I propose that understanding emancipatory struggles – and their far-right, anti-emancipatory counterparts – extends beyond high-level politics and is also a crucial matter for psychotherapy, both within and outside psychological practices. At stake is the fundamental question of whether therapeutic practices contribute to population control or aid in clarifying the problem of society and its political resolution by fostering the development of critical consciousness. Both outcomes are possible, and they are dialectically intertwined within the

contradictions of modern society. As Adorno argued in his 1950 *Remarks on the Authoritarian Personality*, the contradictions inherent in modern industrial society contain an emancipatory potential, which stands as the *intrinsic* antithesis to fascism:

Modern society is a mass society. This does not merely refer to the tremendous quantitative increase of the world population during the industrial era. There are also qualitative connotations. The whole pattern of present-day culture is moulded in such a way that it takes care of the masses by ‘integrating’ them into standardized forms of life which are built after the model of industrial mass production, and by actually or vicariously satisfying their wants and needs. Today’s huge increase of social control over the masses equals the pressure potentially exercised by the masses over the social structure. [...] They are manipulated as objects of all kinds of social organizations, including their own, because their being mere objects has become problematic since they reached—through technical civilization—a stage of enlightenment which would enable them to become true subjects if the control mechanisms would be superseded at any point. Even repression in its most ruthless form had to reckon with the oppressed masses. [...] Nazi economics and politics did not simply represent the interests of the ruling group; they maintained traits of compromise. The masses are incessantly moulded from above, they must be moulded, if they are to be kept at bay. The overwhelming machinery of propaganda and cultural industry evidences the necessity of this apparatus for the perpetuation of a set-up the potentialities of which have outgrown the status quo. Since this potential is also the potential of effective resistance against the fascist trend, it is imperative to study the mentality of those [including us] who are at the receiver’s end of today’s social dynamics. We must study them [and also ourselves] not only because they [and we] reflect these dynamics, but above all because they [and we] are the latter’s intrinsic anti-thesis (Adorno 2019:lxv–lxvi).

The potential resistance against being moulded ‘from above’ echoes Marx’s (1852) dialectical understanding of modern mass politics, first developed in his analysis of the 1848 Revolutions in France and their political aftermath (see chapters 4 and 6). Advancing this potential refers to the cultivation of political autonomy, expressed through the development of orientations among both the masses and individuals desiring political self-representation. While this task can only be fully realized through mass politics (see chapters 2 and 4), therapy – after all an institution of civil society – can still contribute meaningfully to this goal. For therapy and psychology to foster this potential for political self-representation, they must adopt a “perspective of social movements ‘from below’”, that begins “with the *autonomy* of subjectivity and aims at transcending subjects’ mere *functionality*”, as dictated by the preexisting standards of ideological projects ‘from above’ (Marvakis 2019:35). However, modern social movements ‘from below’ are neither inherently resistant to being ‘moulded from above’ nor inertly emancipatory, as the history of fascism has shown. Historic fascism, after all, was both a mass movement from below and a political project

imposed from above, distinguishable by the destructive dynamic it unleashed¹⁰ (Renton 2020). Following Marx's insights, modern social movements 'from below' – whether aimed at emancipation or not – are inherently intertwined with societal transformations 'from above,' which is what ultimately defines them as modern. As Marx emphasized, the character of modern emancipatory struggles, particularly in industrialized societies, is fundamentally different from those of earlier eras.

As the philosopher Gáspár Miklós Tamás notes, in "most of history, humanity was not thought to have been co-extensive with humankind. Women, slaves, foreigners, children were almost invariably excluded everywhere [...]. These and many others were not supposed to share with the rest the prerogatives of full-fledged human beings" (Tamás 2006:242). In precapitalist societies, the struggles of the oppressed were defined by an external relationship to their oppressors, with clear and rigid lines of opposition. The oppressed were not considered responsible for their oppression; they were born into a hereditary system of privileges and power that structured domination. The purpose of society was not to meet the desires or needs of all people but rather to serve only the interests of those deemed full-fledged humans, often with divine or inherited 'divine' authority.

In contrast, the modern industrialized society of capital embodies both oppression and liberation, driving "economic and intellectual growth, imagination, waste, [...] destruction, destitution" (Tamás 2006:230). Its development allows us, at least potentially, a critical view of history¹¹ – one in which the purpose of society is indeed pre-emptive care, though this purpose has been obscured both in the past and continues to be disguised today (Adorno 2003). Capitalism "helps us to know because it is unable to sustain illusions, especially naturalistic and religious illusions. It liberates subjects from their traditional rootedness (which was presented to them by the *ancien régime* as 'natural') only to hurl them onto the labour market where their productive-creative essence reveals itself to be disposable, replaceable, dependent on demand" (Tamás 2006:230). Class in modern society is not hereditary, and power and privilege are far more fluid than in previous systems. What "human beings are, is contingent or stochastic; there is no way in which they are *as such*, in themselves. Their [...] being] is limited by the permanent re-evaluation of the market and by the transient historicity of everything, determined by – among other contingent factors – random developments in science and technology" (ibid.).

¹⁰A key distinction between fascism and other far-right movements lies in its specific dynamic (Renton 2019, 2020, 2024). Fascist mass movements become complicit with their leaders through acts of violence and crime, creating a bond of dependence. The masses, having committed atrocities, rely on their leaders to gain more power to protect them from the consequences of their actions, particularly from what they perceive as their 'enemies.' This creates a dangerous cycle of escalating violence and destruction, exemplified most horrifically by National Socialism.

¹¹Marvakis (2019) argues that the neoliberal transformation of capitalism, through the advancement of individuality as a productive force and the creation of new historical forms of agency, has brought previously underdeveloped aspects of subjectivity to light. A dialectical reflection on this historical shift deepens our critical understanding of the contradictions inherent in motivation, offering a more nuanced theoretical comprehension of capital's implicit potential for freedom.

Moreover, in modern society, it is not only the ‘oppressed’ who are alienated from power – so too are their ‘masters,’ who lack the capacity for direct domination. Their relationship is not external but inherently contradictory. Labor “itself has become a moment of capital“ (Marx 1857:282); thus, the “working class is not situated outside capitalism. It embodies capitalism as much as the bourgeoisie does” (Tamás 2006:248). The discontents arising from modern society, along with the unfulfilled needs and desires it generates, do not offer a straightforward path to emancipation. Instead, they also fuel the subjective drive for transformation and renewal within the system. Consequently, modern emancipatory movements are not external to the conditions they seek to overturn; they emerge from within, symptomatic of the conditions of industrialized society they aim to challenge. (Cutrone 2006). Even as they strive to transcend these conditions, they often reproduce them in new forms. This contradiction led Marx to recognize the necessity of dialectics in the theoretical and practical understanding of modern emancipatory movements (Cutrone 2021b).

Conclusion: The Post-Psychological Perspective

Translating the dialectical perspective on social movements ‘from below’ and transformations from ‘above’ to therapy involves adopting what Nissen terms a post-psychological approach, recognizing that psychological and psychotherapeutic theories are not merely insufficient to grasp the motives behind far-right political orientations but, in fact, contribute to the personalizing and psychologizing of these phenomena. A post-psychological perspective must be capable of acknowledging that psychology and therapy are just two of many collective ideological projects vying for influence in shaping societal and individual self-transformation. Motivation is anchored in both collective projects and individual life, and these are deeply intertwined with (and invested in) historical developments. The importance of this historical perspective has been undervalued in certain strands of Critical Psychology, leading to “endlessly repeated issue of how exactly to relate these ‘inner’ realities” to “social practice; and within many cases, eventually, tends to reduce the whole issue of historically situated social practice, struggles and contradictions, to empty catchphrases” (Nissen 2019:495).

The theories of political orientation and the desire for agency meet the outlined criteria. However, I suggest that their primary advantage for this investigation lies in two key aspects. First, they are not tied to any specific therapeutic school, making them potentially appealing to therapists from diverse backgrounds. Second, they view “participation itself” (whether of individuals in collective subjects, ideological projects, or the broader praxis of society) “as *implying* critique” (Nissen 2019:490). The desire for agency (or ‘productive needs’), understood as the need for “participating in preemptive collective control of life conditions, spur a development, and this includes a reflection and transformation, of the subject, of the particular practice, of the collective and of culture in general, in specific constellations [...]”. ‘Productive needs’ make me ask

‘is this activity worth our efforts?’, and ‘is my participation worth my efforts (and the efforts of those who help me)?’ – but also ‘is this who I want to be?’ In all these aspects, our ways of asking and answering are developed in socio-cultural forms” (Nissen 2019:490f). Developing these questions and responses in socio-cultural contexts like therapy helps counter the industrialized society’s tendency to impose standards ‘from above’, dissolving life into standards. When situated within the subjective desire for agency, these standards can be used as means of orientation to relate willfully to our actions and our investment in collective projects.

The development of critical consciousness as an implicit potential of participation holds significant implications for clinical practices. These implications deserve extensive and thorough discussion, which is beyond the scope of this text. For now, a brief reference to a critical reading of the Vygotskian tradition will have to suffice, as I believe it offers a strong theoretical foundation for dialogue across various therapeutic approaches (González Rey, Fleer, and Veresov 2017; Goulart, Mitjáns Martínez, and Adams 2021; Nissen 2023). I propose that Vygotsky’s understanding of affects and ‘higher psychological faculties’ – emerging first in social interactions as proto-forms before becoming individuated in personal consciousness – helps us theoretically grasp the subversive potential of subjectivity, “a vanishing moment of not-yet-developed personal subjectivity that pervades socio-cultural forms and exceeds standards imposed ‘from above’ (Nissen 2023:158). Further development of this idea must avoid presenting subjectivity as a metaphysical essence of subversion. As discussed in chapter five, where I expanded on the work of Marvakis, Nissen, and Osterkamp, and linked their theories to the Marxist ideas of Georg Lukács and Ágnes Heller, I proposed addressing the issue of subversion by situating it within the historical contradictions of motivation. This approach allows us to explore how motives emerge and evolve to transcend their original boundaries.

Therapy informed by a post-psychological perspective can foster the development of subjective critique implied by participation itself, helping individuals shape political orientations that exceed pre-given standards. However, we must begin this task by examining our own orientation as therapists, counselors, psychologists, or researchers. This involves more than merely doing our jobs by following established guidelines, methodologies, and professional norms¹². We must also ask ourselves a supplementary, orientation-relevant

¹² Encountering far-right clients in therapy might be accompanied unsettling affects that are related to professional standards. For instance, therapists might experience fear of exclusion from professional communities or alienation from colleagues. Travis Heath (2022), a black psychotherapist committed to social justice, shares how the polarized political climate after Trump’s election affected his work. He felt anxious about being judged or excluded by colleagues who supported Hillary Clinton, after he framed his therapeutic relationship with a Trump supporter as a subversive act against polarization. Though risky, this approach turned out to be a pivotal moment in therapy, as it helped the client engage with subversive acts in her own life, overcoming her initial anxiety.

This case highlights the real possibility of exclusion for not aligning with prevailing norms when engaging with far-right clients, even in generally left-leaning or progressive professional spaces. However, it also reflects a broader issue: individuals’ political orientations always express their relationships with collective subjects (families, workplaces, political groups, etc.). Meanings that challenge these norms are particularly relevant for individuals who want or need to be part of such subjects, yet it is rarely clear whether politically contested or morally charged new meanings could lead to

question: What is the broader practical purpose of our work within the collective practice of society, beyond simply carrying out pre-given tasks and solving predefined problems? (Marvakis 1996:49). When encountering far-right clients or reflecting on such cases, we are additionally prompted to ask what we should be motivated for in these encounters and according to which standards.

When seeking answers to the questions we pose, we must remain aware that the nature of our questions influences the answers we find. Our inquiry into the problem of society – the unresolved socio-historical task of emancipation – cannot yield final answers, as this problem itself remains historically open and is subject to transformation through ongoing struggles. Clarifying the problem of society, as well as the task of emancipation, demands engagement with both history *and* theory, as the problem evolves with each new attempt to address it.

Moreover, we should not expect our efforts to result in final answers, particularly because we cannot confidently assert that the task of emancipation can be fully resolved within modern society. As history has shown, “only direct (coercive) social domination was ever overturned by popular revolt. As the experience of so-called ‘real socialism’ shows only too clearly, a change in legal ownership (of the means of production) from that of private citizens or their associations to that of the state or government means as little (for the workers) as the passage of a company from ownership by a family into that of a pension fund. The ‘expropriation of the expropriators’ did not end alienation” – it did not appropriate the potential for freedom implicit in alienation¹³. This historical insight, our knowledge of not knowing the plausibility of true emancipation, must not be treated as a side note. It must be taken seriously by anyone engaging in the project of advancing critical consciousness.

Political autonomy, critical consciousness, or independence in civil society should not be conflated with the concept of autonomy as it is traditionally understood in psychological and therapeutic theories. Adhering strictly to these theories, even those within critical psychology, would fall short of the post-psychological framework and risk once again subjecting life to (industrial) standards. Instead, these theories must be historicized as tools for orientation, offered by the collective projects of psychotherapy (and psychology), designed to make life meaningful, navigate societal contradictions and to expand or preserve agency through participation in the societal process of pre-emptive care. These orientations should be considered in a manner similar to those provided by other collective projects. Following the Marxist theorist Chris Cutrone (2024), I propose understanding collective projects and the hopes they articulate in relation to emancipation as part of an unresolved socio-historical task, one that

exclusion or marginalization. Expanding agency thus involves risk, since it may entail leaving or transforming our participation in collective subjects. Engaging with unsettling, undefined affects without immediately subjecting them to common sense, may lead us to unexpected and transformative places. This affective experience of the “not-yet-wanted” reflects what Ernst Bloch called the “not-yet-known,” full of utopian potential (Nissen 2019:159).

¹³This quote should not imply that merely eliminating alienation is an adequate solution to the complex problem of alienation, which is a defining characteristic of modern society. I address the nuances and broader implications of this issue in more depth in the following chapters.

recognizes how past efforts at emancipation have accumulated into the historical challenges that contemporary attempts must now address.

I hope that the proposed perspective can contribute to advancing emancipatory therapy by offering a deeper understanding of how the individual desire to expand and preserve agency is intertwined with collective attempts in posing and addressing the problem of society, as well as historically accumulated challenges. This perspective is not entirely new but builds upon existing trends in emancipatory therapy that emphasize struggles for recognition. However, by addressing the issue of far-right political orientations, the broader issue of political orientation itself is brought to the forefront as a conflict between competing ideological projects.

Chapter 2: The Problem of Modern Politics and the Marxist hypothesis

This chapter shifts away from the psychological lens to further develop the themes introduced in Chapter One, with a specific focus on the political sphere. It adopts a dialectical approach, framing the far-right as a problem that extends beyond its own immediate implications and signals the political responsibility of the Left. The chapter critically examines and challenges dominant distinctions and conceptual frameworks surrounding political orientations in contemporary political culture and social sciences. By situating the left-right distinction within the broader context of modern politics, shaped by the dual forces of emancipation and opportunism, it presents an alternative perspective. The chapter also introduces Chris Cutrone's Marxist hypothesis as a methodological foundation for understanding political orientations as historically evolving relations between theory and practice. This approach, which emphasizes the political, is contrasted with more conventional uses of Marxist theory in critical social sciences.

2.1. The Problem of Modern Politics

Modern politics – resulting from democratic revolutions, capitalist transformations, conflict and other vicissitudes of history – predominantly interact with the institutions of the nation-state. Despite this institutionalization, they are still shaped by the creative instability of modern society, where “all that is solid melts into air” (Marx and Engels 1848:465). This instability gives rise to constantly new desires, needs, liberating social relations and emancipatory visions, and can become embodied in new political orientations, but also anxieties and desires for solid foundations and stable social relations. It is also the reason why there cannot be agreement about what society is because every attempt to define or represent society implies claims about how society ought to be, what should be preserved and valued, what should be changed and what is changeable through politics, and what constitutes problems requiring political resolutions.

Its inbuilt dissonance demands modern politics to “seek constantly a stability that will always exceed their grasp” (Howard 2002:viii). Thus, it lies in the nature of modern politics that political actors must influence political culture get ‘the people’ invested into their political project by gaining support and legitimacy through votes and/or by building social movements. This striving for legitimacy, along with the inherent instability, distinguish modern politics as mass politics, concerning the whole population, from earlier forms such as aristocratic rule (Landa 2019). The aftereffects of the historical entrance of the masses onto the stage of history, and the instability that comes with it, are a precondition that politically conscious actors, including therapists, must reckon with, either as a problem or as a potential for collective emancipation.

The history of modern politics has seen multiple attempts to radically suppress its creative instability, most prominently through the Nazi variant of fascism, Stalinism, and a range of dictatorships. However, liberal democracies are also marked by such antipolitical tendencies, which exacerbate during times of war, economic and political crisis. Antipolitics are expressed in practices leading to “unmediated identification of politics with society, whether through the subordination of society or the liquidation of the party in the state, all in the name of quieting the inherent instability of politics, which society in its crisis of capitalism cannot afford” (Cutrone 2015a). In antipolitics, the state escapes social control and terminates politics, including the liquidation of political consciousness by compelling the population to identify with a specific vision of society – either defending what exists or fighting for what ought to be (Cutrone 2014b, 2015a). These suppressive tendencies are inherent to modern politics because “the quest for solid foundations in a modern society whose future must remain open is also the source of the antipolitical [...] threat” (Howard 2002:xi).

The history of radical antipolitics haunts collective memory, with contemporary political imagination fostering fears of history repeating itself, most prominently in the form of the spectre of a fascist or Nazi Fourth Reich (Rosenfeld 2019). Political actors frequently invoke these memories to draw dramatic comparisons, mobilize support, and legitimize their projects while delegitimizing others. These comparisons often hinder understanding of the nature of antipolitics and, more subtly, express antipolitics themselves. They promote “the banality of confessions and indignations” that proclaim ‘Never again’ instead of fostering a critical understanding of history “to comprehend what should ‘never again’ return” (Pelinka 2022:246).

Political culture exerts a profound, often unconscious, influence on how political orientations and societal conflicts are perceived and experienced. It is a contradictory phenomenon, shaped by competing currents and highlighted in moments of political conflict. Despite this inherent dynamism, the prevailing political culture tends to function as a conservative force, acting as an interpretive framework that anchors solutions to societal problems and visions of alternative futures within the immediacy of the present. This, in turn, shapes how both the past and future are imagined. Moreover, as this interpretive horizon ripples across the political spectrum, it restricts our understanding of political conflicts to their immediate context, influencing our interpretations of why and

how these conflicts arise. Such interpretations frequently reify modern political processes and conditions, often placing blame on particular political actors or segments of the population for societal issues. Overcoming these and other limitations, which hinder the development of a critical historical consciousness, is a challenging task. It requires clarifying the historical accumulation of interrelated political problems, that has resulted from past attempts at mediating societal conflicts and crises. The challenge lies in moving beyond mere descriptions of these problems to grasp how they point beyond themselves, revealing the potential solutions embedded within their contradictions.

2.2. Social sciences and political culture

Political culture is not an object but societally produced at the interplay of politics, the technologies of mass media and social sciences. The latter serve as powerful apparatus of population control, which is directed by the political allocation of resources and economic investments (Marvakis in press; Rueschemeyer and Skocpol 2017; Wagner 2001). The effects of these allocations often unconsciously limit the desires and needs of those inhabiting the current order, by developing (technocratic) remedies for social problems in accordance with the prevailing political culture (Marvakis 2019). Emerged in wake of the industrial revolution during the second half of the 19th century, modern social science has co-evolved with the political need to find answers for the ‘social question’ referring to conflicts, discontents and human suffering resulting from industrialization (Rueschemeyer and Skocpol 2017; Wagner 2001). In this regard, social sciences can be seen as embodying a specific set of political orientations: Individual social scientists and the associated collectives (professional associations, governmental or industry/business workplaces, advisory positions, contract work) develop from a specific perspective subjective perspective knowledge about society, suggest remedies and by doing so sustain their livelihood.

Until the beginning of the 20th century and the gradual formation of Fordism, social science did not have the sole authority in gaining knowledge about the world or the theoretical interpretation of society and political orientations. The political orientations embodied in the social sciences, served as competition and alternative to socialism in the quest of solving the problems and contradictions of capitalism. Socialism aimed to transcend capitalism, while the social science contributed to the management of capitalism. Thus, the social sciences— along with psychology, psychotherapy and social work (Marvakis in press) – have played a crucial role in the development of the modern welfare state and the emergence of “troubled person industries” (Gusfield 1989). Following Habermas (Habermas 1972), this process was underpinned by historical narrowing of the concept of knowledge itself, expressed in ‘scientism’, “science’s belief in itself: that is, the conviction that we can no longer understand science as one form of possible knowledge” (ibid., 4): The concept of knowledge was identified with scientific understanding, excluding other forms of knowledge

that are crucial for comprehending and transforming society with emancipatory intent. After all, politics is an issue of practical reasoning, strategy and tactics.

I will expand on the role of social science more thoroughly in part two of this manuscript. For now, I will briefly highlight its significance in addressing the methodological problem of how to overcome the limiting effect of political culture on our understanding of how political orientations and conflicts between them emerge in the everyday conduct of life. There are many voices in the social sciences, of course, but as I hope to illustrate, at large the social sciences serve as a conservative force. However, exposing the limiting effects of social sciences – including ‘critical’ social sciences – on human knowledge, by contrasting them with knowledge embodied in other political orientations, provides a powerful perspective to clarify the issue of emancipation. In this respect, the critical engagement with the role of social sciences can be a first step in moving beyond the cultural constraints on understanding political orientations and conflicts.

The role of the observer, as assumed by social sciences, should not be taken at face value, since social sciences are not isolated from politics. A critical view of social sciences must distinguish them from politics ‘proper,’ even though ongoing debates within the field discuss their political influence (Fay 1975, 1987). Nevertheless, social sciences have, after all, a relation to politics. It is the relationship which is crucial, referring to the old question, ascribed to Lenin, pointing to the core of politics: Who will overtake whom? The politics of social sciences are not the driving force but depended on politics of other – the political of parties and governmental administration. While these institutional, capital ‘P’ politics are depended on mass support, social sciences stand in a service relation to politics because it is depended on political resource allocation. By being constrained by and reliant on the horizon of the prevailing political culture of institutional politics, social sciences are a conservative force reinforcing the status quo as Brian Fay (1987) argued. In contrast to the enlightenment philosophy, which developed new ideas of emancipation and have given rise to new political movements (Israel 2001, 2011, 2014), modern social sciences, lacking political independence, did not inspire democratic revolutions but instead serve as apparatus for the control and ‘development’ of the population to manage societal problems within the given order (Habermas 1972; Horkheimer 1947a; Marvakis 2019; Wagner 2001).

This tendency of control and development of subjectivity according to the societal status quo is illustrated by the object of social science: objectifying the population and turning it into data to provide useful information for political intervention (Adorno 1968). Even though anthropologist Laura Nader (1972) urged her colleagues to “study up”, to this day social scientists rarely research societal elites and focus mostly on political orientations that are seen in the prevailing culture as undesirable and in need of control, such as the far-right. In this capacity, social scientists not only study, but *produce* public opinion and not merely represent opinions in the population nor ‘manufactures consent’ as *content* of public opinion. By setting the parameters of what is deemed as of interest, perhaps most notably by determining and controlling the questions of surveys that are of (political) interest, social sciences influence the content of

what appears as the public opinion which is discussed in the media. Pertaining the question of political orientations, the crucial value of social sciences as population control lies less in shaping the content of public opinion but in their capacity to produce *the object* of public opinion as a *standardized* meaning making resource in political culture (Bourdieu 1982, 2001): The standardization of political orientations as *opinions* transforms subjective political orientation into quantifiable objects, which, along with other purposes, legitimizes bureaucratic intervention and supplies political actors with useful information for framing electoral campaigns and policy measures to gain or preserve popular support. The power practice of quantification (Porter 1995) standardizes and normalizes political orientations, establishing what 'counts' as political opinion, but also discriminating against what does not count. Yet the power of interpretation is often beyond the remit of social scientists. The statistics about political violence, including the kind perpetrated by the right, are used by all kinds of political actors for their respective political ends.

However, quantification is not the only practice for limiting subjective political orientations. Also qualitative and theoretical approaches to social science have developed a wide range of practices for objectifying political orientations, which interpret political orientations of others through the lens of the political orientation of social sciences; that is, their relation to politics (Marvakis 1996:65–78). The practices of standardizing and normalizing what political orientations includes assigning who holds what orientation, how these actors they relate to each other, how they should be distinguished, and how they should be categorized in legitimate and illegitimate orientations. Even though modern social sciences are necessarily conservative in that they do not inspire new forms of political movements and politics, they provide a powerful contribution to the political management of the given societal order, by normalizing and standardizing subjective political orientations. Thus, they serve as a powerful technology for politics, shaping the public conception of what is left and what is right, which orientations should be desired and which rejected as illegitimate.

The effects of the social sciences on political culture can be exemplified by considering how we imagine a person whom we would associate with the far-right. Knowing nothing more, but that the person 'is' a right – wing radical will give us a wide array of ideas about the person, their life and what they are in support of and what against. If we were to meet the imagined person, our cultural knowledge would overshadow our perception of the subjective political orientation of the person. Political culture influences not only the content of the political orientations we imagine but more crucial how we imagine political orientations altogether. We are likely to conceive of subjective political orientations in personalized categories such as attitudes, values, identities, character traits or habits; and we are likely to sociologize political orientations by 'knowing' who the sociological groups are which exhibit these categories (see part chapter one for a theoretical clarification of subjective political orientations).

Clarifying the task of emancipation demands a different approach to political orientations to overcome the limits in social sciences. The challenge in clarifying the task is not to naturalize – personalize or sociologize – the

preconditions that make the far-right political appear as a viable and desirable solution for societal problems. This requires a shift in perspective from individual and collective political orientations being not the object of societal formation but its subject. Doing so must entail a critical examination of predominant crisis narratives, which explain the rise of the far right as a result of a political, cultural or economic crisis of some kind or as result of multiple crises (Eatwell and Goodwin 2018; Fraser 2019; Manow 2018, 2021; Mouffe 2018; Mudde 2017; Norris and Inglehart 2019). Furthermore, we must find a way to understand how past political failures to bring about collective emancipation – historically associated with the Left – have contributed as historical forces to the emergence of the contemporary prevailing political culture (Cutrone 2010c, 2014b, 2018a). Doing so is necessary to overcome the fixation on the immediacy of the present and its conflicts. Merely trying to define political orientations theoretically without engaging with history will inevitably be restricted by the horizon of contemporary political culture (Cutrone 2009a).

