaches yourself on a day you really need some encouragement.

Here, positive chains of caring for others end up, once again, ultimately to benefit the giver. From this perspective, human relationships and connections are understood in terms of instrumentality, transforming others into tools for one's own well-being. So, even at points where the campaign explicitly highlights connections and caring for others, the implied individualistic subject is isolated and responsabilized. The resulting neoliberal subject is first and foremost concerned with itself (e.g., Teo, 2018), as exemplified by the ending:

Tomorrow, when you wake up, you can for instance choose to smile at the first person you see. Perhaps to yourself in the mirror.

Figure 8

Here, the potential other has vanished and been replaced by the self ("you"), more precisely: a mirror image of the self (Figure 8), akin to the *doppelgänger* of the "Only You" videos presented above. While the principle of welfare states originally promoted a subjectivity, whereby solidarity and love meant giving priority to the Other (Goodman, 2012), this video perhaps illustrates how far neoliberalism has come in weakening collective bonds (e.g., Bourdieu, 2000). The call for other-directedness and the potential for compassion is turned back onto an imaginary self, thus further isolating the subject from the world of other people: There is only you.

Discussion

Our analysis of the "Only You" public health videos has attempted to illustrate how *psychology functions as politics by other means* in the Norwegian welfare state. The campaign constructs neoliberal subjectivities through both explicit and subtle routes. Self-centered subjects are promoted as agents, but their agency becomes restricted. A key aspect of our analysis is how the campaign explicitly makes use of psychological knowledge, encompassing everyday common sense and references to mainstream science, including well-being research and

neuropsychology, to responsabilize individual subjects for their own mental health. Simultaneously, the campaign conceals societal context in more or less subtle ways. These processes of shifting responsibility away from the collective and instead onto the subject illustrates the continued relevance of Fromm's critique: Public mental health problems are attributed to individual shortcomings.

Throughout the "Only You" and "Everyday Happiness" videos, people are portrayed as able to change. They are endowed with a degree of agency and autonomy (e.g., to get out of their apartments, learn something new, be active). Hence by being encouraged to make certain changes in their everyday lives, people are supposedly enabled to improve their well-being and better realize their potentials. However, the prescribed change is the responsibility of the individual and must take place within individual minds and through self-oriented activities. Using Holzkamp's (1991) terminology, we suggest that the campaign promotes a restrictive action potency. Yet, developing a neoliberal subjectivity is not simply a one-directional process of subordination (Teo, 2018). Subjects who mold themselves and accomplish becoming a part of the neoliberal system (insofar as the system allows) according to prevailing expectations will experience a kind of agency and have access to the fruits of neoliberalism. However, seeking "continuous self-optimization through psychological means" is a form of subjectivity-in-the-making which can never be completed (Cabanaz & Illouz, 2019, p. 177). Such expectations illustrate the heavy burden placed on the shoulders of the self-actualizing, self-monitoring entrepreneurial subject of neoliberalism (Parker, 1999; Rose, 1999; Teo, 2018). Although the campaign frames such responsabilizing in a positive context, with the apparent goal of autonomous individuals who exert agency, it can more critically be seen as forcing forms of autonomy upon individuals, which instead limit and even counteract wider forms of agency (Davies & Elwyn, 2008; see also Marvakis, 2019).

We propose that the underlying expectations of particular forms of participating in life (being active, being mindful, etc.) function throughout the campaign as neoliberal governing techniques. They mold responsible citizens who internalize certain duties or tacit rules and govern themselves accordingly by working on themselves to achieve better mental health (Rose, 1999). As a consequence, possibilities for individuals to imagine changing societal or even local contexts to improve their life conditions are suppressed. Ultimately, change becomes a course of action conducted only by the self, and directed only at the self, while collective action possibilities remain unactualized (Cabanaz & Illouz, 2019; Teo, 2018).

Overall, the campaign appears to be based on a strategy of psychoeducation, also including neuroeducation. Its assumption is that once individuals know how the psyche or the brain works, they will be able to manipulate and profit from it (De Vos, 2016). This premise aligns with neoliberal recipes for how to achieve success for (self-)disciplined and (self-)controlled individuals, who can then be held accountable for success or lack thereof (Teo, 2018, p. 13). Accordingly, in order to mobilize the public to undertake and perform self-governing tasks, the state apparatus needs first and foremost to

educate people. In the "Only You" campaign, this education places the responsibility for well-being on the target population by "promoting" sufficient psychological tools for subjects to challenge their brains in everyday life by engaging in activities that give joy, such as "going for a walk," "playing a guitar," or "doing crossword puzzles." By investing in and strengthening their own mental health, subjects are molded into educated, academically informed entrepreneurs of their selves (Teo, 2018) and their brains (De Vos, 2016; Rose & Abi-Rached, 2014).

Rose (1999, p. xviii) has argued that "[w]hen our culture provides us with life narratives couched in psychological terms, our lives really do become psychological in their design." In the "Everyday Happiness" videos, the brain is depicted as a separate subject, creating a brain-mind duality. Hence, a mereological fallacy is committed: The brain and some of its parts are ascribed psychological attributes that only make sense when ascribed to human beings (e.g., 'lazy'). Thus, the campaign contributes to 'brain-talk' as a commonsense way people make sense of themselves. Through such looping effects (Hacking, 1995), the campaign promotes neurologized subjects, who not only work on themselves, but also on their brains. Through psychological and neuropsychological lenses, the self and the brain become reservoirs of potential that need to be continuously realized (De Vos, 2016). The campaign appears to reflect a belief that "by acting on our brains, we can improve our mental life and enhance our everyday capacities to meet the ceaseless demands for self-development and self-management that characterize our contemporary form of life" (Rose & Abi-Rached, 2013, p. 226).

In most of the videos, as we have tried to illustrate, context is downplayed or largely absent. From our point of view, the campaign therefore functions ideologically to conceal both microsocial and macrosocial dynamics that create conditions for mental health. The microsocial includes structures and practices which may be present in relationships, schools, places of employment and other everyday settings, while the macrosocial includes factors such as social inequalities, inclusion and marginalization. For instance, we have no idea why the woman in the "Only You" mental health video is upset and isolates herself, or why her friends apparently cannot help her. As a result, the decontextualizing catch-all approach of the campaign fails at capturing (or successfully conceals the relevance of) the social location of the individual, ignoring any social and societal mechanisms that structure life in particular ways, and potentially sustain exclusionary and discriminatory practices. Similarly, Moncrieff (2022) has argued that by obscuring the political nature of wellbeing and mental health, individual health-promoting activities are encouraged, while attention is diverted from the failings of the underlying neoliberal capitalist economic system. Contextual concealment is further accomplished by the selective knowledge claims and evidence base in the "Everyday Happiness" videos. The campaign appears to take for granted that happiness is a subjective, psychological issue independent from other social and economic circumstances (Cabanaz & Illouz, 2019).

We are aware that critical analyses of the type we offer here stand the risk of painting too unnuanced a picture of public health work in Norway. Through governmental strategy documents, Norwegian health authorities do acknowledge how societal factors such as poverty, unemployment, discrimination and debt are related to mental health, while reducing social health inequalities is an explicit political aim of the Norwegian welfare state (Meld. St. 19, 2018-2019). Yet, attempting to safeguard health and functioning of the population, the same authorities develop campaigns such as “Only You” which, when directed at the general public, advocate purely individualistic strategies for improving well-being, and conceal context. The campaign language of individual strategies for well-being derived from mainstream psychological research can therefore be understood to be compatible with neoliberalism in offering person-centered explanations as ways out of social malaise (Prilleltensky, 1999; Moncrieff, 2008).

Concluding remarks

In our interpretation, the “Only You” campaign shifts responsibility for the well-being of the population onto the shoulders of the individuals themselves, in part by simply *telling people* how to take care of their own mental health. Critical literature has long recognized the limitations and dangers of framing health problems and solutions primarily at the individual level (e.g., Crawford, 1980; Fromm, 1955). Moreover, in the contemporary neoliberal context, psychological science increasingly promotes active self-management as a key pathway to happiness, and by extension to address mental health issues (Madsen, 2015). Psychological knowledge, such as appropriated in the campaign, can therefore become a powerful ideological tool for the neoliberal state. Individuals who do not engage in constant self-surveillance and self-betterment risk becoming failed neoliberal subjects (Teo, 2018).

Neoliberalism provides a framework where the social safety net of the public welfare state may be gradually downscaled with the goal of creating responsible, healthy, productive, entrepreneurial and seemingly happy subjects for the capitalist economy (Greco & Stenner, 2013; Harvey, 2007). Our analysis of “Only you” illustrates such neoliberal developments in a Norwegian context. As discussed by Wacquant (2012), neoliberalism increasingly transforms the welfare state, originally concerned with public goods, from a protective and collectivizing role towards one that is not only individualizing, but also disciplinary. This implies that groups at the top of the class structure enjoy the freedoms offered by neoliberalism. However, those who find themselves at the bottom become responsibilized as failed subjects faced with a form of punitive paternalism – for example through public health campaigns which tell them to “get a grip” and conceal contexts that impact upon their well-being. These political and societal developments therefore could reflect an issue of structural violence in the welfare state. Marginalized groups at the bottom of the class structure can be further oppressed, as they, through behavioral nudging, become

responsibilized as morally inadequate (Cromby & Willis, 2014; Hodgetts & Stolte, 2017).

To conclude, we do not aim to challenge the rather obvious fact that, at a general level, mindful attention, learning, activity, social bonds and giving can all be beneficial for mental health. We recognize that such ways to well-being can be integrated into community work or wider structural policy reforms to improve people's lives. Our concern is rather *how* the campaign videos function, through being aimed at the general public, to construct and reproduce neoliberal subjectivities. From this perspective, the "Only You" campaign reveals a stark contradiction of neoliberal ideology. While neoliberalism seemingly promotes freedom and emancipation for individuals who are willing to do the necessary work (i.e., work on self), in practice, it arguably functions in totalizing ways, reducing the possibility of generalized action potency.

In contrast to developing psycho- and neuroeducational approaches such as those adopted by the "Only You" campaign, we suggest instead that psychologists should base their work on the idea of consciousness-raising (Martín-Baró, 1995). This implies that no intervention in an individual's life can be considered effective or successful, unless the individual is, as a result, aware of and capable of changing some of the life conditions under which they are living, preferably collectively in solidarity with others, in other words, a generalized action potency (Holzkamp, 1991). Legitimizing only individual solutions makes people less likely to advocate for social change, be it on the local or societal level. It instead bolsters psychology's reconfiguration of social problems into individual shortcomings, reinforcing the notion that there is no need to change the system when you can change the person instead (Prilleltensky, 1999; Teo, 2005), ultimately resulting in victim blaming. Hence, the more 'efficient' psychology as a productive force under neoliberalism becomes, the more it might become "an integral part of the very problems it is called on to help resolve" (Marvakis, 2019, p. 34). Akin to Fromm's critique, resistance towards the dominant requirements of the neoliberal society will only be understood as a dysfunction of the subject – not as a dysfunction of the social order (Marvakis, 2019).

Salman Türken is an Associate Professor at the Oslo Metropolitan University. His work is primarily based on critical approaches to psychology and pedagogy, and his research interests among others revolve around ideological functions of psychology, various forms of social inequalities, and critique of educational systems. Email: salman.turken@oslomet.no

Erik Carlquist is an Associate Professor at Oslo New University College, Oslo, and is also affiliated as an Associate Professor at the University of Oslo. His work takes a critical, social constructionist approach to cultural and community psychology. Erik's research focuses particularly on relationships between language and subjective experience of psychological phenomena, including well-being and emotion. Email: erik.carlquist@oslonh.no

Joshua M. Phelps is an Associate Professor at Oslo New University College. His work is situated within sociocultural and critical psychology, employs mixed methods and gravitates toward applied areas. His current research is concerned with developing better understandings of how people engage in perspective-integrating activities (understanding, evaluating and creatively coordinating multiple perspectives) and how these may lead to different outcomes (e.g. procedural justice in police-citizen interactions or collective decision-making). Email: joshua.phelps@oslonh.no

Is it just plain psychotherapy? Reflecting on the political meaning of the psychotherapist's everyday practical dilemmas

Social Cooperative Enterprise for psychological services (SCE) "*Psychi Logos EpiKinonia*"¹

Youli Tsirtoglou, Electra Anagnostopoulou & Lykourgos Karatzaferis

Abstract

Providing psychotherapy in the context of a Social Cooperative Enterprises (SCE) – under the *common political/ideological umbrella* of *respecting subjectivity* and conceiving requests for psychotherapy both as personal and socio-political too – we often face *practical dilemmas with political implications*. The aim of the current article is: a) to *present the inconsistencies that lie in these dilemmas*, and b) to *emphasize the political meaning they point out for us* as working subjects, as well as for the practice of psychotherapy. Reflecting critically on our first-person perspective narratives, on the basis of a “*cooperative introspection*” (Nissen, 2000), we shall address questions considering *the conditions, the premises and the consequences of*: a) the *transcendence of the individualizing and psychologizing interpretations* about the discomfort the subjects in therapy - as well as we ourselves - face, b) the *utilization of intersubjectivity in the therapeutic/counselling process*, and c) the *therapist's political "coming out", against the practice of his/her political neutrality*. Finally, through our paper we reflect upon the political implications of the different strands and interpretations of critical psychology we employ on the analysis and practice of psychotherapy, along with the discordances which these strands may include or provoke.

Keywords

co-researching, cooperative introspection, subjectivity, intersubjectivity, psychotherapy, practical dilemmas, P/politics

¹ The paper reflects the perspective of three out of six SCE's members.

Methodological references

This paper is the product of an individual and collaborative practice research with the intention to explore and understand the political implications of the practical dilemmas we face in our psychotherapy practice² as working-class members/employees³ in a Social Cooperative Enterprise (SCE)⁴ in the metropolitan centre of Greece. With the premise that the subjects whose actions we want to understand are "agents of their life in a societal context" (Schraube & Osterkamp, 2013a, p. 5) we followed the method of "co-researching" as a "cooperative introspection" (Nissen, 2000) between the co-authors (and co-workers) of this paper trying to: (a) describe in detail both the conditions of our practice and its content, and (b) reflect autonomously but also cooperatively on the everyday practical dilemmas, in order to be able to approach our initial question – as a "common problem" – on the basis of a "social self-understanding", since social knowledge always presupposes knowledge of the self and vice versa (Schraube & Osterkamp 2013; Osterkamp 2009).

During this practice research we faced theoretical and practical requirements similar to those identified by Marvakis and Triliva (2019) as determinants of the social scientists' subjectivity in the context of the psy-services' NGOization in Greece. Both the demand for high-tech knowledge and efficiency, in the absence of sufficient (material or emotional) resources and our research process as a new voluntary responsibility, were soon translated into individual and group conflicts and dilemmas similar to those we will extensively refer to later on. This condition on the one hand resulted in the reduction of our writing group and on the other hand to our constantly dealing with inconsistencies and dipoles – such as final product vs. process, or individual product vs. collaborative work – mediated by the frequent transformation of the practical conditions of our research process. As a consequence, we moved forward by taking turns in the writing of the paper and by articulating three autonomously written and cooperatively introspected critical reflections as a bastion of our "intersubjective understanding" (p. 5), that is the mutual understanding of our "subjective reasons for action" (p.48) (Schraube & Osterkamp, 2013a). After all, we feel the fruitful impact of this process in constructing a more self-and-cooperatively conscious – individual and collaborative – critical-psychological practice.

² We use the term "psychotherapeutic practice" versus "therapeutic practice" in an attempt to reclaim the term through the recognition of the multifaceted existential, social and political dimensions of mental distress, which, however, do not remain outside the boundaries of psychotherapeutic practice but enter into the everyday therapeutic praxis.

³ Our exact working conditions will be clarified later on.

⁴ Such enterprises have been operating in Greece, since the relevant legislation in 2011 (Vairami, 2015), mainly in the food industry and the food trade, as a new capitalist possibility to cope with the economic burden of traditional individual and corporate enterprises. Our SCE was founded in 2017.

Moments of contemporary capitalist restructuring in the Greek context of psychotherapeutic services

Ever since the appearance of the first psychiatric hospital in Corfu, the democratisation of psychology studies in public universities and the first licences to psychologists, the domain of psychotherapy was mainly dominated by psychiatrists in private practice, applying the dominant, Western, and medicalized psychotherapeutic approaches, utilizing the power of the expert acquired from training abroad (Avdi, 2011; Dafermos, Marvakis & Triliva, 2006). From this position, psychotherapists' subjectivity was developed on the basis of international ethical principles (Handelsman et al, 2005) by maintaining the interest in (re)producing the profession's prestige and in promoting adaptation to the specific cultural context⁵ as neutral and objective scientists, rarely disclosing personality traits and only in the context of a therapeutic "self-disclosure" (Marais & McBeath, 2021).

During the last 15 years, the onslaught of the global capitalist crises and the consequent (economic, political and social) restructuring have affected the conditions of the psychotherapeutic services' provision. More specifically, they signalled on the one hand the further shrinkage of the already reduced, degraded, underestimated and understaffed public mental health services; and on the other hand the rapid development of private psychotherapy enterprises, NGOs and a few mental health SCEs.⁶ At the same time, the rapid growth of political mobilisation during the period 2008-12 and the broadening of the social subject of the "anti-authoritarian Chóros"⁷ (Kitis, 2015) in the following years contributed significantly to strengthening the initiatives for the politicization of mental health⁸ and to developing a second wave (since the beginning of the psychiatric reform in the 1980s) of mental health workers – to which we also

⁵ As an example, we quote from the Code of Ethics for Psychologists: "In particular, a psychologist shall ensure that his or her actions, actions and general conduct do not bring his or her profession into disrepute in public opinion and, in particular, do not contradict the "public sentiment" of the place where he or she practices:

https://www.psy.gr/gfiles/3484314029.287_2019.06.19_FEK_2344_KODIKAS_DEONTOLOGIAS_PSYCHOLOGON.pdf

⁶ Indicatively: <https://psychilogos.net/>, <https://www.apo-koinou-cooperative.gr/>, <http://sintheto.kunsep.gr/>, <https://www.psychislogos.gr/>, <https://poreia-ygeias.gr/about/>

⁷ Chóros [χώρος] in Grece literally means "space". According to Christos Boukalas (2011) (as cited in Tsirtoglou, accepted)[the anti-authoritarian] "Chóros can indeed be seen as a space of flows, (inter)action, and belonging, defined and reproduced by, and containing, a multitude of individuals, organised into looser or tighter groups, formed on the basis of a combination of personal bonds, locality, and confluence of theory and/or action, that are in turn linked together selectively, in a looser or tighter fashion" (p.303). Chóros appears as a "new collective identity" in the late '70s pitted against the Right as well as the Left parties (Souzas, 2015). It's broadening during the period 2008-12 is reflected on the inclusion of left and leftist subjects in the particular mobilizations. This broadening is still maintained.