Understanding contemporary political culture through the failure of past attempts at emancipation is a viable alternative to the perspective of social sciences because it allows to not naturalize contemporary understandings of political orientations. However, since social sciences and politics are not completely separate but influence each other, social science literature must not be disregarded, and can actually provide important insight, when its authoritative definitions are critically considered within the historical and political context. Focussing on the knowledge produced by emancipatory social movements as alternative to the perspective of social sciences (Cox 2013; Cox and Fominaya 2009) helps to clarify how the contemporary political culture of despair, which lacks substantial visions for emancipation, is the fertile grounds for the far-right to strive and appear viable. However, it would be equally wrong to simply affirm the knowledge of emancipatory social movements – after all they not archived their goals. Focussing on what these social movements tried to archive, demands clarifying the societal problems that their sought to overcome. By questioning the authority of both social sciences and social movements, we can recognize emancipation as an unresolved socio-historical issue – one that is not yet fully understood. Furthermore, this issue can only be effectively addressed from within our historical context, which itself reflects the inadequacy of our understanding of the problem. Thus, the goal cannot be to arrive at a final definition of emancipation or striving to find the last word on this topic, but rather to engage in an open inquiry into the issue of emancipation.

Such an open inquiry must find a solution to the challenge, that definitions of the right and the left and its slogans are always contested and ideologically exploited in political conflicts. Even if it were possible to adopt the position of an external observer, uninvolved in these conflicts, we would still encounter a similar problem: Political orientations can only be understood from the standpoint of political orientations (Marvakis 1996). We face a hermeneutic circle in the figurative sense of the word, demanding a second order perspective to become aware of our partiality within societal conflicts. Additionally, this inquiry must also overcome the intellectual vagueness that is emblematic for

definitions of the far-right and fascism. While precise definitions are helpful, there are not sufficient to recognize the complex reality of the interrelation of political culture, societal conflicts and the historical transformation of the political movements themselves. Definitions are always articulated from within these dynamics, of which precise definitions can only be a snapshot of. To effectively address these challenges, I propose understanding political movements in relation to each other, their societal preconditions within the framework of modern mass politics, and what they are opposed to in relation to their understanding of the societal problems they seek to overcome (similar solutions have been suggested f.e. by Landa 2019; Pelinka 2022).

2.3. The concept of the Left

The political spectrum is commonly defined as spanning from left to right, referencing the seating-arrangements of the national assembly during the French revolution. Based on common understandings, the left is defined by its desire to advance social equality and the right as justifying social inequality (Bobbio 1996). While this definition of the left is not wrong, it is a sociological definition centred on values that served and still serve as political slogans for social movements. It leaves out the left's perennial interest in advancing freedom, understood as a concrete reality and not merely a principle. But more importantly, this definition limits the meaning emancipation to what is, or what was. It grasps the utopia of mass emancipation only through existing visions. This perspective is not adequate to clarify the task of emancipation because it does not take emancipation seriously as an unresolved socio-historical issue. This perspective is restricted to a certain (left-wing) historical viewpoint that can only find in social movements what it has already assumed. It cannot move beyond its own historical vantage point.

This limitation can be overcome by understanding the left and the right as directly related to emancipation as unresolved historical task as suggested by Leszek Kołakowski (1969). This perspective demands switching from a sociological explanation to the level of ideas, or consciousness to understand the Left and the Right as historical forces, which are not identical with their historical instances. I follow Kołakowski in capitalizing the Left and the Right when viewing them as historical forces instead of historical instances of left-wing or right-wing movements. In this sense, the Left and the Right do not necessarily correspond to social groups which current or past definitions see as the left and the right, for instance as workers, oppressed or marginalized groups or 'left' social movements versus the capitalists, the ruling class, elites or privileged groups in power.

Instead, this manuscript follows Kołakowski's (1969) *the concept of the Left* in understanding political orientations in relation to history and the production of political culture as an open-ended process, rather than taking established distinctions of political culture as a given horizon to understand politics. According to Kołakowski, the distinction between Left and Right is

relative; it spans from a consciousness of the possibility of change on the Left to a foreclosure of those possibilities on the Right, justifying opportunism and purely tactical politics. However, there are never social movements that are purely left or right. Understanding the Left and the Right as relations, allows for contradictions within movements and individual political orientations. The desire to cleanly separate social movements and individuals in Left and Right is an expression of the prevailing political culture. It presupposes reifying emancipation from being a practical task into an identity, values or simply an attribute.

According to Kołakowski the Left is a historical force that negates the current order by producing new ideas and utopian visions of the future that point beyond given societal restrictions and conflicts, grasping not yet realized possibilities that could be realized in societal revolutions. It “strives to base its prospects on the experience and evolutionary tendencies of history” (Kołakowski 1969:153). The Left and the Right are ‘normal’ societal phenomena inherent to modern politics and its historical preconditions. The inherent creative instability of modern history renders “progressive social movement [...] as normal as reactionary ones,” making it “equally normal for the Left, which is a minority, to be persecuted by the Right” (ibid., 149). The task of the Left is in relation to the Right, to not to persecute the right but to be ahead historically, by advancing consciousness of historic possibilities within the political organisations of the Left, raising political consciousness within the masses, clarifying the task of emancipation in its unique historical context and developing practical political thought.

The Right, in contrast, is an opportunistic force – “the embodiment of the inertia of historical reality” (Kołakowski 1969:153). It takes historic societal restrictions and conflicts as preconditions for a power struggle, embodied in its affirming visions, striving to “idealize actual conditions, not change them. What it needs is fraud not utopia” (ibid., 149). In this sense, the Right is a force foreclosing emancipatory potentials and liquidating the production of new truly utopian ideas. While the “Right is the expression of capitulation to the situation of the moment” (ibid., 153), it must not be confused with stagnation or passivity, nor does it merely reproduce the current order. The Right is often driven by “the desire to revert to a state which was once an accomplished fact” (ibid., 149). Combined with its opportunism it is a powerful force capable of harnessing and organizing discontents for political revolutions that negate the political order but never substantially the societal order. As a historical force of inertia, the right doesn’t need to grasp unrealized historical possibilities. It “has nothing but tactics” (ibid., 153).

Kołakowski’s interpretation of ‘utopia’ is useful for illuminating emancipation as a practical task that defies being defined once and for all. His interpretation is unconventional, having similarities to Bloch’s (Bloch 1935) conception, but being narrower. It views utopia as “a mysterious consciousness of an actual historical tendency” (ibid., 147). While this type of utopia may include certain future visions it isn’t strictly defined by them but by pointing negatively to possibilities. As long as the consciousness of possibilities of

historical changes “lives only a clandestine existence, without finding expression in mass social movements, it gives birth to utopias in the narrower sense, that is, to individually constructed models of the world, as it should be. But in time utopia becomes actual social consciousness; it invades the consciousness of a mass movement and becomes one of its essential driving forces. Utopia, then, crosses over from the domain of theoretical and moral thought into the field of practical thinking, and itself begins to govern human action” (ibid., 147). Emancipation, in this sense, is a practical task, that can be only attempted but never claimed as identity or attribute. In light of their resultant relation to praxis, progressive social movements have to constantly revise themselves and the way they organize if it no longer fits to current realities.

Furthermore, what once was counted as left may have outlived its orientation as such. Opportunism may characterize the historic instances of left-wing politics less than the right-wing politics – but it is a feature of all political movements. Utopian vision can become obsolete by history moving forward or can be assimilated in political culture, regressing from being a living embodiment of historic possibilities to a dogmatic vision how society ought to be. “Slogans like ‘freedom’ and ‘equality’ belong, of course, to the tradition of the Left; but they lost their meaning once they became universal catchwords” that can be interpreted arbitrarily by different political actors (ibid., 150). Slogans which are seen as left in political culture are insufficient to comprehend, if the social movements and political actors that claim these slogans are progressive in the sense of embodying in practical politics a consciousness of the possibility of change, capable to advance emancipation. The Left can always regress from practical political thought, capable of expanding historical possibilities, to moral protest that has little effect on history: “Bleeding-heartism”, encouraged by a culture of indignation and confession as a response to the Right” is not a political position” (ibid., 156). The Left cannot be sufficiently distinguished from the Right by its moral practices and ethics; it “must define itself on the level of ideas, conceding that in many instances it will find itself in the minority” (ibid., 151).

The distinction between opportunistic tactics and visions of not – yet – realized possibilities is crucial to open up a trajectory of inquiry into emancipation as an unresolved socio-historical problem. While it is not wrong that the Right has and is appropriating political inventions of the left, this accusation in itself misses the crucial aspect; that is, the distinction points to the relation of theory and practice as the problem of emancipatory politics. This problem has necessarily emerged only for the Left. It finds reflection in Kolakowski’s interpretation of utopia as “the striving for changes which ‘realistically’ cannot be brought about by immediate action, which lie beyond the foreseeable future and defy planning. [...] Utopia always remains a phenomenon of the world of thought. Even when backed by the power of a social movement and, more importantly, even when it enters its consciousness”, an utopia is inadequate in the present while simultaneously” going far beyond the movement’s potentials. [...] It is a warped attempt to impose upon a historically realistic movement goals that are beyond history” (ibid., 147).

This specific historical situation of the Left, which “gives forth utopias just as the pancreas discharges insulin”, demands from the Left theoretical clarification about historical possibilities (*ibid.*, 147). The Left needs theory that not only points beyond the immediacy of the present situation but must also clarify and raise to consciousness the historical tendency it strives to embody. If the utopia “proves so remote from reality that the wish to enforce it would be grotesque”, it would by necessity “lead to a monstrous deformation, to socially harmful changes threatening the freedom of man. The Left, if it succeeds, would then turn into its opposite—the Right. But then, too, the utopia would cease to be a utopia and become a slogan justifying every current practice” (*ibid.*, 147).

Thus, it is the historical changing relation of theory and practice that distinguishes the Left from the Right. The Right does not need to develop a coherent theory. It subordinates its concepts to its tactics, justifying the current condition. It does not need to understand the relation of theory and practice. This has been described by Walter Benjamin in 1936 as the aestheticization of politics by fascism: It seeks to give the “masses not their right” for practical politics to emancipate themselves, “but instead a chance to express themselves” (Benjamin 1991:506). It is crucial to not confuse this capacity with dishonesty, or the chance to merely express discontents. Clara Zetkin (1923), Wilhelm Reich (1933) and Ernst Bloch (1935) emphasized that fascist politics expressed the necessity of change through the masses, recognizing real contradictions albeit maintaining the unstable capitalist dynamic it rebelled against. They also argued that fascism came to historically express the necessity of change driven by the masses resulted out of the failure of the Left to lead the masses. In this dialectical view, the political problem of the radical right points beyond itself, to the necessity of emancipatory mass politics. It demonstrates that democracy, being the historical form of modern mass politics, is contradictory: Both capable of restoring and enforcing societal restraints through revolutionary anti-politics as well as capable of driving emancipation forward.

However, the Left can always become the Right by aestheticizing either its theory or its politics or both, to give its movements the possibility to merely express that it is on the right side of history, while the Right leads the masses. When the Left is a powerful political force, this regression leads to anti-politics, for instance Stalinism. When lacking influence this regression will result in failing to renew the Left. However, also the Left needs tactics for building a mass movement, but it must understand the historically changing relationship between theory and practical politics as embodied in social movements. It should avoid conflating its utopia with its movement. Emancipation is a practical task, not an identity. Thus, the Left must not have an affirmative relationship but a critical relationship to its movements, otherwise it cannot advance consciousness in the masses of practical politics fit for the practical task of emancipation, to become a subject of history. Thus, political orientations must be a problem for the Left, as long as the task of emancipation is an unresolved socio-historical issue.

2.4. Contemporary Situation

Today, we are confronted with a Left lacking a mass movement. While we can find intellectual contributions scattered within and outside social sciences befitting Kolakowski's description of the Left, political culture is mostly unaffected by these contributions. Conversely, the vanishing of the Left as a mass movement – historically the struggle for socialism of the international workers movement – left a deep mark. The resulting unfettered domination of society by the needs of capital is eroding the civil and political rights embodied in citizenship (Tamás 2002, 2006). The absence of the Left led to a desperate and largely uninspired political culture, limiting the political imagination to the immediacy of the present (Cutrone 2018a). Hannah Arendt (1963) has already observed this loss of significance of the political realm in *On Revolution*. She argued that the revolutionary spirit, which once animated modern political culture and enabled citizens to engage in collective self-determination, has been lost or diminished. Today, Politics is overwhelmingly reduced to managing the present miseries and discontents, often in opportunistic ways. Although this condition provides a fertile ground for the far-right to flourish, the far-right's success has neither caused this condition nor is it the only political actor intensifying this condition. We are facing across the political spectrum¹⁴ “a cluster of policies, practices, routines, and ideologies that [...] *reverses the Enlightenment tendency to assimilate citizenship to the human condition*” (Tamás 2002:203f).

The vanishing of the historic revolutionary Left has not merely torn a gap in political culture, depriving it of emancipatory perspectives. The historic failure of the Left and its regression into Stalinism and other reactionary forms of politics created also a burdening legacy in distorting the contemporary understanding of the task of emancipation. According to Chris Cutrone, perhaps “the most pernicious legacy of Stalinism is its equation of liberalism and capitalism, as if civil and social liberty and freedom is essentially the individual ‘liberty’ of social irresponsibility (whether by individual people or by capitalist firms as corporate individuals) and the ‘freedom’ to exploit and oppress others” (Cutrone 2021a). What the equation of liberalism and capitalism disguises “is that capitalism itself – the domination of society by the imperatives of producing and reproducing capital – undermines the freedom and liberty of bourgeois civil society, not only for the working class but for others as well, including the capitalists” (ibid.).

¹⁴Tamas has coined term post-fascism to analyse the contemporary situation. With post-fascism he refers to “a cluster of policies, practices, routines, and ideologies that can be observed everywhere in the contemporary world; that have little or nothing to do, except in Central Europe, with the legacy of Nazism; that are not totalitarian; that are not at all revolutionary; and that are not based on violent mass movements and irrationalist, voluntaristic philosophies, nor are they toying, even in jest, with anti-capitalism. Post-fascism finds its niche easily in the new world of global capitalism without upsetting the dominant political forms of electoral democracy and representative government. It does what I consider to be central to all varieties of fascism, including the post-totalitarian version. *Sans Führer, sans one-party rule, sans SA or SS, post-fascism reverses the Enlightenment tendency to assimilate citizenship to the human condition*” (Tamás 2002:203f).

Another legacy obstructing the contemporary understanding of emancipation results from an insufficient historic differentiation of two kinds of 'socialism' – the Marxist and Rousseauian version (Tamás 2006, 2018). According to G. M. Tamás most conceptions of emancipation, including avowedly Marxists, are shaped by the Rousseauian understanding. In the Marxist understanding, emancipation can only be described negative, as task for liberating the potential of humanity that is alienated in capital. The working class was seen as the subject carrying out this task. Its crucial role was to abolish itself to archive a free political community because the working class was seen to be implicated in recreating the conditions of not only its own oppression but the domination of society as a whole by capital. Thus, the task of emancipation required theoretical and historical clarification.

In the Rousseauian version of emancipation the negative understanding of emancipation is replaced with the belief that "an equal, dignified and just society comes about through equality, usually equality obtained through redistribution" (Tamás 2018:47). The task of the political subject of emancipation is not to abolish itself, but to fight its oppressors, to which it is seen as morally superior: the emancipatory subject needs a villain in the Rousseauian shaped imagination. The "meaning of Rousseauian socialism is the re-establishment of the purity of the people through the forcible destitution of the upper castes [...]; the people is held to be capable of discovering its virtue, which has been obliterated or corrupted by oppression and inequality, servitude and deference" (Tamás 2006:247). This vision has always had a powerful influence on the struggle for proletarian socialism; egalitarianism "and statism (in democratic and tyrannical versions) were the hallmarks of the main official versions of socialism, everywhere" (ibid., 241). With the vanishing of proletarian struggle for socialism in the 20th century the working class was gradually substituted as subject of emancipation with different notions of the oppressed people (Wood 1998), ultimately leading to a "new cross-class coalition of rebellious 'people' desirous of a new kind of [Rousseauian inspired] democracy" (Tamás 2006:249). Overall, this shift eclipsed the negative understanding of the task of emancipation, that requires historical and theoretical clarification, with a specific historic vision of emancipation. This shift contributed to the reduction of politics to the immediacy of the present – politics as matters of policies, principles and values; the possibilities of politics limited to preset rules of given institutions, devoid of the revolutionary spirit of collective self-determination.

The Rousseauian legacy in conjuncture with the growing cultural influence of psychology (see chapter one) contributed to a situation, in which it seems natural to control and or change the subjectivity of individuals, such as far-right orientations, because they appear as the driving forces expanding the ills of society. This personalization of discontents is not limited to far-right orientations but rooted in a powerful historical tendency to locate society's ill in subjectivity (Frawley 2024). A crucial aspect of this situation is the identification of motives and actions (see 1.8.), fostering a political imagination in which political conflicts appearing as conflicts between identities. This political imagination hinders a dialectical understanding of the far-right as indicating the necessity of

mass politics for the Left and its responsibility to overcome the immediacy of present, in which only opportunism appears feasible.

Moreover, the pernicious cultural legacy of Stalinism – the equation of liberalism with capitalism – contributed to a situation in which the prevailing political attempts to mobilize against the far-right appear as hypocritical opportunism, defending a situation of unfreedom as freedom¹⁵. When non-far-right politicians “say, our free community is threatened [...]! Up in arms! Save liberal democracy, save market capitalism, save inequality from the incursions of all sorts of unpleasant people!” the people will say: ‘oh, yeah, right? Should we save a system that does not give us anything nice except cheap merchandise?’ So, people will not” (Tamás 2018:47f). The tragic of this situation is not so much the far-right appears as liberator of insincere morally disguised opportunism, but that the left falls into this trap instead of calling out the fraud of urging political action that won’t change the underlying problem, of being confronted with “two version of the same system: one hypocritical version, pretending to represent equality and liberty, and another that does not” (ibid., 46).

Today, a substantial and ambitious political perspective to advance the task of emancipation is largely absent from the present political culture (Cutrone 2012, 2018a). This *Zeitgeist* includes social movements that are contemporary considered as left, because they have in large replaced advancing politically a consciousness of historic possibilities by either assuming that only ‘resistance’ is possible or by dogmatically copying what they consider as past instances of the historic revolutionary Left (Cutrone 2008b). What is left of the left has overwhelmingly resorted to the management of contemporary miseries and discontents within current societal preconditions, replacing politics with policies or withdrawn from politics to sectarianism. The left “has fallen apart into either accommodating capitalist politics through welfare statism or accommodating society’s disintegration in capitalism” (Cutrone 2021a).

Being fixated on the horizon of the prevailing political culture the left frequently engages in political conflicts by fighting its opponents, with the prevailing political culture determining who the opponents are. It falls into the trap of capitalist politics in invoking the threat of fascism and societal crisis as means to mobilize instead of finding practical ways to manifest politically unrealized historical possibilities that point a way forward. Activities of this ‘left’ are overwhelmingly focused on defending democracy against the far-right, trying to fight oppression and discrimination, criticising the right and those in power,

¹⁵As Tamas puts it passionately: “A real free political community must consist of free people. What does it mean to be a free political community that consists of exploited people under the command of the most stringent and brutal set of rules called technology? A work discipline and a time, a use of time, subordinated to a production of commodities. You enter an office, you enter a shop, you enter a factory and your autonomy disappears. And this is where you are spending the majority of your waking hours. What kind of a political community of free citizens can this be? This is obviously an illusion. And it has been proved many times to be an illusion, and of course there is the discontent, the humiliation [...]. Humiliation of people of colour, humiliation of white people, humiliation of poor and even humiliation of not-so-poor people by being dependent – even my intellectual colleagues, writing their submissions for grants, everybody collecting their points, everybody trying to get good marks in exams – there is not one single moment of independence. Is this a free society? That is ridiculous! Well, let us stop pretending and being hypocrites” (Tamás 2018:48).

and demanding for some degree redistributive politics, though often on an unambitious scale. Instead of interrogating its inherited vision to expand it, the 'left' has accepted the ahistorical cultural distinctions of the left and the right as identities, values or principles, which foreclosed an understanding of how past failures of left social movements have resulted in the current limitations of political culture, from which the far-right benefits (Cutrone 2023).

The immediacy of the present cannot be transcended by simply advocating for an ostensibly emancipatory unity of theory and practice. This approach subordinates theory to the demands of immediate practice¹⁶, such as combating the far right with the means at hand, ultimately reducing theoretical reflection on the meaning of emancipation to a mere tool in service of justifying short-term political actions (Adorno 1973:143f, 1977). This approach contributed to a lack of emancipatory agency, fostering a political culture of despair. Year-long efforts to combat the far-right, educating about the strategies of the far-right and raising awareness about their danger seem to have been in vain. This must appear even more desperate when we consider that those efforts have been supported by the social sciences, equipping the fight against the far right with substantial criticism since the UNESCO statements on race 1950, 1951 and subsequent declarations (Balibar 2005; Banton 2008; Miles and Brown 2003; UNESCO 1952). Not to speak of the World Conference Against Racism 1978, 1983, 2001, 2009 and 2021 and the multitude of declarations and statements against all forms of discrimination, since the Universal Declaration of Human Rights in 1948. Indeed, the social sciences have suggested a multitude of explanations for the emergence of the far right, providing insights in its societal preconditions and its transformations (Balibar 1991; Taguieff 2001), to combat not only the far-right but all forms of oppression to strive for social justice to overcome social inequality (Fraser 2022). No doubt the success of the far-right is a challenge to the achievements, that those statements embody. This situation tasks us to reconsider the relation of theory and practice withing the relationship of social sciences to politics. Who will overtake whom? Or rather, who has overtaken whom?

The challenge posed by the far-right to the Left is not simply a matter of finding more effective ways to politically isolate and control the Right while maintaining the status quo. Rather, it involves confronting and overcoming the regression of the left itself. The left has regressed by being fixated on a horizon that resulted from of failed attempts of the historic Left to bring about emancipation. This led in the subjection of the (production of) theory of the left to the demands of its practice, merely affirming struggles against oppression, instead of clarifying the historical meaning of these struggles. The Right is not to blame for this outcome because this is what the Right does: foreclosing emancipation. It is the responsibility of the Left to find a way forward.

¹⁶“The call for unity of theory and practice has irresistibly degraded theory to a servant’s role, removing the very traits it should have brought to that unity. The visa stamp of practice which we demand of all theory became a censor’s placet. Yet whereas theory succumbed in the vaunted mixture, practice became nonconceptual, a piece of the politics it was supposed to lead out of; it became the prey of power. The liquidation of theory by dogmatization and thought taboos contributed to the bad practice; the recovery of theory’s independence lies in the interest of practice itself” (Adorno 1973:143).

The task today is not merely about ‘learning’ from the mistakes of the past, but to clarify the task of emancipation by understanding what emancipatory movements tried to archive but failed to do so, while grasping the role of the Left within these movements. This task of historical self-reflection demands that we estrange the limiting cultural understanding of political orientations and their desirability by examining them as historically evolving relationships between theory and practice. This perspective can overcome the culturally dominant reified view of political orientations, such as the practice of categorizing them according to more or less arbitrary criteria.

Crisis talk

The predominant response to the success of the new far-right parties and currents frames them as danger of society sliding towards fascism, calling upon the democratic spectrum to prevent barbarism from happening again, urging to learn from history, by aligning with established political parties. In determining if the new far-right as fascist or not political commentator, intellectuals and social scientists mostly apply a ‘shopping list’ or an ‘ideal-type’ approach (Renton 2001:x–xvii, 2024). However, this approach does rarely generate critical insights about the new convergence of the right, nor was it successful in excluding the far-right politically (Renton 2019). The new far-right parties appear more than ever to a substantial section of the population and the political as viable and legitimate political orientation to solve social problems.

No doubt the danger of the current situation must not be underestimated. However, subscribing to apocalyptic visions, the opposite of the previously discussed utopian ones, must be avoided. Such visions do not present an adequate analysis of the situation. Instead of an analysis, they represent ‘crisis-talk’ (Marvakis 2022; Marvakis, Triliva, and Tourtouras 2016). Crisis-talk that is driven by such visions tends to naturalize the loss of agency and the feeling of powerlessness, thereby disguising that what we ‘see’ as a ‘crisis’ is “*produced* by powerful political actions” (Marvakis 2022:152). Crisis-talk is not limited to commentators officially aligned with the status quo but also ubiquitous in analysis produced by critical social sciences. Although differently intended, these analyses contribute often to the reification of political actions, by framing these action as anonymous processes. Indeed, many of the phenomena “we attribute much too readily to the sheer factuality of some ‘crisis’ are, in fact, *produced* by powerful elites and *labeled* by authoritative social scientists” (ibid.).

All this crisis talk arguably has pernicious effects that undermine emancipation. This situation demands careful consideration. The failure of past attempts to solve the problem of the far-right has contributed to a loss of agency in emancipatory politics. Calls to try harder to delegitimize and exclude the far-right politically should be questioned, instead of blindly followed. Indeed, the predominance of such responses as answers to the problem of the far-right unveils a more fundamental issue: the progressive political imagination lacks plausible and credible pathways for emancipation.

Instead of suggesting a way forward by bringing to consciousness the emancipatory potential implicit in society but yet to be realized, progressive political orientations often urge an uncritical identification of society with the status quo. This is combined with promises that the only way out of misery is increased social control in the name of defending society from its assumed enemies. This results in campism (La Botz 2022), pressuring individuals to identify with the 'right' cause and to 'stand on the right side of history': 'Either you are for us or against us'. Social pressure is intensified by such crisis narratives.

Instead of promoting 'crisis talk', analysis and critical theory have to point a way forward. Simply describing how things are – or more precise how things appear – and taking a stance against how things are is not sufficient. Reproducing the current political culture of despair in theory and analysis must be considered as a failure to move beyond the oppressive immediacy of the present. Such theory and analysis can indeed be questioned for lacking a truly critical stance, instead serving to justify the status quo and the inadequate efforts to move beyond the current state of misery. We should face the sobering reality that contemporary critical theory is that it is no longer critical (Pippin 2004).

These developments – the lack of critical theory and emancipatory practice worthy of the name, alongside prevalent crisis-talk – have led to an unintended yet troubling alliance across the entire political spectrum, which significantly benefits the far-right. Facing this situation tasks us, as Marvakis suggest, to reconsider Adorno's warning "to let neither the power of others, nor our own powerlessness, stupefy us" (Adorno 1974:57). In the words of Kolakowski: When the Left realizes that "it is powerless in the face of crime, it refuses to call crime a 'blessing'" (Kolakowski 1969:157). The task is, of course, not become stupefied, or label a crime a blessing, but to facilitate a substantial, historically-grounded change of perspective.

To summarize, the futility of the desperate situation appears in a different light when recognizing how the prevailing political imagination limits and restrains thinking about political orientations. The prevailing solutions for the problem of the far-right are rooted in unquestioned premises about political orientation, that are embedded in the immediacy of the present political culture. I suggest seeing this focus on the present as a regression, which was not produced by the right, but unintentionally by an alliance across the political spectrum. To understand how far initially emancipatory approaches to politics have regressed, it is worthwhile to recall Sartre's discernment about what can be done about the problem of antisemitism.

Shift in Perspective

Sartre warns convincingly in his *Reflections of the Jewish Question* written in 1946, about "illusions about the effectiveness of" today's solutions: "it is not enough to appeal to the free will of the anti-Semite through propaganda, education, and legal prohibitions. Since the anti-Semite, like every person,

represents a free will conditioned by the situation, it is the situation that we must fundamentally change. One must fundamentally change the opportunities for self-determination to transform the ego-choice. This does not affect the free will directly, but the free will decides based on different circumstances and with regard to other formations” (Sartre 1986:187 my translation).

Further clarification of the task demands considering that Sartre’s statement can be interpreted in the prevailing political culture as a necessity to exclude the antisemite or right wingradicals. However, Sartre conceived of such solutions as illusions arguing that “laws have never embarrassed and will never embarrass the anti-Semite, who conceives of himself belonging to a mystical society outside the bounds legality. We may pile up regulations and prohibitions, but they will always emanate from official France, while the antisemite claims to be the representative of the ‘true’ France” (Sartre 1986:186f my translation).

What is required is a fundamental “shift in perspective, whereby people are not seen as objects of societal formation, but as potential subjects of its development [...]. Instead of accepting the conditions as unquestionable frameworks for individual as well as scientific thinking and action from the outset, and categorizing individuals according to their ‘development’ or usability, thereby participating in the legitimization of the exclusion of the ‘non-belongers,’ the conditions themselves should be questioned for their legitimacy” (Osterkamp 1996:218). This shift in perspective implies questioning the conditions under which it seems reasonable to categorize individuals according to their (psychological) development as democratic citizens, thus demanding and legitimizing the exclusion of those with undesirable political orientations. However, this “shift in perspective is only complete when it applies to all people without exception, including those who exclude others – because the exclusion of the excluders dissolves the boundaries between them” (Osterkamp 1996:218).

2.5. The historic Marxist Vision

Sarte’s and Osterkamp’s pronouncements should not be seen as a mere clarion call for therapeutic practice to shift to a more inclusive perspective. The required shift demands an emancipatory imagination which does not limit emancipatory visions to partiality, but to take up the challenge of fundamental emancipation for everyone. However, taking this demand serious results in a contradictory task: The required shift in perspective requires from the emancipatory imagination escaping both the present misery, under which a substantial increase in freedom seems unfeasible, and the temptation of abstract utopia as a naïve dream of a better world, were deadly far-right politics have dispersed – this would be a denial of contemporary conflicts and conditions. To address these challenges that are inherent to modern politics, I argue that it is worthwhile to revisit the original Marxist vision because it developed in face of these challenges and had to critically renew itself in its history, when this vision was facing its own crisis. I do not suggest either adopting it as a dogma nor as mere inspiration, but to investigate the vision critically to advance our understanding of the problem of

political orientations as historical relations of theory and practice. Let us first get a rough idea about the vision.

The original Marxist vision, distinguished from its Stalinist and neo-stalinist perversions, assumed that a fundamental emancipatory transformation of our modern capitalist society is plausible. The Marxist vision is rooted in its theoretical understanding of the task of emancipation, which was seen as intertwined with the problem of capitalism. The vision asserted that a specific form of politics is necessary for the transformation, capable to fulfil the promises of liberalism by extending democracy. The emancipatory horizon of the latter, rooted in the enlightenment philosophy, was seen being contradicted by the inequities and heightened contradictions spurred by the industrial revolution. Bourgeois society was “not meant to be torn down but transcended in overcoming capitalism” (Cutrone 2011a). Following this path meant not, as many lay interpretations of Marxism claim, merely denying capitalism, but drawing on its productive and dynamic capabilities to transcend it by realizing its inherent potential for emancipation.

The original Marxist vision directed the emancipatory imagination to desire moving beyond the antagonisms of contemporary capitalist society towards “an association in which the free development of each is the condition for the free development of all” (Marx and Engels 1848:482). This perspective did not ignore the conflicts and antagonism of its time but recognized those as false necessities of capitalism. ‘False’ because they are not unchangeable. ‘Necessary’ because the underlying needs behind these conflicts are no delusions and not merely false consciousness but grounded in real nevertheless opposed needs, produced and reproduced by the contradiction of capitalism. This vision, rooted in the Marxist conception of political practice, tasked emancipatory politics to encompass a wide spectrum of conflicting discontents. The goal was to politically manifest societal contradictions and advance consciousness beyond the immediacy of the false necessity of opposed needs. To this end, Marxist theory aimed to grasp political orientations as part of the contradictory totality of society.

However, we will not arrive at substantial answers to the contemporary challenges of emancipation within and outside therapy by simply adopting the Marxist vision that had its roots in the political struggle for socialism as a response to the effects of the industrial revolution. Not only have there been multiple ‘Marxisms’ and fierce battles between them. Marxist theory cannot be taken from one historical situation and applied to another. Marxist dialectics is not a social science but a specific form of theory *and* political practice. Social sciences, in contrast, while also having a relation to politics, cannot claim to have such a direct relation to specific form of politics. This lacking relation arguably makes them a conservative force, serving the needs of the respective politics. Common interpretations of Marxism assume that it would seek the unity of theory and practice, referring to Marx’s famous 11th thesis on Feuerbach (1845:7), engraved on Marx’s tomb: “Philosophers have only interpreted the world, in various ways; the point, however, is to change it”.

However, less understood is that the relation of theory and practice was not identical throughout the history of Marxism. The relationship between theory and

practice has been critically examined throughout the history of Marxist theory, especially in efforts to understand Marxism's own historical crises. These critiques often applied the dialectical method to Marxism itself, seeking to confront its internal contradictions. The problem of historically changing relations of theory and practice was discovered in some regards by Georg Lukács in his *History and Class Consciousness* (1923). and more extensively elaborated on by Karl Korsch (1923) in *Marxism and Philosophy*. The latter discussed explicitly “the historically changing relation of theory and practice, and the self-consciousness of this problem, in the history of Marxism. This meant that the matter was, from a Marxian perspective, as Adorno put it in *Negative Dialectics*, ‘not settled once and for all, but fluctuates historically’” (Cutrone 2010a).

Both Korsch and Lukacs tried to grasp theoretically how Marxist such as Rosa Luxemburg and Lenin engaged with the crisis of the Second International, when its social democratic parties with Marxist leadership were in support of the first world war, affiliating themselves with the national war efforts. In the crisis of the Second International Marxist theory and practice became fixated on its own past, thus regressing when it faced new historical challenges to being a mere dogma equated with a simplified social scientific description of society from a ‘Marxist’ perspective. The understanding of dialectics became mechanical and emmeshed into the past success of the socialist movement in the form of social democracy. This perspective failed to grasp how the social democracy itself started to manifest the contradictions of capitalism that were advanced by the socialist movement. It had to rediscover how to ‘be’ Left in the sense of Kolakowski advocated for.

Yet, already Marx and Engels were concerned with the problem of changing relations of theory and practice, without defining the problem in these terms. They did not identify Marxism with the struggle for socialism, the workers movement or its institutions. Being actively involved and not mere observers, they sought to contribute to the self-clarification the historical meaning of the struggle for socialism. They asserted that the struggle for socialism and the larger political orientation of the workers movement were stuck in an inherited and limited horizon for emancipation; one initially guided the French revolution but made obsolete and contradicted in capitalism. They found the “necessity of the dialectic [...] in the self-contradictory character of not only capitalism but of the struggle to overcome it in socialism. Marxism has its origins in the dialectical critique of capitalism which also includes — at its core — the dialectical critique of socialism” (Cutrone 2021b).

Today, the negative character of the Marxist dialectics has been largely forgotten because Marxist theory has been turned predominantly into a descriptive tool highlighting the pitfalls of capitalism. Marx saw capitalism as “a contradiction and crisis of society, a contradiction of its self-understanding and self-consciousness” (ibid.). The dialectical conception of theory and practice allowed Marxist to clarify anew the meaning of emancipation in relation to the problem of capitalism it sought to address through politics.

Lukács argued that even if “research had conclusively demonstrated the factual inaccuracy of all individual statements by Marx, any serious Marxist

could” unconditionally acknowledge” such a reality, and “reject all individual theses by Marx — without having to abandon” their dialectical method (Lukács 1923:35). Lukács emphasizes that the meaning of Marxism refers to the dialectical method of historical self-clarification. Marxism was “not the ‘belief’ in this or that thesis, nor the exegesis of a ‘sacred’ book” (ibid.). Marxists did not come “with blueprints for an emancipated society in hand. [They...] advocated pursuing the forms of the struggle for socialism that had emerged historically in and through the development of the workers’ movement itself. Historical Marxism did not formulate independent schemes for emancipation, but sought the potential social-emancipatory content of emergent political phenomena in light of history. [...] Marxists] advocated the workers’ right to rule, but followed other [non-marxist] socialists in doing so” (Cutrone 2011b).

Thus, the question if the Marxist vision should be adopted or if it is still plausible is a misleading question because it overlooks the more fundamental problem that has to be addressed first: The problem of the historical changing relation between theory and practice. Indeed, the history of Marxism, its origin, its crisis and renewal and ultimately its failure made it necessary for Marxists to discover and rediscover this problem through the method of dialectics. This constant task of revision is precisely the value of the engagement with Marxism – not as a dogma, theory or method to be applied, but as a series of attempts for the historical self-clarification of the task of emancipation under historical changing relations of theory and practice. Reengaging in the clarification of the problem of political orientations as historically changing relations of theory and practice provides a pathway to move beyond the limits that the prevailing political culture poses on finding answers to the problem of the far-right and emancipation. The value of this approach lies in its negativity, meaning that it does not prescribe specific solutions to these problems but instead fosters new and creative responses to contemporary challenges – both in therapy and beyond. It achieves this task by estranging our cultural preconceptions about political orientations, thus potentially contributing to a critical historical consciousness about the possibility of change, and advancing our comprehension of the emergence of emancipatory motives. To archive this goal, we must consider what an appropriate approach to Marxism is today, since the Marxist vision cannot simply be adopted.

2.6. The Marxist Wager

Marxism has been described as a wager (Goldmann 1964; MacIntyre 1971) on the possibility of fundamentally transforming our modern capitalist society through political action, realizing its inherent emancipatory possibilities by appropriating capital’s potential for freedom. Describing Marxism as a wager emphasizes that no certainty of outcome can be claimed, nor can the emancipatory transcendence of capitalism be guaranteed. This perspective distinguishes Marxism from other political orientations, which make different assumptions about the future – such as the belief that abandoning capitalism

would inevitably lead to worse outcomes, restricting emancipation and democracy even more than under capitalism. Is Marxism as a wager plausible as approach?

What is certain, however, is that historical Marxism has failed. Its “failure [...] was profound. Hence, there is no Marxism to return to. There is no answer, only a question. The question is the failure of Marxism” (Cutrone 2012:3). This failure directs us to the history of Marxism, particularly its crises. Historical Marxism has renewed itself by grasping its historically changing relation of theory and practice through its entangled history with capitalism. Dialectical self-criticism was used to understand how Marxism manifested the contradictions of capitalism in its own history through splits and contradictions, such as the revisionist debate and the collapse of the Second International. These fissures made necessary and possible, at the same time, the dialectical critique of Marxism and the workers' movement by Rosa Luxemburg, Lenin, Trotsky, and others. From the 1848 revolutions onwards Marxism was repeating and escalating through these dialectics societal contradictions and crises on a higher and more dramatic level, culminating in the revolutions of 1917-1919 (Cutrone 2021b).

Marxism has failed to bring about the societal emancipation it strived for. The failure contributed to the catastrophes of the 20th century: The rise of fascism and in particular Nazism, the Holocaust, World War II and the atomic bomb. We live in a historical situation where there is no revolutionary proletariat in sight. Additionally, one could argue, from a counterfactual perspective, that the workers' movement might have been more successful in the end without Marxism. We could entertain the thought that the dominance of Marxism, pushing for proletarian socialism, was actually the decline of the workers movement, and that other forms of socialism, such as anarchism, feminist or utopian socialism could have advanced the task of emancipation beyond what Marxism archived.

Setting aside the counterfactual perspective, the possibility must be considered, “that the potential Marxism expressed missed its chance, and has carried on only in a degenerate, spectral way, until passing effectively into history” (Cutrone 2010c). However, the Marxist wager is entangled with the fate of capital, whose potential for freedom it seeks to appropriate. Since capital holds unbroken historical significance, the obsolescence of Marxism can be doubted, but it cannot be rejected either, especially as Marxism is now disentangled from the workers' movement.

This condition of our contemporary situation turns the wager into a true dilemma. It is often resolved by dogmatism or an existential leap into a quasi-religious creed or otherwise structured set of believes. However, such resolutions would fall short of the scientific dialectics of Marxism, as articulated by Lukács and Korsch, which seek historical self-clarification rather than immediate solutions. Such an existential leap would not realise the needed estrangement of our cultural preconceptions to advance our understanding of the emergence of emancipatory motives. It would not provide insights into political orientations as

historically changing relations of theory and practice. Thus, the Marxist wager cannot be a foundation for this inquiry.

2.7. The Marxist hypothesis

Instead of the wager, I suggest to use the Marxist hypothesis as put forth by Chris Cutrone (2010c). The Marxist hypothesis understands modern history of mass politics and emancipation through the lens of “the history of capital and its potential overcoming, as expressed in the history of Marxism¹⁷ [...]”. This would be a history of the emergence, crisis, and decline of Marxism as expressing the possibility of getting beyond capital, as Marx and the best Marxists understood this” (ibid.). However, this is not a linear history of events, but an inquiry into how the different ‘Marxisms’ understood the problem of capitalism tasking emancipation and how past attempts failing to solve this problem have resulted through the political regression of the left in our contemporary limits in imagining emancipation. In this sense, the Marxist hypothesis can be seen as a methodological device for estranging our cultural preconceptions of emancipation, political orientations and their contemporary desirability.

According to Cutrone the “Marxist hypothesis is that Marx’s thought and [the subsequent Marxist] politics correspond to a moment of profound transformation in the history of modern society, indeed, in the history of humanity: the rise of ‘industrial capital’ and of the concomitant ‘social-democratic’ workers’ movement that attended this change” (Cutrone 2010c). While the plausibility of the Marxist vision can be debated, it cannot be denied that Marxism was the most encompassing attempt at a fundamental emancipatory transform of modern industrialized society that reached an impact on the world scale. In this sense, the historical fate of Marxism is intimately intertwined with the development of modern politics after 1848.

This unique entanglement of Marxism with modern politics makes it possible to illuminate the history of modern emancipation through the history of Marxism and its self-criticism. This justifies the core assumption of the hypothesis “that Marxism, as a perspective and politics, could be the vital nerve center of modern history” (ibid.). The Marxist hypothesis seeks “to grasp the history of the specifically modern society of capital, the different historical phases of capital as characterized by Marx’s and other Marxists’ accounts, beginning in the mid-19th century” (ibid.). The 19th century’s discovery of history marked a profound realization: humanity is not just passively shaped by external forces, but actively engages in its historical self-transformation. History, therefore, is not just a chronicle of events but the unfolding record of humanity’s ongoing “self-production; it is the activity of a historical being recovering the past into a present which anticipates the future” (Preuss 1986:1).

¹⁷“It is divided into the different periods in the history of Marxism: from 1848–95, the publication of Marx and Engels’s *Communist Manifesto* to Engels’s death, to 1914–19, the crisis of Marxism in war and revolution; and from 1923–40, post-Bolshevik Marxism, to 1968–89, the “New Left” and the collapse of ‘Communism’” (Cutrone 2010c).

The problem of history is, for Marx, capital. The “hypothesis is that capital is the source of what Kant called ‘universal history’”(Cutrone 2010c). We must at first understand what Kant meant by universal history, before moving to Marx. Kant (1784b) argued that ‘universal history’ was essential for emancipation because it was not just a record of past events but a tool for guiding humanity towards freedom and autonomy. By viewing history as a reason-driven process, individuals could align their actions with principles that promote human development and overcome ignorance and oppression. He believed that without such a perspective, nations might remain trapped in cycles of conflict and competition. Universal history, therefore, fosters the recognition of a common human destiny, encouraging peaceful and cooperative relations – echoing Adam Smith's (1776) ideas on economic interdependence and mutual benefit.

Marx's version of universal history recognizes the industrial revolution as an inflection point giving rise to both undreamt-of potentials for human freedom as well as oppression and self-destruction. Marx distinguished “the moment of industrial capital as marking the crisis in modern society—or even, an event and crisis in ‘natural history’ – in which humanity faced the choice”, epitomized in Luxemburg's expression ‘socialism or barbarism’, stated during the first World War (Cutrone 2010c). For humanity to realize capital's potential for freedom, humanity would need to be appropriated capital consciously and realize it's potential by transforming society. If humanity would fail to do so, it would be continued to be dominated by capital as alienated objective totality.

Marx recognized that the “classical bourgeois forms of politics that had emerged in the preceding era of the rise of manufacturing capital in the 17th and 18th centuries, liberalism and democracy, proved to be inadequate to the problems and tasks of modern society since the 19th century” (ibid.). These problems result according to Marx from capital giving rise to opposing but real needs, resulting in endless cycles of new societal conflicts, unforeseen by the enlightenment radicals, where attempts to resolve the problems of society were rendered contradictory, perpetuating the problems they sought to overcome. The bourgeois horizon for emancipation, Kant's universal history, was not capable to reckon with the contradictory nature of capital driving these conflicts. According to Marx, this new situation demanded “to press further the gains of historically ‘bourgeois’ liberal democracy” by expanding mass politics, cultivating a new collective and critical consciousness (Cutrone 2011b). This possibility was for Marx “expressed in the workers’ demand for *social* democracy, which Marx thought needed to be raised to greater self-consciousness to achieve its aims” (ibid.). Otherwise, it would not be capable of recognizing the reality of opposing needs as a false necessity, resulting from the failed appropriation of capital's potential for freedom.

This required a dialectical approach to politics because moving beyond the partiality of opposing needs could only be achieved from within the conflicting societal reality. Transcending the partial perspectives demanded the standpoint of a new universal history – which Marx found embodied in capital. Thus, Marxists did not come “with blueprints for an emancipated society in hand. [...] They] advocated pursuing the forms of the struggle for socialism that had emerged

historically in and through the development of the workers' movement itself. Historical Marxism did not formulate independent schemes for emancipation, but sought the potential social-emancipatory content of emergent political phenomena in light of history" (Cutrone 2011b), included Marxism itself – especially in times of crisis.

In contrast to the wager, the failure of Marxism serves in the Marxist hypothesis as a crucial moment to inquire into the historically changing relation of theory and practice – not only of Marxism, but of the Left as a whole, in the sense articulated by Kolakowski. Thus, this failure provides a unique perspective to clarify the meaning of emancipation, by taking it serious as an unresolved socio-historical issue. As Cutrone argues (Cutrone 2010c):

While Marx and Engels had written of the 'specter' of communism, today it is the memory of Marx that haunts the world. This difference is important to register: Marx and Engels could count on a political movement – communism – that they sought to clarify and raise to self-consciousness of its historical significance. Today, by contrast, we need to remember not the historical political movement so much as the form of critical consciousness given expression in Marxism (ibid.).

By focussing on the failure of the Left the perspective of the Marxist hypothesis seeks to grasp the history of radical antipolitics, which haunts the contemporary political imagination. While the Right appears to strive on the contemporary contradictions and preconditions, which are – alter all – marked by the absence of a powerful Left, the left needs to clarify how these contradictions and preconditions relate to the task of emancipation. The Marxist hypothesis helps us to see through contemporary representations of politics as abstract principles that oppose each other to different degree (such as democratic vs authoritarian politics). This would reduce the task of emancipation to fighting 'anti-emancipatory' currents.

By focusing on the failure of the Left, the perspective of the Marxist hypothesis seeks to understand the history of radical antipolitics that haunts contemporary political thought. While the Right seems to thrive on the contradictions and preconditions of today – conditions marked by the absence of a powerful Left – the Left must clarify how these same contradictions and preconditions relate to the task of emancipation. The Marxist hypothesis helps us see through contemporary representations of politics, which are often framed as opposing abstract principles (such as democratic vs. authoritarian politics). This narrow framing reduces emancipation to the task of merely combating 'anti-emancipatory' forces.

The Marxist hypothesis warns us of such illusions and encourages us to understand democracy, liberalism, socialism, conservatism, the far-right and fascism as contradictory, historically changing *and* interrelated phenomena, that are *necessary* expression of a society that is not only dominated by the needs of capital that needs to reckon politically with its domination by capital. For Marx, the historic significance and distinguishing feature of socialism (or communism) as a political movement did not lie in the consciousness it expressed – it was to him as bourgeois as other forms of politics – but in its embodiment of a

contradiction that pointed beyond itself. To Marx, this contradiction signaled the potential to overcome society's "need for 'bourgeois' politics per se. But this was to be achieved through the politics of the demands for *bourgeois* rights of the working class [...]. Marx sought the potential in capital of going beyond demands for greater liberalism and democracy. Subsequent 'communism' lost sight of Marx on this, and disintegrated into the 20th century antinomy of socialism and liberalism. The Marxist hypothesis is that Marx recognized the possibility, not of opposition, but of a qualitative transformation, in, through, and beyond bourgeois society" (Cutrone 2010c).

Recalling this critical consciousness, rooted in historical Marxism, helps us steer clear of the illusion that the task of emancipation can be replaced by quick theoretical or political solutions. Whether it's the desire to exclude political orientations deemed undesirable from a particular standpoint in contemporary political conflicts, or the promise offered to professions such as therapists and social scientists to secure a position of power in managing society's ills in seemingly benevolent ways, these shortcuts divert from the deeper, ongoing work required for true emancipation. The suggested approach recognizes instead the insufficiency of all political orientations today for the task of emancipation; or more precisely as being alienated from the task of emancipation. Developing a conscious recognition of the desire to abandon the clarification of the task of emancipation in favor of immediate politics can inspire us to take up this task again by making us aware of what we miss. In chapters four and five, I have elaborated on how this recognition can advance our understanding of cultivating emancipatory motives by building on the insights of Ágnes Heller and Georg Lukács and connecting these insights to theories and debates in Critical Psychology.

The Marxist hypothesis instructs us, "today, to view the history of the modern society of capital through the figure of Marx" (Cutrone 2010c). But doing so can only be done by critically examining the history of the wagers of Marxism, which entails understanding Marxism as a historically situated theory-practice relationships – in plural as 'marxisms' – that have not (yet) brought about the emancipation from capital. While Marxism has failed, its memory remains, embodied not in the spectre of communism – as in the time of Marx – but in the spectre of Marx and Marxism, which continues to haunt the political imagination to this day. The Marxist hypothesis guides us through the spectre of Marxism(s) as a series of attempts of historical self-clarification of the socio-historical unresolved task of emancipation to rediscover the specific form of critical consciousness Marxism gave rise to. Thus, the wager of Marxism remains – even in its most regressive and dogmatic forms. So does capital and history. And with it, the historical task of overcoming the alienation of our present condition that cultivates across the political spectrum the collective experience of existential threat, despair and the anticipation of the loss of agency, on which the Right knows to thrive. This alienation is reflected in a political culture that lacks a living embodiment of the concrete utopia of freedom and harbors a deep-seated pessimism about the emancipatory potential of subjectivity. This culture limits the political imagination, restricting the horizon of emancipation to the

suffocating immediacy of the present, which has itself moved through many political mediations to reach the reified immediacy that almost totally obscures the trajectory of emancipation.

Yet, paradoxically, rediscovering the limits of contemporary political culture through this history of the failure of the Left might advance our understanding of the task of emancipation and the cultivation of emancipatory motives. The historical perspective of capital as the source for universal history unfolds a standpoint, capable of overcoming the immediacy of the false necessity of opposed but real needs. Thus, the Marxist hypothesis might provide us with crucial insights into the problem of political orientations, which are absent in the prevailing political culture. It advances our understanding of political orientations as contradictory phenomena related to attempts to solve the problems of capitalism, tasks the Left with emancipation, and urges us to rethink the problem of political orientations rather than reifying societal conflicts and opposed needs by personalizing political orientations.

Part Two

Chapter 3: Political Culture and Subjective Responses to the Far-Right: Overcoming Present Limitations

I think it is not an exaggeration to claim that the prevailing response to the emergence and successes of far-right parties is to define the present as a crisis, which is understood as a call to action to defend ‘the’ or ‘our’ ‘democracy’. Those calls to actions don’t specify what is understood by democracy but are in effect a more or less authoritarian restriction of democracy with the pretence of avoiding undesirable outcomes that are defined as undemocratic. In my opinion this also holds true for the far right itself – excluding the influence lacking fascist minority (Davidson 2015; Renton 2019, 2020; Saull 2015) (see footnote for further elaboration and explanation of my position¹⁸). The latter claims to resolve

¹⁸I am aware that my position may seem contentious, particularly as I do not offer a strict definition of fascism here. First, it is crucial to differentiate fascism from other far-right tendencies. Historically, the far right cannot be seen as an inevitable progression toward fascism (Paxton 2004). This oversimplified "slippery slope" theory diminishes the unique dangers posed by fascism, particularly the horrific singularity of the Holocaust. Moreover, the idea that fascism always culminates in an extreme, antisemitic form like Hitler’s regime risks trivializing the specificity of the Holocaust.

The emergence of fascism in contemporary liberal democracies is highly improbable, even under historical conditions that once favored its rise as a radical, violent counter-revolutionary movement (Paxton 2004). Consider some key factors that fostered the growth of fascism in the 20th century: rampant chauvinistic imperialism, militarized societies shaped by unprecedented carnage during World War I, a revolutionary proletariat, the Russian Revolution, and significant geopolitical and economic turmoil, such as the Great Depression and hyperinflation (Pätzold 2013; Pätzold and Weissbecker 2009; Paxton 2004; Renton 2020; Weißbecker 2020). None of these conditions exist in a form comparable to that time. Despite these conditions, fascism only rose to power in two cases from *within a non-fascist* nation-state: Germany and Italy (Payne 1996).

Fascism is also not a monolithic phenomenon; its different movements can conflict with each other. The conservative right has historically opposed fascist movements, often seeing them as threats rather than allies (Paxton 2004). Furthermore, the relationship between capital, fascism, and the far right is inherently

the crisis not by limiting but by doing away of liberal democracy to replace its institutions with the expansion of the authoritarian state.