⁸ Some Athens-based projects are indicative of this politicization: the *Pan-Hellenic Coalition for Psychiatric Reform* <http://www.psypirosi.gr/>, the journal *Notebooks of Psychiatry* (quarterly publication of the scientific association of the Psychiatric Hospital of Athens), the *Hearing Voices Network* <http://www.hearingvoices.gr/>

belong – inspired by the anti-psychiatric and grassroots movements as well as by Western critical psychological theories and practices.⁹

These socio-political conditions mediated decisively the development of a rudimentary visibility of a new mental health experts' generation, subjects of the contemporary working class, who sought to challenge the dominant psychotherapeutic practice both within the workplace and in public¹⁰. The growth of this visibility as well as the rapid spread of the culture of "psychocentrism"¹¹ in everyday life (Rimke, 2011) – either through the psychologization of the economic crisis (Marvakis, 2014), or through the pathologization of "adaptation disorders" (Marvakis & Triliva, 2019), or through various psychologizing distortions of the relationship between politics and psychotherapy,¹² are factors that contributed substantially, in our opinion, to the emergence of a *differential mental health clientele* that is positioned closer (than the mainstream clientele) to the movements' politics and relevant contexts of local social participation (Dreier, 1999, p. 7) and favorably disposed towards psy-approaches critical to the dominant psychological discourse and practice. Part of this differential clientele are we ourselves and especially the younger subjects of *Chóros* who traditionally had positioned themselves against the experts and the mainstream social practices (Kitis, 2015; Souzas, 2015).

In this context, we became aware of our working with critical-psychological methodologies, in relation to what we call the *psychotherapist's political coming out*¹³ – i.e. the visibility of Politics in psychotherapy and the politics of psychotherapy (Winter, 2021) – but also of our critical reflections on the political implications of the everyday dilemmas we face and (re)produce while working, as part of the regional and international restructuring of the social conditions under which psychotherapy is provided.

A Greek SCE for the provision of psychotherapeutic services

The headquarters of our SCE (which for us is just *the office*) is a value for money apartment in a commercially developing zone of the metropolitan centre, equally shared by six partners according to each individual's needs. We are all founding members of this joint venture, working cooperatively as freelance

⁹ For a relevant presentation of the dialectical connection between *Chóros* as a social practice and the development of critical psychology in Greece see the book chapter of Youli Tsirtoglou (accepted).

¹⁰ Athens-based projects: <https://criticalpsygreece.wordpress.com/2012-omada-aytomorfosis/>, https://issuu.com/radicalma/docs/radical__1st_issue, <http://criticalpsy-net.blogspot.com/>, <https://delirium.espivblogs.net/>, Initiative for a diverse mental health movement <http://protovouliapsy.blogspot.com/>, Open social space for health <https://pikpa.squat.gr/>, Orlando LGBT+ stigma-free mental health <https://orlandolgbt.gr/>, <http://psi-action.blogspot.com/>

¹¹ In Rimke's words, the concept of "psychocentrism" refers to "the outlook that all human problems are innate pathologies of the individual mind and/or body, with the individual held responsible for health and illness, success and failure".

¹² See, for example, the anthology by the Hellenic Society for Systemic Thinking and Family Psychotherapy (2019).

¹³ See also the discussion that Youli Tsirtoglou (accepted) presents in relevance with the psychotherapist's political identity concerning "the recent development of conservative or right-leaning therapeutic practices" [critical to the dominant psychological practice] which are presented "as liberal or leftist".

partners, while most of us work in parallel¹⁴ in other mainstream psy-regimes (public education, NGOs). We think of ourselves as part of the contemporary, highly qualified cognitariat, we are inspired by (grassroots) movements (anti-psychiatry, feminist, anti-capitalist) and psy-practices in relation to such movements (e.g. self-help groups, self-consciousness groups, open dialogue, etc.), participating regularly or not in relevant socio-political actions. Gradually, through the reports of treated subjects and the increased requests from *Chóro's* subjects, we are publicly perceived at a great extent as *Chóro's psychotherapists*. This boundary *political-therapeutic identity* though – as a corporate identity – is something we have not conscientiously aimed at so far and that some of us seem more sceptical about its attribution.

Our main organised activities are: a) psychotherapeutic/ counselling sessions and b) peer-supervision. In therapeutic sessions (mainly with adults in an individual and secondarily in a family or group context) each of us has the freedom to work with a considerable degree of autonomy regarding his/her methodology, within the framework of certain, mainly implicitly formed collective guiding principles (to which we will refer later on). Other practices we have collectively decided and that we conduct are: a) finding a "therapeutic fee" (Weiner, 2019) in conjunction with the treated subjects, on the basis of the collectively agreed upon range of our fee per session as well as the financial restrictions of the treated subjects, and b) informing the treated subjects about the way we work as a team/ SCE.

The practice of peer-supervision refers to our jointly decided monthly meetings with the aim of managing: a) our working conditions (e.g. bureaucratic obligations, financial issues, working hours, space configuration) and b) the content of our work (e.g. dilemmas in the therapeutic process). The issues arise either from the current needs of our everyday practice or from our need to share methodologies and get to know each other's personal trajectories (professional, social, political, etc). The issues which each of us brings in are discussed, analysed, understood and resolved, either through sharing knowledge and responsibilities or through individual initiatives and compromises, on the basis of an *intuitive parity* – meaning the intrinsic awareness and fulfilment of everybody's needs in a fair way. In addition, however, we irregularly meet in between our sessions, in *our kitchenette*, where we often share in an offhand way everyday working or personal concerns, thus forming an atmosphere of intimacy and trust between us, which in turn creates more space for intersubjective understanding. These discussions often take place freely in the presence of the treated subjects.

At the same time, our practice is institutionally liable to a) the Code of Ethics for Psychologists and the Code of Medical Ethics and b) the SCE's legal framework. However, practically in Greece, according to our experience so far, these regulatory systems – including "ethical commitments" (Siklafidou et al., 2012) in the practice of psychiatry – constitute general and official guiding principles which are rarely subjected to scrutiny and even when they are, this is done opportunistically to serve particular interests in relation to particular

¹⁴ The reasons we resort to this choice will be presented further down.

political circumstances. This condition has provided us, also, with the possibility of operating on the borderline between the SCEs' legal framework and the legal framework of private practices/individual enterprises in shared housing. On the one hand, the cooperating members share the capital, operating costs and duties, and benefit from the favourable tax or insurance arrangements that are set for the SCEs and, on the other hand, each member is paid individually by his/her clients, having the possibility of determining individually his/her working hours and each particular therapeutic fee. The choice of this hybrid working condition (in combination with our parallel work in other working contexts) was made in order to minimize individual and group precarity, to escape the necessity (in the context of a private practice) for commercial development (through advertising, for example) and/or in order to overcome (at least partially) our dependency on the commercial exchange with clients and the negative consequences it may have on therapeutic work (e.g. keeping treated subjects in therapy due to financial interests). In addition, as Thodoris Megalooikonomou¹⁵ observes, we operate within an inherently contradictory condition, a structure within the so-called "third sector", where we must necessarily manage the provision of services through private provision in conjunction with the pursuit and search for emancipatory processes, goals and visions.

During the years of our cooperation, we try to gradually formulate concretely, in a cooperative way our internal operation regulation, concerning the conditions and the content of our work to which *we (will) choose* to be accountable. For this, we also try to develop *our guiding political/ ideological principles* on the basis of which – explicitly or implicitly – our cooperation was initiated and is developing until now. In this article we will focus on two of these guiding principles: that is a) respecting subjectivity and b) conceiving psychotherapy requests as personal *and* socio-political as well.

Respecting subjectivity

Respecting subjectivity for us¹⁶ stands as a political and ideological principle for two basic reasons. First of all, we believe that referring to the concept of subjectivity makes the connection between psychotherapy and P/politics more visible, meaning that the concept of subjectivity refers both to the concept of *work/ practice* in the context of which the subject becomes the agent for the production and control of the conditions of her life, and to *life's objective conditions* by which people are determined (Tolman, 1994; Nissen, 2002). Secondly, though, respecting subjectivity remains, for us, an implicit¹⁷ agreement at some ideological level, as an immaterial, theoretical and intellectual reality in the context of which the connection between psychotherapy - respect - subjectivity is a priori something obviously good. In other words, we seem to

¹⁵ Personal communication in the context of this article review.

¹⁶ Meaning the three co-authors of this article.

¹⁷ The practical conditions for the realization of respecting subjectivity as a principle have not yet been the subject of discussion among the whole team.

believe that this connection reflects a qualitatively and critically oriented psychotherapy since it is not part of the dominant psychotherapeutic culture in the ways it is (re)produced in various psy-discourses and practices as scientific objectivity and politically neutrality.

From our perspective, respect and subjectivity as cultural meanings, and their connection, mediate and determine the conditions and content of our work, constituting in a way some of the means of the (re)production of our work (i.e. psychotherapy). More specifically, these meanings mediate our everyday praxis, e.g. the decision making, the management of the treatment requests, the therapeutic process, the agreements of cooperation with other professionals. At the same time, we believe that by tapping into these meanings we (re)produce possibilities for "alternative/critical" (Nissen, 2009) action which for us and the treated subjects we work for/with seem to transcend the dominant objectifying – and therefore "dehumanizing" (Nissen, 2009; McWilliams, 2005) – psychotherapeutic norms.

Through our cooperative introspection for the purposes of this article, we realized that respecting subjectivity (as guiding principle) reflects our intention to relate/work inclusively, in a "decentred way" (Schraube & Osterkamp, 2013, p.333) towards the different subjective "reasons for action" (cf.p.) of the subjects with whom we (co-)work (partners, treated subjects, other professionals). In other words, respecting subjectivity reflects our subjective interest to work by acknowledging the meaning that each subject's subjective perspective may have for herself and by including equally in a collective perspective every subject's possibility to subjectively define their actions. For this, we make sure that differentiations in each subject's subjective interests (reasons, needs, values), possibilities and restrictions, concerning his/her autonomy in shaping the conditions of his/her activity/ work (e.g. in relevance with workload, need for supervision or training, need for a diagnosis or not, sessions frequency, particular everyday life advices, etc.) are being primarily understood and accepted.

From this perspective, we seem to be seeking to develop an attitude that is more concerned with what we would call the quality of the "global worker"¹⁸ (operatore globale), for whom Paolo Borghi was talking about at Trieste in relevance with the de-institutionalization, and refers to the undertaking of care, intervention and engagement including everything which may weight on the "therapeutic situation" and may constitute the conditions of the possible, the real context that is. It is about a political stance that according to Megalooikonomou (2022) involves a completely different understanding of what the therapeutic is and how it is pursued. Thus, for us respecting subjectivity as a practice is about the development of a supportive and as transparent as possible communication, understanding and action, between *not fragmented* (with all the dimensions of individuality they choose or are socially subjected to), *equal* (in terms of

¹⁸ The "global worker" (operatore globale), was a term generally discussed during Lykourgos' Karatzaferis training at the International meeting *Why change? Creativity and Innovation in mental health*, held at Trieste (22 - 27 of October 2012) and organized by the *WHO Collaborating Centre for Research and Training* for the Second module of the *Franca and Franco Basaglia International School*, in relevance with the de-institutionalization and the undertaking of care.

opportunities of participation), but also *different* (in terms of different reasons for action) subjects.

Conceiving psychotherapy requests as personal and socio-political

From our perspective, drawing on various critical psychological and critical psychiatric approaches which inspire us, the principle of conceiving psychotherapy requests as personal *and* socio-political as well reflects our interpretation of the psychological distress, which the treated subjects seek to understand, cope with or alleviate. More specifically, we support that psychological distress is not universally and deterministically determined by intrinsic and individualised, biological or psychological causes, but it is one of among the various consequences (re)produced within the socio-political organisation of societies. In addition, we believe that the way in which the socio-political organization of society (re)produces individual distress is mediated by various everyday subjective oppressions in the form of specific social/ political restrictions and possibilities for action. In other words, from our perspective psychological distress is (re)produced in the realm of the particular, everyday societal/ political conditions within which subjective reasons and possibilities for action develop.

The practical realization of this principle determines our entire practice in an unsystematic and often messy (Law, 2007) way, both in the context of the psychotherapeutic work as sessions, and in the context of our work with each other as working partners. More specifically, through our cooperative introspection we realized that the practice of this principle is about: a) ***whether we have the ability to work*** with the psychologizing/ pathologising interpretations that the treated subjects give to their distress; b) ***how we do actually work*** psychotherapeutically; by using, for example, methods of the dominant psychological/ psychiatric approaches and by focusing on the development of the subject's functioning (e.g. resilience strategies, medication)? By utilizing the expert's power, we are societally ascribed? Or, by using critical psychological/ anti-psychiatric methods, focusing – beyond adaptation and plain functionality – on an emancipatory orientation *also*, standing critical to the dominant social organization? c) ***whether we will develop other possibilities for action*** (e.g. educational, political actions) along with (or even instead of) the plainly psychotherapeutic ones, focusing on the interpretation of individual problems as socio-political problems as well. In other words, whether we will publicly (re)produce a critical-psychological/ anti-psychiatric discourse and whether our office will practically become a socio-political space and/ or place as well.

Thus, in practice, from our perspective, conceiving of psychotherapy requests as socio-political also is about restructuring the object/ content of our work within the given context of societal structures. To put it simply, it determines whether we will keep working/ surviving individually and socially as "normal" (Marvakis, 2019, p.32-33) psychotherapists "in terms of a Fordist psychology" and the means we will have to or be able to use.

Practical dilemmas and political implications

Our practice, in the way we have described it so far, constitutes a context of conditions that (re)produces a series of different individual and group practical dilemmas with clear political implications, as long as they are in relation to the *control*¹⁹ (Totton, 2000) of both ourselves' as workers and the other subjects' behaviour. Through our cooperative introspection we realized that it is of particular importance for us to illustrate these dilemmas' mental, emotional and practical structure²⁰, which is also conflictual, rambling, algorithmic and even dead-end (in an individualized way). Moreover, we wanted to inclusively illustrate their "moral" character (Teo, 2015) along with different way(s) each one of the co-authors was able to make such dilemmas "sayable" (Schraube & Osterkamp, 2013c, p. 330) as subjective reasons, possibilities or restrictions for action.

We have thus seen that our dilemmas usually involve in some way the following critical/ reflective questioning in relation to our agency:

how should I **or** how can I **or** how am I allowed to act **or**
 what is the meaning of my actions/ feelings/ experiences
 so that the consequences of my action
 to me and to the other subject(s) are right or good, with the premise that these
 consequences remain
 therapeutic or supportive,
 either in terms of functionality,
 and/ or in terms of social justice or emancipation?

We also noticed that our dilemmas – which are usually expressed during our peer-supervision or offhandedly between sessions – emerge in the following circumstances: a) when we do not know *what else we could do* in order to work therapeutically, b) when we do not know *how to apply/ follow rules or laws* concerning therapy, c) when the client's *request conflicts with our socio-political consciousness*, d) when we have *the need to understand/ get to know each other better as working social subjects*.

Finally, we came to the conclusion that the difficulties reflected in the dilemmas relate to three overarching and interrelated issues: (a) how respecting subjectivity and conceiving subjective distress will not lead us to individualistic or psychologizing acts; (b) how collaboration with other subjects (partners and/ or clients) will acquire the meaning of intersubjectivity; (c) how these two conditions will help us act more transparently as psychotherapists regarding our political position (which is quite far from neutrality).

Some indicative dilemmas that we face in relation to the above-mentioned questions and issues concerning our work are:

¹⁹ Nick Totton provides numerous examples which point out how politics and control are indissolubly connected implicitly or explicitly in various ways in relation to psychotherapy or not.

²⁰ The structure of the dilemmas' presentation below, in their written form, is deliberately chosen in order to illustrate in an emphatic way this structure as well as their moral character along with the different way(s) of their articulation.

1. *Should I or can I or is it allowed or what is the meaning of*²¹ *work/ing* with subjects whose oppression is greater than mine's, due to their subjective position (e.g. immigrants, low economic status)? Or *should I* (and *how exactly* should I) refer these clients to a professional of a corresponding subjective position, or to a therapeutic intervention specifically developed for subjects of a similar subjective position, or to a political group of solidarity towards such subjects?

2. *Should I or can I or is it allowed or what is the meaning of use/ing* concepts specifically adapted to the concepts that each treated subject uses to describe his/her personal distress? Or *can I* (and *how exactly* can I) use concepts or even political slogans which I perceive as not-psychologizing and/ or not-individualizing in relation to the distress of a collective social subject (in relevance with class, gender, race, etc.) to which both me and the particular subject (which I want to understand) belong?

3. *Should I or can I or is it allowed or what is the meaning of use/ing* the despair I experience while working psychotherapeutically with a subject experiencing despair, overwhelmed by voices (auditory hallucinations in mainstream psychiatric terminology), and *how exactly* can I use it supportively as a shared experience?

4. *Should I or can I or is it allowed or what is the meaning of talk/ing* transparently about the sexist treatment and the power differential I experience by the treated subject because of the relevant gendered social discriminations? Or *should I* (and *how exactly* should I) silence such a treatment and ask for supervision in order to deal with it individually?

5. *Should I or can I or is it allowed or what is the meaning of inform/ing* (and *how exactly* should I do this) the treated person if I am vaccinated (covid-19), respecting his/her legitimate (based on the established state of exception) right to know, violating my own political-therapeutic position towards these measures?

6. *Should I or can I or is it allowed or what is the meaning of speaking* transparently (and *how exactly*) from the position of power socially attributed to us as psychotherapists about our minority political positions and their psychotherapeutic significance, without occupying a position of alternative authority/power vis-à-vis the subject being treated?

We realized that the way we formulate our dilemmas is much more rambling than the functionalist version of a *should I do this or that* dilemma. This has to do with the fact that our practice is shaped in an often inconsistent way between dipoles such as the following: a) individual – socio-political consciousness; b) functionality – emancipation; c) obedience – resistance; d) executive action – autonomous action; e) individualization – collectivization. These dipoles reflect the socio-political contradictions that we – theoretically and practically – are trying to overcome in the context of psychotherapeutic work. On the one hand, we develop self-consciousness of our skills, possibilities for action as well as the rank (Mindell, 1995) that we or the treated subjects have, in order

²¹ These questions emerged as different ways of expressing the therapeutic dilemmas that each one of us faces and in this light, we present them here as different components of the same dilemmas.

to use them (skills, possibilities for action and rank) during the session. At the same time, within the spectrum of the dipoles, we discover *new micro-possibilities* for action, which are often included or implied in the dilemmas themselves.