As a first step it is important to recognize that these crisis-definitions embody claims of social groups and social movements for the ownership of social problems, that are articulated in reified form and often addressed by claiming a superior moral standpoint (Gusfield 1989). In this process social problems are presented as solvable if the 'right' political approach is chosen. This disguises what Rittel and Webber (1973) called the wicked nature of social problems, meaning that they can't be solved objectively but are subject to the contingency of the societal process that transforms them.

It is crucial to understand that all such claims have so far failed to realize their promises to resolve the problems of capitalism (see chapter two and four). This failure has led to the generalization of a rather pessimistic account of subjectivity that is deemed incapable to bring about freedom and therefore needs to be ruled in one way or another. This represents a dominant aspect of the prevailing political culture encompassing the whole political spectrum. By example of the mental health industry Ashley Frawley (2024) illustrates this

contradictory. Fascism does not simply serve the needs of capital; rather, it embodies contradictory tendencies within capitalism that require specific historical conditions to become relevant (Davidson 2015). Fascism does not merely express the needs of capital; instead, put simply, it embodies contradictory tendencies within capital that require specific circumstances to become relevant (Pätzold 2013).

It is essential to recognize that many diagnoses of fascism made by the left, particularly since the rise of the New Left, have often been inaccurate (Passmore 2014). Therefore, I argue for rejecting the tendency to label every authoritarian development and reactionary movement as fascism. This tendency is rooted in the New Left and the prevailing political culture that emerged with it. It is based on the premise that social movements claim ownership of socially constructed problems from a moral standpoint (Gusfield 1989). This has led to an overuse of the term 'fascism,' which, as Palmiro Togliatti pointed out, risks reducing it to a catch-all for any authoritarian or reactionary development. He criticized this during the interwar years, stating that labeling every instance of political repression as fascism does little to clarify the actual nature of the threat: "If someone thinks it is reasonable to use the term 'fascism' to designate every form of reaction, so be it. But I do not see the advantage we gain, except perhaps an agitational one. The actuality is something different. Fascism is a particular, specific type of reaction" (Togliatti in Renton 2020).

It might not be an exaggeration to say that the left had its best political understanding of fascism during the interwar period, as seen in the analyses of Marxists from that era (Renton 2020). However, this understanding is now mostly forgotten, deliberately misunderstood, or even considered reactionary (Pätzold 2013:26–58, 2015; Weißbecker 2020:406–19). Fascism needs to be defined clearly in terms of its specific practices and theories, which embody a historical horizon for transforming society. Idealistic trends that obsessively reduce political practice to language and discourse should be firmly rejected as reductionist (Renton 2001).

In my assessment of the current political landscape, I align with antifascist historian David Renton, who argues that the fascist elements within the modern far right remain marginal and have not (yet) significantly capitalized on the broader success of far-right politics – however, they might (Renton 2019, 2024). The antifascist stance I support is rooted in opposing fascist elements specifically, as they close off emancipatory possibilities. Mislabeling non-fascist far-right movements as fascist is counterproductive and can inadvertently strengthen actual fascist movements (Renton 2019). In this light, 'negative' antifascist tactics should be reserved for genuine fascist threats, while 'positive' emancipatory politics should be the primary means of countering the broader far-right. Appeals to state power or restrictions on free speech, including hate speech laws, should be avoided by the left (Renton 2021, 2022). While there may be complex situations where opposing such laws is challenging, the left should remain committed to opposing restrictions on civil liberties, such as free speech, and focus on creating a cultural space for open debate. Criticism should be rooted in emancipatory practice rather than moralistic or paternalistic judgments (Renton 2021).

strain of the prevailing political culture. She argues that such failed claims narrate “a society stuck between what *is* and what *ought to be*. That is, the gap between the promises of the modern world and the world *as it is* has come to seem like an unbridgeable chasm. The persistent inability to move beyond some of the most wicked issues of the present has led to their gradual naturalization and relocation within the human soul [...]. However, [...] the problems promised finally to be solved are still there. As they persist so too does the underlying story which places human subjectivity at the centre of a system of social problems. [...] The conclusion is [...] ‘human subjectivity is far weaker than we imagined’” (Frawley 2024:3). Such pessimistic accounts of subjectivity that habituate a society stuck in an everlasting present between what is and what ought to be express the alienated political culture. This is crucial to be kept in mind to understand the problem-formation in the therapeutic process.

To establish the deeper foundation for my argument on why and how therapists can and should move beyond the prevailing political culture when confronted with right-wing clients, I want to briefly describe the unique situation therapists find themselves in. From this starting point, I aim to develop the inherent contradictions that hold epistemological value for my argument (for the concept “epistemological value of contradiction” see f.e. Højholt and Kousholt 2020; Ollman 2015).

The discussion will outline the subjective processes that shape therapists' responses to encounters with right-wing clients, situating these processes within a cultural and historical perspective. With appropriate concepts, these subjective responses can become valuable meaning-making resources for overcoming the immediacy of the prevailing culture. It is crucial to distinguish the suggested concept of meaning-making from discourse, as it encompasses subjective processes involving emotional, conceptual, and symbolic aspects that constitute motivational systems (González Rey 2018a). While this may seem similar to psychoanalytic conceptions of meaning, the differences are significant (González Rey 2019c, 2019d). The suggested concepts – liminality, fabulation, and historical prototypes – are only preliminary. Developing an adequate framework for describing these subjective processes requires advancing these concepts through a substantial discussion of the theory of subjectivity and theoretical psychology more generally (González Rey 2017; González Rey, Mitjans Martínez, et al. 2017; González Rey 2018a, 2019a, 2019c, 2019d, 2019b, 2019b; Teo 2018). An explicit discussion of theorizing subjective processes is crucial to overcoming the limits of culturally prevailing conceptions, such as psychoanalytic theories.

Let's begin by considering that therapists are continually confronted with the historical and cultural boundary of what is considered sane and what is deemed insane/mad (Dörner 1969; Foucault 1969). Regardless of their therapeutic orientation, therapists must engage in a collaborative meaning-making process, drawing on frameworks of meaning that help clients navigate this boundary to live more meaningful lives and overcome constraints (Richards and Stenner 2022:193f). Whether this 'help' is genuinely emancipatory or a form of social control, these “frameworks of meaning which Psychology and its clients

jointly supply are [...] part and parcel of the cultural process by which that boundary is continually revised and the meaning of madness itself constantly reformulated” (Richards and Stenner 2022:197).

As Helmut Dahmer elaborates with the case of psychoanalysis, this places emancipatory psychotherapeutic practice in a peculiar position. Initially, it must disguise itself in a scientific language to claim ownership of life problems that appear reified and medicalized as mental illness or in other forms that individualize life problems. “Why? Because it must take the pseudo-natural status of its 'objects' (patients, clients) seriously until they are able to extricate themselves from it” (Dahmer 2001:31–42, 2012). It is worth noting here, though I will elaborate later, that within this reification lie contradictions that harbor the potential to overcome the prevailing political culture. I will address this later as a historical problem to cultivate meta-motivation.

3.1. Liminality

To advance my argument, I suggest that situations within therapy where the process of meaning-making revises naturalized meanings, or those co-created by these processes, can be considered liminal. Paul Stenner (2017:62) explains liminality as “the ‘betwixt and between’ condition of being *in the process of crossing a threshold* (i.e. of becoming). Gennep’s concept of liminality was developed to understand the rituals of the small-scale societies traditionally studied by anthropologists, but Victor Turner (1969), Arpad Szokolczai (2009) and others have extended its use to modern societies and also to the kinds of spontaneous (as distinct from ritualized) liminal experiences [...]. Any situation involving the removal or erasure of the usual limits that organize life (providing recognizable social identities and positions with allocated rights and responsibilities, etc.) can be considered liminal (Thomassen 2014)”. Therefore, the process of the revision of meaning in therapy is, on a more general level, not that different from other cultural meaning-revising processes, like the historical experience of tragedy in art (Stenner and Zittoun 2021). The concept of catharsis directly illustrates this parallel.

While the experience of liminality as a process of becoming primarily pertains to the client in therapy, it would be incorrect to assume that therapists remain unchanged throughout this process. Therapists inevitably develop their practice in conjunction with the client’s liminal experiences. This is particularly evident when considering supervision and similar social practices as rituals ingrained in therapy culture, designed as liminal spaces to help therapists learn from and overcome challenging experiences. These situations not only offer therapists their own liminal spaces but also highlight that the motivation to participate in such practices can be triggered by a liminal experience in therapy. This fits Stenner’s description of liminal experiences as a temporary suspension of limits with the potential to transition to a different set of limits, marking the emergence of novelty (Stenner 2021).

When therapists encounter clients with far-right political orientations, reflections on underlying cultural processes can emerge. While therapists may often be unconscious of their roles as both subjects and objects within these processes – particularly since their profession relies on the existence of 'troubled person industries' – the meaning-making processes specific to therapy culture are likely to fail in providing convincing meanings for encounters with right-wing orientations. The lack of orientation tools (*Orientierungsmittel*) and offers (*Orientierungsangebote*) within therapy culture creates problems for therapists in developing an orientation capable of navigating such encounters. This is especially true since conscious reflection on broader cultural and societal processes is unlikely. Before describing the subjective processes likely to emerge instead of conscious reflection, I will specify such encounters in more detail.

Firstly, such encounters can manifest as conflicts among therapists, their clients, and co-workers over whether the right-wing orientation is pathological – in the traditional sense of the concept. This can draw attention to the historical revision of the sanity-insanity boundary. More importantly, these encounters can lead to a crisis where prevailing meaning-making processes are temporarily suspended. This can occur in moments when clients disclose their far-right orientation to therapists, or when therapists are suddenly struck by the realization that their client might belong to the far right. It can also happen when therapists seek self-clarification and support from colleagues, only to discover in a sudden turn of events that their colleagues may themselves hold far-right or 'anti-democratic' views. Such scenarios can motivate therapists to actively participate in social practices within the therapy culture, such as intervision, supervision, or informal collegial counseling, to gain a better understanding of their clients' political orientations. Alternatively, they may seek this understanding outside the established therapeutic culture.

3.2. Fabulation

While such scenarios include moments of crisis and accompanying liminal experiences that suspend prevailing meaning-making processes therapists, that encounter such scenarios, might rarely consciously reflect on the underlying cultural processes, but, and that is more important, they must engage in reimagining political culture in order to orientate themselves. Such engagement can be theorized with Stenner as fabulation. Fabulation conceptualized “*as the passage* from disturbing event to creative intuition. This passage need not lead to a creative advancement, but might get blocked in a purely destructive phase, in conservatism, or in an unproductive paralysis” (Stenner 2017:61). Fabulation is a myth-making capacity that engages with the world on imaginative grounds, that precedes conceptual understanding. Before “we can accurately describe the world, we must imaginatively construct it, and become an active part of it. [...] Fabulation points to this affectively charged process of construction that necessarily precedes the more abstract and intellectual business of concept formation and abstract thought. Fabulation, from this perspective, is less a

question of misrepresenting a pre-existent world of facts, and more a question of gaining imaginative access to a world that ever exceeds us, but that we are already in some sense a part of” (Stenner 2017:39f).

Another aspect of fabulation is crucial here. That pertains the fabulation of a collective. In this way, Fabulation “is tied to a necessary project of creating ourselves, both individually and collectively: a project of self-formation through culture. Any human collective necessarily involves a fabulation of sorts” (Stenner 2017:40). I find Stenner’s understanding of fabulations helpful because it conveys the power of imaginative practices to engage individuals into collective projects. Considering my outline of the prevailing political culture so far how fabulations might recruit oneself, colleagues or clients into the defence of ‘democracy’, including convincing oneself of the necessity of such a defence and thereby chaining one’s imagination to the immediacy of the pessimistic and alienated horizon of the dominant political imagination of the present. Therefore, “to fabulate a collective is not merely to imagine a people, but to invent an idea powerful enough to *collect* one. This always also means: powerful enough to undo the principle that had collected them to date” (Stenner 2017:66).

In other words, fabulation in the context of such scenarios as described above allows to engage with subjective processes that are not simply reproducing dominant political orientations but rather subjectively configuring the reimagination and recreation of political culture (for the concept of subjective configurations: González Rey 2017; González Rey, Mitjans Martínez, et al. 2017). While this does not mean to move beyond the prevailing political culture, engaging with such subjective processes is a starting point, since they are related to liminal moments that are generative. Nissen notes: Liminality in regard to fabulation does “not merely point to the situation of being in-between but also to the cultural formation of this situation and of the hopes of becoming that it harbored and (thus) to the artifacts with which this formation was accomplished [...] and on why fabulation, the creation of model artifacts, is more than simply true or false replicas of a given situation” (Nissen 2023:149).

To further clarify the task of moving beyond the immediacy of the prevailing political culture, it is essential to note that fabulation is intrinsically connected to the concept of utopia. Fabulation occupies the middle ground between abstract utopia, which can be understood as blueprints for how society should be, and concrete utopia, which serves as a negation of the present (Kołakowski 1969). The latter embodies a future-oriented surplus of not-yet-realized emancipatory tendencies embedded in the societal process, capable of overcoming the immediacy of prevailing political culture (Bloch 1959; Marvakis 2006, 2007). Compared to the conceptions of utopia, fabulation “points to a more messy, liminal and un-predetermined process of transformative passage. [...] The concept notably emerges from debates about the origins of religion and the sacred, pointing to a zone of indiscernability between the aesthetic and the sacred (see Stenner, 2017b). A moment’s reflection shows that we have wandered into territory that is a profoundly transdisciplinary mixture of art, politics, religion, psychology, philosophy, anthropology and, [...] historical sociology” (Stenner 2018:179).

What can't be pursued here is that the zone of indiscernability between the aesthetic and the sacred holds important implications pertaining the advancement of the study of the interplay of subjective processes and cultural representation of the fascist far right. However, the next section will draw on historical and sociological studies that have investigated this topic regarding how invocations of the cultural representations of the fascist far right after the world war II are used to foster political legitimacy and how those practices transform national remembrance culture; the usage of the collective memory of the holocaust to legitimize authoritarian measures; and the reconfiguration of the political legitimization of American imperialism post 9/11 (Bond 2015; Herz 1996, 1997; Herz and Schwab-Trapp 1997; Schwab-Trapp 2002, 2007; Segev 2000).

3.3. Fabulation and Political Orientation

To advance my argument, it is crucial to examine the content that fabulation, as a myth-making capacity, might produce in scenarios where therapists encounter far-right political orientations in their workplace. This examination requires connecting the concept of fabulation with my depiction of political orientations as historical theory-practice relations. When considering the explanations, I have developed so far, it becomes clear that therapists are both the objects and subjects of these historical theory-practice relations. However, it would be an overstatement to suggest that therapists possess a conscious theoretical account of the societal arrangement of their everyday lives. Instead, through their political orientation, they produce a vision of society that can be better understood as myth-making. Contrary to popular opinion, this myth-making is quite similar to the societal theories developed by social scientists, who themselves are not outside historical theory-practice relations (Marvakis 1996:65–78).

While the claim that social science itself is a social problem is overly simplistic and fails to address the reification of societal relations as mere social problems, such claims can nonetheless highlight the effects of social scientists' efforts to address issues within capitalism (Best 2003). For instance, Christensen (2013) illustrates how public sociology creates visions of society as quasi-mythical plights populated by villains and saviors, to whom motives and desires are ascribed, thereby outlining paths to progress and presenting the framework of public sociology as the remedy. Considering this, I believe it is justified to claim that social scientists are not necessarily more or less conscious than therapists of the societal arrangement of their everyday lives, because, in the end, their job is to integrate progressive developments into the welfare state (Marvakis in press).

The existence of the welfare state, both in the West and in the former Eastern Bloc, relies on a state-managed capitalist economy—originally in the form of Fordism and now in the form of neoliberalism. Even when attempts to integrate progressive developments into the welfare state are successful (Pollock 1941), they remain perilously insecure and constantly vulnerable to attacks aimed at saving the system from the threat of crisis, whether the crisis is real or politically manufactured (Marvakis et al. 2016). Therefore, the development of

the welfare state can be seen as the failure of revolutionary alternatives. This failure has fundamentally shaped the world we live in, yet social sciences struggle to grasp its full meaning. Like therapy, social science is situated in a world stuck between what is and what ought to be. In the wake of the failure of historical theory-practice relations, only fabulation (not theory) remains to bridge this chasm: “Sociological and psychological concepts are too superficial to express what has happened to revolutionaries [... in those] decades: their will toward freedom has been damaged, without which neither understanding nor solidarity nor a correct relation between leader and group is conceivable” (Horkheimer 1942).

3.4. The Naturalization of Politics within the Prevailing Political Culture

Having established the connection between political orientation and fabulation, my argument must take an intermediate step before exploring the contents of fabulation that might emerge when therapists are confronted with far-right orientations. This is necessary because fabulation, as a myth-making capacity, must draw from the meaning-making resources of the prevailing political culture. To explain this, we must first delve deeper into the political culture before returning to the practice of fabulation.

Given the context of this political culture, as previously outlined, the fabulation will inevitably contain reifications. Political orientations, understood as historical theory-practice relations, are reified within the prevailing horizon for societal transformation, limiting possible means of political change to a specific set of practices. For example, this naturalization can be understood through the established distinction in political science between politics, polity, and policies. This distinction emerged and became prominent through the work of influential scholars like Max Weber (1905, 1921), David Easton (1956), Talcott Parsons (1937, 1950), Harold Lasswell (1950, 1963), Gabriel Almond and Bingham Powell (1966)

The distinction defines politics as the overall process of governance, including decision-making, conflict resolution, and the struggle for power and influence that is driven by different political ideologies. Polity: The constitutional structures, legal systems, and forms of government that shape the institutional framework within which political processes occur. This is also understood as the ‘the body’ of politics as the institutional framework within which political processes and activities take place. Policies: The principles or courses of action adopted or proposed by governments, addressing specific issues through laws, regulations, and programs, like healthcare and economic policies.

Using this framework, we understand how certain forms of politics, such as liberal democracy, are institutionalized as the most rational and desirable way of doing politics, while other conceptions like one-party dictatorships, paramilitary rule, or absolute monarchies are outlawed. This perspective, however, is not sufficient to understand the naturalization of politics and why far-right orientations are represented as anti-democratic and irrational. To grasp this fully,

we must revisit the conception of political orientations as historical theory-practice relations.

The cultural representation of liberal democracy suggests that a system deemed most desirable and rational would only be rejected for irrational reasons. While this perspective is not entirely incorrect, it presupposes a reified way of conceptualizing politics and the far-right. It implies that undesirable outcomes of the system are independent of its inherent value and must ultimately be external to what is considered proper or real democracy. Consequently, undesirable outcomes are often explained paternalistic by demagoguery, corruption, or the confused subjectivity of those who have not (yet) 'seen the light'.

This perspective frequently leads to the development of measures to control such undesirable outcomes, justified by references like the paradox of tolerance (Popper 1945). These means of social control or biopolitics employ psychological technologies and have significantly influenced the development of psychology as an academic discipline. This influence is exemplified by Harold Lasswell's (1948) influential model of communication, developed through his studies of propaganda and drawing on psychoanalytic resources (Lasswell 1927, 1935, 1949), exemplifies this influence. Lasswell, along with Walter Lippmann (1922) in his book "Public Opinion," argued that liberal democracy requires propaganda to function effectively. Lippmann further contended that public opinion should be controlled by an intellectual elite, echoing Tocqueville's and Burke's older pessimistic sentiments about the feasibility of mass emancipation, which they described as the tyranny of the masses (Landa 2009). Together, Lasswell's and Lippman's work suggests that institutions of liberal democracy dominate other political orientations. This candid account should not be surprising, considering that political science emerged as a project of the liberal allies who emerged victorious from the Second World War and had to reckon with the world system that developed afterward.

This perspective, however, understates the fact that liberal democracy is also a political form of heterodoxy, where some people dominate others through the state monopoly on violence. Justifications like the tolerance paradox overshadow the historical preconditions that make reified cultural representations of the far-right comprehensible. Categorizations of the far-right as irrational rely on an individualized understanding of political orientations, reducing them to personal attributes rather than historical relations of theory and practice. This view naturalizes political orientations to individual decision-making, as expressed in the idea of "one person, one vote," which presupposes the historical development of universal suffrage and the theory that political orientations can be quantified (Bourdieu 2001).

While the idea of "one person, one vote" might initially appear as a progressive call for universal suffrage, but the levelling of political judgment through its quantification can also seem problematic when considering that political thinking and judgment are not uniformly distributed. People's lives differ significantly, and not everyone has the same level of critical judgment about every aspect of society, often due to constraints imposed by their social position (Bourdieu 1982). The general comprehensibility of this idea presupposes

not only the quantifiable standardization of political opinions but also the production of the object of political opinions itself. This can be traced to a specific form of reification expressed in the development of mass politics in during the second half of the 19th century.

The political forms that emerged during this period are the historical preconditions for alienated political representation, which identifies individuals with political structures like parties, governments, policies or the body of politics as the state itself thereby cultivating authoritarianism. Howard Dick (2002) has referred to this as an anti-political crisis that is structurally rooted in modern politics. Such authoritarianism “claims that it incarnates the true realization of democracy when in fact it is the attempt to overcome the creative instability characteristic of democratic social relations typical of modernity” (Howard 2002:vii). Cutrone (Cutrone 2014b) extends this argument as “unmediated identification of politics with society, whether through the subordination of society or the liquidation of the party in the state - all in the name of quieting the inherent instability of politics, which society in its crisis of capitalism cannot afford”. This also marks the historical origin of the modern far-right (Saull 2015).

Ishay Landa (2019) explains that societal elites viewed the drive for mass emancipation and the emergence of mass society through industrial production as threats that needed to be contained. It is crucial to understand that it was not mass politics themselves but the dialectic between mass politics and the authoritarian response that created the historical conditions in which practices of alienated political representation originated, including the production of public opinion. The latter has since evolved into the business of manufacturing consent through public opinion production by market mechanisms and opinion polls, thereby providing numerous job opportunities for social scientists (Bourdieu 2001; Gusfield 1989).

Marx captured this historical constellation in his writings on the failed 1848 revolution and Louis Bonaparte's subsequent authoritarian rule, analyzing dialectically the emergence of the ‘bonapartist’ form of the modern authoritarian welfare state, later adopted by Bismarck. This model, featuring alienated forms of political representation, later became historically dominant, manifesting in various forms within liberal democracies, fascism, and Stalinism, thus integrating the masses into state-managed capitalism (Horkheimer 1942). Marx described how the emancipatory hopes of the exploited and oppressed masses get inevitably captured if they cannot lead and organize themselves politically: “They cannot represent themselves, they must be represented. Their representative must appear as their master, an authority over them, an unlimited governmental power protecting them from other classes” (Marx 1852:198f).

This reified historical form of politics, naturalized in prevailing political culture and tied to the development of the authoritarian welfare state, reduces democracy to established formal procedures like voting. Unwanted outcomes of these procedures, such as the success of far-right parties, must – in the absence of alternative conceptions of politics – appear in the prevailing political imagination as some kind of enigmatic almost mystic paradox. Democracy, reduced to a

voting procedure, is defined as the most desirable and rational system, sharing no similarities with far-right conceptions of politics, seen as irrational emotional appeals. If the naturalized horizon of this contradiction is not questioned, defenders of democracy may revise their democratic attitudes in authoritarian ways. In such a political imagination, other forms of collective self-determination that extend democracy beyond voting procedures will not only be overlooked but also appear anti-democratic.

This is crucial since the Marxist conception of politics, as class struggle, can explain the far-right's emergence without mystification by theorizing the problem of capitalism. Although class struggle remains landscape of the political imagination, its theory is confused and distorted. Class struggle is not culturally represented as a form of collective self-determination and potential to extend democracy but is seen one-sidedly as a means to improve living conditions rather than transcend the system entirely:

“The obsolescence of this second idea is merely a symptom of the fundamental change that has taken place since then: Class struggle has been transformed into a system of transactions between monopolistic entities, a means of class adjustment, and wars. Previously, the relationship between daily struggle and revolutionary goal determined the entire labor movement, at least in Continental Europe. Critical theory determined which path to take in each situation. However, the fighting class was not ‘integrated’ as just another competitor in the pursuit of surplus value. The party consciously did not concern itself with wage increases for its members or even the income, career, or social status of its leaders”, but aimed at fundamental social transformation (Horkheimer 1943).

3.5. Myth-making in Historical Prototypes and Crisis-definitions

With this context established, we can now turn to the content of the creative myth-making that therapists might engage in when confronted with far-right orientations. When discussing the fabulated content on a necessarily general level, I do not assume that the proposed elements of the content will be present in every encounter with the far-right or in every response of therapists to such political orientations. Rather, I believe this content will rarely be directly fabulated during such encounters, emerging more often in the aftermath when therapists try to make sense of what has happened. But this process can also occur during encounters, forming part of the response or reflection.

With this in mind, I am referring to a specific set of encounters which leave therapists at least momentarily troubled, unsettled or helpless, creating a need or wish to reflect, or share these experiences with someone supportive. Specifically, I am referring to those encounters and responses accompanied by some degree of discontent, malaise, confusion, disappointment, bewilderment, uncertainty, or anger, fear, or a sense of diminishing hope, or despair, or a more or less specific and lingering dissatisfaction with one's own responses to the encounter with far-right orientations that might even build up to feelings of shame, remorse, regret,

or the experience of personal failure. These subjective processes can evolve into problems that restricts therapists in their work, but they don't have to. I assume that what I describe as thefabulated content will also refer to instances where these subjective processes are a minor irritation in everyday working life, which therapists can mostly push aside and ignore but still feel the need or wish to discuss.

I understand the intentional engagement with such experiences as an opportunity for therapists because this engagement can serve as an entry point to historical self-clarification. This process is not only a prerequisite for addressing the task of moving beyond the prevailing political culture but also an opportunity to better understand how problems emerge in the therapeutic process and how to address them from an emancipatory standpoint. Our approach to this will always be influenced by our own political orientation, but we will rarely be aware of how history is expressed through our political orientation. Therefore, I consider such reflections valuable.

The content of fabulation will necessarily reflect how therapists and the collective they fabulate understand the problems of capitalism. This is because we inevitably situate our concerns with others' political orientations within the context of our times, drawing on the available meaning-making resources, including our explanations of how individuals come to adopt political orientations that we reject. Ultimately, we form an idea of the societal arrangement of everyday life for those whose political orientations we oppose. This is particularly pertinent for therapists, as their profession involves understanding and forming ideas about the social arrangement of their clients' lives (Dreier 2008, 2011, 2015).