Finally, we concluded that the core of our dilemmas relates to a dominant (critical) psychological – and therefore political – stake for us: *The socio-political conceptualization of the particular and situated expression of individual subjectivity, as part of a social subjectivity* (Nissen, 2002), *meaning the conceptualization of the subject and her individual action within, and mediated by, particular socio-political and cultural-historical conditions and reasons for action, along with the relevant possibilities and restrictions.*

In order to point out the meaningfulness that the above political stake has for each one of the co-authors as well as its connection with the aforementioned dipoles and our psychotherapeutic practice, we have developed three autonomous critical reflections (written by each one of us), which the reader can refer to in the appendix of this paper. In the following part though we will present the conclusions arising from our cooperative introspection over these three autonomous critical reflections.

Cooperative critical conclusions

By introspecting cooperatively over the three autonomous critical reflections, each one of us starting from a similar but also different critical-psychological and socio-political position, we discerned points of convergence and differentiation between them. All three critical reflections refer to "micropolitical tasks" (Pakman, 2004, p. 266) as new socio-political possibilities of action at various micro-levels, in the context of emancipating from the dominant psychologizing and individualizing therapeutic discourse and practice. Such micro-possibilities for action may be developed²²:

a) at the individual level and at the level of interpersonal relationship with other subjects as:

- *resistance to the covering up of dilemmas* with political implications
- the reconstruction of the therapeutic relationship so as to *involve an intersubjective condition which will include two subjects resisting a change that threatens their autonomy*²³

- *the politicization of pain in relation to the crisis of the contexts that contain the subjects in question and [the therapist's] own crisis, which s/he experiences as a professional, as a member of a cooperative in crisis, as part of the social crisis* (Karatzafis, 2023).

b) at a group level as:

²² The words in italics are extracted from the autonomous critical reflections in the appendix.

²³ Gabriel Camarrata (2022) supports that "in mainstream Psychology, [...] the concept of resilience seems to hold, in itself, all that is needed to recover from a crisis, disturbance/violence/abuse, power struggle, while resistance instead is seen as something to dismantle. This approach seems to serve the narrative of a forever resilient and adaptive human being, who at the same time is seen by governments as "so fragile" and "irresponsible" as to have to be controlled at all times for their safety and wellbeing".

- *the self-institution of practices and functionalities that will serve our needs and transcend the dilemmas*"

- *the search for alliances, "affinities" (Day, 2004).*

- *the organization of reflection groups, not of a therapeutic/ counselling objective, but with the aim of understanding subjective problems as personal and socio-political as well (...), such as the social self-understanding groups in Berlin²⁴, or the Multiloog open meetings in the Netherlands²⁵.*

c) In a broader collective political context as:

- *the (re)construction of collective emancipatory activities and processes where we develop new possibilities to overcome fears and restrictions (psychologized or material) in order to resist and collectively assert life conditions other than those which produce our distress.*

- *the prefiguration of desired worlds²⁶.*

Such micro-empowerments as movements *against the pessimism of reason, for the optimism of action²⁷* can:

- *legitimize us as emancipatory agents,*

- *help a small part of the contemporary, white proletariat to fight it out individually and socio-politically in the context of their "personal social practice" (Dreier, 2009) and in the context of the dominant capitalist dipoles,*

- *provide the place to develop forms of c/overt resistance (Schilt, 2003)²⁸.*

However, all three autonomous reflections recognise as a new political stake how we can move from this micro-level to a collective level. The first critical reflection points to the *commodification of the therapeutic services and alternativism* within neoliberal capitalism as basic constraints for the abolition of basic capitalist contradictions and suggests that *political actions are needed by psy-professionals as a collective subject of the contemporary working class*. The second critical reflection integrates *psychotherapy* [as a practice that] *"cannot substitute collective struggle; it can only contribute to it, help to empower it"* (Llorens, 2009). Additionally, the third critical reflection notes that *the anxiety of assimilation has always been there* as well as *the finite limits of action* and at the same time points out the importance of *having [these limits], to some extent, clear, as they are determined both by our relationship as partners, which is not bound to a tireless and continued political transaction, but also by the limits of the SCE itself as an institutional structure [...] of the "third sector"*.

All micro-possibilities of action within psychotherapeutic practices have limitations in their connection to a collective political level, which have to do with contemporary cultural-historical conditions. The clientelistic interests of psy-professionals in Greece, the lack of a collective labour consciousness among

²⁴ <https://www.kritische-psychologie.de/einstieg>

²⁵ <http://inca-pa.nl> & Mölders, H. (2001)

²⁶ According to Richard Day (2008, as cited in Souzas, 2015, p.18) social movements are characterised by a "prefigurative politics" where prefiguration is not just a performative process but contributes to the creation of a collective memory. It is much more a form of action that illuminates, signifies and inspires, by its very paradigm, aspects of desired worlds.

²⁷ From the titular book of Franco Basaglia (2008).

²⁸ On *I'll resist with every inch and every breath: Girls and zine making as a form of resistance*, Schilt defines c/overt resistance as the combination of overt and covert resistance (as defined by Carol Gilligan et al. 1995), highlighting their interconnectedness and the importance of both.

psy-workers, the incomplete attempts to form a labor union of psychologists/ psychotherapists (in free lance/ private practice and waged services), the decline of the social movements, as well as the lack of a culture of critical reflection on the internal processes of the social movements/ sectoral / cooperative initiatives, (re)produce the conditions in which collective demands do not thrive.

We realize, though, that even the political possibilities for action at the micro-level are not easily developed as a consequence of the continuous restructuring of everyday life due to the successive capitalist crises, the psychologization of these crises, the establishment of the "therapeutic ethos"²⁹, but also due to the lack of a more coherent and practical understanding of psychology as politics by other means. We recognize that such micro-level possibilities for action are carried out as necessary "pseudo-emancipations" (Ratner, 2013, p.15) within the context of a reformist critique³⁰ and demonstrate our inability to develop our critical praxis beyond the session as a possibility for political intervention³¹. To move beyond the practice of pseudo-emancipation as well as beyond the "session culture" (Dreier, 2008), it is necessary to develop a deep understanding of the world, self, roles and possibilities, which Freire called "conscientization" (Freire, 1970), as well as the development of a broad concept of human subjectivity and agency, where self-awareness and knowledge of social reality "are two sides of the same cognitive process" (Holzkamp, 1973, as cited in Osterkamp, 2009).

From this perspective, we conclude that what we call the therapist's *political coming out*, the way we envision it, cannot be limited to a technocratic disclosure of our political identity as therapists - as it has become recently the case in the USA³² (Drexler, 2023) - but needs to be developed through collective political actions as a socio-political consciousness raising, and from our intersubjective position/ perspective as both psy-workers and (potential) users of psy-services as well.

Acknowledgement

With respect and appreciation to Despoina Papagiannopoulou for editing the English version and to Theodoros Megaloikonomou and Alexandra Vasileiou for providing invaluable reflections to our work.

²⁹ According to Silva (2011): "Despite its resonance, however, the therapeutic ethos is ultimately a risky and temporary solution to the problems that are structurally embedded in their coming of age journeys. In teaching young people that they alone can manage their emotions and heal their wounded psyches, the therapeutic ethos dovetails with neoliberal ideology in such a way as to make powerless working-class young adults feel responsible for their own happiness".

³⁰ According to Carl Ratner (2013): "Reformist critique [...] works within existing macro cultural factors to introduce small, marginal improvements in them".

³¹ Ole Dreier analyses in his book *Psychotherapy in Everyday Life* (2008), the necessity to move from the view that the subject's change takes place in sessions, towards a comprehensive view of the subject's personal social practice in many contexts.

³² For a relevant discussion in relation to the Greek context of psychotherapy and social movements see also Tsirtoglou (accepted).

Appendix

Autonomous critical reflections

A.

What I personally find meaningful is to critically reflect over the aforementioned stake, in the context of contemporary capitalist contradictions, from a working-class perspective and in relevance with the interests of the contemporary, gendered and racialised working class.

I think, then, that psychotherapy as a dominant psychological professional activity has been developed serving the interests – in money, power and recognition (Teo, 2009) – of mainstream bourgeois psychology as a distinct positivist-scientific discipline, within the broader social division of labour. In other words, psychotherapy's development as a professional practice has been mediated by a worldless conceptualization of individual subjectivity (Schraube & Osterkamp, 2013a, p. 4), focusing on restoring the functionality of a fragmented – by psychology itself into discrete, neutral and objectively measurable functions – soul/ agency, conceptualized also as an internal consciousness (Teo, 2009).

When, therefore, the socio-political conceptualization of individual subjectivity is posed as the political stake of a psychotherapeutic activity, what is also at stake is the *value* of such a conceptualization for the *purpose* of the activity, which is the therapy of individual consciousness as a "plainly internal mental activity" (Kakarinos, 2012) and the particular subjective interests that this activity serves. In this regard, the question which arises is: can such a socio-political perspective be/ become therapeutic as well, for me as a worker and freelance entrepreneur in the context of an SCE, and for the various subjects of the contemporary working class who request treatment from me, and if so, what socio-political interests will this serve, in the specific cultural-historical context of the commodified psychotherapeutic services' provision?

In order to understand the political implications even of this alternative, critical-psychological conceptualization of the object of my work, as white, working class woman, in a way that transcends the "basic contradiction of bourgeois societies between capital and labour", I need to understand these implications practically in the context of the "secondary contradictions that determine it", such as "the international conjuncture", "the effects of the economic cycle", "the contradictions within the state apparatus" and "the contradictions within the ruling classes" (Milios, 2016). However, the social division of labour, as I have embedded it through my studies in psychology and by working as a psychologist, almost *forbids* my confident "voicing" (Schraube & Osterkamp, 2013c, p.331) here about these matters.

What I can, though, "make sayable" (Schraube & Osterkamp, 2013c, p. 330) is that for the last ten years, in my psychotherapeutic work I have been related to the contemporary high tech cognitive proletarians, co-participants of mine in the radicalized social practice of Chóros and potential comrades (Tsirtoglou, accepted), who are currently trying to deal with various kinds of dominant anxieties and symptoms related to the understanding and the development of their individual/ social subjectivity not so much (any more) by participating in collective political actions but more by seeking individualized therapeutic interventions. In this context, the *psychotherapeutic value* that the socio-political conceptualization of individual subjectivity produces today is more easily assimilated by the dominant psychotherapeutic practice and by the capitalist context of welfare services' commodification and alternativism than it is enlisted in political struggles serving the working-class interests.

So, if I want to abandon the *position of the goldfish*, "which can easily imagine itself to be swimming in the Atlantic as long it manages to swim without touching the sides" (Schraube & Osterkamp, 2013b, p. 26) I must not only reflect on what is both (therapeutically) effective and emancipatory within the context of the dominantly structured object of my work but also realize and struggle against those forces that currently situate me in the multiply contradictory position of the working class worker/ free-lance entrepreneur in a SCE, who reflects here on what could be reviewed³³ as therapeutic and emancipatory also.

From my perspective, this means that even if I can now/ here be therapeutically accounted as a good/ emancipatory psychotherapist, nothing could guarantee to me, in the context of the basic capitalist contradiction, that the emancipatory psychotherapy I (even cooperatively) trade, will at the same time be good for the socio-political interests of the contemporary working class also. In other words, helping a small part of the contemporary, white proletariat to open up micro-possibilities for action within the dominant capitalist dipoles mentioned in the previous chapter, and to fight it out individually and socio-politically within the context of its "personal social practice" (Dreier, 2009), through the micro-possibilities that I myself respectively open up for myself (and others) as a therapist/ worker/ entrepreneur, in no way ensures that whatever emancipation is achieved within/ through the therapeutic session is not still a psychotherapeutic commodity, of a *differential consumer interest*, serving the interests of a "differential normality" (Marvakis 2019).

B.

Reflecting on the above-mentioned political stake and the dipoles with which this stake is connected, I realize my following reasons and intentions for action: to reconstruct (initially we, the SCE's partners and then jointly with other cooperative or individual initiatives) our psy-practice and our psy-discourse in a direction that will serve the interests of the contemporary working class as a collective social subject, including therapists and treated subjects as well. This means to organize our collectivisation and/ or our antagonisms on the basis of

³³ See the relevant discussion of Pillay (2020).

class consciousness rather than scientific power (e.g. the politically neutral experts vs. the lay treated subjects, diagnosed or not).

The purpose of this nascent practice will be all subjects' emancipation, on the basis of our collective class common interests (as long as on a personal level all subjects suffer more or less from distress/ symptoms, regardless of whether they are attributed a pathologizing diagnosis, or a critical-psychological interpretation of their distress). In other words, rather than being content by providing individual (therapeutic) sessions (or even group sessions for individualized requests), where we offer relief and/ or cultivate a social awareness concerning the relation between psy-problems and society (even through critical-alternative methods), we can develop collective emancipatory activities and processes where we will create new possibilities to overcome societal fears and restrictions (psychologized or material) in order to resist and collectively assert life conditions other than those which produce our distress.

More specifically, in our SCE, we can organise *reflection groups*³⁴, not of a therapeutic/ counselling objective, but with the aim of understanding subjective problems as personal and socio-political as well such as the social self-understanding groups in Berlin, or the Multiloog open meetings in the Netherlands.

These reflection groups will be grassroots groups where subjects participate equally, by jointly choosing the topics and drawing on the power of their knowledge, wherever it comes from (e.g. formal education, personal or collective experience, researching literature, etc.) and could possibly organise activities such as texts writing, journal publishing or events' organising. Such a practice may be one more, *differential* micro-possibility for action, which does not necessarily overturn the socially prefabricated contradictions which (re)produce our practical dilemmas. So, which is the point that micro-possibilities for action could have?

From my perspective, they are actions on a micro-level which can provide a place to develop forms of resistance – c/overt resistance (Schilt, 2003)³⁵ – and which by doing so remind us that "psychotherapy cannot substitute collective struggle; it can only contribute to it, help to empower it" (Llorens, 2009). Micro-possibilities for action seem to me as the minimum necessary way of activation by which we can within the limits of our psy-practice resist societal oppression, reproduce a critical psychological discourse in public and by extension develop new possibilities for action in the context of collective political social movements.

³⁴ To set up such reflection groups, we draw on existing models: The Multiloog open meetings in the Netherlands <http://inca-pa.nl/>, Experts by experience, Self-help groups <https://www.hearingvoices.gr/>, Social self-understanding groups in Berlin <https://www.kritische-psychologie.de/einstieg>.

³⁵ On "I'll resist with every inch and every breath: Girls and zine making as a form of resistance", Schilt defines c/overt resistance as the combination of overt and covert resistance (as defined by Carol Gilligan et al. 1995), highlighting their interconnectedness and the importance of both.

C.

When I realize the dilemmas my first sensation is a choking feeling. The choking softens, softens, softens and even becomes a joy which calls me to move "against the pessimism of reason, for the optimism of action"³⁶. On a first level, for me, action means keeping the dilemmas open. In re-reading them I find that both the treated subjects I meet and we as the three co-authors of this article face similar dilemmas while reflecting on our (therapeutic) process/ practice. I want to be aware of the dilemmas, to seek ways of not covering them up, of opening them up and unravelling them, and so I think I need to move beyond the dominant interpretive schemes. This may mean that:

- I seek to move beyond the univocal reading of individual resilience and embrace resistance as well. I aim directly or indirectly to a therapeutic process/ practice which involves an intersubjective condition into which two subjects resist a change which threatens their autonomy³⁷. This means my resisting the covering up.
- I accept the other person as a responsible being who can take responsibility of his/her own recovery and thus, the pain of resistance acquires a political meaning. The collective experience of pain, especially within a group, opens up a new possibility for action beyond the neoliberal exhortation to happiness which calls for the pain's suppression at its onset and depoliticizes it by turning it into an individualized medical affair.
- I look for alliances, "affinities" (Day, 2004), for momentary points of connection where we meet each other and something happens that is transformative and consistent with our collective ethics of justice-doing (Reynolds, 2011).

I think about all this while recognizing that I am already talking about the ways the dilemmas themselves are emerging in an era where easy answers are proclaimed or even obliged. People, often, especially when experiencing a crisis or fear, ask me for something "to be healed", an "instruction to get through the pain" or a remedy, a diagnosis. I don't see the instruction, the medicine and the diagnosis univocally. If I have a good advice I can give it when someone asks for it. But I find it consistent from an emancipatory perspective to seek ways to see the crisis – which often permeates and fragments any sense of identity and personal formation – in relation to the crisis of the contexts that contain the subjects in question and in relation to my own crisis, which I experience as a professional accompanying (to a certain extent) other subjects on their road to recovery, as a member of a cooperative in crisis, as part of a social crisis (Karatzafiris, 2023). Could this crisis be related to the crisis our group went through while writing this article? I believe so.

³⁶ From the titular book of Franco Basaglia (2008).

³⁷ Gabriel Camarrata (2022) supports that "in mainstream Psychology, [...] the concept of resilience seems to hold, in itself, all that is needed to recover from a crisis, disturbance/violence/abuse, power struggle, while resistance instead is seen as something to dismantle. This approach seems to serve the narrative of a forever resilient and adaptive human being, who at the same time is seen by governments as "so fragile" and "irresponsible" as to have to be controlled at all times for their safety and wellbeing".

I acknowledge that I am part of the world of threats and abuses by which subjects "in sickness" feel oppressed, and the crisis of these subjects is my crisis as well. I need to move to all possible levels. I need to move from the ego to the world, from the "therapeutic relationship" to our relationships within the SCE, from the personal to the political, etc. One action that will light the way is to open up the dilemmas; to discuss the problems that have arisen from our collaboration with each other, to see the political implications of these problems, to self-institute practices and functionalities that serve our needs and transcend the dilemmas. I think of this action, like all the meetings within our SCE, with partners or treated subjects, as a prefiguration of desired worlds³⁸.

However, there seem to be finite limits to action and it is important that these are, to some extent, clear, since they are determined both by our relationship as partners, which is not bound to a tireless and continued political transaction, but also by the limits of the SCE itself as an institutional structure. We are essentially operating within the so-called "third sector where the game is inherently tied to processes that promote (choice) competition between providers" (Speed, 2011). However, during the last 15 years or so that I have been performing the role of a psy-professional from a variety of positions (within the public and private sectors, in NGOs, associations or squats), the anxiety of assimilation has always been there.