Furthermore, such ideas are inherently – at least implicitly – included in our subjective explanations of political orientations that we reject. For instance, whether we believe that capitalism is characterized by contradictions that produce crises, or if we think crises are created by those who do not adhere to the correct norms. This understanding of capitalism's problems is closely linked to our concepts of emancipation: Do the crises of capitalism point beyond it in an emancipatory way? Must one morally combat capitalism? Does one see oneself as outside the capitalist relation? Is the expansion of the public sector within state-managed capitalism the road to socialism or not? Or do crises have nothing to do with capitalism, with emancipation running quite differently, for instance, through the advocacy of liberal values?

These questions are crucial for understanding the content of fabulation in the context of therapy, as they shape the way therapists conceptualize and respond to the political orientations of their clients. By examining these underlying assumptions and narratives, therapists can better navigate the complex dynamics of political orientations in their practice and contribute to a more nuanced and emancipatory therapeutic process.

Ultimately, and crucial for my argument, this engagement with reimagining political culture through fabulation includes historicizations and the rearticulation of historical prototypes (for the concept prototype see Nissen 2009, 2023; Nissen and Mørck 2019). These historical prototypes are used to assess the meaning of

political orientations that one rejects, thereby implicitly situating one's own standpoint within the broader societal context. Furthermore, historical prototypes are essential for developing generalized understandings in and through practices of political orientation. For instance, in a social situation we might reference the French Revolution or the Enlightenment (Davidson 2012) to categorize right-wing orientations as reactionary, regressive, anti-modern, counter-rationalist, or irrationalist, or to place them within the tradition of the Counter-Enlightenment. This doesn't need to be explicit. Simply categorizing someone who believes in conspiracy theories as rejecting scientific reasoning will today inevitably invoke such prototypes – even if only very implicitly. Practices of categorizing far-right orientations are embedded in a broader cultural web of meaning, that represents such practices as an answer to the transgression of 'sacred' political norms (by the far right) and therefore such practices are always situated in instructive and explanatory discourses that contextualize far-right orientations within dominant narratives about societal development (Herz 1993). Without this web, expressing a rejection of a political orientation with a simple label would not be possible.

This becomes evident when considering practices that compare the success of far-right parties today and the Nazi Party's rise to power in 1933 in Germany (Herz and Schwab-Trapp 1997). Such comparisons invoke explicitly historical prototypes. But these can be fabricated in various ways, thereby engaging with cultural knowledge to understand what is to be done in the current situation. Establishing a continuity between the present and 1933 by imagining 1933 as a seizure of power, will lead to different conclusions than 1933 as a crisis of the liberal Weimar Republic crushed by political extremes, or an instance where elites handed over power to the Nazis.

Fabricated responses to the far-right will necessarily convey an interpretation of the contemporary historical situation as a crisis. This can manifest by explicitly or implicitly invoking cultural representations of revolution or counter-revolution, the decline of progress, or themes of a threat either to the ruling order or that the ruling order or other social or political forces could endanger substantial areas of life if things continue without intervention. To explore crisis definitions as practices that reimagine the prevailing historicity of political culture, it is worthwhile to draw on Koselleck's (2002) conceptual history. He understands 'crisis' as a fundamental and irreplaceable precondition for articulating history in a culturally comprehensible manner. As such, crisis definitions are deeply ingrained in political culture. Despite his work representing a conservative interpretation of history, Koselleck provides a valuable starting point.

In what follows, I will revise his articulation of the concept by connecting it to my previous elaborations, thereby extending my discussion of historical prototypes. In the next section, I will ground the notion of crisis in the Marxist understanding of the problem of capitalism, providing a more comprehensive framework for understanding the implications of fabricated responses to far-right orientations. But first, let's consult some key quotes from Koselleck's conceptual history to establish a foundation for this analysis.

Derived from *krino*, to cut, to select, to decide, to judge; by extension, to measure, to quarrel, to fight "crisis" aimed at a definitive, irrevocable decision. The concept implied strict alternatives that permitted no further revision: success or failure, right or wrong, life or death, and finally, salvation or damnation [...]. Thus the concept potentially registered all the decision situations of inner and outer life, of individual humans and their communities. It was always a question of definitive alternatives about which an appropriate judgment had to be passed and whose alternative consummation was also determined by and in connection with the particular issues themselves (Koselleck 2002:237).

Koselleck emphasizes how the temporal dimension of the concept conveys a theory of time that transports knowledge about the right moment for action: "'Crisis' pointed toward the pressure of time, so to speak, which constituted the understanding of the sense of the concept. The knowledge of uncertainty and the compulsion toward foresight were part of almost every mention of crisis in order to prevent disaster or to search for salvation. In so doing, the particular temporal spans were delimited in varying ways according to the spheres of life thematized" (Koselleck 2002:238).

He argues that "'crisis' followed a career similar to that of 'revolution' or 'progress.' Both of the latter turned into temporal concepts, and their initial spatial or natural meaning dissipated with the Enlightenment as they became primarily historical concepts" (Koselleck 2002:239). Koselleck helps us understand how practices of crisis definitions became not only deeply rooted in modern political culture but also constantly reimagine modern political culture. He explains that "at least since the French Revolution, 'crisis' turned into a central" to make sense of "both political and social history. The same goes for the long-term Industrial Revolution, which was accompanied and influenced by a scientifically differentiated doctrine of crises and economic activity" (Koselleck 2002:239). But the prominent location of "crisis" in the reimagination of modern political culture and revolutions does not alone exhaust its historical significance. At least of similar importance is the capability of crisis as an interpretative category to make the claim that "that the entire course of history can be interpreted out of its diagnosis of time. Since then, it is always one's own particular time that is experienced as crisis. And reflection upon the particular temporal situation disposes one to both a knowledge of the entire past and a prognosis of the future" (Koselleck 2002:239).

As such, crisis definitions will always entail calls to action. By rearticulating the present situation as a crisis, they make sense of history by establishing a sense of historical continuity and discontinuity, thereby drawing on historical prototypes. Davidson's (2012) work explains how bourgeois revolutions became models to make sense of history for subsequent generations of not only radicals but also counter-revolutionaries, less radical reactionaries, and conservatives alike. Encompassing the connection of historical prototypes (that is, cultural memories of successful and failed bourgeois revolutions) with crisis definitions, the model of bourgeois revolution establishes an experience of historical time that provides knowledge for political action by outlining the trajectory of history as being both determined by political opponents or other

non-controllable factors and as being contingent, thereby indicating moments suitable for political intervention.

Even though these elaborations refer to world history, the described political imagination as embedded in modern culture is significant for individuals making sense of unwanted political developments. A simple encounter with far-right propaganda on the way to work or more drastically, encountering a swastika graffiti in public space, will inevitably engage individuals in the reimagination of history. Categorizing political advertisements and symbols as far-right propaganda, rather than simply seeing them as election posters or graffiti, inherently invokes historical prototypes. Therefore, individuals don't need specific or elaborate knowledge about historical events, nor do they have to refer to them explicitly to make sense of their present historical situation, as resources or means for orientation are already deeply embedded in the political culture that permeates everyday life.

Stenner (2022) has argued, using the example of the COVID-19 pandemic, that experiencing an event as a crisis disrupts the continuous chronological experience of time, where time is measured and quantifiable, representing all units of time (hours, days, etc.) as identical. Such encounters, he explains, can "generate *liminal experiences* by disrupting and re-ordering expectations of the future, reconfiguring memories of the past, and thereby transforming the very seat of reality: the present" (Stenner 2022:77). Therefore, the "temporal dimensions of liminality" help understand the experience of crises "as a 'between worlds' phase of becoming inherently in process as both a 'no longer what it was' and a 'not yet what it will be'" (Stenner 2022:80). I argue that this experience of a 'between worlds' phase of becoming necessitates subjective engagement in the reimagination of political culture to reestablish a sense of historical continuity. Fabulations play a key role in this process. This does not mean that such experiences of crisis are short-lived or that fabulations will resolve these conditions; rather, these experiences of a 'between worlds' phase of becoming are permanently present and recur in everyday life, much like memories. This ongoing process urges fabulation to come to terms with these experiences.

For fabulations to establish a sense of historicity as continuity and discontinuity, they must convey the interconnection of individual life and historical trajectories as temporal experiences through narrative practices that draw from wider cultural repertoires, narrative models of life, and temporality (Brockmeier 2002, 2015, 2022). It is crucial to not understand such fabulations as attempts of an individual trying to cope with societal developments. This would convey a false dichotomy between individual life and the societal process. Subjects are not separate from but active participants in society. Instead, to fabulate one's own historical situation as a situation being in crisis illustrates how individual and collective memory are intertwined and never separate.

Even when historical prototypes are not explicitly depicted in fabulations that reimagining the present as crisis, merely invoking indirectly a historical event within a narrative structure – that is to remember and select – means participating in the collective reimagination of cultural memory and its historicity (Assmann 1998). Cultural memory is neither a singular stable object nor can it be

dichotomously conceptualized as individual versus collective or cultural memory (Brockmeier 2002; Halbwachs 1992; Wertsch 2002, 2009). Rather, memories are best understood through the cultural practices of remembering and forgetting themselves as “transindividual or collective phenomena, cultural creations like myths, legends, and other stories that reverberate in the minds of generations. They do not necessarily have to be mental but can also be material and social artifacts, objectified in landscapes, monuments, museums, libraries, computers, rituals, calendars, anniversaries, and other structures and collective practices” (Brockmeier 2010:6). These artifacts can serve as indirect means to invoke historical prototypes to understand and convey interpretations of the contemporary historical situation because, “typically, such material structures of cultural memory are embedded in contexts of explanatory and interpretive discourse” (Brockmeier 2010:6).

Thus, the articulation of historical prototypes in the context of crisis definitions can objectify, convey, generate, and transform generalized understandings. These understandings can serve as means or resources in political orientation (as a practice) to either move beyond the prevailing political culture or limit historical consciousness to the immediacy of the dominant political culture's historicity. The subjective framing of historical prototypes in practices of remembering and forgetting is crucial. It is always a creative process that reimagines political culture but is never independent of the prevailing political culture. Such processes presuppose and rearticulate historical theory-practice relations. I will explain this in more detail, as it challenges established myths within the prevailing political culture. For now, I want to point out that understanding the invocation of historical prototypes in the context of crisis definitions as practices of forgetting and remembering of memories as transindividual phenomena, and considering that those practices are situated in the everyday conduct of life, can help us deepen our understanding of the subjective processes involved in the fabulation of a collective and how such processes can capture individuals to engage in political projects.

It's important to note that historical prototypes are necessary preconditions to make causal claims of crisis definitions intelligible. Crisis definitions call historical discontinuity to attention by reimagining events as watershed moments or historical turning points in societal development. For these narratives of historical discontinuity to be intelligible to subjects, they must draw on memories of historical watershed moments as prototypes to understand the claim for discontinuity. For instance, when a historical situation or event is narrated as a crisis of something valued, such crisis definitions must at least implicitly invoke cultural memories of progress or civilizational regression for the historical trajectory that the narrative conveys to be comprehensible.

3.6. Crisis-definitions and Causal Thinking in the Culture of Despair

I argue for carefully observing the real political effects of crisis claims, as calls for a state of emergency are not necessarily conducive to emancipatory politics.

It is crucial to understand how the interplay of causal thinking, crisis definitions, and historical prototypes fosters a political imagination steeped in despair, where far-right claims for a state of emergency appear more convincing.

Causal thinking emerged as a widespread practice to influence public opinion with the transformation of the public sphere, turning attention into a valuable resource, historically through the evolution of advertising and more recently through social media (McCombs and Valenzuela 2021). Causal thinking is conveyed through narratives that shift conflictual societal situations from the realm of fate to human agency (Stone 1989). This process, operating within a framework of cause and effect, transforms discontents, suffering, and grievances into social problems that appear resolvable if the right remedy is chosen and implemented by the right people. This is a process of reification because, for claim makers to appear capable of providing remedies, they must frame problems within the limits of their agency (Frawley 2024).

These practices contribute to constraining and alienating political imagination, reducing politics to a domain best left to experts and separating it from the economy, which is seen as a sphere governed by natural laws outside direct democratic control, manageable only by cunning politicians, economic experts, and successful capitalists (Mattei 2022). The alienated experience of politics is validated by a general reified consciousness of history and society that a hallmark of capitalism. The resulting fragmentation, Lukács (1923) argues, manifests in consciousness as a separation of different spheres of life: economics, politics, and culture.

In politics, causal thinking is neither inherently right nor wrong but contingent, primarily serving the purpose of competing over resources within state-managed capitalism. Claim makers often obscure the societal situation they address to compete for scarce media attention, needing powerful, dramatic, and simplifying narratives that promise more competitive solutions compared to other claims (Hilgartner and Bosk 1988). Claims compete within a “culture of vulnerability” deeply influenced by psychological theories and discourses (Frawley 2024), where appeals to “sensitivity to harm and responsiveness to the harmed” (Haslam 2016:13) receive attention and recognition. In this competitive environment, claims must appeal to authorities for recognition, often inflating harm to gain attention. This creates opportunities for authorities to introduce authoritarian measures in the name of security and harm prevention, which can cause harm themselves. This makes causal thinking prone to confusing cause and effect because claims must prioritize effective rhetoric that draws on the themes of raising awareness and harm reduction, fitting established narratives (Frawley 2024). To be instantly convincing, these narratives inevitably align with the immediacy of the prevailing political culture, which promotes reified and pessimistic views about the emancipatory potential of subjectivity (Frawley 2024). As such, causal thinking is a widespread phenomenon shaping political imagination, capable of capturing even emancipatory political intentions.

In the context of climate change and migration, Calum Nicholson (2014) demonstrates how crisis definitions use causal thinking, fabulating climate change as tipping points and crossroads to dramatize the plight and intensify

despair, urging people to act quickly. This approach reimagines the prevailing political culture but ultimately fails to lead to relevant emancipatory conclusions. Similarly, fabulating the problem of the far-right as a crisis of discrimination, inequality, and violence that needs addressing to avoid further escalation often employs causal thinking. This not only oversimplifies complex societal issues but also risks perpetuating a sense of urgency that may stifle thoughtful and effective emancipatory actions. This highlights the importance of scrutinizing how crisis narratives are constructed and the potential consequences they carry for both understanding and addressing social problems.

It is important to clarify that I do not claim such accounts are inherently wrong. Right-wing violence and discrimination have indeed risen. Historically, the far-right has always driven discrimination. However, we now observe a situation in which the Left, often unintentionally, promotes discriminatory accounts when responding to far-right violence with the intention of combating racism, antisemitism, misogyny, or transphobia. This can be illustrated by the Left's attempts to make sense of recent events such as the Hamas-led attack on October 7th, 2023, and the subsequent military response by the Israeli right-wing government, or the Ukraine war. Another example is the Left's reaction to authoritarian state measures during the COVID-19 pandemic, which restricted freedom of assembly and delegitimized protests against those measures without addressing the content of the protests. But the question of how this contradiction emerged historically, where the Left acts against its own declared goals, and how it should be addressed can be answered in various ways, are ultimately depending on the political orientation employed. What follows is a preliminary investigation of the contradiction, which I will extend in the section following the discussion of the problem of capitalism.

However, causal thinking obscures this contradiction, posing the danger of replacing argumentation and historical self-clarification with a sense of emergency that necessitates immediate action. Such thinking quantifies incidents of right-wing motivated violence within a narrative of ever-increasing inequality and discrimination without explicitly developing historical prototypes. The fabricated historical trajectory implicitly relies on prevailing historical prototypes to create a vision of societal derailment into barbarism. This approach, metaphorically speaking, remains unconscious of history, thus forfeiting the opportunity to reengage with history to build consciousness. Lacking such self-clarification, causal thinking can only employ abstract, often undefined terms like society or democracy, which prevailing political culture interprets within a nationalistic framework as collective objects of care that must be defended. This calls for affiliation with the 'good' camp and fighting the 'bad' one, which makes it impossible to understand contradictory developments and dynamics. It replaces theoretical efforts to understand political orientations as historically changing relation of theory and practice with identities. Such accounts do not provide the historical self-clarification needed for emancipatory politics. Instead, they create confusion and despair, contributing to a political culture in which crisis accounts of the far right appear more credible.

The contradiction where emancipatory-intended politics inadvertently foreclose emancipatory potentials can be observed in the paradoxical effect of practices like awareness-raising to mobilize support against discrimination and the far-right by influencing public opinion. To highlight social exclusion and violence as effects of discrimination and far-right politics, the Left commonly employs rhetoric emphasizing harm and sensitivity to harm. These are prime pathways for influencing public opinion and resonate with the desire of the Left to give voice to marginalized people. Causal thinking portrays the far-right as progressing towards fascism unless countered by the policies and measures proposed by the Left as suitable remedies. As a result, the Left has been campaigning for authoritarian state measures like hate speech laws and advocating for corporations to use similar measures like deplatforming; appealing to domestic intelligence agencies to police and ban far-right organizations and call on municipalities to ban far-right assemblies, thereby supporting a conservative agenda (Renton 2021, 2022).

Furthermore, by using this strategy, the Left falls prey to the "semantic inflation of harm," which is seen as a core component of the culture of vulnerability. Haslam (2016) describes semantic inflation as the extension of psychological concepts that "focus on negative phenomena—social and personal harms such as abuse, addiction, bullying, mental disorder, prejudice, and trauma" (Haslam 2016, 13). Semantic inflation extends those concepts both horizontally, to capture qualitatively new phenomena, and vertically, to encompass less extreme phenomena. This extension dilutes the meaning of the concepts which has the contradictory effect of pathologizing and psychologizing everyday phenomena and also trivializing violence and suffering. This is significant because the Left articulates phenomena like racism, sexism, and the far-right often with reference to psychological concepts, and therefore we can observe an inflation of concepts of fascism and racism. This is exacerbated by the fact that the Left has a longstanding history of associating political orientations it rejects with fascism to create a stronger moral contrast with its agenda, thereby appearing more virtuous (Passmore 2014). This inflation might not contribute to awareness about such phenomena but rather lead to the dilution of their meaning, trivializing the associated violence.

Overall, the effects of the described constellation are the development of authoritarian state measures and the inflation of violence to the cultural experience of permanent threat in which makes authoritarian solutions appear as viable security measures to police those who are seen as perpetrators of harm. This legitimizes and generalizes political strategies that have been used traditionally by the political right and generates a sense of powerlessness on the Left which also contributes to the culture of despair.

Such fabricated visions of societal development, articulated through crisis definitions, obscure not only the dialectics of discrimination, inequality, the far-right, the Left, and other subjective moments in the societal process but also the meaning-making resources necessary to make these fabricated social myths convincing and intelligible. By implicitly drawing on historical prototypes that narrate the story of fascist development from the perspective of politically

insufficient antifascism, these narratives necessitate a revision of the aspirations of the 'old' Left while accepting 'just' wars. Consequently, these narratives position inequality and discrimination as central issues of concern, while creating a background experience of historical paralysis that fosters anxiety by portraying fascism as a force only stoppable by war. However, this approach fails to critically engage with the history of the revolutionary Left – specifically what they attempted but failed to achieve – and how this historic failure has impacted the subsequent political imagination of the Left. Consequently, it distorts the complex interplay of societal factors and limits the potential for a deeper, emancipatory understanding of social issues from a historical perspective.

I want to emphasize that these implicit historical prototypes do more than provide a vision of historical discontinuity by evoking cultural representations of barbarism; they also create a sense of historical continuity by drawing on historical conceptions of emancipation. While it is widely accepted that the bourgeois horizon of emancipation already employs the perspective of equality (Bobbio 1996), it may seem controversial today to claim that political criticism of inequality and discrimination that is a hallmark of the contemporary Left is not the 'natural' extension of the bourgeois revolutionaries of the 18th and early 19th century. The narrative that the 'modern' Left from the mid-19th century onwards has taken up these concepts as its natural heritage is not historically accurate. It represents a simplifying and distorting narrative of the history of the Left from a specific historical standpoint. Indeed, the use of these concepts for political criticism only appears as a largely undisputed marker of the Left within the political culture that emerged only after the failure of the historical revolutionary Marxism.

This shift in political culture was embraced by subsequent generations of the political Left. The emphasis on culture and subjectivity, and the relocation of the development of the emancipatory project into universities, was seen as political and theoretical progress that could finally do justice to the complexity and interrelatedness of different forms of oppression. In the view of the New Left, the old Left was incapable of this due to their theoretical and political limitations. Thus, the concept of emancipation as a project of liberation was replaced by the idea of emancipation as resistance against oppression and the just redistribution of wealth (Cutrone 2023).

Chapter 4: The Problem of Capitalism and Modern Politics

The historical Marxist and other sections of the revolutionary socialist Left were neither oblivious, ignorant, nor clueless about issues now categorized under 'discrimination,' 'exclusion,' and 'inequality.' They debated and theorized these topics through concepts like the 'Jewish question,' 'Women question,' and 'Negro question.' They situated these issues within the broader problem of capitalism, understanding this problem as a contradictory constellation that drives social and political conflicts. These contradictions were understood dialectically as not only reproducing and historically transforming these issues

but also simultaneously embodying historical possibilities for emancipation to overcome them. (Adi 2013; D'Emilio 1983; Frankel 1981; Michels 2011; Mitchell 1966; Notz 2020; Weigand 2002). Their engagement significantly shaped the political culture of the Left at that time. Even after the failure of the revolutionary Left, the title of Sartre's (1946) "Reflections on the Jewish Question" still reflects this historical context. Additionally, debates about revising the political orientation, that is the theory and practice of the revolutionary Marxists, and critically engaging with its history were part of the Marxist tradition, for example, under terms such as revisionism and orthodoxy, emphasising the important role of Karl Kautsky, Rosa Luxemburg and Lenin (Korsch 1923; Lukács 1923).

4.1. The Problem of Capitalism

The question of what historical Marxists understood as the problem of capitalism has sparked both internal Marxist debate and wider historical and political conflicts, leading to multiple interpretations. Given the complexity, this issue cannot be fully covered here. I will primarily present Chris Cutrone's interpretation, focusing on key aspects. I chose Cutrone's interpretation because it seeks to rediscover the political meaning of this problem through a critical interpretation of Marxism's history, rather than following the scholastic trend of interpreting Marx's *Capital*, which often results in sophistry and jargon-laden language that obscures more than it explains. Cutrone's approach does not claim to offer ready-made solutions in Marxism to be reapplied but acknowledges the difficulties that emancipatory politics face today. It's important to note that I did not invent this interpretation but aim to convey it clearly to enhance my overall argument. However, this interpretation should not be taken as final truth but scrutinized. Additionally, my discussion should not be seen as the final word but as an effort towards historical self-understanding.

I hope this selective discussion can contribute to developing a perspective capable of overcoming the repeating cycles of misery and despair. This belief stems from the idea that quick fixes or focusing on a set of political issues or values are insufficient. Instead, we must clarify how to interpret the problem of capitalism to understand *the* issue of politics within capitalism; how past attempts at solving the problem continue to shape both the character of capitalism and politics historically. Only such a historical perspective can overcome the immediacy of misery and despair, by grasping the interrelation of conflicting political orientations and the false necessity of opposing needs and social conflicts. Without this understanding, I believe it will be impossible to move beyond the cycles of self-destruction.

This presentation begins with a condensed depiction of some fundamental assumptions about the problem of capitalism. The following discussion will elaborate and explain the implications and meaning of these assumptions, using contrasts with more common interpretations of the problem of capitalism today to enhance understanding. The discussion will aim to clarify my suggested

understanding of political orientations and their interrelations as a problem of historically changing relations of theory and practice. This will provide, within a historical perspective, a clear understanding of emancipation and the far-right.

The concluding section of this part will connect these insights to the discussion of the problem of motivation and needs, suggesting a trajectory for engaging with the discussed issues within the context of therapy. In part three, I will further elaborate on this interpretation from a historical perspective, aiming to make it more comprehensible to a wider audience.

To set the stage for this presentation, it is crucial to highlight an important point: the “propaganda of working-class struggle politics by historical Marxism” has often been mistaken for its theoretical articulation of the problem of capitalism. This misrecognition has led to several confusions regarding the relationship between cause and effect in capitalism. Specifically, it has resulted in the misunderstanding of “the class division and conflict between workers and capitalists as the cause rather than the effect of capitalism and its inherent contradictions” (Cutrone 2021a). “Class inequality and hierarchy and its resulting relationships of exploitation is not the cause of the problem of capitalism, but, as Marxism properly recognized, the effect of capitalism” (Cutrone 2020b).

Given the confusion, it is important to clarify that capitalism is not simply greed or profiteering, nor is it merely exploitation. Those issues are recognized problems within our society. As Chris Cutrone (2020b) explains, “Capitalism is not a societal system or moral order or set of values — it is a crisis of the societal system, moral order, and set of values. The society we live in is bourgeois society. We live in bourgeois values and morality. Capitalism is the contradiction of that society and its values.” Thus, capitalism is not a society but a historical era, marked by this contradiction. Now, it is crucial to understand that this contradiction does not merely refer to the disparity between the normative ideals of bourgeois society and its reality. This perspective misses the core issue.

To grasp the issue, it is helpful to remember that Rosa Luxemburg (1913) referred to capitalism as ‘the wage system’. “This suggests the problem of capitalism that Marxism thought tasked socialism, namely, the crisis of capital accumulation that undermines and destroys the social value of wage labor” (Cutrone 2020b). For Marx this crisis resulted from “the contradiction of bourgeois social relations and industrial forces of production” (*ibid.*). This is a self-contradiction because industrial production is not external but internal to bourgeois society. Comprehending this self-contradiction both theoretically and practically constitutes the problem of capitalism, which began to emerge during the late 18th to early 19th century when the industrial revolution spread through Europe and the United States. The effect of this self-contradiction – and not its cause – “is the division of capital and labor” (*ibid.*), resulting in conflicting needs of capital and labor, such as profit versus human needs, including the needs of nature to regenerate and reproduce itself.

For Marx, capitalism was a ‘false necessity’. This means “not simply wrong necessity, but rather self-contradictory necessity. For the needs of capital and the needs of labor are the same” (Cutrone 2020a). It began as means to an end as increased productivity for greater liberty, but with needs “becoming opposed in

capitalism, there is the conflict of labor with itself as well as of capital with itself” (ibid.). Furthermore, from the division of capital and labor derive “the opposed classes of capitalists and workers” (Cutrone 2020a). The class struggle between capitalists and workers is not the cause but an effect of the self-contradiction of capitalism, resulting not only in conflicts between capitalists and workers but also among capitalists and among workers. The self-contradiction of capitalism “expresses labor’s contradiction with itself — which is also capital’s contradiction with itself” (ibid.).