In conclusion, it is important for me to be constantly alert to the next set of dilemmas, which I suspect are inherent in the ones I began with: love and death, question and answer, process and purpose, chance and necessity. It is this dialectic of dipoles that the technology-control-security complex threatens to eliminate by ordering the seeking of eternal life and sustainable development, the elimination of ambiguity and of our inherent restriction to fully understand (by imposing algorithmization and artificial intelligence), the subservience of all to the need and purpose of production at the expense of dialogicity and play. In this respect, every crack within the "psychotherapeutic space", every micro-possibility for action could have an impact on the macro-level and let the light in.

Youli Tsirtoglou is a clinical psychologist/ psychotherapist at the Social Cooperative Enterprise "Psychi Logos EpiKinonia" in Athens which provides psychological interventions for children and adults, and at the Special Education High School of Ilion. She holds a bachelor's in Psychology from the Panteion University of Social and Political Sciences, a bachelor's in Special Education from the University of Thessaly and a master's in Social and Clinical Psychology from the Aristotle University of Thessaloniki. She has worked as a psychologist in various working contexts and she is interested in adopting a critical-psychological perspective concerning her working practice and the psychologist's subjectivity. Email: tsirtoglou_g@yahoo.gr

³⁸ According to Richard Day (2008, as cited in Souza, 2015, p.18) social movements are characterised by a "prefigurative politics" where prefiguration is not just a performative process but contributes to the creation of a collective memory. It is much more a form of action that illuminates, signifies and inspires, by its very paradigm, aspects of desired worlds.

Electra Anagnostopoulou is a developmental psychologist. She works at the Social Cooperative Enterprise "Psychi Logos EpiKinonia" and at primary schools in Athens. She holds a bachelor's degree in Philosophy, Pedagogy, Psychology from the University of Athens and a master's degree in Developmental Psychology from the Rijksuniversiteit Groningen. Her work experience includes different settings of mental health care services and education in Groningen and Athens. The challenge for her is to integrate her critical standpoint in her various work settings, as well as in parenting. Email: electranl@hotmail.com

Lykourgos Karatzaferis works as psychiatrist and family therapist. He is member of the Social Cooperative "Psychi Logos EpiKinonia", of the "Hearing Voices Network" and of the "Initiative for a Polymorphous Movement in Mental Health" in Athens. He holds a bachelor's in Medicine from the Department of Medicine at Democritus University of Thrace, a master's degree on Mental Health Promotion-Prevention of Mental Disorders from the Medical School of National and Kapodistrian University of Athens and continues a never ending education at Athenian Institute of Anthropos (AIA) which uses a Systemic - Dialectic Psychosocial Approach according to which "Anthropos", is conceptualized as a biopsychosocial, open, information-processing, decision-making, Anotropic System. He also provides training in family therapy and facilitates groups. Email: lykourgorsk@gmail.com

Reflections on right-wing radicalism and emancipation in therapy: A Marxist perspective

Peter Brook

Abstract

This manuscript seeks to make Marxist dialectics accessible to therapists and counselors, while contributing to discussions of Marxist theory within Critical Psychology. It offers a critical reflection on how therapy can engage with far-right political orientations and explores ways to foster emancipatory practices. The text opens with case vignettes that illustrate challenges faced by therapists working with far-right clients. These cases serve as a starting point for a deeper investigation into how political orientations manifest in therapy and how they reflect broader cultural and political limitations. Reflecting on such cases is presented as a pathway to advance emancipatory therapy, regardless of whether therapists encounter far-right clients or not, making this exploration relevant to all therapists seeking to engage with political and cultural dynamics in their practice. Through a historical and theoretical lens, the manuscript examines political orientations as dynamic problems rather than fixed categories, situating them within the broader, unresolved socio-historical task of emancipation. It traces the contradictions inherent in capitalism, emphasizing the need to understand political and economic systems from within their historical contexts. The text argues that left and right political orientations represent the competing forces of societal emancipation and its foreclosure, and that recognizing the transformative failures of past emancipatory movements is crucial for addressing current political crises. The manuscript also critically engages with the societal role of psychology and therapy in shaping human motives, examining how these fields can either adapt individuals to capitalist demands or help them transcend those limitations. The historical evolution of emancipatory concepts in both politics and therapy is explored, highlighting the shifts from 19th-century utopias of individual freedom to contemporary struggles for collective emancipation. Finally, practical recommendations are offered for therapists working with right-wing clients, with an emphasis on fostering critical political consciousness and deepening the therapeutic process in an emancipatory direction. This text argues that a Marxist perspective can offer valuable insights for advancing therapeutic practices and engaging with the broader socio-political challenges of our time.

Keywords

marxist dialectics, emancipatory therapy, far-right, political orientations, desire for agency, therapist-client dynamics, political culture, capitalism and subjectivity, social movements, socialism

Introductory Remarks

This manuscript is written for readers interested in Critical Psychology, as well as therapists and counselors dedicated to fostering emancipation through their practice. It resulted from discussions with colleagues about the difficulties we face as therapists or counselors when we know or assume that our clients hold far-right political orientations. These discussions occurred in various settings, including workplaces, training sessions, research contexts, conferences, and other events dedicated to these issues. Over the past decade, beginning with my initial training during my psychology studies, I have participated in, observed, or initiated these conversations. This period has been long enough to witness a historical shift in these discussions.

Initially, colleagues rarely reported difficulties working with far-right clients, often considering far-right political orientations as relics of the past, rendered obsolete by political progress. Individuals holding far-right views were commonly categorized as people "stuck in the past." However, this perception changed with the success of new far-right parties. Increasingly, colleagues shared their challenges in working with far-right clients, difficulties that could not be easily resolved by reverting to their training. These challenges stem from therapy training and continued education rarely addressing problems arising from conflicting political orientations.

In my observation, therapists committed to emancipation in their work were particularly eager to learn from these difficulties to advance their practice. I share this sentiment and have dedicated myself to investigating these problems as opportunities for advancing emancipatory-intended therapy. However, each time I believed I had found substantial answers, new contradictions soon emerged. Initially, I thought these contradictions indicated my lack of experience since I am relatively early in my career. However, upon discussing them with more experienced therapists, I found that the emergence of new contradictions is a persistent theme, regardless of experience level.

Over the years, influenced by my own political trajectory, I have concluded that we are not merely dealing with issues to be resolved in therapy but with societal contradictions and the broader socio-historical task of emancipation. These issues can only be effectively addressed through collective political action during a time arguably characterized by a lack of broad emancipatory movement. This unusually lengthy manuscript should be seen as a preliminary attempt to understand the tasks these contradictions pose. I hope it serves as a contribution to the ongoing historical self-clarification and furthers this crucial conversation.

If the emergence of the far-right proves one thing, it is the necessity to clarify what emancipation means today—for therapists, counselors, and

psychologists—both within and outside the confines of therapy. This involves understanding political orientations in relation to emancipation, interrogating the historical forces that shape the present moment, and exploring how current predicaments might point toward new possibilities. Although preliminary in many respects, this manuscript aims to contribute to that crucial discussion.

Overview

Before diving into the introduction, I will provide an overview of this manuscript to help orient the reader. Doing so is necessary due to the text's dual goals: making the complex nature of Marxist dialectics accessible to therapists and counselors, while also contributing to the discussion of Marxist theory within Critical Psychology. To this end, manuscript includes summaries of key themes in Marxist thought, crafted to shed light on our current cultural and political predicaments. Writing this text presented the challenge of addressing readers with diverse interests and varying levels of knowledge—some may feel overwhelmed by the complexity, while others may desire more depth and differentiation.

I encourage readers to browse through the manuscript and focus on sections that capture their interest. A table of contents is attached after these introductory remarks. Part one ties together the different themes and arguments of the manuscript, offering a cohesive overview of the text. For those primarily interested in therapeutic practice and less in theory, I recommend Chapter one and part four. Readers unfamiliar with theoretical psychology or Marxist theory may prefer to skip part two initially and return to it later. If part one proves challenging, I suggest moving on to parts three and four after the introduction and revisiting part one afterward.

The **introduction** familiarizes the reader with one of the assumptions of this manuscript that therapy always interacts with culture and politics in contemporary society. This section ends with a brief discussion of **three case vignettes** to illustrate some common problems encountered in therapeutic practice when working with clients from the far right.

Following a reflection on these cases, **part one** will outline the task posed by these problems from a historical and theoretical perspective, explaining how reflecting on cases with far-right clients can advance emancipatory therapy. Since part one ties together the different themes and arguments of the manuscript, I will give a more extended summary of Chapter one and two to help the reader in navigating the manuscript and engage with sections that are particularly relevant to their interest.

Chapter one introduces the key theories and concepts that ground the overall inquiry into how emancipatory therapy can address the challenge of far-right political orientations. Drawing on the theory of political orientations developed by Athanasios Marvakis and linking it with Ute Osterkamp's theory of the desire for agency (further advanced by Morten Nissen), the chapter explores the intersection between subjective knowledge and societal participation. These

theories suggest that political orientations are not simply subjective activities for navigating a preexisting societal order, but rather subjective attempts to pose and clarify the problem of society—what it is and what it ought to be. By addressing the relationship between individual agency and collective societal transformation, along with the desires driving participation in it, this framework opens up possibilities for therapy to contribute to broader emancipatory efforts.

Through tracing historical shifts in the cultural and political understanding of political orientations, the chapter contextualizes the role of political and economic revolutions as well as the rise of modern social sciences, particularly psychology and psychotherapy, in shaping today's understanding of human subjectivity and motivation. Examining the contradictions inherent in industrialized society, especially the psychological problem of motivation, the chapter explores how therapy can harness the potential within these contradictions to foster political autonomy and critical consciousness in civil society, which are essential for emancipation and serve as a counterforce to the far-right.

The chapter also highlights specific challenges that arise when working with far-right clients in therapy, exploring how reflecting on these cases can provide new insights for emancipatory practices. Ultimately, it advocates for a post-psychological perspective that integrates historical and political critique with therapeutic work, emphasizing the need to engage with political orientations and social movements as part of therapy's broader role in civil society.

Chapter two continues to develop the themes introduced in Chapter one by shifting the focus from a psychological lens to a concentrated exploration of the political sphere. Adopting a dialectical approach, it treats the far-right as a problem pointing beyond itself to the political responsibility of the Left. The chapter critically examines conventional distinctions in contemporary political culture and social sciences, exploring the latter's relationship with politics and its role in population control. It suggests that political orientations – whether left or right -must be understood within the broader contradictions of modern politics. Emancipation and opportunism are presented as central, shaping forces in this context.

Chris Cutrone's Marxist hypothesis is introduced as a key methodological framework. In doing so, the chapter outlines the specific Marxist perspective that underpins the entire manuscript. This perspective contrasts with the conventional applications of Marxist theory, particularly in critical social sciences, where it is often employed as a normative social theory. These approaches tend to assume that the Marxist vision of emancipation remains directly applicable (referred to as the 'Marxist wager'). In contrast, the Marxist hypothesis regards emancipation as an unresolved socio-historical task, focusing on how historical revolutionary attempts – despite their failures – have profoundly influenced political culture and the contemporary meaning of emancipation. Reflecting on these failures, the hypothesis provides a framework for addressing challenges faced by present-day emancipatory movements.

Linking these insights to a post-psychological perspective, can generate new ideas about how therapists can learn from cases with far-right clients and

contribute to the development of critical historical consciousness – both within and beyond the therapeutic setting.

Part two explores the themes from part one in greater detail. It begins with discussing potential pathways for therapists to become aware of the limitations of the prevailing political culture. **Chapter three** introduces concepts to view therapists' subjective responses to their encounters with right-wing clients as subjective resources to re-engage with political culture and to move beyond these limitations. Instead of defining political orientations, I suggest understanding political orientations as a problem that requires historical self-clarification. This approach situates political orientations within the unresolved socio-historical problem of emancipation, which arose from capitalism and has shaped modern life ever since.

The subsequent **chapter four** of the problem of capitalism and politics within capitalism argues that these issues cannot be described from the position of a detached observer, as social science often claims, because this would amount to claiming a position outside history. The problem of capitalism can only be understood from within its contradictions and conflicted history, recognizing that past attempts to resolve the problem of capitalism have changed the character of capitalism, often leading to unintended consequences.

I propose situating political orientations in this context as problems of historically changing relations of theory and practice. Building on this, the left and the right are distinguished not sociologically but conceptually from a historical perspective as the embodiment of societal emancipation or the foreclosure of it.

Chapter five concludes with investigating political orientation in the context of the problem of motivation. It discusses the societal role of psychology and therapy in directing motives to satisfy individual needs through the adaptation to the needs of capital. This analysis is juxtaposed with the emergence of motives that transcend the capitalist reality of false necessities of conflicting but real needs. The final section connects these insights to psychology and therapy, highlighting pathways how these historical and theoretical perspectives can advance emancipatory – intended therapeutic practice.

Part three starts by delving into the historical foundations of contemporary concepts of emancipation in psychotherapy and politics, examining the emergence, crisis, and transformation of modern utopias of freedom. **Chapter six** traces the rise and decline of the utopia of the free bourgeois individual and explains how its crisis in the mid-19th century gave way to a new vision: the utopia of the social individual. This exploration leads to a critical examination of the new societal conditions brought about by the industrial revolution, which have shaped modern politics, given rise to new emancipatory movements, and profoundly transformed the modern ideals of freedom. I argue that the political right can be understood as a response to this situation, embodying the subjective moment (both a force and a period) of the societal process that is opposed to universal mass emancipation.

Finally, I will offer in **chapter seven** four recommendations for working with right-wing oriented clients, drawing on theories from Critical Psychology.

These recommendations can also be valuable in cases where other political orientations emerge as conflicts or problems that disrupt the therapeutic process. Even if practitioners rarely encounter explicit tensions between their own political orientations and those of the client, reflecting on such situations may inspire new approaches to addressing political orientations in therapy, potentially expanding their practice in an emancipatory direction – this is my hope. Additionally, readers are encouraged to critically engage with these recommendations, as this may help clarify their own ideas and assumptions about the possibilities and limitations of therapy with emancipatory intentions.

Overall, this manuscript aims to demonstrate that a Marxist perspective can offer valuable insights into addressing the challenges encountered in therapeutic work with right-wing oriented individuals. This perspective, rooted in a specific interpretation of Marxist theory, may not be shared by everyone. It is not necessary to agree with the Marxist standpoint from which I am writing to generate insights from reading this manuscript when seen as an attempt to contribute to the emancipatory understanding of contemporary issues.

Acknowledgements

I am very grateful to following friends and colleagues for their more than generous support, discussion and comments that were vital in bringing this manuscript together: Alissa Brook, Eva Bowler, Jonas Ecke, Valentina Ellinghaus, Alina Göres, Stefan Gužvica, Caroline Huss, Athanasios Marvakis, Eileen Wengemuth.

Limitations

This manuscript has several limitations, reflecting its preliminary nature. Three, in particular, must be briefly discussed to set clear expectations: the absence of a thorough definition of fascism and the far-right; the limited treatment of sexism, racism, and other forms of discrimination predating the industrial revolution; and the lack of an explicit discussion on different Marxist approaches.

First, concerning the definition of fascism, the manuscript does not engage with the extensive debates on how to define and distinguish fascism from the far-right. These discussions—both within and outside of the social sciences—are deeply influenced by the political orientations of those involved in them. While these debates are important, I have chosen not to explore them in detail here, as they would require a separate and substantial treatment. Moreover, these discussions often center on categorization schemes and do not sufficiently examine the role such schemes play in shaping subjective political orientations. The focus of this manuscript is on political orientations as subjective phenomena rather than on specific types of such orientations. I address far-right political orientations because they foreground the issue of political orientation itself.

However, for those interested, a longer footnote in chapter three briefly outlines my position on distinguishing fascism from the far-right.

I think that the problems of sexism, racism, and other forms of oppression that predate the industrial revolution, are of central importance for the task of emancipation, particularly given the historical weight of issues such as women's oppression, aptly described by Juliet Mitchell (1966) as 'the longest revolution'. However, this manuscript focuses on contributing to the broader effort of overcoming the current limitations in political culture, which would require an extensive discussion of these forms of oppression to be fully addressed. Adopting contemporary approaches to these issues would be insufficient because how these issues are typically framed in political culture reflects general limitations in political culture. The Marxist perspective I follow, offers a methodological approach to these concerns¹. A brief discussion of these issues can be found in section 4.7.

Lastly, this manuscript does not delve into an explicit discussion of different Marxist approaches. This is partly because such a discussion would require a breadth of expertise beyond my scope. Nonetheless, chapter two outlines the specific Marxist perspective that informs my writing, contrasting it with other Marxist traditions. The manuscript does not claim to exhaustively cover all Marxist approaches, but it does engage with the Marxist hypothesis as a critical methodological framework for understanding political orientations and their implications for therapy.

Note on Sources Cited from Chris Cutrone's Works

At the time of writing, several works by Chris Cutrone cited throughout this manuscript were only available online or in socialist publications that I could not access in print. Consequently, direct quotations from these sources do not include page numbers, as they were drawn from digital versions without consistent pagination. These works have since been collected and published in *Marxism and Politics: Essays on Critical Theory and the Party 2006–2024*. For consistency and to maintain the context of the original research, I have retained references to the online versions. Readers are encouraged to consult the print edition where page numbers are now available.

¹ Chris Cutrone (2010b) noted, to approach the issue of opening possibilities for gender and sexual practices globally, it's crucial to address *capital as the fundamental and global context*. In the distorted forms of current gender and sexual phenomena, there are latent possibilities for becoming human in ways barely imaginable today. Mitchell's essay from over 40 years ago cautions against letting present discontents take static forms and warns of the normative principles we might propose against destructive practices we wish to overcome. It's essential to *grasp the 'movement of becoming' in capital* that must be transformed, from the breakdown of tradition to the false re-establishment of tradition in response to modernity, into a genuine human achievement of emancipation.

Introduction

Critical Psychology and emancipatory approaches to psychotherapy emphasize that the traditional view of psychotherapy as an apolitical practice is an ideological construction, distorting both the history of psychotherapy and the reality of what therapists actually do in their practice (Dreier 2008; Goulart 2019; Knebel 2021; Nissen 2019; Osterkamp 1991b, 1991a). The complex relationship between psychotherapy and politics can be understood through several dimensions, including how therapy engages with political processes, applies therapeutic concepts to political life, and reflects power dynamics within the profession itself (Totton 2000). Additionally, the history of psychotherapy reveals how deeply intertwined it has always been with political contexts, despite efforts to present it as an apolitical practice. This history is vividly illustrated by the tragic trajectory of the early psychoanalytic movement: Freud, often seen as conservative, was nonetheless animated by the Enlightenment spirit, advocating for psychoanalysis as a tool for personal and social emancipation. The left Freudians sought to radicalize this spirit through their involvement in revolutionary Marxism, aiming to further the cause of emancipation. In stark contrast, the right-wing of the psychoanalytic movement co-opted with Nazism, actively persecuting its Jewish members and purging psychoanalysis of its 'Jewishness' to establish a 'German' psychotherapy (Dahmer 1997, 2012; Geuter 1984; Peglau 2013). The crisis of professionalization for these early psychoanalysts was not merely a matter of status or regulation; it was a life-threatening struggle against political forces that sought to undermine and co-opt their work.

This historical entanglement underscores the ideological construction of psychotherapy as separate from politics, obscuring the reality of how therapeutic practices are influenced by and contribute to political structures and ideologies. Moreover, the ongoing crisis of psychotherapy, particularly in the context of professionalization, highlights the tensions that arise when therapy is positioned as a profession on par with medicine and law (Totton 2000). This professionalization has led to increased regulation and the commodification of therapy, mirroring broader societal conflicts that have historically shaped the "troubled person industries," which emerged as mechanisms for managing

societal conflicts and discontents within the welfare state (Cohen 2016; Dörner 1969; Frawley 2024; Gusfield 1989; Moncrieff 2022). The story of Edward Bernays, Freud's nephew, who pioneered public relations by applying psychoanalytic concepts to manipulate public opinion, exemplifies how psychoanalysis, in its quest for professionalization, became entangled in the very problems it sought to address. Understanding these political dimensions is crucial for comprehending the true nature of psychotherapy and its role in society in addressing societal and political malaise, as it navigates the pressures of professionalization while grappling with its inherent political implications.

Consequently, Critical Psychology and emancipatory approaches to therapy have emphasized that psychotherapy is inherently political because it deals with human experience, which is always shaped by social, cultural, and political contexts. Therapists, consciously or unconsciously, bring their own political beliefs into the therapy room, influencing how they understand and interact with clients. Thus, psychotherapy inevitably both reflects and influences political structures and ideologies.

Emancipatory critiques have not only challenged the apolitical view of therapy but also argued that political awareness is essential for ethical and effective therapeutic practice. By recognizing the political dimensions of therapy, therapists can better support their clients in navigating the complexities of their lives, which are invariably influenced by broader social and political forces. However, an open question remains: how should political awareness be advanced for emancipatory therapy to move forward (Knebel 2018, 2019)? Answering this question requires clarifying the meaning of emancipation – a task that is far from straightforward. Emancipation is not only a politically contested topic but is also shaped by the prevailing political culture, influencing what emancipation is and what it can be in a utopian sense. Therefore, it is crucial to explore how the intricate relationship between different political orientations and emancipation is mediated by political culture.

For this inquiry to be truly relevant to advancing therapy, however, it must be grounded in the specific, historically rooted problems that therapists encounter in their practice. Critical Psychology has long emphasized the importance of theorizing the concrete problems that arise in psychological practice, a focus central to what is known as practice research². This approach not only seeks to clarify the inherent contradictions in these problems but also to understand them within the context of collective subjectivities – such as research or practice communities – which are seen as part of the broader societal process³. By exploring these contradictions, practitioners and researchers aim to foster a deeper understanding how to shape the societal process in more conscious and emancipatory ways, thereby addressing the deeper issues that modern life

² Advancing practice by theorizing concrete problems that psychologists encounter in their work, is a well-established topic in Critical Psychology, discussed under the rubric of practice research (Dege 2023; Dreier 2008; Held 2020; Holzkamp 1983; Knebel 2021; Langemeyer 2011; Markard 2009; Nissen 2012).

³ Articulating this perspective is a more recent development within Critical Psychology (Axel and Højholt 2019; Dreier 2019; González Rey 2019b; González Rey and Mitjáns Martínez 2017, 2019; Højholt and Kousholt 2020; Mørck 2010; Nissen 2000, 2006, 2009, 2018, 2023; Nissen and Mørck 2019; Wengemuth and Waleng in press).

presents. The central task is to theorize how these contradictions are interconnected with efforts to overcome practical challenges, ultimately contributing to a more conscious and emancipatory participation in the societal process, which is after all constituted and re-constituted through subjective activities. Thus, this approach can be contrasted with looking for quick and instrumental solutions to these problems,

Drawing on these approaches, this manuscript suggests that encounters with far-right clients in therapy present a unique opportunity to advance emancipatory practices in therapy. These encounters foreground the role of political orientations in therapy, revealing the conflictual nature of these orientations and how they reflect the broader despair within contemporary political culture. Therapists' subjective responses to their encounters of far-right clients not only mirror a despair within political culture but also embody efforts to overcome it. The political orientation of right-wing radicals is seen in the prevailing political culture not only as undesirable but also as a powerful threat. Calls to actions across the political spectrum, defining the rise of the far-right as crisis, demand that the democratic spectrum must defend itself against the threat of the far-right establishing a fourth Reich (Rosenfeld 2019), suggest mostly means of social control in lack emancipatory answers.

The inadequacy of current emancipatory answers to societal and political malaise, as evidenced by the success of the far-right underscores the need to move beyond the prevailing limitations of political culture. In this context, the common assumption that categorizes individuals' political orientations into rigid labels like left and right – equating the left with emancipation and the right with anti-emancipation – must be carefully reconsidered. By consciously addressing the political and cultural dynamics at play, and exploring therapists' subjective efforts to transcend these limitations, encounters with far-right clients can be transformed into opportunities to advance emancipatory therapy and deepening our understanding of political orientations – within and beyond the context of therapy. However, this requires a specific and thoughtful approach to how such encounters interfere with the therapeutic process.

Encounters with far-right clients have the potential of disrupting the everyday work routine of therapists, presenting them with problems of orientation. Questions like 'What does this mean?' and 'What should I do now?' arise as therapists navigate these unsettling situations. To unfold such encounters as opportunities to transcend the limits of current political culture, we must resist the temptation to treat them as problems to be resolved by simply finding the next step in the therapeutic process, or by defaulting to actions aimed at continuing therapy as usual. Instead, I suggest we theorize and historicize our responses – such as the desire to change, control, or ignore the far-right political orientation through technical means – to transform these encounters into open problems of orientation, holding the potential to reveal new and unforeseen ways to advance emancipatory therapy. This potential is particularly strong in encounters where therapists are committed to emancipatory practices or are otherwise deeply concerned about the rise of the far-right.

The following case vignettes illustrate some of the common problems therapists encounter when working with clients from the far right. These cases provide concrete examples of how political orientations can interfere with therapeutic practice, serving as an entry point to explore the broader themes of this manuscript. Through these vignettes, we begin to unpack how these challenging situations hold the potential for therapists to critically engage with political orientations, using these encounters not only to navigate but also to transcend the limitations of the prevailing political culture. They offer a starting point for reflecting on how emancipatory practices might be advanced in therapy by drawing on the experience of working with far-right cases.

Three Case Vignettes

The following case vignettes are based on my clinical work experiences and qualitative interviews conducted during a research project at the Medical School of Brandenburg. The results of this project, carried out by my colleague Frank Schumann and me, will be published separately. The cases presented here, while grounded in real experiences, are not empirical data interpretations from the project but have been assembled to illustrate typical problems and questions encountered when working with far-right clients.

Vignette 1

The first case vignette involves a systemic therapist in training who identifies as a lesbian with a queer feminist political orientation. She is highly concerned about the potential rise of fascism, interpreting the current right-wing shift through this lens. She assesses her prior knowledge of right-wing extremism as rather limited. The vignette reflects on her work during an eight-week inpatient therapy setting in a psychosomatic clinic in Thuringia (a federal state in eastern Germany), discussing her interactions with a male client in his mid-30s, whose father was violent.

The client is financially dependent on his family of origin and has been diagnosed with depression and alcohol abuse. He confides in the therapist about his involvement in a neo-Nazi scene but expresses a desire to distance himself from it. He states that he disclosed his political orientation and his desire to change because he trusts her. Throughout the therapeutic process, the therapist often feels threatened by the client's homophobic comments, who is unaware that his therapist identifies as a lesbian. For the therapist, the client's desire to distance himself from his previous affiliations is crucial for her ability to continue working with him after she learns about his far-right convictions.

In the therapeutic process, the therapist and client develop a shared understanding of the problem, viewing violence as a learned coping mechanism. They reframe the client's depression as an opportunity to develop alternative conflict resolution strategies. The therapist involves the station's social worker to

explore specialized support services designed for individuals seeking to leave far-right organizations and subcultures. The therapy is assessed as progressing well, with the client expressing a desire to distance himself from his family of origin. However, upon discharge, the client rejects contact with the professional support services for leaving far-right groups. Reflecting retrospectively, the therapist questions whether she might have sugarcoated the client's political orientation to be able to work with him and acknowledges her lack of background knowledge.

Reflecting on this case, several conclusions can be drawn. The therapist effectively used systemic concepts to collaboratively develop a connection between the client's therapeutic issues and his political orientation. The therapist's feminist orientation introduced an emancipatory perspective, enabling a focus on change and envisioning a pathway out of the far-right convictions. Her interpretation of current political developments as potentially leading to a resurgence of fascism and her own positioning undoubtedly influenced the process. However, she was unable to reflect on this influence due to a lack of opportunities for self-clarification, such as inter- or supervision or further education. Additionally, it cannot be ruled out that the client was strategically acting to gain sympathy and ultimately make himself fit again for the far-right scene.

Vignette 2

The second case vignette involves a male psychiatrist with a psychodynamic orientation. He is highly experienced in his profession and has a pronounced humanistic perspective. With a deep interest in critical theory, he continuously educates himself about contemporary far-right organizations and their strategies. This commitment began in his youth, which he spent in left-wing subculture. The setting for this vignette involves six weeks of outreach treatment as part of psychosocial health services in Mecklenburg-Western Pomerania, a federal state in the north-east of Germany.

The client is a woman in her late 20s, unemployed, and living in what the psychiatrist describes as a "Nazi house." She resides there with a partner of the same age who works as an electrician. She has been diagnosed with agoraphobia, which renders her unable to leave the house, making her eligible for outreach treatment. She is frequently visited by three male friends of the couple, who are in their mid-20s to early 30s and live in a shared flat in the same house. They try to support the client by running errands since she would otherwise be alone during the day.

The therapist infers her right-wing orientation from scene-specific symbols on the T-shirts that the friends and her partner wear. When he questions the client about it, she downplays the significance, claiming they are simply football fans and that such T-shirts are common. Despite her explanations, the therapist remains skeptical but is nonetheless surprised by the friendliness and helpfulness of her friends.

Throughout the therapy sessions, the psychiatrist searches for evidence of an authoritarian character in the client but reaches no clear conclusions. He maintains a professional distance, failing to develop a sustainable and trustful therapeutic relationship. Instead, the relationship is shaped by mutual distrust. The therapist does not engage in a collaborative exploration of the client's political orientation and is unable to link his assumptions about her political stance with the therapeutic issues and her concerns. In reflection, he acknowledges that he may not have met the standards he set for his therapeutic practice.

Here are my conclusions regarding this case: The therapist identified the client's political orientation through his background knowledge. However, it appears that his familiarity with critical theory might have complicated his therapeutic efforts. While it is not unreasonable to assume that the client held a right-wing orientation, the therapist did not explore the specifics of this orientation or the context in which the client depended on others. His assumptions seemed to have eclipsed the real person in front of him. Consequently, the therapist struggled to apply theoretical assumptions from the theory of the authoritarian character, such as relational disturbances, to the therapeutic problem in a way that advanced the therapeutic process. Furthermore, he was unaware of the dynamics that labeling the situation as involving an authoritarian character had on the therapeutic process, which I discussed earlier in the introduction regarding problem formation. Additionally, the therapist lacked an explicit emancipatory perspective in his work.

Critical theory, which often emphasizes the decline of emancipatory possibilities in social developments post the failure of the Russian Revolution through Stalinization, does not provide direct practical guidance for therapeutic contexts. This raises the question: Which theories are actually helpful, and which might even be hindrances? In my opinion, the direct application of social criticism, such as critical theory, in therapeutic work is questionable. This does not mean to deny the value of critical theory but to recognize the difference between critical theory and therapeutic practice. Theory must not be used as a justification for practice.

Vignette 3

Case vignette 3 is ideal-typical, not drawn from interviews. We developed it from a literature analysis. Fortunately, we did not find such problems in our interviews, and we were quite surprised not to find them: Namely, the phenomenon of politicizing psychological orientation. This is more commonly found in the literature and is often psychodynamically oriented. In the ideal-typical case vignette, the setting is outpatient individual therapy, and clients with left-wing, right-wing extremist, and Islamist orientations are lumped together. Here, extremism theory serves as the common thread. Political orientations are interpreted as defense mechanisms, with the assumption that they are used to cope with ego weakness. The specific orientation is considered irrelevant, and the

identification of an “extremist” orientation is done intuitively as a deviation from norms, as there are no substantive criteria. The assumption is often that extremist orientations arise from authoritarian need frustration in childhood. This working hypothesis is not disclosed in the therapeutic process, but the focus of the intervention is on reparenting or corrective emotional experiences.

Case vignette 3 revolves around the psychologization of political orientation. This vignette is not drawn from interviews but based on a literature analysis of the mentioned research project (Schumann, Brook, and Heinze 2022). Interestingly, we did not encounter such problems in our interviews, which was surprising. The psychologization of political orientations is more commonly discussed in the literature, often from a psychodynamic perspective. In this case vignette, the setting is outpatient individual therapy, and clients with left-wing, right-wing extremist, and Islamist orientations are grouped together under the umbrella of extremism theory.

In this scenario, political orientations are interpreted as defense mechanisms, presumed to be coping strategies for dealing with ego weakness. This assumption is loosely inspired by the psychoanalytic aspect of the theory of the authoritarian personality, while neglecting the social criticism of that theory (Adorno et al. 1950). The specific political orientation is deemed irrelevant, and left- and right-wing orientations are not distinguished. Identifying an “extremist” orientation is done intuitively as a deviation from norms, without substantive criteria. The prevailing assumption is that extremist orientations stem from authoritarian need frustration in childhood. This working hypothesis is not disclosed during the therapeutic process; instead, the intervention focuses on reparenting or providing corrective emotional experiences.

Here are some of my conclusions about this case vignette. The reasons for therapy, the concerns, and the problems addressed in therapy are superficially connected to the political orientation, following a rather formulaic approach predetermined by theory. This poses the risk of self-immunization against criticism if therapy outcomes are lacking. One could always argue that the therapy did not progress or work because the defense mechanisms were too strong.

There is no emancipatory perspective here, just an adaptation to prevailing norms. However, implicitly or dialectically viewed, an emancipatory perspective exists within this framework, but one must read the literature against the grain. In psychoanalytic theory, there is the idea of the autonomous bourgeois individual who can assert themselves against authoritarian structures and critically evaluate societal norms. While this is not a bad utopia, it is unrealistic under capitalist conditions, as I will elaborate.

Additionally, the theoretical foundations of this concept, the theory of extremism as a version of the theory of totalitarianism, are not critically examined, which has political consequences. Consequently, we see a psychologization and therapeutization of deviant political orientations. However, deviant political orientations can also be emancipatory, but no distinction is made here. Furthermore, there are possible misjudgments of political orientation, as substantive knowledge of political orientations is deemed irrelevant – for

instance, distinguishing between emancipatory and reactionary orientations. Ultimately, this reflects a technocratic understanding of psychotherapy as a social technology for adaptation.

Interim reflection

A brief reflection on the three case vignettes is necessary. In each example, far-right political orientations were viewed as problematic and thus became a focus of therapeutic intervention. However, the reasons for categorizing these orientations as problematic were neither fully articulated nor explicitly reflected upon. Instead, these judgments remained largely implicit, shaped by the therapists' own political orientations and broader political culture. In particular, the therapists tended to frame political orientations as personal identities rather than understanding them as contradictory phenomena – though the first case offered some nuance. Here, the far-right orientation was collaboratively defined by the therapist and client as a set of conflicting motives embedded in violent conduct. This process facilitated the cultivation of new motives toward resolving conflicts more peacefully. Yet, whether these motivations were realized in the client's everyday life remains uncertain. Even in this more nuanced case, the framing of political orientation as identity is still dominant.

It is important to recognize that therapists' categorization of clients' political orientations as problematic does not merely reflect cultural norms but also expresses the therapist's own subjective relationship to those norms. Though individual therapists do not simply reproduce dominant political horizons, their efforts to address therapeutic challenges are often shaped by the prevailing political imagination. This is especially evident in therapy cases involving far-right clients, where political culture strongly influences the formation of problems within therapy.

For instance, in the first case, the therapist's concerns were influenced by an inability to envision progressive societal change – an attitude shaped by an apocalyptic strand of contemporary political imagination, which situates Germany on the verge of another 1933 and anticipates a fascist resurgence. In the second case, the psychiatrist's clear-cut views of far-right orientations reflected a broader political culture that treats political identities as fixed, erasing the fluid, socially embedded nature of political orientations. This perspective overshadowed the client's subjective political stance, leading the psychiatrist to focus solely on his own convictions rather than confronting the societal dynamics at play.

Thus, emancipatory therapy should not limit itself to cultivating meta-motivation – the motivation to change one's motivation – aimed at revising clients' far-right orientations. Instead, the primary task lies in reexamining and potentially revising our own political orientations. This does not mean substituting therapy with politics, but rather establishing a foundation for the development of meta-motivation within therapy through the deepening of our own orientations and political understandings. Doing so offers a more nuanced

grasp of problem formation within therapy, which, as I aim to show, often appears in reified forms.

In the following chapters, we will delve deeper into the nature of political orientations, problem formation, and the potential for therapy to engage with these issues in a more nuanced and transformative way.

Part one

Chapter 1: Political Orientations and the Psychology of Agency: Historical Shifts and Emancipatory Possibilities

Political orientations are a subjective form of knowledge (*Erkenntnis*), a specific personal understanding of and insight into the relationship between individual subjects and the societal process (Marvakis 1996). These subjects can be both individual persons and collectives. Collective subjects – such as families, political parties, social movements, corporations, or workforces – are composed of individuals who participate in them (Nissen 2023:130–42). The purpose of the knowledge expressed through political orientations is to expand or preserve agency by guiding individuals in their ‘conscious’ engagement with society. However, political orientations are not merely about adaptation; they reflect how subjects understand and attempt to transform the societal challenges they face, articulating both how society is and how it ought to be (Marvakis 1996:53–78).