Without going into the details of Marx’s thought, he distinguishes two different forms of productive capital: ‘variable and constant’ as well as ‘fixed and circulating’ capital. The first distinction refers to the creation and increase of value, the second to the physical and temporal aspects of capital turnover. Thus, capital is not a thing but a process involving several processes with specific demands and conditions for their reproduction. This is expressed in different temporal logics for their reproduction, which can come into contradictions and create crises. But this process is ultimately sustained through labor because capital and labor “are actually just two forms of capital [...] and both refer to labor” in its dual existence as a commodity or wage-labor and as human activity. Therefore, “Marx called capital ‘alienated labor’” (Cutrone 2020a). This underscores that both forms of capital, whether variable and constant, fixed and circulating, are ultimately embodiments of labor.

Marx also describes the distinction between capital and labor in temporal terms as the “domination of accumulated, past, [dead], reified labor over immediate, living labor is what first transforms accumulated labor into capital” (Marx 1849:409). This clarifies that capital is a process of domination in which past dead labor represents how capital dominates and directs labor as human activity, reversing means and ends: “The contradiction Marxism found in capitalism was that what began as a means to an end of societal production and wealth, capital, became an end in itself, and what was an end in itself, human life and activity, becomes a mere means to the ends of capital” (Cutrone 2021a).

Bourgeois Society

To untangle those phenomena, it is necessary to understand what is meant by bourgeois social relations and rights, since I stated that capitalism is the contradiction of bourgeois society and its values. To this end, it is helpful to recall the historical situation in which these phenomena emerged on the stage of world history. I keep my remarks brief here. See part three for a more detailed explanation. Through the bourgeois revolutions, especially the French Revolution, also termed the revolt of the third estate (Sieyès 1789), “it appeared that humanity attained its “natural” condition of Enlightenment, in relation both to the natural world and in humans’ relations with each other. Seemingly unlimited possibilities opened up, and the Dark Ages were finally brought to an end” (Cutrone 2010a). This meant that bourgeois society, which had developed within feudalism over several hundred years, found its political expression and

historical self-consciousness to state through the revolution the ‘truth’ of society as a society of free commodity producers that cooperated within free market exchange that wanted to liberate itself from feudal and clerical authorities. This resulted in the institutionalization of political and civil rights as a direct expression or implication of the declaration of human rights. The social and cultural bond that regulated human coexistence prior to the revolution was no longer understood as a natural or divine order, formerly expressed and codified in the language of religion, but as human-made, a product of human labor and cooperation. Consequently, the language of politics, history, and economy emerged, as well as the concept of society, to articulate the potential of humans to regulate their coexistence rationally and consciously, thereby becoming the subject (and no longer the object) that turns natural history into the history of humanity as the development of collective freedom, which was seen to be attainable only as a world society (Cubela 2023; Cutrone 2013a; Spencer 2013).

Thus, Enlightenment was not an era or epoch but a process in which society became conscious of itself and history. The social relations of bourgeois society and bourgeois rights were seen as expressing the principles necessary for the self-regulation of society to advance the process of Enlightenment towards universal freedom. For this to be possible, society was understood as a society of free property-owning commodity producers that developed societal wealth through free labor (not slavery or serfdom) and market exchange. Central to this, and also expressed in human rights, was the right to property grounded in the right of self-ownership. Self-ownership means that every human owns their labor power and the products produced through their labor (not the state, king, or church). In other words, labor time was established as the measure of wealth produced through societal cooperation and served as a regulatory principle for the appropriation and distribution of wealth, allowing individuals to participate in and transform society (not the position of the natural order into which they were born) to enable a historical trajectory of the free development of all.

Emergence of the Contradiction of Capitalism

With this in mind, we can now explain, how the contradiction between the industrial forces of production and bourgeois social relations has resulted in an ongoing “divergence and disparity between the value of capital and the value of wages” (Cutrone 2021a). In pre-industrial bourgeois society the value of the production of wealth was measure by the “value of labor, especially of labor-time” but this was still the measure of value of social production in capitalism (Cutrone 2020b). But unlike the pre-industrial era, were Adam Smith “observed that higher wages and lower profits increased productivity in society as a whole, after the Industrial Revolution, increased productivity was not due to workers’ greater efficiency but rather that of machines (Cutrone 2010a).

The increased productivity of machines “made not work but the workers superfluous” (Horkheimer 1942:293), resulting in mass unemployment as the process of proletarianization that created modern working class. “Marx and

Engels understood this unemployment [...as] a permanent feature of modern society after the Industrial Revolution, in which preserving the value of capital was in conflict with the value of workers' wages" (Cutrone 2010a). It is rooted in this conflict that "greater productivity increased not employment and wealth but rather unemployment and impoverishment, as capitalism destroyed traditional ways of life (for instance of the peasants) but failed to be able to provide meaningful productive employment and thus participation in society for all, as originally envisioned in the revolt of the Third Estate and promised in the bourgeois revolution against the hierarchy of the *ancien régime*." (Cutrone 2010a).

General Dynamic of Capitalism

The measure of value made obsolete by the industrial mode of production could not be replaced by the politically established self-regulating principles of bourgeois society. Society's productive capacities, what Marx termed the "general social intellect" – its potential for the production of societal wealth – have historically "outstripped the social and political rights of appropriation through living human labor by the working class" (Cutrone 2021a). The political failure to establish new regulatory principles adequate for industrial production resulted in the compulsion to preserve the value of capital, unleashing a crisis-ridden dynamic that dominates bourgeois society ever since.

The self-undermining and self-destructive nature of the disparity between "the general social intellect" and the diminishing value of human labor is expressed in two "increasingly divergent commodities produced by industry: goods for the subsistence of the working class; and surplus value for investment in production" – whether in wages or technology. This conflict between technology and human labor "characterizes capitalism on a societal scale" (Cutrone 2021a), manifesting the historical temporality that is typical of capitalism and expressed in "inflation, the necessity of interest in credit, and finance as the necessary form of speculation — namely, the claim of the past and present on the future — in investment in production" (Cutrone 2020b).

This leads to the constant increase in productivity, resulting in the cheapening of labor. The outcome is the cheapening of value. "But this cheapening threatens the value of investment and its speculation, hence the crisis of social value in capital. Attempts to preserve value in capital result in accumulation and concentration, producing a separate capitalist class of investors: they are capitalists in the sense of not merely owners of capital, but rather are the agents and servants of capital. Capital does not follow the dictates of the capitalists; but the capitalists follow the dictates of capital" (Cutrone 2020b).

Workers are compelled to support the "profitability of the capital that employs them, to preserve social investment in their work," (Cutrone 2021a) because their livelihood depends on it. Thus, the profitability of capital becomes essential for workers to reproduce themselves within capitalism, creating a cycle

where capital must constantly seek profit not as an end goal but as a means to sustain its value. “Marxism thus considered capitalism to be a general social compulsion to produce and preserve value in the form of capital to which all – everyone – in society are subject. In this sense, everyone in capitalism is a capital-ist, namely a follower of capital” (Cutrone 2020b). Consequently, disputes over the priorities of social investment in capital lead to conflicts not only among capitalists but also among workers, expressing “labor’s contradiction with itself — which is also capital’s contradiction with itself” (Cutrone 2020a).

The ordinary cheapening of value typically unfolds into crises when superfluous labor and superfluous money arise simultaneously. Labor cannot find employment, and money cannot find investment as capital. Crises result in “the destruction of existing concrete forms of production – the destruction of the concrete manifestations of capital – which means the depreciation of money and the unemployment, starving and perishing of the workers, the idling of machines and factories, the bankruptcy and dissolution of firms, etc.” (Cutrone 2020b).

Furthermore, the temporality of capital’s reproduction contradicts with the time needed for ecosystems to regenerate and human lives to reproduce. Capital’s need to sustain its value draws on human labor and ecosystems, which creates metabolic exchange problems due to conflicting temporal logics, such as climate change and the destruction of ecosystems (Fraser 2022). This metabolism between nature and society is not simply external exploitation but a historical process where labor shapes nature and vice versa. Fraser (2022) illustrates this with examples like the transformation of prairies into farmland, rainforests into mining and farming areas and the replacement of forests with tree plantations. The modern idea of nature as separate from society emerged with capitalism, expressed in the language of political economy, contrasting with earlier views that recognized the integrated metabolism of societal and natural reproduction, which was expressed in the language of religion (Cubela 2023).

When Marxists saw the self-contradiction of the social relations of labor represented in the condition of industrial production, they meant this in a very concrete sense. The recognition of the value of labor in the bourgeois concept of emancipation, through the right to property, was intended to ensure societal participation, leading to the development of freedom in a world society. But as Marx and Engels wrote in the ‘Communist Manifesto’, that capitalism itself “abolished – undermined and destroyed – private property, not only in the form of capital but also and most importantly in the form of labor: industrial production abolished the value of labor as a commodity. Nonetheless, this constant self-destruction of value was the occasion for its reconstitution and reproduction in different concrete forms after each crisis in value. In short, so long as there were starving workers desperate for employment, the social value of labor would be reconstituted — however, it was subject to self-destruction, restarting the cycle of capital accumulation again” (Cutrone 2020b). Thus, capitalism, rather than being a stable social system, is a contradiction of bourgeois social relations driven by industrial forces of production.

4.2. The Problem of Politics: The Bonapartist Dynamic and Class Struggle

Having established the Marxist conception of the problem of capitalism, I will now address some key issues related to the problem of politics in capitalism. To avoid misunderstandings, this section is not advocating for replacing therapy with class struggle. Rather, it reflects on political orientations and political culture by considering the Marxist vision of emancipation as the historical horizon of freedom – a vision largely absent from contemporary political culture. The aim of this discussion, starting with the problem of Bonapartism, is to provide insights into the false necessity of opposed needs, politics and social conflicts.

Marx and Engels observed during the 1848 Revolutions that failed attempts to overcome capitalism's problems reconstituted its contradictions. This confirmed their dialectical understanding that the working class embodies not only the potential to move beyond capitalism but also the capacity to save and renew it during crises. Engels captured this in a well-known phrase, “the proletariat was not yet able to rule [...], the bourgeoisie could no longer do so” (Engels 1891:617). This statement, referring to the phenomenon of Bonapartism, is often misinterpreted by sociological conceptions of class as a stalemate in class struggle (for example: Beck and Stützle 2018). However, Engels articulated that capitalism is a historical condition with a specific temporality, where society is stuck in a transition phase. In the Marxist view, “Bonaparte’s success [...] the failure of politics” (Cutrone 2015b) signifies the failure to transition into socialism and move forward in history – not just in France, but as *the* condition of modern politics.

Marx saw in Bonapartism “a ‘dictatorship of the bourgeoisie’ – not in the sense of the rule of the capitalists, but rather in terms of the political necessity of the state continuing to organise capitalism on a bourgeois basis and the imperative for doing so after the capitalists had lost the ability to lead through civil society” (Cutrone 2015b). Here, ‘Bonapartism’ serves as a historical prototype, illuminating how the relation of theory (bourgeois conception of emancipation) and practice (class struggle, modern forms of politics, and the state) have historically changed.

Invoking Bonapartism as a historical prototype aims at the historical self-clarification of the condition of modern politics. This approach provides insights into the role of the working class in the ongoing reconstitution of capitalism's contradictions. It also illustrates how these dynamics have shaped and continue to shape modern contradictory forms of politics, revolutions and the authoritarian development of the modern state, which manages societal contradictions expressed in social and political conflicts and discontents.

Thus, the “question is not whether and how state capitalism contradicts socialism, but how to grasp that contradiction *dialectically*” (Cutrone 2015b). Marx and Engels understood “state capitalism, as its Bonapartist state, as a form of *suspended revolution*; indeed, as a form of suspended ‘class struggle’. The

struggle for socialism – or its absence – affects the character of capitalism. Certainly, it affects the *politics* of it” (Cutrone 2015b). Politics, for Marx (1847:180f), *is* class struggle. Both capitalists and the working class are only constituted as political classes through the struggle for socialism, driven by the working class against the capitalists. Without this struggle, we are left with unbridled competition among capitalists, which Horkheimer (1943) described as the formation of rackets. “In the absence of a true Left, politics and the state - capitalism - will be led by others [..., resulting in] hard or soft, and more or less *irresponsible* capitalist state dictatorship. We will have political irresponsibility” and ongoing proletarianization (Cutrone 2015b).

Proletarianization is a dynamic process that continually reconstitutes the working class as a dependent underclass, mixing cultures, diversely gendering, and racializing people globally. In this process, machines serve as “means of destruction not merely in the literal sense: they have made not work but the workers superfluous. The bourgeoisie has been decimated, and the majority of members have lost their independence; where they have not been thrown into the ranks of the proletariat, or more commonly into the masses of unemployed, they have become dependents of the big concerns or the state” (Horkheimer 1942:293).

Without a true Left, the effects of proletarianization will continue to be understood and addressed in reified forms, unconscious of reification, as initially done under the rubric of the social question, where social sciences suggested remedies. These remedies did not provide a perspective to overcome the problem of capitalism but merely to cope with it within the wage system, leading to the development of the welfare state in conjunction with authoritarian measures like police and psychiatry (Dörner 1969, 1988; Neocleous 2021). The need to limit the repercussions of the problem of capitalism also drove the development of the mentioned troubled person industries. Those developments are not immediate expressions of the self-contradiction of capital but are interrelated with other attempts to solve or mitigate the problem of capitalism.

Furthermore, Bonapartism, serving as a historical prototype in Marxist political orientation, emphasizes that the dynamic of irresponsible capitalist state dictatorship can exacerbate during crises, resulting in the identification of politics, society, and state by liquidating the mediation function of political forms. This is done “in the name of quieting the inherent instability of politics, which society in its crisis of capitalism cannot afford” (Cutrone 2015a). Understanding this dynamic as merely “undemocratic liberalism, unbridled capitalism without political accountability to society” is insufficient; it should be grasped as “the state run amok, dominating society, and with a great deal of popular support; [...as] “the reduction of society to a politically undifferentiated mass”, that depends on the authority of others and is incapable of representing itself, which is “the very opposite of what Marx considered the necessary ‘class-consciousness’ of the proletariat” (Cutrone 2014b).

To underscore this aspect of the class struggle, Marx and Engels (1891; 1871; 1848) and other Marxists spoke of an ongoing civil war. Marx was clear that appeals to representatives of the Bonapartist state, the self-proclaimed

“saviours of society”, will just repeat the cycle of destruction, while appearing to the working masses that cannot represent themselves “as their master, as an authority over them, an unlimited governmental power which protects them from the other classes and sends them rain and sunshine from above” (Marx 1852:198f).

Marx was also clear that the ‘saviours of society’ won’t even save themselves from the wrecking of the state run amok. “They had ‘saved’ society from ‘the enemies of society.’ They had given out the watchwords of the old society, ‘property, family, religion, order,’ to their army as passwords. [...] Society is saved just as often as the circle of its rulers contracts, as a more exclusive interest is maintained against a wider one. Every demand of the simplest bourgeois financial reform, of the most ordinary liberalism, of the most formal republicanism, of the most shallow democracy, is simultaneously castigated as an ‘attempt on society’ and stigmatized as ‘socialism’ [and we have to add for today: ‘as fascism’, ‘extremism’, ‘antisemitism’, ‘racism’, ‘sexism’, and so on]. And finally the high priests of ‘religion and order’ themselves are driven with kicks from their Pythian tripods, hauled out of their beds in the darkness of night, put in prison vans, thrown into dungeons or sent into exile; their temple is razed to the ground, their mouths are sealed, their pens broken, their law torn to pieces in the name of religion, of property, of the family, of order. Bourgeois fanatics for order are shot down on their balconies by mobs of drunken soldiers, their domestic sanctuaries profaned, their houses bombarded for amusement – in the name of property, of the family, of religion, and of order” (Marx 1852:123).

Marx did not see the Bonapartist dynamic as the corruption of democracy by external factors. Viewing it this way would encourage a “battle ‘for’ democracy as some yet unattained ideal” (Cutrone 2015b). For Marx, however, “democracy was constitutive of the modern state in bourgeois society and capitalism” (ibid.). He considered Bonapartism to represent the problems inherent in modern politics, implying that socialism, liberal democracy, and other political orientations are internal to this issue. Thus, the question is not whether liberal democracy or socialism is part of the problem, but how they differ in being part of it and how to grasp this dialectically.

I have already hinted at how this problem is expressed in the struggle for socialism: the working class has not only the greatest potential to overcome capitalism but also to reconstitute and save it. This underscores that the problem of modern politics can only be adequately understood dialectically. The issue to grasp is what Howard Dick (2016:2) recognized as “*antipolitics*, which is a paradoxical vision of the political that seeks to eliminate particular conditions that produce the need for politics.” No modern political orientation is immune to antipolitics. Instead, every modern political orientation can be an active element for antipolitics to emerge – including Marxism (Howard 2002).

The dialectics of politics and antipolitics is the issue that Bonapartism illuminates. Bonapartism represents the threat of politics reversing into the antipolitical quieting of politics in the “quest for solid foundations in a modern society whose future must remain open” (Howard 2002:xi). This points us to an

understanding of democracy through democratic revolution that goes beyond theories of liberal democracy, which are insufficient to grasp the instability of modern society, where “all that is solid melts into air” (Marx and Engels 1848:465). Indeed, these theories already contain the seeds for quieting this instability in the name of how society ought to be (Howard 2002).

The issue “with liberal democracy is that it proceeds as if the democratic revolution has been achieved already, and ignores that capitalism has undermined it. Capitalism makes the democratic revolution both necessary and impossible” (Cutrone 2014b). This statement holds two important implications, providing insights into the antipolitical nature of Bonapartism and how to overcome it. First, “democratic revolution reproduces not ‘capitalism’ as some stable system (which, by Marx’s definition, it cannot be) but rather the *crisis* of bourgeois society in capitalism”; and second, the democratic revolution reproduces the crisis “in a *political*, and hence in a potentially *conscious* way” (ibid.).

To understand these implications, it is essential to examine how the political reproduction of society’s crisis manifests in differentiated forms of bourgeois politics. These forms “express the crisis and disintegration of bourgeois social relations. They also manifest the accumulation of past attempts at mediating bourgeois social relations in and through the crisis of capitalism” (Cutrone 2014b). In this sense, democratic revolutions highlight the non-identity of the different mediating elements that constitute the political form of modern bourgeois society. For instance, “the non-identity of law (as legislated), its (judicial) interpretation, and (executive) enforcement, or, the non-identity of civil society and the state, as expressed by the specific phenomenon of modern political parties. States are compulsory; political parties are voluntary, civil society formations. And governments are not identical with legislatures” (ibid.).

As mediating elements, these forms contribute to the inherent instability of modern society. The Bonapartist dynamic seeks to quiet this instability through antipolitics, exacerbating the civil war of capitalism by the unmediated identification of politics with society, thereby liquidating or subordinating the mediating aspects of society. This can manifest in various forms, not only as the Nazi ‘*Gleichschaltung*’ (Howard 2002, 2016). In this sense, manifestations of democracy through revolutions “in capitalism are not only opportunist compromises but also struggles to assert politics” against antipolitics (Cutrone 2014b). This also implies, however, that politics which claim democracy against perceived anti-democratic politics can be antipolitical themselves.

Moreover, the reconstitution of the crisis of society through democratic revolutions indicates the potential to *consciously* manifest contradictions in a *political* way. This potential is realized only if “the struggle for democracy is recognized properly as a manifestation of the crisis of capitalism and hence the need to go beyond bourgeois social relations, to go beyond democracy. Bourgeois forms of politics will be overcome through advancing them to their limits—in crisis” (Cutrone 2014b). However, it is also essential to recognize past attempts at solving the problem of capitalism as the “historical accumulation of political problems in capitalism, and of grasping adequately how these forms are

symptomatic of the development – or lack thereof – of the politics of the struggle for socialism in and through these forms” (ibid.).

Understanding this context helps us see why Marx argued that revolutionary politics are necessary to overcome the Bonapartist dynamic, which, as mentioned, he saw as *the problem* of modern politics. “Its purpose will be to make manifestly political the civil war of capitalism that occurs nonetheless anyway. We are very far from such a politics today” (Cutrone 2015b). This verdict should not be understood merely as advocating for class politics over other forms of politics, although it does so. Instead, it highlights a deeper issue: *the problem* of politics itself is not adequately understood or discussed in emancipatory movements today, thus limiting their options to a restricted understanding of this fundamental issue. This problem is not obvious, as the original vision has been lost in the historical failure of Marxism. It must be rediscovered. The problem becomes clearer when we consider the distance between Marx’s vision and contemporary attempts to realize it.

To understand this distance, it is useful to examine the political culture of the Left that seeks to reinstate class struggle as the central form of Left-wing politics. Here, revolutionary politics are seen as the intensification of class struggle by promoting the proletariat as the working majority that relies on the societal wage fund. The manifesto *Feminism of the 99%* (Arruzza, Bhattacharya, and Fraser 2019) illustrates this approach, aiming to compel all intermediate classes to choose sides between labor and capital. However, this approach not only reduces the theory and practice of class struggle – remember that for Marx, politics *is* class struggle – to a matter of convincing people to identify as proletariat or workers, but it also overlooks the mutual dependence of labor and capital.

Even though such conceptions recognize the class struggle, it is often forgotten today that the recognition of class struggle was not an achievement of socialists but of liberal thought and politics. The class struggle is not a distinguishing criterion for socialism nor for Marxism. However, Marxism is distinguished by its conception of the class struggle, rooted in problem of capitalism. Marx criticized socialists of his time for falling “below the threshold of liberalism in avoiding both the necessity of the separation of classes in capitalism and the necessity of the class struggle resulting from that division of society. Socialists blamed the capitalists rather than recognizing that they were not the cause, but the *effect*, of the self-contradiction of society in capitalism” (Cutrone 2014b).

This self-contradiction must be pursued beyond the false necessity of class conflicts to comprehend the problem of politics. According to Marx, the “proletarianisation of society is not addressed adequately as a matter of the condition of labor, but rather the social dependence on and domination by capital. And capital for Marx is not synonymous with the private property in the means of production belonging to the capitalists, but rather the relation of wages, or the resources for the reproduction of labor-power (including the ‘means of consumption’), to society as a whole. This is what makes it a *political* matter – a

matter of politics in *society* – rather than merely the struggle of one group against another” (Cutrone 2014b).

The historical task to move beyond the problem of capitalism and its endless cycle of destruction means examining political issues in the context of *the* problem of politics in society. For Marxism, this meant drawing political consequences from the insight that the self-destruction of capital can be seen as capitalism trying to abolish itself but failing to do so. Consequently, Marxists envisioned strategically that “the wage-laborers would need to abolish wage labor – the laborers would need to abolish labor. It was not enough that the capitalists destroyed capitalism – that capitalism destroyed capital. The very basis for the reproduction of capital—labor—must be overcome. What society already was doing in capitalism in an unconscious and self-alienated way must be overcome in a disalienated and self-conscious way. But first, it would need to be done consciously: the working class must politically and socially take over and appropriate capitalism before it can be overcome” (Cutrone 2021a).

However, this original vision is far removed from what is considered class politics today. The historical failure of Marxism and the absence of the struggle for socialism have deeply shaped both capitalism and the character of politics within it. As a result, this vision cannot simply be replicated today because this history has profoundly changed the relations of theory and practice that constitute contemporary political orientations. “The difference between Marx’s time and ours is not in the essential problem of society, its self-contradictory form of value between wages and capital, but rather in the social and political conflicts, which no longer take the form primarily, as in Marx’s time, of the ‘class struggle’ between workers and capitalists. ‘Class’ has become a passive, objective category, rather than an active, subjective one, as it had been in Marx’s day and in the time of historical Marxism. What Marxists once meant by ‘class consciousness’ is no more” (Cutrone 2010a).

So, what is to be done today to move beyond the prevailing political culture of despair? It does not mean replacing the historical vision with a poor copy but rather grasping anew the problem of politics in capitalism. This requires an adequate understanding of the problem of capitalism and relating this to the issue of political orientation. It means rediscovering, with emancipatory intent, political orientations as the problem of historically changing relations of theory and practice.

For this purpose, Comparing the original Marxist understanding of this problem with today’s conception of political orientations might be a small step towards transcending the immediacy of today’s prevailing political imagination. The historical gap might help foster a consciousness of this immediacy, thus making a small contribution to moving beyond it.

4.3. The Historical Significance of the Struggle for Socialism

Marxists understood capitalism from the standpoint of world history as a transitional phase, highlighting both modern potential and new restrictions on

freedom. They saw this modern problem of freedom expressed in the desire and political struggle for socialism. This meant for Marxists to grasp the problems of politics and political orientations by clarifying the historic relation between the desire for socialism and other horizons for emancipation. For Marxists, all these aspirations are expressed in reified and alienated forms of politics, which are interrelated as subjective moments driving the societal process.

They believed it was necessary to conceive different political orientations dialectically, as interrelated aspects of society that express various historical horizons for societal transformation. This approach aims to grasp the societal form of politics to develop politics adequate for substantial emancipation. Without it, contradictions could not be consciously manifested and advanced through politics, forfeiting the historical self-clarification necessary for developing political orientations that can move beyond the transitional phase represented by capitalism and realize the potential of societal freedom.

To untangle this, we must revisit the problem of proletarianization that emerged during the Industrial Revolution and understand what distinguished Marx and Engels from their socialist contemporaries. Born in 1818 and 1820, respectively, Marx and Engels were not only passive observers but active participants in the profound political and social changes of the 19th century “was accompanied by the optimistic and exhilarating socialist utopias suggested by these new developments, pointing to fantastical possibilities expressed in the imaginations of Fourier and Saint-Simon, among others” (Cutrone 2008a). Marx and Engels sought to grasp the world-historic meaning of the emergence of proletarianization and the various conceptions of socialism as subjective responses to these changes. They did not invent socialism or communism, but their historical approach set them apart from other radicals.

Especially Marx “tasked himself with understanding the *meaning* of the emergence of proletarian socialism in *history*. Marx was not simply the best or most consistent or radical socialist, but rather the most *historically*, and hence critically, *self-aware*. By ‘scientific’ socialism, Marx understood himself to be elaborating a form of knowledge aware of its own conditions of possibility” (Cutrone 2008a). This required invoking historical prototypes to develop a generalized understanding of historical continuity and discontinuity. To achieve historical self-clarification, Marx, like many of his contemporaries, such as Hegel, invoked the French Revolution, as it was the prevailing prototype to understand and navigate the theory-practice problem of modern politics.