Athanasios Marvakis distinguished political orientations by their “object of reference [...] as particular anticipations and alignments concerning social relations. In a preliminary definition, ‘my’ political orientations can be understood as subjective references to social relations. In other words, ‘my’ political orientations express ‘my’ relationship to these social relations in a subjective way. Political orientations, from the perspective of the orienting subjects, are perspectival references to social relations, to ‘society as a whole’” (Marvakis 1996:54). To fully grasp this definition, it is essential to explore its components and contextualize them historically. The subsequent discussion of Enlightenment ideas will broaden the understanding of political orientations as subjective attempts to clarify the modern problem of society.

From the perspective of the orienting subject, ‘society as a whole’ refers to something greater than the sum of its individual parts – it encompasses the broader societal interconnectedness that underpins the lives of individual subjects. It is the world in which subjects live and continuously reproduce through their actions (Adorno 1965). Subjects must reflect on the possibilities and problems of this world, not as isolated issues but as potential constraints, pitfalls, and opportunities, which they must anticipate and align with to preserve or expand their own agency. Whether individuals or collectives, subjects need to adjust their course of life to align with the development tendencies of the world they inhabit, anticipating how the societal future might shape their agency.

1.1. Society as Subjective Problem of Orientation

‘Society as a whole’ is not merely an object for subjects; it represents a subjective problem of orientation, requiring the practical knowledge embedded in political orientations. This involves determining how to anticipate and align one’s course of life with historical developments that are both beyond the immediate control of individual subjects and shaped by collective subjective activity. Therefore, political orientations are neither innate attributes of subjects nor the direct result of socialization, but subjective practices that reflect the interconnected development of individual subjects, the societal process, and their conscious participation in this process. Moreover, the necessity of anticipating societal relations introduces a temporal dimension to political orientations: the interconnectedness of society and history.

Problems of orientation can be categorized as having either clear and distinct (closed) meanings or problematic and open ones (Marvakis 1996:38–50). Political orientations are relevant only to the latter. Problems with clear and distinct meanings can have uncontested solutions, while those with problematic and open meanings must be resolved normatively, with their resolutions potentially subject to contestation and conflict. For example (*ibid.*, 38f), navigating from point A to point B in an unfamiliar city is a clear task with a distinct meaning, even though it can be approached using various methods (maps, internet, asking strangers) and different routes (short, convenient, scenic, etc.). However, this problem can become problematic if one critiques the city’s design – whether it is car-friendly or pedestrian-friendly – shifting the task from a clear and distinct problem to an open question. In such a case, it remains unclear what the subject will do with this critique – if they act on it at all – as the criticism could serve an entirely different purpose. Another example of an orientation problem with a problematic and open meaning would be encountering a far-right client in therapy. There is no uncontested solution, and the therapist’s approach depends on their political orientation. However, as with the previous example, this problem could also be transformed into the opposite type – one with a clear and distinct (closed) meaning.

The meaning or significance of orientation problems, such as encountering a far-right client, can be approached through technical reasoning or through open inquiry into the nature and history of the problem. Therapists may choose to interpret the encounter “in the sense of instrumental reasoning for optimizing the subsequent execution of action” (Marvakis 1996:49). This reduces the encounter to a discrete, isolated problem, solvable by technical means and specific actions designed to achieve a predetermined goal: continuing therapy (and life) as usual. In this approach, the technical knowledge and methods required appear external to the problem itself, creating divisions between theory and practice, content and method, and the ‘what’ and ‘how’ of action (Schraube and Marvakis 2019). These divisions are reflected in the question: ‘What theory or technique can be applied?’ As a result, the therapist’s personal relationship to the problem is treated as a mere disturbance in routine; what the encounter could mean beyond being an obstacle is largely irrelevant. The task posed by the encounter becomes

a predetermined goal: either to continue work as usual or to transform the far-right convictions of the client into a more socially acceptable political orientation.

However, such an instrumental approach is likely to unconsciously perpetuate broader societal conflicts mirrored in the encounter. As Marvakis (1996:49) notes, human “reasoning is not merely about solving problems but fundamentally about posing them. It strives for ‘comprehensive understanding’ rather than just ‘guiding [instrumental] knowledge’ (Holzkamp 1973, Chap. 8; Seidel 1976, p. 16). Human thought and action are not confined to task-oriented actions; they actively engage in setting goals”. Regarding political orientations, this suggests that these orientations are not merely subjective activities aimed at navigating a preexisting societal order but are subjective attempts to pose and clarify the problem of society – what ‘it’ is and how it ought to be. As Marvakis (1996:45) explains, subjective “orientation within (collective) activity” in the societal process necessarily raises “the (orientation-relevant) question of the relationship between individual and collective goals/interests”. These goals/interests are not limited to preexisting directives but emerge historically from subjective participation in the societal process. This also implies that political orientations include knowledge about how others, such as far-right clients, pose and clarify the problem of society from their perspective.

Society and its development – history – cannot be directly observed from our limited perspectives in everyday life. It can only be understood through concepts that represent the abstract relations of ‘society as a whole’. The subjective knowledge embedded in political orientations is never entirely private but rooted in the meaning-making resources of political culture (Marvakis 1996:50–53). These concepts are not necessarily theoretical but include a broad range of symbolic representations such as myths, stories, collective memories of historical events, and metaphors, which serve as resources to navigate the contradictions of everyday life. They do not merely describe what society is or was; they also anticipate how it ought to be in the future (Marvakis 1996:54–60). Rooted in political culture, these representations are collectively produced and contested in struggles over societal influence. They reflect different political orientations, each expressing more or less conflicting visions of how society should be organized and how societal problems should be addressed.

It is important to recognize that ‘society as a whole’ is not identical with the theories produced by the social sciences (Marvakis 1996). These theories represent only a small fraction of the broader cultural representations developed throughout modern history to make sense of the conditions of modern existence. Concepts like nation-state, democracy, social contract, constitution, constitutional rights, civil society, popular sovereignty, class struggle, capitalism, human rights, progress and regress, self-determination, the people, the nation, the welfare state, and the republic are just a few examples that have shaped not only intellectual discourse but have also become deeply embedded in political movements and public consciousness. These key terms help individuals and collectives engage with and understand society and its governance, influencing political action and shaping the modern world. In addition to these more global concepts, there exists

a wide variety of localized and idiosyncratic symbolic expressions that serve as more or less unique cultural representations of society. None of these terms remain static, as the ‘object’ of society is an ongoing process unfolding through history. In fact, the concept of society itself emerged alongside the recognition of history as the historicity of humanity, which superseded religious conceptions of time (Adorno 1965; Preuss 1986).

1.2. Labor, Society, and Freedom: The Enlightenment’s Transformative Vision

All of these concepts emerged from the broader Enlightenment conception of modern society⁴ and history, marking a radical departure from earlier notions of social organization rooted in eternal hierarchies, such as systems of castes or estates (Cutrone 2013a). Enlightenment thinkers like Jean-Jacques Rousseau used the idea of ‘society’ both as a critique of the old feudal order and as a vision of freedom through collective and individual self-transformation. This concept aimed to address the modern problem of freedom by balancing personal autonomy with the necessity for a cohesive societal structure that supports collective emancipation and the moral and political development of individuals. Kant (1784a) famously defined Enlightenment as humanity’s liberation from “self-imposed immaturity” and subservience to authority. Rather than being seen as a single event, the Enlightenment was viewed as a historical task driven by the development of critical reasoning, whose collective cultivation was closely tied to the problem of modern freedom and the concept of society.

In *On the Social Contract*, Rousseau (1762) develops the concept of the ‘general will,’ expressing the idea that society is more than the sum of its parts, acting as a collective force that shapes both individual freedom and societal progress. While society is a creation of human will, Rousseau argues that it also imposes its own constraints and possibilities, reflecting both subjective and objective dimensions. Unlike Hobbes’ *Leviathan*, which seeks to tame the “war of all against all,” Rousseau envisions society as a force for collective self-transformation. Hegel’s (1807, 1820) concept society of as “a ‘second nature’, a

⁴ The Enlightenment’s conception of modern society is deeply rooted in the works of key figures such as Adam Smith, John Locke, Benjamin Constant, Jean-Jacques Rousseau, and Montesquieu. Adam Smith’s *The Wealth of Nations* underscores how individual self-interest and labor drive economic progress, reflecting a shift towards a society where economic activity is central to personal and collective advancement. Similarly, John Locke’s *Two Treatises of Government* articulates the importance of natural rights and the social contract, framing modern society as one built on individual freedoms and collective governance. Benjamin Constant’s *The Liberty of the Ancients Compared with that of the Moderns* contrasts the active political participation of ancient societies with the individual liberties central to modernity, emphasizing the transformative impact of Enlightenment thought on concepts of freedom and societal organization. Jean-Jacques Rousseau’s *The Social Contract* introduces the concept of the general will, asserting that true freedom is achieved through collective self-determination rather than individual interests alone. Rousseau’s vision of society as an embodiment of the collective will challenges the notion that freedom is merely the absence of constraints, proposing instead that it involves active participation in the formation of societal norms and governance. Montesquieu’s *The Spirit of the Laws* contributes to this discourse by exploring how different forms of government – republican, monarchical, and despotic – affect societal stability and the protection of freedoms. His analysis of the separation of powers and checks and balances provides a foundational framework for understanding how modern democratic institutions can manage the tension between liberty and authority.

rebirth of potential, both collectively and individually. [According to Rousseau,] human nature found the realization of its freedom in society, but humans were free to develop and transform themselves, for good or ill” (Cutrone 2013a). Recognizing this radical ambivalence of societal freedom, Rousseau had no illusions about the difficult task that the problem of society posed. He believed society represented unprecedented possibilities for both emancipation and barbarism. For Rousseau, an emancipatory response to this duality required that “society had to be clear about its aims, in practice as well as in theory” (Cutrone 2013a). This clarity is crucial because reflecting on societal practices – whether political, moral, or institutional – is only possible “from within the conditions of ‘second nature’ that express our condition of freedom – including our self-imposed conditions of unfreedom” (ibid.).

For Enlightenment radicals like Rousseau (1755, 1762), Kant (1784b), and Hegel (1807, 1820), transforming society from within the conditions of ‘second nature’ was understood as a dynamic interplay between society as both a subjective and objective force. As a subjective force, society expresses humanity’s historical realization that it can transform itself through political and moral action. At the same time, society is also an objective force resulting from the accumulation and condensation of prior subjective activity. As an objective force, society can both constrain and foster the subjective capacity for moral and political action guided by enlightened reasoning. For these thinkers and the political radicals influenced by their ideas, the task was to understand and consciously appropriate the emancipatory potential they saw inherent in society as this dynamic between subjective and objective forces. Appropriating this potential required understanding society’s objective force as a product of historically unresolved and accumulated problems stemming from prior subjective actions. As a result, they viewed social problems – such as the lack of critical reasoning or social inequality – not as isolated issues, but as interconnected expressions of what society is and what it ought to become.

The Enlightenment view of the problem of freedom marks a profound historical transformation, as noted by Benjamin Constant (1819) in *The Liberty of the Ancients Compared with that of the Moderns*. It represents a significant shift from the feudal order, where social roles were fixed and divinely ordained, and from ancient Greece and Rome, where freedom meant that⁵ “that society had complete authority over its members” (ibid., 9). This stands in stark contrast to the modern understanding, in which labor and freedom are central to both individual and collective transformation. Constant famously argued that modern society, through commerce, could achieve the benefits of ancient liberty – such as collective well-being and societal cohesion – without the need for war. Commerce provided a way for modern societies to achieve the same levels of

⁵“The liberty of the ancients consisted in carrying out collectively but directly many parts of the over-all functions of government, coming together in the public square to discuss and make decisions about war and peace; form alliances with foreign governments; vote on new laws; pronounce judgments; examine the accounts, acts, and stewardship of the magistrates; call the magistrates to appear in front of the assembled people; accuse the magistrates and then condemn or acquit them. But while the ancients called this liberty, they saw no inconsistency between this collective freedom and the complete subjection of the individual to the authority of the group” (Constant 1819:2).

influence and interconnectedness that ancient societies pursued through war and conquest. Like other liberals of his time Benjamin Constant “considered war to be, not merely the failure of politics, but a crime. Unlike for the Ancients who celebrated war, indeed as among the highest of values, after every modern war people search for who was criminally culpable for the regrettable catastrophe” (Cutrone 2014a).

Within the Enlightenment context, labor emerges as a universal force that mediates and transforms society, as reflected in the work of John Locke (1689b), who tied labor to property rights, and Adam Smith (1776), who emphasized labor as the source of a nation's wealth. Unlike the static freedom of antiquity, which was tied to predefined roles, modern labor allows individuals and society to continually reinvent themselves. This dynamic view of labor aligns with the Enlightenment's vision of self-transformation through free activity. Modern society, therefore, is characterized by its capacity to evolve and redefine itself, in stark contrast to ancient views that saw social change as a threat to established order.

1.3. Revolutions and Political Orientations

This brief digression into Enlightenment ideas should not mislead us into thinking that society is merely a philosophical problem. Enlightenment ideals inspired the revolutions that shaped the modern world (Howard 2002; Israel 2001, 2011, 2014). Yet, the fact that today the problem of society predominantly appears as a philosophical matter reflects the impoverishment of contemporary political culture. For the majority, the issue of society has been reduced to participation in preexisting political institutions – such as the act of voting – while the broader societal questions are left to the concerns of a select few, namely politicians, political advisors, bureaucratic and economic elites. This narrowing of political culture has impoverished the representation of political orientations, reducing them to the completion of pre-given tasks and masking their true nature as subjective attempts to pose and address the broader problem of modern society.

In *On Revolution* (1963), Hannah Arendt observed the diminishing significance of the political realm. She argued that the revolutionary spirit, which once energized political culture and enabled citizens to engage in collective self-determination, has been lost or severely weakened. For Arendt, revolutions are a distinctly modern phenomenon and potentially a more human alternative to war, which has been as old as humanity itself. Through her examination of the American and French revolutions as paradigmatic examples, she offers an optimistic view of revolutions, acknowledging both their potential successes and inherent dangers. Arendt suggested that as modern society developed, revolutions could potentially replace war as the primary means of asserting political freedom. In other words, while revolutions are necessary for the exercise of political freedom, wars are not.

In Arendt's view, political orientations relate fundamentally to the problem of modern freedom, with the revolutionary spirit serving as the paradigmatic example of their full potential. However, the prevailing political culture largely overlooks the significance of the American and French Revolutions, reducing them to mere historical events rather than recognizing them as the transformative models for political change that they were (Davidson 2012; Howard 2002). In the 19th and early 20th centuries, these revolutions were seen as part of an ongoing historical task – to fulfill the unrealized potential of the French and American Revolutions. This vision manifested in numerous subsequent revolutions: the July Revolution of 1830 in France, the world revolution of 1848, the concept of a 'second American revolution' referring to the Civil War, Reconstruction, the Civil Rights Movement, and the New Deal; the Marxist view that the bourgeois revolution must be completed through a socialist revolution; and finally, the decolonization movements.

1.4. From Enlightenment to Industrial Society: The Shift in Understanding Human Subjectivity

The impoverishment of contemporary political culture and the narrowing of political orientations is not merely a matter of high-level politics. It reflects a deeper cultural shift in how we understand the reasons behind human behavior, a shift largely driven by the historical institutionalization of psychological and psychotherapeutic practices. This shift reframed human behavior through the lens of 'motivation'. Understanding the significance of this change is crucial for grasping the relationship between 'motivation' and political orientations. By exploring this connection, we can arrive at a more comprehensive understanding of 'motivation' itself. I hope that by linking political orientations – an area therapists may not typically focus on – to motivation, a more familiar topic, therapists can develop new approaches to addressing political orientations within therapy. To fully appreciate this shift, it is useful to contrast the contemporary view of human subjectivity with the Enlightenment conception, from which it significantly diverges.

The optimistic outlook of Enlightenment thought did not frame human subjectivity through theories of motivation. Instead, what drove human behavior was seen in its potential for *encompassing reasoning* – a synthesis of thinking and emotions – aimed at conceiving individual freedom in relation to societal freedom. Enlightenment thinkers believed that such reasoning could be achieved in various ways: for example, Kant saw the *public use of reason* as a means to transcend private interests, while Hegel and Rousseau emphasized the integration of individual interests within a collective or rational framework. For them, true freedom was realized through participation in a social order that reflected the common good. In other words, human behavior was understood historically as a dialectic between society as both a subjective and objective force. This dialectic embodied the utopian vision of the development of free bourgeois individuals, capable of independent reasoning, critical of authority, and driven by a desire for

collective freedom and cooperation. The later Enlightenment thinkers' views were preceded by an earlier shift from a feudal to a bourgeois understanding of subjectivity.

In the feudal era, the laws of reason were seen as a reflection of "the order of values that governed the human world. This order was fixed and objective, though individuals could be deficient in their understanding of it. By the High Middle Ages individuals were thought to be endowed with a rational will that enabled them to participate voluntarily in the higher order of the cosmos by controlling their passions" (Danziger 1997:43). By the High Middle Ages, individuals were thought to possess a rational will, enabling them to voluntarily participate in the higher order of the cosmos by controlling their passions. However, this conception of human subjectivity changed drastically with the rise of bourgeois society – the society of free commodity producers – emerging in the cities. Moral philosophers of the late 17th and 18th centuries recognized that the subjectivity underpinning commercial activities was culturally interpreted as driven by passion, often perceived as vices⁶ (Hume 1751; Locke 1689a; Mandeville 1714; Smith 1759). Success in this emerging bourgeois society demanded a revaluation of the feudal understanding of passions and reason, resulting in the transformation of passions into self-interest (Danziger 1997:36–50; Hirschman 1977). This shift was epitomized in Locke's philosophy of natural rights, grounded in the right of self-ownership. Locke famously argued, "every man has a *property* in his own *person*: This no body has any right to but himself. The *labour* of his body, and the *work* of his hands, we may say, are properly his" (Locke 1689b: §§ 27). Locke's philosophy reflected the historically new relationship between the individual and their world: the bond with the divine order was severed, and individuals were free to use their labor to produce and benefit from their work according to their self-interest. The individual became synonymous with self-consciousness, forming the conception of subjectivity on which Enlightenment radicals would build their utopia of the autonomous bourgeois individual.

Another shift demanded a re-evaluation of Enlightenment conceptions. The Industrial Revolution profoundly transformed society, and by the 1840s, large-scale economic crises emerged for the first time. The revolutions of 1848, driven by Enlightenment ideals, failed to deliver on the promises of earlier revolutions. The resulting political and economic crises, along with the failure of Enlightenment reasoning to address this new historical context, led to massive social fallout. Poverty, disease, and new social and political conflicts cast a long shadow over the emancipatory optimism of the Enlightenment, a shadow that lingers to this day. The dynamic interplay of society as a subjective and objective force seemed to shift into an alienated, objective totality, undermining subjective

⁶ E.J. Hundert (1994) notes in *The Enlightenment's Fable: Bernard Mandeville and the Discovery of Society* that for Bernard Mandeville, society functions as an assembly of self-interested individuals who are connected, not by shared civic responsibilities or moral integrity, but by fragile bonds rooted in envy, competition, and exploitation. Mandeville argued that individuals were often hypocritical, advocating strict moral principles while failing to practice them privately. He further observed that those denouncing vice often profited from the societal wealth generated by these very vices, such as luxury, gambling, and crime, which supported industries like law and the justice system.

capacities and rendering the Enlightenment utopia of the autonomous individual increasingly obsolete (Horkheimer 1947b; Stapelfeldt 2014). This alienation found resonance in the works of Kierkegaard, Nietzsche, and later Freud, who reflected on the contradictory condition of modern existence (Horkheimer and Adorno 1944). Though these thinkers did not abandon Enlightenment reasoning, their deep skepticism of its original optimism regarding individual reasoning as a driver of progress led them to seek its renewal. They proposed that emancipation was still possible but only as a profoundly individual process. While they accepted the potential for personal liberation, they rejected the collective forms of emancipation prevalent in their time – embodied by the labor movement and the socialist struggle – viewing them as inadequate for addressing the deeper, more personal dimensions of freedom.

The upheavals of the mid-19th century and the transformation of bourgeois society – from one of free commodity producers to an industrial mass society with an emerging proletariat – sparked diverse responses to the fundamentally altered social landscape. One prominent set of responses framed the problems of industrialized society as the ‘social question’, advocating for the expansion of state power to mediate between the needs of capital and labor. This marked a departure from earlier Enlightenment ideas, where the state's role was limited to protecting civil liberties and rights without interference in civil society. John Stuart Mill's (1848) *Principles of Political Economy*, which he revised continuously until his death in 1873, exemplified an attempt to reconcile Enlightenment principles with the challenges of an industrial society. Another key response was the rise of the social sciences, which sought to further extend state powers to manage the complexities of industrialized society (Wagner 2001, 2003).

From the mid-19th century onward, modern institutions such as the police, educational systems, and the welfare state began to take shape (Rueschemeyer and Skocpol 2017). These institutions' growing demand for skilled workers played a crucial role in the professionalization of the social sciences (Furner 2011; Wagner, Wittrock, and Whitley 1991). By the early 20th century, the progressivist movement had embraced the vision of scientifically managing industrialized society, which became the dominant articulation of the social question. Critiquing both classical liberalism and revolutionary socialism, the progressivists drew inspiration from thinkers like John Stuart Mill and from the emerging possibilities offered by the social sciences (Kloppenber 1986). This political vision gained momentum during the presidencies of Theodore Roosevelt and Woodrow Wilson and reached its culmination in Franklin D. Roosevelt's New Deal (Nugent 2010). The resulting profound restructuring of industrialized society, while evolving, endures to this day. Despite their deep ideological differences, the shift towards the scientific management of society through instrumental reasoning became a common thread linking fascism, Soviet-aligned states, and liberal Western democracies shaped by reformist social democracy, as well as the dominant model for peripheral states (Cutrone 2015b). In this broader context of social and institutional transformation, subjectivity increasingly emerged as a central concern, addressed by psychologists and psychotherapists.

1.5. Harnessing Human Subjectivity: The Contradictions of Motivation in Industrialized Society

These responses to the new problem of industrialized society led to a revaluation of subjectivity. In contrast to the earlier revolutionary transformation of passions into interests, efforts to address the problem of industrial society through state management resulted in a contradictory revaluation of subjectivity (further discussion on politics will follow). The expansion of the state into civil society, mediating the needs of capital and labor, necessitated both the development and control of subjectivity (Marvakis 2019). As Marvakis (2019, 31f.) notes, if this contradiction were to be formulated as a question, it “could be: How can individual productivity and creativity be developed *and* exploited (or even developed *to be* exploited)? Or, as a slogan: No *value appreciation* (*Wertschöpfung*) of the productive force ‘individuality,’ without its simultaneous *appreciative evaluation* (*Wertschätzung*)”.

Managing the discontents of industrial society – from both capital and labor – brought forth a range of technologies, such as psychology, designed to shape subjectivity into the productive force of individuality – whether as labor power, through the creation of new consumer needs and desires, or beyond. This constellation also gave rise to new authoritarian tendencies. These were not only expressed as a desire to protect privileges and control others to improve one’s own living standards, but also as a desire for the abdication of personal political responsibility in favor of formal procedures and professional politicians (Adorno and Horkheimer 1952; Cutrone 2013b; Horkheimer 1942).

The contradictory societal need to both develop and control subjectivity is most apparent in the problem of motivation. As a concept and field within psychology, ‘motivation’ gained prominence a century ago, emerging from the growing influence of psychoanalysis and gradually replacing it in certain domains. By the early 20th century, the phrase ‘to motivate’ became popular, particularly within the “rapidly expanding discourse of ‘social control’”. The specific reference of this term was at that time directed at the growing literature on the improvement of advertising and salesmanship, industrial efficiency, teaching practice, and personal advancement” (Danziger 1997:113). Psychologists and psychoanalysts, including Freud’s nephew Edward Bernays, became key players in this industry. They adopted its language and provided services that ranged from increasing labor’s industrial efficiency (Osterkamp 1975), public relations (Ewen 1996), and “investigations showing that the most effective kind of advertising was aimed at the creation of new ‘wants’” (Danziger 1997:113). The development of advertising was closely intertwined with the rise of crowd and mass psychology (Le Bon 1896; Trotter 1916), and new technologies of governance, including public relations and political propaganda (Bernays 1923, 1928; Lippmann 1922). As Bernays (1928) himself described in his book *Propaganda*, this new form of social control was based on the conscious manipulation of public opinion:

The conscious and intelligent manipulation of the organized habits and opinions of the masses is an important element in democratic society. Those who manipulate this unseen mechanism of society constitute an invisible government which is the true ruling power of our country. We are governed, our minds are molded, our tastes formed, our ideas suggested, largely by men we have never heard of. This is a logical result of the way in which our democratic society is organized. Vast numbers of human beings must cooperate in this manner if they are to live together as a smoothly functioning society. Our invisible governors are, in many cases, unaware of the identity of their fellow members in the inner cabinet. They govern us by their qualities of natural leadership, their ability to supply needed ideas and by their key position in the social structure. Whatever attitude one chooses to take toward this condition, it remains a fact that in almost every act of our daily lives, whether in the sphere of politics or business, in our social conduct or our ethical thinking, we are dominated by the relatively small number of persons — a trifling fraction of our hundred and twenty million — who understand the mental processes and social patterns of the masses. It is they who pull the wires which control the public mind, who harness old social forces and contrive new ways to bind and guide the world (Bernays 1928:9).

The establishment of psychology as a reliable tool of social control necessitated theoretical innovations to harness human subjectivity as an object of governance. The newly emerging psychology of motivation drew upon two key resources. First, 19th-century ideas about the relationship between consciousness and bodily movement led to the reduction of intentional consciousness to habitual behaviors, which could be influenced and modified through external training (Danziger 1997:115). This gradually transformed the concept of conscious intentionality into something controllable, with motives eventually replacing the concept of will in shaping behavior. Second, the metaphor of 'energy,' already prevalent in scientific discourse, became a powerful bridge "between the subjective experience of striving and 'motivation' as an object of control" (ibid.). Mental energy, whether conceived as drive, will, or instinct, could be "engineered like physical energy", and this idea became central to the emerging psychological framework of motivation (ibid., 116).

The psychology of motivation, closely linked to the emergence of 'personality'⁷ and 'attitudes' as psychological objects, extended the earlier

⁷"Historically, the big question about the category of 'personality' is how it ended up as a *psychological* category. It certainly did not start out that way. Prior to the nineteenth century it had been used primarily in theological, legal and ethical contexts. The theological context is the oldest, going back to mediaeval debates about the attributes of God and other spiritual beings.⁶ Here, 'personality' tends to be used mostly in the sense of a quality of personhood. Transfer to a legal context followed during the Renaissance. This was important for subsequent developments in that the category was now definitely humanized. In due course, natural right theorists were able to speak of a 'right to personality', and by the late eighteenth century the category had become established in the discourse of Continental European moral philosophy. Kant introduced a clear distinction between 'person' and 'personality', reserving the latter for the autonomous ethical subject. In the course of the nineteenth century, however, the tendency was to apply the term to the concrete individual, though often still in an ethical, not a psychological, context. 'Personality' was beginning to come down to earth. [...]"

It is unlikely that this would have been a matter of great consequence had it not been for another development that had occurred in France in the late nineteenth century. This was the *medicalization* of the category of 'personality'. The philosophical doctrines with which the term had become enmeshed were much despised by certain French doctors strongly committed to a naturalistic approach to human

interpretation of human behavior as driven by hypothetical intra-individual forces such as bodily needs and will (Danziger 1997:110–57). These assumptions about internal forces shaping behavior echoed and built upon the crisis of bourgeois subjectivity in industrialized society. The Enlightenment's encompassing reasoning, which represented human striving for freedom through individual and collective self-transformation, had been fragmented, reflecting the historical experience of society as an alienated, objective totality. Rooted in these developments, the term motivation “now signified abstract and generalizing claims about what *causes* any and all kinds of ‘behavior’”. This claimed knowledge was sometimes presented as relevant to specific fields of practice (education, industry, etc.), or even as a general ethos of a social and human engineering” (Nissen 2023:36).

The utopian promise of this new psychology was to unlock the mysteries of human behavior, offering explanations “not just for the ‘how’ but for the ‘why’ of all human activity” (Danziger 1997:110). This approach presented the prospect of a technology for turning human subjectivity into an object of governance. By disguising its normative standards, it elevated “one set of historically contingent conventions to the status of universal human needs not only emphasized their importance for the society in which they originated but provided a rationale for proselytizing efforts elsewhere” (Danziger 1997:123). The feasibility of such a technology was rooted in the “more general, and historically more deeply rooted, belief that the reasons for human conduct were to be looked for [...] in hypothetical forces that inhabited individuals” (ibid.).

In developing an emancipatory theory of motivation, Ute Osterkamp (1975) identified a fundamental contradiction in the problem of ‘motivation’ that the emerging psychological technologies sought to address. This contradiction was later echoed by Kurt Danziger (1997), though without reference to Osterkamp’s work: “‘Motivation’ is whether, how much and why people want to do what they are required to do; it is subjectivity appropriated as the object of governance, primarily in industry and education; but – as an object of a putatively neutral psychological science – it is conceptualized as if this framing power relation were irrelevant” (Nissen 2019:473). Psychological technologies aimed at regulating motivation have since become central to counseling and psychotherapy, with their purpose often being the cultivation of meta-motivation – the motivation to change one’s motivation. Examples of this include helping clients find new ways to express their ‘needs’ or to embrace motives for living more fully, as opposed to perpetuating ‘symptoms’ or ‘problematic’ behavior. Techniques like motivational interviewing, goal setting, or interpreting symptoms

problems. For them, an individual's personality was no spiritual principle but a natural, embodied entity as much prone to disease as other such entities. Of course, insofar as it was subject to disease personality became an appropriate object for medical, rather than philosophical, attention. By 1885 Ribot had published the first authoritative text on ‘The Diseases of the Personality’. Cases of what had previously been known as ‘alternating consciousness’ played a key role in these developments. They now became cases of ‘alternating personality’, a reformulation adopted by William James in his widely read *Principles of Psychology* of 1890. A warrant for this transformation could be obtained from the Lockean tradition of equating the individual self with consciousness of self [...]. Another prominent figure who played a role in bringing the French medical usage of ‘personality’ to America was Morton Prince (1905) whose early studies of multiple personality were disseminated very widely” (Danziger 1997:124).

through psychotherapeutic theories don't simply describe needs—they reinterpret human subjectivity through implicit standards. In doing so, they frame and produce needs in the first place, in accordance with the standards embedded in psychological technologies.

The standardization of human needs was not confined to psychological technologies and practices; it also reshaped our cultural understanding of society as subjective force. Concepts such as interests, motives, morals, values, passions, needs, desires, drives, preferences, reasons, intentions, and will became associated with an inner world of 'psychological' forces or individual attributes, governed by their own laws and disconnected from society as a subjective problem of orientation. This narrowing of our collective understanding of human subjectivity parallels the loss of the revolutionary spirit in political culture. The limited framing of motivation is insufficient to capture the desire for freedom expressed by Enlightenment radicals, the 'motivation' of subsequent emancipatory movements, or the impulses behind their reactionary counterparts.

We are witnessing a historical regression from the expansive understanding of political orientations *and* motivation embodied in Enlightenment reasoning, where individual freedom was only conceivable in relation to societal freedom, to a narrower view that increasingly locates problems within the subjectivity of individuals or groups. Ashley Frawley (2024) argues that the persistent political failure to bridge the gap between 'what is' and 'what ought to be' in society has led to the naturalization of unresolved societal issues as aspects of human subjectivity. This failure has reinforced a narrative in which human subjectivity is viewed as increasingly inadequate to address and overcome entrenched societal problems.

However, it is crucial not to stop at merely describing the impoverishment of our cultural understanding of subjectivity, as doing so would totalize this development and eclipse the latent emancipatory possibilities or tendencies. After all, the precondition for theory to hold emancipatory value is to move beyond the immediacy of the present. While limiting standards of psychological technologies represent the prevailing historical tendency, they cannot fully dominate human strivings and understandings, because the problem of motivation is rooted in a real contradiction—subjectivity must be developed and controlled. The “societalized/cultivated [vergesellschaftete] production of individuality, subjectivity and selfhood continues to evolve in ever new contradictory forms that matter in complex and unstable ways depending on local conditions and force relations” (Nissen 2019:479).

1.6. Productive Needs and the Desire for Agency

Critical psychologists like Ute Osterkamp (1975, 1976), Morten Nissen (2019, 2023), and Athanasios Marvakis (2019, 2022, in press) have suggested the hypothesis that these contradictory historical developments “may include latencies” for an emancipatory “societalization / cultivation [Vergesellschaftung]” (Nissen 2019:478). Nissen argues that such a project must “look in the rear-view

mirror to identify, in the terms of Ernst Bloch (1995), tendencies as latencies it might actualize, rather than imagine itself to be the first or the only alternative to an oppressive or imbecile totality. To Bloch, this is the difference between concrete or abstract utopia – hopes that either articulate and develop real possibilities, or revert and thus mirror a given state of affairs by sanctifying an abstraction that signifies a mere wish for alternatives” (Nissen 2023:35).

Retracing historical tendencies should not be seen as an attempt to recover ready-made solutions for society’s problems – history has rendered these obsolete, such as the original Enlightenment vision – nor as a teleological claim to historical truth. Rather, it should be understood as a theoretical engagement with history, aiming to clarify and develop perspectives for moving beyond accumulated historical problems that are perpetuated by the present limitations of our emancipatory understanding of subjectivity. In other words, this project seeks to revalue subjectivity in its potential for self-determination, grounded in the real possibilities of history, rather than as a mere abstract utopia.

The 20th century saw a wide variety of new concepts of human needs, recognizing individuals as increasingly self-determining, , though primarily “to harness their subjectivity for purposes that were not to be questioned” (Nissen 2019:473). This contradictory tendency – driven by capital’s societal need to acknowledge human subjectivity as self-determining (Marvakis 2019) – led Osterkamp (1975, 1976), to suggest that the inherent contradiction within the problem of motivation “could be overcome by siding with the subjects and recognizing their need for participation in collective self-determination as true and expansive agency” (Nissen 2019:473). For Osterkamp, the unique nature of human needs is encapsulated in the need to engage in collective self-determination, a concept she referred to as productive needs.

Building on evolutionary anthropology and Leontiev’s cultural historical activity theory, Osterkamp (1975) linked the development of productive needs to the broader context of anthropogenesis⁸. She suggested that human social formations historically distinguished themselves from animal societies through the advanced use and collective production of tools. These tools were not only created for immediate use but were also stored, refined, and maintained, fostering a shared intentionality centered on pre-emptive collective care. This collective activity expanded human agency, enabling the creation of symbolic artefacts and leading to the development of culture. Through participation in pre-emptive collective care, humans extended their capacities beyond natural limitations, fostering new forms of agency and generating new needs. In this social formation, needs were addressed collectively, and participation in collective care itself spurred the emergence of additional needs, creating a dynamic interplay between human agency and societal development.

While Osterkamp distinguished productive needs from the conventional understanding of needs as culturally *pregiven* sets of basic and higher needs, her

⁸Osterkamp’s conception of humanity’s societal nature was further developed and systematized by Klaus Holzkamp (1983). In a recent analysis, Michael Zander (Zander in press) discusses the work of developmental psychologist and evolutionary anthropologist Michael Tomasello (Tomasello 2019), concluding that contemporary research on anthropogenesis continues to align with key insights from these earlier Critical Psychology theories.

theory does not simply classify motives in line with established theories of motivation, but offers a fundamentally different framework for understanding them. The theory of productive needs – or, in Nissen’s terms, the desire to expand agency – focuses on the production of needs by fundamentally *detaching* the desire for agency from socialization conceived as adaptation or internalization of societally produced motives or needs (Nissen 2023:130). This theoretical detachment is achieved by linking the emergence of motivation to participation in practices through which motives are cultivated. In other words, the theory of the desire for agency conceptualizes the “personal integration of needs [...] as *individuated cultivation*” (Nissen 2023:126). This shift in perspective is crucial because it allows for addressing the problem of meta-motivation – the emergence of motives to change one’s motivation, such as altering one’s political orientation – without reducing subjects to objects of societal formation or reducing political motives to psychological events (see Adorno 2019). Instead, it views subjects as active participants in personal and collective self-transformation. Emerging “motives that ‘subjectivize’ objects, goals and hopes based on ‘productive needs’ for agency respond to the dynamic emergence of those objects, goals and hopes through *participation* in their emergence, in the constitution of the activities defined and redefined by them” (Nissen 2019:488).

The theory of the desire for agency holds significant implications for understanding far-right orientations, as well as political orientations in general. While I will only briefly address some of these points here, part two of this work further explore aspects of the theory. In future publications, I hope to delve deeper into topics such as authoritarianism – specifically the abdication of political responsibility – by drawing connections to Freudo-Marxism and the Critical Theory of Adorno and Horkheimer. Before proceeding, however, it is necessary to examine how the theory intertwines the concepts of motivation and practice in the framework of the desire for agency. In doing so, we will explore the relationship between individual agency and collective societal transformation, along with the desires driving participation in it.