The memory of the revolt of the Third Estate was very much alive in the political culture of the mid-19th century. Marx and Engels “found the workers’ struggles against the capitalists to be motivated by bourgeois consciousness, the consciousness of the bourgeois revolution. Socialism was born in the Jacobinism of the French Revolution, [...] still motivated by the aspirations of ‘liberty, equality and fraternity’. Proudhon, for example, was motivated in his anarchist socialism, avowedly, by Adam Smith and Hegel (and the Bible) — animated, unabashedly, by bourgeois political economy and philosophy. Marx and Engels didn’t think that this was wrong, but only inadequate” (Cutrone 2018b).

They agreed with the other socialists that “the trajectory of this society, from the revolt of the Third Estate and the manufacturing era in the 18th Century to the Industrial Revolution of the 19th Century, indicated the possibility of a further development” (Cutrone 2008a). However, they believed that the historical prototypes of the revolt of the Third Estate and the Industrial Revolution needed to be critically rearticulated to develop an adequate understanding of the problem of capitalism and the new requirements for emancipatory politics. Their grasp of the contradiction of capitalism provided them insights into how proletarianization changed the relations of theory and practice that once offered an adequate horizon for emancipation in bourgeois society. But these relations entered into crisis, rendering the bourgeois horizon of emancipation obsolete and transforming it into an expression of the self-contradiction of society.

In this dialectical perspective, the revolt of the third estate, which “initiated a still on-going and never-to-be-exhausted modern history of bourgeois-democratic revolutions is both the ground for, and [...] the now potentially historically obsolescent social form of politics from which proletarian socialist politics seeks to depart, to get beyond” (Cutrone 2018b). Marx argued in his dialectical critique that the socialism of Proudhon and others was “itself symptomatic of capital: proletarian labor was *constitutive* of capital, and thus its politics was *symptomatic* of how the society conditioned by capital might reveal itself as transitional, as pointing beyond itself. – This was Marx's most fundamental point of departure, [...] that the proletarianization of society was not the overcoming of capital but its fullest realization, and that this – the proletarianized society of *capital* – pointed beyond itself” (Cutrone 2008a).

When Marx and Engels found other socialisms inadequate (not wrong), they underscored that the bourgeois conception of emancipation – as political orientations – was still alive (and is to this day) as subjective moments that reconstitute the contradiction of capitalism and must therefore be understood as part of the problem of politics in capitalism. They recognized this as a necessary condition, arguing that the world could only appear in bourgeois terms because “there were no other terms. There was no other form of consciousness” (Cutrone 2018b). However, the bourgeois conception of emancipation, embodying the measure of value for societal wealth, was made obsolete by industrial production. Efforts to solve the problem of capitalism from within this horizon of emancipation were seen as expressing the self-contradiction of society, recreating the capitalist temporality of a bourgeois society stuck in a transitory phase.

To move beyond this, Marx and Engels did not assume the “need for a new philosophy [...] but only a critique of how bourgeois thought mystified the crisis and task of capitalism” (Cutrone 2018b). What was (and is) required is “a new consciousness of contradiction, a ‘dialectical’ and ‘historical’ ‘materialism’, to properly recognize” the tasks of the “proletarianization of the bourgeois social relations of labor – the society of cooperative production in crisis with the Industrial Revolution” (Cutrone 2018b). However, this task cannot be achieved by the political orientation informed by the historical consciousness embodied in the revolt of the third estate. As Marx wrote: “The social revolution of the

nineteenth century cannot take its poetry from the past but only from the future. It cannot begin with itself before it has stripped away all superstition about the past" (Marx 1852:117). This does not mean abandoning the bourgeois revolution as a historical prototype, which illustrates an important moment in the theory-practice problem, but clarifying how invoking this prototype as an affirmative guide for politics would actually mean "the loss of the true horizon of possibility" (Cutrone 2008a) by mystifying "the crisis and task of capitalism" (Cutrone 2018b).

4.4. Interlude: Today's Ideology-critique versus Clarifying the Theory-Practice Problem

To understand Marx and Engels' conception of critique of ideology as engagement with the problem of historically changing relations of theory and practice, it is helpful to contrast their understanding with today's practice of ideology-critique. While both forms of ideology-critique address political orientations, the political orientation from which they engage in this practice is very different as well as the conception of political orientations. Marx and Engels aimed at the historical self-clarification their own political orientations to engage adequately with the task of capitalism. They did not define political orientations as ideologies but considered political orientations as a problem expressing the self-contradiction of society that necessitates clarifying the historical transformation of the relations between theory and practice of politics.

In contrast, today's ideology-critique constitutes a specific relation of theory and practice. These elaborate practices and material analyses developed only after the failure of Marxism, when theory development aimed at emancipation shifted into universities. Although ideology-critique and its cousin 'deconstruction' often claim to be true successors of Marx's legacy or even improvements, these practices differ significantly from the original version of ideology-critique. These approaches almost never focus on the most progressive ideologies but on what are considered regressive ideologies, such as racism, sexism, and ideologies of inequality more generally. This choice of focus turns ideologies into either a property of the 'other,' criticized from a 'progressive' stance, or considers regressive ideology omnipresent¹⁹.

The common consensus of these perspectives is that people are trapped in false consciousness, which prevents them from recognizing their true interests, assuming that such recognition would lead to emancipation. However, these approaches do not illuminate the problem of how to advance emancipation politically; instead, criticism becomes a value in itself, detached from the historical conditions of politics. They omit the critical historical engagement with the theory-practice problem and can therefore be better considered an expression of this problem by reifying political orientations. Marx and Engels did not seek to liberate people from 'false consciousness' nor did they "think that the poor

¹⁹Terry Eagleton illustrates the first choice by comparing ideology to bad breath, stating, "Ideology, like halitosis, is [...] what the other person has" (1991:2). For an overview of the more elaborate versions that consider ideology omnipresent, see Jan Rehmann (2013).

benighted workers and other subaltern need us intellectuals to tell them what their true social interests are” (Cutrone 2018b).

Such practices, often informed by psychoanalysis or a version of critical psychology, produce elaborate but mystifying categorizations of political orientations. They seek to explain why people do not act as left-wing intellectuals believe they should, based on their standpoint. These explanations implicitly judge and measure the everyday lives of others by the values embodied in external scientific criteria and/or the political orientations of left-wing intellectuals, including their ‘scientifically sanctified’ conception of society (Marvakis 1996:65–78). This becomes evident when examining the definitions of fascism. By demonstrating their scientific advancements through comparing their categorizations of fascism to the ostensibly ‘wrong,’ older *political* definitions of historical Marxism, such practices actually reveal a story of regress rather than progress, failing to understand the historical reasons and political purposes behind categorizing other political orientations.

Kurt Pätzold (2013:118–27) has illustrated this by example of historical definition of fascism by the Communist International²⁰, attributed to Georgi Dimitrov. This definition did not aim to grasp the ahistorical or the whole truth of fascism as a sociological ideal type or as ideology considered as a structural element of bourgeois society. Such ahistorical considerations are the privilege of distanced and detached observers removed from politics. Instead, the Comintern definition aimed to provide orientation in the political struggle of that specific time, focusing only on selective aspects of the phenomenon of fascism. The “ideologists and theorists of the Comintern did not conduct research for [...] encyclopedias. Their goal was to make it clear to themselves and their comrades in a worldwide movement what to think and expect from the two novel” fascist state dictatorships in Germany and Italy (Pätzold 2013:119). To avoid misunderstandings, emphasizing the political orientation value of such categorizations does not result in an uncritical stance towards the Comintern definition, but the opposite. Understanding its (limited) political value is the precondition for adequate criticism (Pätzold 2015:11–34; Renton 2020; Weißbecker 2020:406–19).

However, by not critically and historically engaging with the theory-practice problem, these often academic practices are limited to categorizing different political orientations as distinct entities. Their interrelation is not examined from a historical perspective but is often determined by the immediacy

²⁰ “Ideologists and theorists of the Comintern did not conduct research for [...] encyclopedias. Their goal was to make it clear to themselves and their comrades in a worldwide movement what to think and expect from the two novel, recognizably related state structures, the one established in Italy in 1922 and the recent one in Germany. They issued a warning and provided orientation for the struggle. In short, the brief definitional characterization of the fascist powers – and movements in several countries worked in the 1920s and 1930s to increase their number – was not done with academic but political intent. It was part of efforts to mobilize masses against fascism. For this, it had to be understandable and memorable. Its extreme brevity, as in similar cases, included the risk of misunderstandings and facilitated deliberate misinterpretations. Considering these contexts even from a temporal distance – this may be granted to bourgeois researchers – is difficult for people who have never participated in political struggles or even familiarized themselves with their requirements as observers. There are many such individuals among today's social scientists” (Pätzold 2013:119).

of naturalized social conflicts. Such practices are insufficient for a dialectical understanding of political orientations as different but interrelated subjective moments within the societal process.

Yet, a dialectical understanding is necessary for an adequate political horizon for emancipation, which can only be developed from the standpoint of universal history. As Chris Cutrone explains, the “false necessity of capitalism as self-contradictory but opposed real needs [and the mystification of social and political conflicts] can only be truly engaged and overcome from the standpoint of universal world history. This can only take place from within the social antagonisms of capitalism, and not from partial, single-sided aspects of its contradictory totality” (Cutrone 2020a).

Thus, the original Marxist ideology-critique aimed at the “true consciousness of the workers as well as of the capitalists” to provide political orientation within the contradiction of capitalism (Cutrone 2018b). Marx and Engels focused solely on the self-contradiction of the bourgeois horizon of emancipation in capitalism; not on “its hypocrisy, but its authentic antinomies, which both drove it on and left it stuck” (Cutrone 2018b). Marx and Engels did not invent new political orientations but engaged critically with those they considered the most emancipatorily advanced bourgeois ideologies of their time: German idealist philosophy, English political economy, and French socialist politics. They criticized these dialectically as “true expressions of their historical moment, of the Industrial Revolution. But as such, they were also all false” (Cutrone 2018b).

Their goal was to unveil the historical meaning of “the experience of the struggle for socialism in their time. They did not seek to tell the workers their interest in overcoming capitalism, but rather tried to help clarify the workers’ own consciousness of their historical situation, the crisis of bourgeois society in capital” (Cutrone 2010a). Thus, they interpreted the conflict between the workers and capitalists historically as a new form of class struggle, distinct yet similar to the revolt of the Third Estate.

For Marx and Engels, the desire for ‘socialism’ was not inherently new, as it found its historical inspiration in the revolt of the Third Estate, which limited it to an obsolete horizon of emancipation. Only by clarifying the historical change in the relationship between theory (the ideology of the Third Estate) and practice (the struggle for socialism) could dialectical criticism unveil what was historically new: the desire for “society becoming true to itself, [developing an adequate historical horizon for] the value of the contributions of all society’s members being recognized and their being allowed to participate fully in the development and political direction of humanity” (Cutrone 2010a).

The goal of ‘scientific’ socialism was the development of a form of knowledge “aware of its own conditions of possibility”, capable of manifesting contradictions politically to move beyond capitalism (Cutrone 2008a). However, this is only possible negatively, as there were (and are) only historically obsolete conceptions of emancipation. The negativity is expressed in the Marxist conception of politics, where “workers were meant to replace the capitalist ruling class not merely to eliminate exploitation but to make politically explicit and thus

‘conscious’ the contradiction of capital” (Cutrone 2021a). These contradictions of capital were considered the historical preconditions for and potential path to emancipation, inevitably thwarted by the contradiction of capital if not properly understood theoretically and practically. Thus, an adequate engagement with the theory-practice problem was seen as a precondition for raising these contradictions to consciousness through political means.

4.5. The Role of the Socialist Party to Advance Contradictions

The history of Marxism led to different conclusions about the role of the party, class struggle, and theory for the working class to take political responsibility for the problem of capitalism. Engagement with the history and crisis of Marxism, especially the crisis of the Second International, led Korsch (1923) and Lukacs (1923) to rediscover the theory-practice problem as an adequate horizon for discussing the problem of political orientations.

‘Workers must rule’ encapsulates the need for the organized working class to provide political leadership because if they did not, others would provide leadership to the exploited and oppressed masses, as “Bonaparte had done in 1848 and 1851. The means for this was the political party for socialism. [...] But the party was not *itself* the solution” (Cutrone 2016). It was, metaphorically speaking, the vehicle to manifest the contradictions of capitalism and “the *problem* of political power in capitalism and indeed the problem of “society” itself” (Cutrone 2016).

The conception of ‘the’ political party for Luxemburg, Trotsky, Lenin, and other Marxists was not limited to our contemporary understanding of a singular political party; they did not identify the party with the legal entity of the party. Instead, they thought of it as a political form that constitutes a historical moment in societal development, interrelated with other attempts to change society and the resulting political conflicts. The party as a political form “allowed for conscious participation in all the variety of arenas for politics that had developed in capitalism: parliaments, labor unions, mass strikes and their councils, and popular assemblies including workers’ councils for revolutionary governance. However, as a political form [...] the party was not only or even especially a subject, but also, and perhaps most importantly, an object of political action” (Cutrone 2015a).

The unity of the party, as a political form, was seen dialectically in the non-identical roles of its various elements because the non-identity of theory and practice is necessary to manifest contradictions politically and advance consciousness (Cutrone 2011a). The opposite of this is the condition of Bonapartism, which has plagued the Left in the form of the “long and pervasive, if largely unrecognized, Stalinist inheritance that justifies the party only by identifying it with the people, which puts an end to politics, including political consciousness” (Cutrone 2014b).

The dialectical understanding of the problem of politics and the party in capitalism underscored the need for the socialist movement to encompass “the

wide variety of discontents within the working class and across the history of its developments in capitalism [...] to overcome capitalism become adequate to its task and mission, by becoming conscious of it” (Cutrone 2020a). This is much more complex than today’s endeavors to build an emancipatory movement through intersectionality or other attempts to combine class politics with feminism and anti-racist struggles. In contrast, the strategic Marxist vision underscored and explained the necessity to manifest opposed discontents and needs because capital and labor embody opposed aspects but are inseparable in the self-contradiction of capitalism.

They emphasized the importance of developing political orientations that understand the false necessity of the societal development of opposed but real discontents and needs, as expressed in social and political conflicts: between capitalist politicians over policies and the associated “conflicting interests of different capitalists, such as different industry sectors or capitalist nation-states. [But also] workers employed in different occupations or industries can thus have different and conflicting interests, competing over the priorities of social investment in capital” (Cutrone 2020a). Because of the dialectics of capital and labor, horizontal conflicts cannot be separated from vertical ones: conflicts between workers, competing over investment in capital, can be articulated as conflicts between workers and a capitalist, as illustrated by labor struggles against relocation or closure of a production facility.

Therefore, the standpoint of world history is needed to express politically the wide spectrum of conflicting discontents within capitalism, “encompassing the divisions among the capitalists as well as within capitalism itself as a total movement of society” (Cutrone 2020a). This standpoint tasked the working class with overcoming the false necessity of opposed but real needs to “take responsibility politically for capitalism as a whole. In so doing, the working class would confront the choices posed by the contradictions of capitalism that are otherwise expressed by the conflicts between different capitalists and thus among workers of the world. All the conflicts exhibited in the world must be grasped as expressions and various forms of the self-contradiction of capitalism” (ibid.). This was the political vision to solve the problem of politics within capitalism. This task, within this Marxist perspective, grounds and motivates the historical self-clarification and development of political orientations.

4.6. Clarifying the Problem of Political Orientations

Furthermore, when addressing political orientations that the historical Marxist Left deemed insufficient, they saw this as a prompt for “self-clarification [...] of the struggles and wishes” of their time (Marx 1843:346). They developed categorizations as meaning-making resources to provide orientation within contradictions, appropriate for the emancipatory task. These categories were consciously rooted in political conceptions of historical prototypes aimed at historical self-clarification, unlike the norms and standards for theory development in social sciences. In the absence of the struggle for socialism,

social sciences could fulfill their original political aspiration to be an alternative to socialism (Marvakis in press). Subsequently, these standards and norms shape today's categorizations of the political landscape – the only alternative present today are the politically undesirable categorizations that the far-right provides²¹.

As Horkheimer (1943) argued, sociological and psychological concepts fall short of grasping the meaning of the historical failure of the revolutionary Left – that is, the problem of historically changing relations of theory and practice. This should be juxtaposed with the widespread social scientific categorization, claiming Marxism as an (early) social science, where classes appear as sociological categories expressing group interests. Such an understanding of Marxism, which misrecognizes the political *and* theoretical nature of Marxist dialectics, was prominently criticized by Korsch (1923).

In this spirit, Chris Cutrone clarifies that the Marxist conception of political orientations, such as classes, “did not define politics ‘sociologically,’ but rather historically: as representing not the interests of members of various groups, but as different historical horizons of politics and for the transformation of society” (Cutrone 2014). Thus, we can speak of the standpoint of capital and the proletariat as they embody different historical horizons for engaging with the problem of capitalism. Only in this perspective do Marxist categories make political sense. Contrary to widespread conceptions, these categorizations were not limited to just two standpoints, even though they were deemed the most important, as they expressed the trajectory to politically advance the contradiction of capitalism.

Likewise, the development of further categories for other political orientations was supposed to equip Marxists with the orientation necessary to engage with the task of the problem of politics in capitalism. Therefore, political orientations were categorized in relation to contradictions, opposing needs and crises of the bourgeois horizon for emancipation. This explains the seemingly contradictory employment of terms in compound concepts, such as bourgeois worker party (Lenin 1916), reactionary socialism, petty bourgeois socialism, German socialism, conservative or bourgeois socialism (Marx and Engels 1848).

²¹ When social scientists encounter political orientations that deviate from established norms, such as far-right ideologies or racism, they often regard these orientations as scientifically incorrect rather than politically undesirable. This ahistorical stance assumes that they possess the true conception and blueprint of society. Marvakis scrutinizes this approach, highlighting the ahistorical stance as an attempt by social scientists and their commissioners to overcome the tension between politics and science. He argues that this assumption fosters a paternalistic view, suggesting that only social scientists and philosophers are capable of developing a ‘proper’ conception of society. The “implicit, explicit, and other societal- and future-related assumptions are incorporated into theory formation as an anthropological measure, rather than as (politically and subjectively) justified proposals of how the world should be viewed and where it should develop. Their premises are thus taken for granted in such a way that they are assumed to be self-evident to those being studied [the racist subjects]. The empirical statements of the research subjects do not appear as possible political (counter-)designs that might conflict with the researchers’ political considerations and value judgments but merely as deviations from their own political-scientific norm. But even with racism, nationalism, etc., we must ask where the seemingly anthropological certainty arises that these political orientations are scientifically ‘in themselves’ wrong. [...] Whether these orientations ‘convince’ or prevail is decided in the political struggle of (social) opposites, not in the scientific justification of the untenability of one (social) design by representatives of another” (Marvakis 1996:73f).

Such concepts were utilized to denote specific “horizons of politics”, expressing historical forms “of discontents with capitalism, but ideologically hemmed in by what Marxism regarded as a limited horizon. [...] Various political parties, as well as different political forms, represented different historical horizons for discontents within capitalism. For Marxists, only ‘proletarian socialist’ politics could adequately represent the problem—the crisis and contradiction—of capitalism” (Cutrone 2014b).

Different political forms were understood in the classical Marxist conception as sustained practices that embody history – as for example historical prototypes and past attempts to resolve the problem of capitalism. However, the goal of historical self-clarification demanded not to separate different political forms from each other but to understand their interrelation dialectically. This is a sharp contradistinction to contemporary political thought, expressing the reified thought of alienated political culture. But to conceive of political forms as interrelated was not merely a choice by Marxists but history itself demanded it: “because none of the forms emerging in the capitalist era - since the early to mid-19th century - has existed without the others, they must all be considered together, as mediating (the crisis of) capitalism at various levels, rather than in opposition to one another. Furthermore, these forms do not merely instantiate the bourgeois society that must be overcome - in a reified view - but rather mediate its crisis in capitalism, and inevitably so” (Cutrone 2014b).

By understanding political forms in this way and linking this understanding to the historical clarification of the problem of capitalism, we can gain insights into the contradictions of practices that aim for emancipation but, in effect, reverse or limit emancipatory possibilities. This approach avoids seeking quick fixes in limited psychological conceptions of subjectivity that provide only mystifying answers. However, such insights do not directly overcome the contradictions of these emancipatory practices. It is crucial to recognize the illusion and dangerous fantasy for emancipatory politics to assume that the repetition of historical problems can be simply avoided; this is a dream to escape history. On the contrary, many problems will need to be politically repeated—but with a conscious awareness of the historical differences in their repetition. Moreover, moving beyond prior limits is often impossible in the absence of a Left that truly embodies historical possibility.

Nevertheless, it is essential to recognize that “history cannot be regarded as a catalogue of errors to be avoided, but must be regarded, however critically, as a resource informing the present, whether or not adequately consciously. If past historical problems repeat themselves, they do not do so literally but with a difference. The question is the significance of that difference. It cannot be regarded as itself progressive. Indeed, the difference often expresses the degradation of a problem. One cannot avoid either the repetition or the difference in capitalist history. An adequate ‘proletarian socialist’ party would immediately push beyond prior historical limits. That is how it could both manifest and advance the contradiction in capitalism” (Cutrone 2014b).

4.7. The Left and Right Distinguished by History

We can now summarize the preceding discussion to clarify the distinction between Left and Right politics from the standpoint of universal history. The historical juxtaposition between the Marxist and contemporary distinction I will draw out should contribute to a critical understanding of today's political horizons and forms, highlighting the difference from the prevailing distinction of Left and Right. This will necessarily be schematic and simplify matters and should not be taken as a thorough discussion of today's Left.

Today's distinction resides primarily on values or attitudes towards predefined social problems, defining the Left as striving for social equality and inclusion, and the Right as defending privileges and justifying exclusion. However, this distinction is stuck in a bourgeois conception of emancipation made obsolete by the industrial mode of production. Attempts to solve the problem of capitalism by adhering to this horizon, meaning the reappropriation of capital, will reconstitute but not move beyond the contradiction of capitalism. Furthermore, in today's political culture, the ways in which social conflicts are redefined as 'social problems' are rarely critically examined but taken for granted, concealing the reified preconditions of politics.

In contrast, Marxists historically understood the Left as "a new, unprecedented historical phenomenon [which ...] manifested in political life" when bourgeois society entered into crisis by the late 18th century (Cutrone 2008a). Marx and Engels sought to theoretically and politically engage with the historical meaning of this unprecedented phenomenon while observing, in the wake of the Industrial Revolution, how the progress expected by the Left of their time failed to materialize. Instead of progress, they witnessed the now proletarianized bourgeois society, politically led by the Left, entering crisis again by the mid-19th century.

This led Marx and Engels to deeply engage with the problem of capitalism and the dialectical critique of emancipatory politics. They understood the proletariat as the negative condition of society, tasking the Left with transforming itself into the historical consciousness of this negativity. This transformation was seen as a precondition for developing an adequate political horizon to appropriate capital's potential for freedom and overcome its alienated form. From the standpoint of world history, Marx and Engels clarified and concretized the task of the Left to embody this possibility as historical truth, as society's drive to become true to itself.

The Left, understood as a primarily negative political orientation, embodies the historical capacity and task of the political "clarification of the specificity of the modern problem of social freedom. [... Thus,] it becomes clear that the Left must define itself not sociologically, whether in terms of socioeconomic *class* or a principle of collectivism over individualism, etc., but rather as a matter of *consciousness*, specifically *historical* consciousness" (Cutrone 2008a). This defines the Left as the negation of the historical situation it is part of (Kołakowski 1969), instead of proposing a positive vision or abstract utopia of how society should be. Political programmes and political forms serve as vehicle and not as

solutions. In this negative sense, the revolutionary left aimed to replace “the old bourgeois society, with its classes and class antagonisms” through a revolutionary process with “an association, in which the free development of each is the condition for the free development of all” (Marx and Engels 1848:482).

This perspective entails a distinction of the political left and the political right that is very different to today's established systems of categorizations of political orientations because it assigns a historical task to the left from the standpoint of world history. The left is first and foremost a “consciousness of history and historical *potential* and *possibilities*” (Cutrone 2008a). It is not distinguished from the right by “the struggle against oppression — which the modern Right also claims. The Right does not represent the past but rather the foreclosing of possibilities in the present. For this reason, it is important for us to recognize the potential and fact of regression that the possibilities for the Left in theory and practice have suffered as a result of the abandonment of *historical* consciousness in favor of the *immediacies* of struggles against *oppression*” (Cutrone 2008a).

The historical chasm between the political imagination of the historical Marxist Left and today's Left becomes more pronounced when contrasting their categorization of right-wing political orientations and their conception of the problem of politics. To explain the difference, I will only selectively and schematically discuss the New Left, using it as an umbrella term for the emergence of the new social movements and counterculture in the 60s and onwards, which exploded in 1968 and was driven by the emerging new middle classes. I am not considering its origins in relation to the failure of Marxism, which would be needed for an adequate treatment of the subject (for thorough discussion see: Cutrone 2012, 2018a, 2023).

I have described how Marxists understood political forms and orientations as different historical horizons to engage with the problem of capitalism, which were seen as dialectically interrelated moments of history. Past attempts at mediating bourgeois social relations in and through the crises of capitalism were seen as accumulation of political problems of capitalism, expressed in different but interrelated political forms. Since they considered emancipation impossible from partial, single-sided aspects of society's contradictory totality, they deemed it essential to encompass the wide spectrum of opposed discontents to politically manifest and advance the contradiction of capitalism. This was considered necessary to overcome the antipolitical, bonapartist dynamic, which represented the problem of politics. The foreclosure of emancipation, embodied by the political Right, was seen as failure of the dialectical politics of the Left (Bloch 1935; Reich 1933; Zetkin 1923).

The New Left appears to have lost this Marxist understanding of political forms as historically interrelated moments. Instead, the New Left attempted to interrelate different forms of oppression by conceptually separating them into the categories of Race, Class, and Gender. These categories are theoretical abstractions providing a more or less transhistorical perspective on oppression, under which the history of capitalism is subsumed. For instance, the oppression

of women predates capitalism (Lerner 1986; Patou-Mathis 2021). While there is no consensus on the historical origin of racism and whether it is a purely modern form of oppression, it is certain that racism emerged before the industrial revolution (Fredrickson 2003; Miles and Brown 2003).

According to the interpretation I follow, capitalism began with the industrial revolution rather than through exploitation, marking a world-historic turning point. When the emergence of capitalism is explained through its prehistory in colonialism and/or inner European racism, it assumes exploitation as the cause of capitalism rather than its effect, by emphasizing historical continuity (Bhattacharyya 2018; Robinson 1983). However, this perspective cannot sufficiently explain how capitalism emerged as the self-contradiction of bourgeois society, dominated by capital. This can only be understood by examining how bourgeois society entered into crisis through the industrial revolution.