The comprehensive form of motivation, understood as “as the anticipation of increased agency through participation” expresses the utopian possibility of the self-transformation of collective pre-emptive care to expand human agency as individual and collective freedom (Nissen 2023:128). Such an emancipatory transformation requires the anticipation of real, yet not fully actualized historical possibilities – as opposed to an abstract wish for alternatives. This anticipation of real historical possibilities necessitates some form of symbolic representation. While this does not need to be a theoretical articulation of the Enlightenment radicals’ societal critique, it must be *affectively* rooted in what Kant referred to as ‘public reasoning’, or more broadly, in a cultural context that fosters the “production of hope”. This hope is driven by “ideologically defined projects” and “emergent communities of hope” that embody real, though unrealized, historical tendencies (Nissen 2019:493). However, this comprehensive form of motivation is rare, and even when it does emerge, it is never in a ‘pure’ form. The desire for agency in industrialized society is inherently contradictory and must manifest in contradictory ways. Moreover, every attempt to expand agency must contain

adaptive elements; without adaptation, such attempts would be mere fantasies, ungrounded in the current reality. The dialectical relationship between adaptation and transformation of reality is always intertwined (Marvakis 2019).

However, even in its ‘impure’ and contradictory form, the comprehensive desire for agency is rarely decisive. In its more common, prevailing form, the defensive aspect takes precedence “where we participate the way we do to *avoid a reduction* of our relative agency (or of the relative fulfilment of other needs), that is, because of *coercion*” (Nissen 2023:128). Despite this, the defensive form remains tied to its comprehensive counterpart, which continues to push for change, “spurred by ever renewed reminders that self-restriction may temporarily provide safety, but undermine it on the longer run, *because it implies renouncing* (participating in) *the control of its own extension*” (ibid.). By reinterpreting Freud, Osterkamp addresses the dynamic tension between the comprehensive and defensive desires for agency, using concepts such as denial and repression. As Nissen (ibid.) explains, the “desire for expanding agency is inescapable, yet provokes anxiety and must be actively counteracted”. In psychoanalytic terms, this counteraction corresponds to what Freud identified as repression. However, in Osterkamp's theory, what Freud considered ‘primitive’ drives are instead understood as desires that push for expanded agency but simultaneously threaten security by undermining submission to existing cultural norms and structures of power.

As previously discussed in relation to the comprehensive form of motivation, the anticipatory aspect of the desire for agency must be anchored in collective projects. This principle also applies to the restrictive or defensive aspects of the desire for agency, which are similarly anchored in ideologically defined projects that drive the cultural production of hope. However, the key question is not simply whether the desire for agency is anchored, but how it is anchored and in what types of projects.

1.7. The Desire for Agency and Political Orientations

As we have already explored, the desire for agency is rooted in the collective production of symbolic representations tied to the practice of pre-emptive care. These representations of ‘society as a whole’ are necessary for individual subjects to align themselves with and anticipate societal relations in order to expand or preserve their agency. I have described how these symbolic representations are key components of the subjective knowledge expressed in political orientations. It is essential to remember that these representations are not the same as the social theories produced by the social sciences. The cultural production of hope is much broader, and for such hopes to be meaningful, they must contain an affective dimension that anchors the anticipatory aspect of the desire for agency. This affective dimension is often obscured in social science theories because they do not account for the underlying desires for agency of social scientists themselves. For example, people may be drawn to the social sciences by the hope for a stable livelihood that allows them to pursue

intellectual interests and develop their subjective capacities, or by the promise of a self-determined intellectual life.

The affective anticipation of both expanded and defensive aspects of agency is always anchored in the cultural production of hope. For ideological projects “to be motivating, be they ever soconvincing on the collective level, they must also offer – at least potentially – meaningful participation for the person motivated” (Nissen 2019:493). However, the ideological projects that produce these hopes do not necessarily embody a concrete utopia grounded in real, yet unactualized, historical possibilities. In the case of the restrictive or defensive quality, the affective anticipation is often rooted in hopes of preserving agency or preventing its reduction. This analytic distinction should not be mistaken for the reality of ideological projects, which, as always, remain inherently contradictory in nature.

While political parties and tendencies play a significant role in the cultural production of hope, ideological projects extend far beyond these examples. They encompass a wide range of aspirations, such as visions for societal transformation and knowledge articulated by the social sciences, dreams of self-transformation and insight in psychology and psychotherapy, finding meaning in family, love, and friendships, or pursuing intellectual satisfaction and critical perspectives in philosophy. Additionally, projects of hope are seen in the appreciation of beauty and aesthetics in art, seeking comfort and guidance in religion, enjoying consumer culture, striving for a better life through employment or entrepreneurship, and seeking social security through welfare services. Some ideological projects are “historically variable”, while others are “more overarching and stable”, particularly when connected “to professions, nation-states, social movements, or (e.g. religious, pedagogical etc.) institutions of everyday life, and insofar as they deal with pervasive material constraints that appear in different ways through economy, health, military, climate, etc.” (Nissen 2019:493).

Ideological projects often conflict with one another over the meanings they provide for individuals to engage in them. These conflicts can arise both within and between projects. In the latter case, the conflict centers on the practices themselves, as ideological projects compete for the ‘ownership of social problems’ (Gusfield 1989). For example, the social sciences and socialism have historically contested the solution to the ‘social question’ (Wagner 2001). In the former case, conflict involves the standards of participation that define those projects. For instance, psychotherapy establishes detailed standards regarding what constitutes psychotherapy, including what topics can and should be addressed and the prohibition against physical contact with patients (except in specific forms like body psychotherapy). In contrast, manual therapy is defined by standards focusing on the physical manipulation of muscles and joints, with less emphasis on the conversational aspects of therapist-patient interaction.

The history of psychology provides a compelling example of conflicts both between and within ideological projects, revealing the complex relationships among them. Psychologists were not always “recognized indisputably as experts in institutional fields” that we now associate with psychology (Nissen 2023:75).

Addressing the problem of the far-right or fascism was, in the first half of the 20th century, primarily a matter of (mass) politics. Political culture was focused on collective movements rather than the personal political orientations of individuals. The rise of psychology and its growing recognition of *individual* subjectivity laid the groundwork for far-right orientations to emerge as issues within the realm of psychological expertise: as problems of *individual* or *personal* political orientations.

In claiming ownership of social problems, psychologists have historically been (and still are) in competition with other “professions such as teachers, social workers, organizational consultants, and psychiatrists”, all of whom drew “on academic psychologies independently of the profession and training of psychologists” (Nissen 2023:75). Additionally, within certain fields of practice, conflicts arose within these ideological projects themselves. In counselling and psychotherapy, “alternative networks and infrastructures provided competing ‘disciplines’, both in terms of academic societies and professional training” (ibid.). For example, psychoanalytic societies dominated the mid-20th century but later networks focused on approaches like “motivational interviewing, mindfulness, systemic or narrative therapy, etc., [which] would offer standards and communities that mattered more to professionals” than their initial academic training (ibid.).

The nature of conflictual relationships between and within ideological projects varies significantly. In some cases, it may be more appropriate to describe these relationships as tensions rather than outright conflicts. For instance, starting a new family involves navigating the tension between the cultural values of the families of origin and the aspirations of the new family unit. Additionally, the couple must balance the dynamics of their life as a couple with their evolving roles within the family. In contrast, the political opposition between the Left and Right is more accurately characterized as a historical antagonism, reflecting deeper ideological and structural conflicts (Bobbio 1996; Kołakowski 1969).

1.8. Therapy with Far-Right Clients: The Challenge of Political Orientations

The conflictual relationship between and within ideological projects is especially relevant when encountering far-right clients in therapy. On one hand, there is often a conflict within the therapeutic process itself, as the humanistic values of the therapist clash with the far-right views of the client. On the other hand, a broader conflict exists between the collective projects of psychotherapy and far-right politics. Both offer drastically different worldviews and approaches to navigating societal reality, and their competing offers for rendering life meaningful are in direct conflict. Recognizing this clash between ideological projects helps explain why far-right clients might reject the established standards for what constitutes meaningful participation in therapy. For example, far-right clients might insist on discussing political issues in group therapy, making sexist or racist remarks, promoting conspiracy theories, or expressing grievances about

perceived political, moral, or cultural decline. It is crucial to understand these behaviors in the context of a broader rejection of other ideological projects and societal institutions (Harder and Opratko 2022; Opratko et al. 2021). Without this context, therapists are likely to reify the conflict between ideological projects, misinterpreting it as a personal or psychological failure on the part of the client to engage meaningfully in the therapeutic process.

Rather than reifying the conflict or using therapeutic techniques to manipulate far-right clients into complying with the established standards for participation in therapy, we should instead inquire why these clients find the far-right's ideological project more compelling for their desire for agency than participation in psychotherapy. After all, this is what they communicate to us. However, in posing such questions – both to ourselves and to the clients – we cannot assume that therapy necessarily offers a better solution from the client's perspective. Instead, we should strive for an open inquiry, focusing on self-reflection – both of the client and ourselves – regarding the motives behind supporting specific ideological projects. If this approach seems paradoxical, it is likely due to cultural representations of far-right radicals as lacking intellectual capacity, often linked to the concept of an 'authoritarian personality.' Yet the relevant question is not whether clients 'are' or 'are not' authoritarian, but whether the therapeutic encounter fosters authoritarian needs. This occurs when the cultivation of the desire for agency is constrained to a limited set of needs defined by the standards of psychological theories and practices.

Despite cultural representations of far-right radicals, being "motivated for something" implies always "reflecting and enjoying that 'something' as worth pursuing. This reflexivity is an ongoing collective process of at once framing and affective tuning; it is immanent to any activity, and not reserved for or limited to individuals' thoughts or feelings" (Nissen 2019:487). An inquiry focused on self-reflexivity must avoid conflating far-right clients with far-right movements or our symbolic interpretations of them, as well as our assumptions about the societal conditions that may benefit such movements. The same caution applies to not identify actions and motives. For instance, attributing actions associated with the far right, such as acts of racism, to a singular and same kind of (racist) motive⁹. What an action represents culturally must not be conflated with the *subjective* motives inspiring these actions.

⁹ Adorno remarked critically regarding antisemitism, quoting Shlomo Bergman's *Methodological Errors in the Study of Anti-Semitism* "that 'there is no reason for assuming that a man who physically assaults Jews is more anti-semitic than one who declaims against them at street-corners: he is merely more violent. Similarly, the disaster which results from an anti-Jewish act in no way reflects the degree of anti-semitism which inspires it. The firing of a synagogue, for instance, may be far more tragic than the circulation of a pamphlet, but this does not prove that its instigator is more anti-semitic. He may equally well be inspired by mere mob hysteria or opportunist ambition. Yet in the majority of modern treatments of the subject, degrees of violence and disaster are blithely identified with degrees of anti-semitism. We must teach ourselves to realize that every act from which Jews suffer is not necessarily and automatically anti-semitic'. These critical remarks should be strongly emphasized. Not only do we have to carefully avoid a short-circuit between theory and practice which could easily lead us to fight symptoms and neglect essentials, but the interconnection between anti-semitic manifestations and the problem of discrimination as it has arisen from the powerful example of Hitler-Germany, is highly dubious. There was no immediate relationship between spontaneous anti-semitic outbreaks and the extermination policy of the Nazis" (Adorno 2019:xlvi). Marvakis (Marvakis 1996:75–77) made a similar

Furthermore, the theory of the desire for agency advises us not to view this inquiry, which aims at differentiating between actions and motives, as a search for pre-existing reasons for clients joining or supporting the far right. Instead, we should approach it as a process of cultivating these reasons or motives. I argue that cultivating these *individual* reasons or motives advances the political autonomy of the subject, which opposes the authoritarian tendencies that fuel far-right politics. Conversely, if therapy fails to achieve this, it risks contributing to the authoritarian condition by shaping individual subjects ‘from above’ – for example, by fostering a culture that reduces individual racist slurs to mere reflections of societal trends or far-right movements, thus obscuring personal responsibility; or by encouraging clients to replace their far-right orientations with preestablished cultural norms.

When asking far-right clients what they find compelling about a slogan they have recently used, such as ‘refugees are taking our jobs and housing,’ they are likely to respond with another propaganda phrase like ‘our people must come first; I want to protect the nation, the folk, etc.’ Right-wing radicals may believe these slogans represent their true reasons for supporting far-right ideologies, possibly telling themselves heroic stories about their (future) contribution to the ‘rebirth of the nation’ or ‘redeeming the folk from its enemies.’ However, we should not be sidetracked by such surface-level answers but should continue the inquiry into *individual* motives. This *practice* holds the potential to *cultivate* and strengthen these motives, which otherwise risk being eclipsed by the far-right slogans and the standards they express.

Far-right clients only begin to cultivate motives that align with far-right slogans after engaging in activities that support these ideologies – such as consuming far-right internet propaganda or attending far-right events. Yet, the original hopes that drew them into these activities were likely different. These hopes were not initially rooted in the standards of far-right ideological projects but stemmed from their everyday life, reflecting *personal* reasons for why supporting the far-right seemed to offer *them* a way to expand or preserve their agency. These initial motives were likely more profane and self-serving than the heroic narratives they now adopt, since, at least to some extent, their decision to support the far-right would have been opportunistic (Osterkamp 1982) – even if only in terms of seizing the far-right’s promise of salvation from the alienated experience of modern life. However, these opportunistic hopes ceased to be cultivated as motives once the client adopted far-right orientations because they conflicted with the ideological standards of far-right projects, which demand unselfish or even heroic participation. Consequently, these standards shape the development of motives to align with such ideals.

Conversely, a similar transformation occurs when far-right clients signal to their therapists that they have either stopped supporting the far-right or intend to do so. In these cases, it is equally important not to limit the cultivation of their desire for agency to the pre-established standards of ‘democratic’ projects, such

argument, analyzing how in Nazi Germany antisemitism became so ingrained in societal processes that individual antisemitic motives became more and more insignificant. This led to a demoralization of subjective responsibility. I have elaborated on this theme of demoralization in part three.

as the aspiration to become a ‘good citizen.’ Instead, therapy should focus on nurturing the client’s individual motives for revising their political orientation (see last chapter). In other words, the goal should be to foster the development of critical, *individual* political orientations that are not merely aligned or striving to become identical with the standards of any given ideological project. This process requires self-reflection on which needs should be cultivated, not from a purely philosophical standpoint, but grounded in the everyday conduct of life. Such reflection must also address the societal phenomenon of opportunism. Rather than condemning opportunistic motives or the identification with ideological projects as unethical – a perspective rooted in ideological projects themselves – opportunism should be approached with a critical awareness of the unresolved socio-historical problem of emancipation. This perspective must be able to recognize the subjective necessity of opportunism within the current societal reality, while simultaneously understanding it as a false necessity (see chapter 2 and 4).

Making opportunistic motives for joining ideological projects invisible by transforming them into motives that align with the standards such projects uphold – leading to an uncritical identification with them – is not unique to the far-right. This possibility stems from the affective anticipation of participating in collective projects, regardless of their political orientation. Creative “accomplishments, insights, necessity or political strength (etc.) of a collective activity can be experienced as joyful and engaging (or disappointing, boring, terrifying, etc.) before the various individual implications are fully reflected and felt. Sometimes, this ‘seduction’ turns out problematic or even leads to self-deceit; sometimes, it is the birth, the communal proto-form, of new individual motives” (Nissen 2019:487f).

1.9. Contradictory Movements: Capitalism, Alienation, and Emancipatory Struggles

The emergence of new motives is always contradictory, coevolving with the societal “production of individuality, subjectivity and selfhood [...] in ever new contradictory forms that matter in complex and unstable ways depending on local conditions and force relations” (Nissen 2019:479). On one hand, this process leads to the dissolution of life into the standards of industrialized society, which erodes subjective capacities to articulate the problem of society, now experienced as an alienated objective totality. The “all-pervading trait of social ‘alienation’ largely reflects the nature of a commodity economy in which” humans are mere “producer and consumer of goods” but not “the subject of [...] their] society” (Adorno 2019:li). On the other hand, industrialized society is a collective praxis in constant self-transformation, continuously incited to transcend itself. This process produces new forms of life while simultaneously dismantling others, driven by the contradiction that collective societal praxis “keeps transforming and challenging the life that it [...] reassert[s] repeatedly as its core concern. But each time, this is a wager. There is no guarantee that evolving practices can be

resituated in life as meaningful, and there is no standpoint of ‘bare life’ outside praxis from which we can judge them” (Nissen 2019:497).

Understanding this contradiction is crucial, as it represents a subjective problem of orientation of the open and problematic kind. It reflects the problem of society, which cannot be approached from a detached or neutral standpoint but must be addressed within its historical context. History provides us with the perspectives and standpoints of political orientations, and the interpretation of these orientations is always normative (Marvakis 1996:65–78). Any interpretation, including the one suggested here, should be evaluated based on its ethical and political implications in raising and addressing the problem of society. The perspective outlined so far shows how psychological technologies historically emerged from “industrial and institutional standardizations of activities that people could (should, must!) be motivated for” (Nissen 2019:487). Therapy and psychology compete with other ideological projects in making life meaningful within an otherwise opaque, alienated societal reality produced and transformed by industrialized society.

Even if the *value appreciation* or *appreciative evaluation* of subjectivity (see 1.5.), embodied in psychological practices, is largely instrumentalized to serve industrial standards in developing individuality as a productive force, this does not mean that the broader historical tendency to value subjectivity in the form of individuality is wrong from an emancipatory perspective. Rather, these standards simultaneously undermine and propel the development of new forms subjectivity and subjective capacities. Political struggles for the recognition of waged labor, women, sexual minorities, racialized, and Indigenous populations have always reflected and sometimes revealed new possibilities within the contradictory developments brought about by industrialized society (D’Emilio 1983; Mitchell 1966). As Nissen (2019:483) argues, each of these struggles is, potentially, a struggle to transform society as a whole; “‘society’, as a potentially self-reflecting agent and arena of struggles for recognition (i.e. a state), becomes visible”. However, this potential is rarely fully articulated in these struggles, which are still largely driven by pre-industrial conceptions of the problem of society (Tamás 2006).

The following chapters will delve into this topic further, proposing that emancipation must be understood as an unresolved socio-historical problem. First, by examining the historical failures of emancipatory movements, and second, by analyzing the success of the far-right as a dialectical response to these failures, particularly in articulating compelling answers to the problem of an alienated objective totality. This section continues to explore implications for therapeutic practice.