In this sense, the categories of Race, Class, and Gender reverse the Marxist approach, which emphasizes the self-contradiction of bourgeois society in capitalism and its historically specific antinomies that drive bourgeois society while keeping it in a transitional phase. The Marxist view considers political orientations as interrelated subjective moments that attempt to solve the problem of capitalism but have so far only reconstituted it, leading to the historical accumulation of political problems that shape the societal form of politics. While the New Left's categories aim to understand political orientations historically, they fail to grasp the concrete historical forms of politics and political orientations as expressions of the contradiction of capitalism. Instead, they recontextualize these orientations and forms under capitalism in a transhistorical perspective, often treating them as independent forces of history. This is evident in debates about the interrelation of Race, Class, and Gender, whereas Marxists sought to understand the self-contradiction of society. Consequently, the New Left's approach is primarily past-oriented (expressed in social justice), while the Marxist approach highlights the specific temporality of capitalism, pointing to a future society in which capital's potential for freedom has been realized.

However, the New Left understood its development of its new political orientations by the aforementioned categories as theoretical progress compared to the historical Marxist Left, which they understood as one-dimensional. But it was the New Left's interpretation of Marxism that confused the working class with the white male industrial worker, instead of understanding the historical constitution and reconstitution of the working class through the dynamics of proletarianization, tasking the Left with the development of adequate 'negative' political consciousness.

After all, the New Left failed to grasp the crisis of Fordist capital in the late 60s and early 70s in both theory and practice. The international accumulation regime of Fordism, including the Eastern bloc, was characterized by high wages and low profits. Its crisis resulted in the collapse of the Fordist welfare state model and marked the beginning of the end of the Eastern bloc, which lacked a political revolution capable of revolving the crisis. The resolution of this crisis came through the neoliberal political revolution that successfully reappropriated

capital. The New Left's was hindered to grasp the crisis by its preconception that political change by democratic means is the hallmark of the Left. The success of neoliberal politics challenged the New Left's assumptions, leading to frustration when mainstream politics achieved change driven by the Right through democratic means "rather than through the Left's own 'revolutionary politics'". Capitalism has continued and will continue through political revolutions of greater or lesser drastic character" (Cutrone 2023:104).

The majority of the New Left addressed this defeat by abandoning Marxist theory in practice, replacing or blending it with post-structuralism, which they deemed more adequate for understanding the 'postmodern' condition. Although most of the New Left initially identified as socialist, (neo)anarchism became a more commonly used label (Cutrone 2012). Instead of critically and historically reflecting on the political orientations of the Left, they turned to culture and subjectivity, focusing on the emergence of the new Right to understand the failure of the Left.

Undoubtedly, conceptions like 'racism without races', 'differential racism', 'culturalist racism', or 'retorsion' generated insights into the changing semantics of racism, which replaced biology with culture and inequality with difference (Balibar 1991, 2005; Miles and Brown 2003; Taguieff 2001). However, these insights could only mitigate the success of the Right and resist new forms of racism, but they lost sight of collective societal emancipation. Similarly, feminism abandoned the vision of historical emancipation in favor of micro-politics. This shift offered new insights but was ultimately thwarted by the success of the Right. In this context, culture and subjectivity were employed to explain the persistence of patriarchal oppression despite the efforts of older New Left feminism (Butler 1990; Wolf 1992), comprehending the success of the new Thatcherite and Reaganite right-wing politics as antifeminist backlash (Faludi 1991).

This reorientation was assumed sufficient to advance the feminist and antiracist agenda of the New Left in neoliberalism: challenging cultural norms, oppression, and discrimination, and furthering gender and racial equality, empowerment, and diversity. In contrast to these more influential political orientations of the New Left, what has constrained "the sectarian 'Marxist Left' has been the freezing of the theory-practice problem, which then continued to elude a progressive-emancipatory solution at any given moment. Particular historical moments in the theory-practice problem have become dogmatized by various sects [Trotskyists, Leninists, Maoists, council communists, etc.], thus dooming them to irrelevance" (Cutrone 2010a).

The underlying problem of all these developments is not, in my opinion, the prioritization of culture versus economy or vice versa, but the insufficient treatment of the theory-practice problem of left-wing politics. This insufficiency arises either from fetishizing a specific moment in the history of this problem (as seen with the sectarian Left) or from fetishizing the Right or oppressive ideology/cultural practices as the problem. This resulted in the loss of the dialectical understanding of the interrelation of different political forms and discontents in the societal totality. Furthermore, this loss obscured the fact that a

Left based on categories like social justice and equality cannot sufficiently distinguish itself politically from the Right. Distinctions rooted in those categories disguise not only that the Left and the Right are claiming similar concepts in justifying politics but also that both are rooted in the historical horizon of the ideology of the Third Estate.

Prevailing distinctions of the Left and the Right, with Noberto Bobbio (1996) serving as a paradigmatic example, commonly refer directly or indirectly to the French Revolution. The French Revolution serves as a historical prototype, distinguishing the Left as those seeking to advance the revolution's progressive values, and the Right as those aiming to slow this process or revert to an aristocratic system. Consequently, the Right is seen as defenders of inequality and liberty based on privilege, while the Left is viewed as the historical force for advancing social equality and justice.

However, this common conception overlooks how the political challenge of 1848 and the emerging contradictions of capitalism profoundly transformed both the Left and Right that emerged from the French Revolution. It mistakenly casts the Right as representing the past, while in reality, it has shaped modern mass politics as much as the Left. Modern mass politics were alien to the 'old' pre-1848 aristocratic Right (Saul 2015). Additionally, it is incorrect to view the Right as representing the past because they do not seek a return to a pre-capitalist society (Davidson 2015). They are capitalists, followers of capital – like everyone else. Most importantly, the Right cannot be anchored in the past because it is entrenched in the immediacy of the present of capitalism, defined by the false necessity of opposed but real needs, without offering any political perspective to overcome this false necessity. Providing such a political perspective is the historic responsibility of the Left. This is what differentiates the Left from the Right as a subjective force in history.

Furthermore, social equality *and* social justice are not unique to the Left but can also be claimed by the Right that emerged after 1848. The prototype of 1848 helps clarify this counterintuitive idea. This will require recalling some aspects of the preceding discussion. The examination of the Bonapartist condition of modern politics, characterized by a society stuck in transition, has shown that capital-reconstituting struggles are the norm under capitalism, with even the working class having an interest in such efforts. These struggles are not due to ideological blindness but rather to the obsolescence of the political horizon of the Third Estate, which fails to grasp proletarianization.

Moreover, the division of capital and labor does not cause capitalism; it is an effect of capitalism's self-contradiction. The opposed aspects of capital and labor are inseparable; they need each other although their needs have become opposed in capitalism. The conflicts and opposing needs resulting from this self-contradiction are false but real necessities. This leads to a multitude of problems, and attempts to resolve them regularly fail to bring intended or lasting effects, thus constituting widely observable phenomena that express the crisis of values of bourgeois society.

However, these issues are rarely recognized as crisis but instead appear as hypocrisies – promises not kept – because these problems are already recognized

as issues within bourgeois society. Even if the values of bourgeois society are criticized as a whole, either from the Left or the Right, it is done within the political horizon of the Third Estate (Nobbio 1996 serving again as an example). The rejection of those values does not escape this horizon. This rather illustrates that, what is seen as bourgeois value and what should be valued as value is conflicted, illustrated by differences in seeing mass society as egalitarian leveling, demoralization, or degeneration. This is why both the Left and the Right can 'legitimately' make claims of social equality and justice.

The New Left claims, that the Right would not embody true 'justice' and 'equality' and would make those claims only for opportunistic reasons. This is not false as such, but insufficient, since the Right also claims that the New Left would twist those concepts ideologically to advance its particularist agenda. The Right frequently uses this conflict about values as illustration that politics or life in general would be nothing but a struggle for power. This premise is often shared by 'post-marxist' intellectuals of the New Left, arguing dissent and conflict should be seen as the core of radical democracy (Laclau and Mouffe 1985; Mouffe 2000).

Whose claim to 'justice' and 'equality' is justified cannot be decided scientifically or philosophically; it is a political question. This should not lead to relativistic conclusions about the Left and the Right but highlight the aporias²² that arise when distinguishing the two through values. These aporias can be overcome by recognizing that the preconditions for making opposed and legitimate claims on justice and equality are based on different premises of how to conceive of society. Unfortunately, the Left often assumes these premises to be self-evident to their political opponents on the Right. If those opponents don't subscribe to these premises, the widespread explanation is that they must be blinded by ideology. While I can only superficially discuss these aporias here, I will outline some main trajectories:

When society is presumed to be a meritocratic system, social equality refers to equality of opportunity. Introducing measures of redistribution in such a system would be seen as discrimination. Conversely, if society is considered a discriminatory system producing social inequality, social equality can either refer to equality of outcome, demanding measures of redistribution, or transforming the system to ensure equality of opportunity. Thus, the Left and the Right can agree that inequality is socially produced. However, if society is seen as a functioning meritocracy, inequality of outcome could be interpreted as 'proof' of natural human inequality. Thus, social equality can be used to 'prove' natural inequality.

²²Jason Stanley (2015:178–291) has an interesting but ahistorical discussion of this issue, using the tools of analytic philosophy. However, he does not see the significance of the problem of political orientations and instead 'solves' this issue philosophically by reverting to a version of class interested founded deliberative democracy and the concept of epistemic injustice by Miranda Fricker (2007). Although Ishay Landa (2009) does not discuss this problem explicitly in his study of the similarities between fascist and liberal tradition. However, his book provides rich material to study this issue. Athanasios Marvakis (1996) has referred to this issue explicitly as methodological limitation of social sciences inquiring into political orientations.

These aporias are not coincidental or merely philosophical problems; they represent the false necessity of opposed but real discontents and viewpoints. Rather than presuming the associated premises as self-evident, the task is to clarify the understanding of society while taking the partialities of standpoints seriously, as expressions of the self-contradiction of capitalism.

In this sense, the Marxist view of capitalism suggests that the contemporary conflict between the New Left and the new Right is essentially about different priorities for social investments in capital. In the current context, if a value crisis of capital is resolved through political revolution, it is not merely a question of values or class compromise but rather which social investments can preserve the value of capital. While it is not irrelevant whether social investments in capital are dictated by the values of the Right or the Left, it is essentially confined to “hard or soft, and more or less irresponsible capitalist state dictatorship” (Cutrone 2015b).

Capital continues to dominate society, and politics remains irresponsible. Both the Left and the Right can make claims for social investment in capital in the name of social justice or social equality because these concepts are appropriated from partial standpoints within the contradictory totality. Even if the Left claims to have a universal standpoint, this does not necessarily hold true.

The partiality of standpoints cannot be overcome by ethics of inclusion or theories of universality because capital is the ‘true’ universal, dominating society; it cannot be simply claimed. It can only be overcome negatively from the standpoint of world history within the social antagonism of capitalism. The historic responsibility of the Left is not to be merely ‘against’ the Right, protesting its hypocrisies. The Left must be historically ahead of the foreclosure of emancipation by the Right. The Left can only do this by embodying a historical consciousness about the concrete emancipatory potential of society. Its job is to stay ahead of the curve by advancing contradiction. This necessitates encompassing a wide spectrum of discontents and opposing needs of the working class, politically manifesting, and advancing the contradiction of capitalism through adequate political forms that can build the necessary consciousness of historical possibilities.

However, as Chris Cutrone points out, “this task has been abandoned in favour of what are essentially capital-*reconstituting* struggles, attempting to cope with the vicissitudes of the dynamics of modern history. But this re-assimilation of Marxism[and/or the New Left] back into ideology characteristic of the revolt of the Third Estate means the loss of the true horizon of possibility that motivated Marx and gave his project meaning and urgency” (Cutrone 2008a).

4.8. Interim Reflection: The Theory-Practice Problem in Therapy

After having redefined the problem of the far-right as the question of historically changing relations of theory and practice, I will now start connecting this analysis to the practice of therapy. Considering my elaboration so far, it should be clear that there is no simple way of transferring insights from this analysis to

therapy. Indeed, it is important not to confuse emancipation in politics with emancipation in therapy (Knebel 2018, 2019). Both are distinct forms of *political* practice. Therapy is, like psychology, “*politics with other means*” (Marvakis 2022:155).

As should be evident by now, the political orientations of therapists and clients will inevitably influence the trajectory of therapy. To understand this, we must conceive of politics in a broad sense as “a constitutive moment of every human action, encompassing ‘transcendent’ references beyond the concrete acting individual and the individual act. Agency cannot only be the performing, executing, carrying-out of certain (given) tasks. We also have to recognize its anticipative and creative dimensions, its ability to answer (given) questions, solve (existing) problems, and formulate questions and indicate phenomena as problematic and calling for action” (ibid.).

Thus, political orientations are essential in our everyday conduct of life to make sense of ourselves and the world we live in to have agency in shaping our world in meaningful and intentional ways, while often leading to unintended contradictory outcomes. This holds true for therapists as well as their clients (Dreier 2008). However, it is insufficient to explain contradictory outcomes solely by referring to one or another ahistorical conception of the mischiefs of the unconscious. History must be adequately considered because “there is no primary unconscious; unconscious appears as a quality of [the theoretical conception of] subjectivity. Subjectivity as a cultural-historical formation [encompassing its theoretical articulations] is not anchored in a universal condition of individuals” (González Rey 2021:40).

In other words, different approaches in therapy (and psychology), including critical or emancipatory approaches, are not simply theories, techniques, or methods to be applied but always relations of theory and practice or of knowledge and skills/capacities (Dafernos et al. 2013; Holzkamp 1988; Markard 2019). This implies that different approaches are also different orientations to the historically dominant psychology/therapy and its institutionalized relations of theory and practice in universities, health and social systems, training institutes, publishing houses, professions, professional associations, clients as free customers or forced patients, and so on (Dafernos et al. 2013; Marvakis 2019).

Furthermore, different approaches have to orient themselves towards other approaches and especially towards the dominant one. This is not a matter of choice but a necessity because the different approaches of therapy (and psychology) are part of the societal process. They have to compete over societal resources, including clients/patients/research subjects, by claiming the ownership of social problems, as highlighted by the existence of professional associations, advocacy, and lobbying groups (Burstow 2015; Cohen 2016; Frawley 2024; Hilgartner and Bosk 1988; Marvakis 2019, 2022).

When viewed in this light, it should be clear that emancipatory-intended therapy can learn from historical investigations into the theory-practice problem of emancipatory politics. While cautioning against drawing simple analogies, I suggest that the theory-practice problem must be specifically rediscovered for therapy. This should be understood as the “necessity of a continuous, historical-

societal contextualization of (critical) psychology [which] assigns us many tasks for the coming decades” (Marvakis 2019:25). Here, I can only offer some preliminary remarks.

When we take the conceptions of political orientations as subjective moments of the societal process seriously, it becomes clear that not only has the development of therapy been heavily influenced by politics, but therapy itself can be considered a form of politics. Professionals and their (political) organisations actively participate in the transformation of capitalism because they must compete for societal resources, having to prove their capacity to preserve the value of capital. If they fail to re-legitimize their recognition, they risk losing the resources they enjoy (Marvakis 2019).

This dynamic is particularly evident in the resolution of the crisis of capital through neoliberal politics. As Marvakis (2022:157) notes, psychology's “basic virtue” in the neoliberal transformation involves contributing to the “extended ‘*commodification of the psychic*’,” reframing “social phenomena as private commodities”, responding to “individual, private demands and ,in the neoliberal logic”, being privately paid for.

To develop my argument I refer to Marvakis (2022:157) distinction of two different political-epistemological perspectives: The “‘*perspective of bureaucracy*’ – probing for knowledge about people and the management of human action confined to only performance, execution.” This technocratic form of politics in therapy involves carrying out societally assigned tasks without questioning their broader implications. Second, the “‘*social-movement-perspective*’, interested in knowledge for people who are co-defining questions and co-deciding about potential answers and solutions to be pursued”. This emancipatory or critical form of politics in therapy questions and clarifies given tasks to move beyond their restrictions. Marvakis (2019:34) considers the latter perspective “the historical, ideological counter-model to the dominant social sciences of the 20th century,” noting that it has often survived only “as a ‘critique of the mainstream,’ as the illegitimate half-sister of the discipline’s most current mainstream”.

We must remember that the emergence of the social sciences in the 19th century was seen as an alternative solution to socialism for addressing the problem of proletarianization (Marvakis in press). Since socialism failed, the question of the “survival” of the counter-model to dominant social science indicates that an adequate inquiry into the theory-practice problem of the forms of politics in therapy must consider not only the problem of capitalism but also the problem of politics in capitalism, taking seriously the historic failure of the Marxist Left. I will explain this in several steps.

As a first step, technocratic forms must be analyzed as a co-evolution of therapy practices, the welfare state, and the troubled person industries. These forms express past attempts to solve the problem of capitalism and mediate, as interrelated accumulated problems, the crisis of bourgeois society dominated by capital. This context is also crucial for understanding critical approaches; releasing them from this context would mean understanding them from an ahistorical and technocratic standpoint.

The advancement of therapy practices towards accountability in emancipation has aimed at exposing the political nature of established practices in therapy and psychiatry, striving to institutionalize more progressive standards (Burstow 2015). However, contradictory outcomes of these efforts can be observed. Understanding and framing how the politics of therapy resulted in a repetition of these problems instead of overcoming them must be carefully considered. Undesirable outcomes should not be attributed solely to competing conservative approaches or to having the wrong theory. Additionally, proposing quick fixes, such as better approaches without an adequate understanding of the problem, is not desirable.

Emancipatory-intended therapy cannot be imagined without acknowledging the history and impact of emancipatory politics; it draws from the same concepts and political prototypes. This influence extends beyond therapy practice to the everyday lives of therapists, including the politics of therapy itself, making the theory-practice problem of politics relevant to therapy. Thus, emancipatory-intended therapy (and its broader politics) can learn a crucial lesson: the problem of political orientations as historically changing relations of theory and practice “is not a matter of formulating a correct theory and then implementing it in practice. It is rather a question of what Lukács called ‘historical consciousness’ [of the contradictory totality]” (Cutrone 2010a).

Given that the historical trajectory of therapy is intertwined with the fate of the welfare state and its associated institutions and markets, shaped by past efforts to address the problem of capitalism, we can see that establishing new standards, whether ‘progressive’ or technocratic, is invariably linked to the problem of politics in capitalism. This connection helps us understand how various forms of therapeutic politics have contributed – some intentionally, others unintentionally – to the emergence of a culture of vulnerability and despair (Cohen 2016; Frawley 2024; Haslam 2016; Haslam, Tse, and De Deyne 2021; Moncrieff 2022).

The connection between the problem of politics in capitalism and the politics of therapy becomes even clearer when considering how the contradictions of the New Left were expressed through one of its political projects: the deinstitutionalization of psychiatry. This initiative has not resolved the issues it aimed to address. Instead, it has indirectly promoted the psychiatrization of everyday life, effectively aiding neoliberal politics in finding new profitable ways to manage proletarianization and preserve the value of capital (Beeker et al. 2021; Dörner 2002; Goulart 2019; Mills 2014).

Examining the contradictory outcomes requires us to consider the role of criticism. We previously defined criticism indirectly by describing emancipatory forms of therapy and their practices as efforts to critically reflect on and move beyond the constraints of societally assigned tasks. However, the true impact of critical approaches cannot be fully understood by simply accepting their self-descriptions. Claiming criticality often signifies a desire to transcend mainstream limitations, yet critical approaches remain bound by history and cannot claim a monopoly on critique.

In this sense, critique can easily become reified – as a property or trait of an approach, a quality of thinking, an identity, or even as another “type of ‘fetish’ we embellish ourselves with [...] ‘criticality’ can effortlessly be transformed into a ‘technocratic’ tool” (Dafernos et al. 2013:11). For instance, asserting criticality as a property or quality can be a strategy to gain an edge over other critical approaches when competing for societal resources. Understanding this reification of the desire to be critical helps us see how the politics of therapy can become fixated on the immediacy of false necessities, thereby unintentionally repeating problems.

Understanding the reification of critique requires us to conceptualize critique as an orientation – a “relationship with the historical mainstream as the counterpart; it is a social relationship in which real subjects (must) form historical regimes of agency in and for their lives” (Marvakis 2019:24), encompassing the changing relationships among the critics themselves (ibid.). Engaging in these relationships is inevitably informed by historical concepts of emancipation, providing different horizons for societal transformation. Thus, even therapy intended to be emancipatory can engage with a technocratic or otherwise limited horizon. This holds especially true if emancipation is considered as something that therapists provide for their clients and society, rather than recognizing that their own emancipation depends on capital, which enables them to work as therapists. Such horizons remain stuck in the false necessity of capitalism.

To avoid getting fixated on the immediacy of false necessities, it is crucial to recognize that critical and emancipatory approaches have almost exclusively emerged within Fordism as critiques of Fordism. Viewing the ‘social movement perspective’ as a historically changing relationship underscores that the emancipatory horizon of these approaches is tied to the fate of the New Left. From the 60s onwards, the New Left believed it “was rebelling against capitalism, and thought it was doing so more profoundly than the preceding “Old” Left was able to do. But now it is difficult to deny that it was responding to one particular form of capitalism, one already in the process of dissolution. The New Left did not reach deeply enough to affect much of the subsequent transformation of capitalism in the 1980s–90s, but it did serve to legitimize the replacement of what had grown obsolete” (Cutrone 2009b). This misinterpretation of Fordism as capitalism is not confined to poststructuralist and post-Marxist approaches but also extends to Marxist approaches that co-evolved with the New Left (Marvakis 2019).

However, an adequate understanding of capitalism cannot be simply gained by reading Marx's *Capital*, as suggested by the Capital reading groups that emerged as part of the New Left. These groups hoped to rediscover Marxism and make it viable again but were limited by a sociological interpretation of Marxist dialectics. It is crucial to consider the historical changes in the social relations of critique to understand this fully. To this end, we must grasp the historical meaning of the emergence of critical approaches under Fordism. Fordism, including the state capitalism of the Eastern Bloc, could only evolve because of the historical failure of Marxism – or more generally, the revolutionary workers'

movement. This is why therapy and psychology, despite their criticality, are enmeshed with the accumulated problems of past attempts to solve the problem of capitalism.

The horizon of the New Left did not solve these problems but instead became part of them. Critical and emancipatory approaches to therapy are also entangled in this issue. This is not only because the emancipatory horizon of these approaches is informed by the horizon of the New Left, making it difficult to move beyond false necessities, but also because the failure of the New Left has shaped the societal and cultural conditions in which therapy takes place today. Therefore, for (re)discovering the theory-practice problem in therapy, the failure of the Left must be taken into account.

4.9. Far-right orientations in therapy as theory-practice problem

Investigating the problem of right-wing orientations in emancipatory therapy offers a viable trajectory for exploring the theory-practice problem in therapy, as it intersects with the contradictions of therapy and contemporary politics. However, this requires a careful calibration of our viewpoint. A perspective that foregrounds contradictions is needed. Therefore, I propose redefining issues encountered with right-wing clients in emancipatory therapy as problems of motivation.

Formulated as questions: How can therapy with right-wing clients foster the meta-motivation to change their 'right-wing motivation' towards questioning their political orientation? How might clients develop a desire to revise their political convictions? What can therapists contribute to cultivating such a desire? What might motivate therapists to question their own political orientation? How can therapists find the meta-motivation to examine their desire to be critical anew?

Pursuing these questions will provide insights into the motivational trajectories that have captured and limited the desire of emancipatory and critical approaches to move beyond restrictions. Instead of achieving this goal, these limiting trajectories have restricted the desire for emancipation itself. Consequently, these approaches have only contributed to the societal transformation from Fordism to neoliberalism and now struggle to move beyond the immediacy of the present political culture. By investigating the problem of motivation, we can gain insights into more profound trajectories for emancipation beyond the false necessities of the present.

To further refine our viewpoint, we need to revisit key aspects of the preceding discussion on fabulation, historical prototypes, and the culture of despair. It's essential to understand fabulation not as a problem but as a resource for engaging with these questions. Reified accounts, as I will explain soon, cannot be avoided; instead, the task is to become conscious of these accounts. After recalling these aspects, we will delve into the contradictions of motivation, shedding light on the societal task assigned to psychology and therapy. This exploration will help clarify how motives for emancipation emerge that provide

trajectories for transcending the immediacy of false necessities. This journey will lead us through an examination of the emancipatory value of Lukács's theory of reification and Ágnes Heller's concept of consciousness that exceeds its bounds, ultimately discovering Marx's notion of the social individual as a profound horizon for emancipation.

Fabulation, as a sense-making process, inevitably draws on reified accounts of the contradictions expressed in the problems of motivation and politics in capitalism. However, it also relies on historical prototypes, which serve as subjective resources to reimagine the horizon of emancipation. By grounding these reflections in adequate theoretical concepts, fabulation can potentially contribute to an awareness of reification. Therefore, it is crucial to recall some aspects of the culture of despair.

Starting with the widespread reification of unwanted political orientations through 'scientific' explanations, these explanations elevate the scientific standpoint and disguise the politics behind it, thereby avoiding political conflict. Such attempts claim a superior scientific perspective that presumes to understand the essence of social reality objectively, suggesting that individuals embodying rejected political orientations (such as the far-right) lack insight into societal reality and are limited to perceiving the superficial appearance of social reality (Marvakis 1996:68). From this standpoint, right-wingers are assumed to act against their interests, are subject to unconscious motivation, entrapped in defense mechanisms, and/or their socialization as authoritarian personalities, and so on. All this implies a paternalistic standpoint claiming to know what the 'true' interests of the right-winger in question are. This can be prominently observed in the practice of claiming scientific truth in encounters with conspiracy theories (to a lesser degree concerning 'fake news'), which are conceived of as denying the truth and value of science. It should be clear by now that such practices should be understood as reified expressions of the lack of truly emancipatory politics. Marx and Engels (1848) called such visions to replace politics by technocratic practices bourgeois socialism.

Understanding the reification of political orientations historically through the failure of the Left is crucial. Compared to historical Marxists, the Left that emerged later has regressed to a more modest bourgeois horizon of emancipation, limited to transforming capitalism (Cutrone 2021a, 2023). Regardless of one's stance on the plausibility of rediscovering the Marxist vision for emancipation, ignoring the historical impact of the Left's failure on contemporary political culture will inevitably naturalize the immediacy of contemporary political culture as the only true horizon for politics. While reified accounts of societal reality cannot be entirely avoided, fabulations that attempt to make sense of encounters with the far-right by drawing on this political culture will likely remain unconscious of this reification.

The tendency to present a reified account of societal reality without conscious recognition is reflected in prevailing naturalized theory-practice relations, which often employ causal thinking like the 'broken window' theory to make sense of the contemporary successes of the far-right. Lacking a historical perspective on the effects of the absence of the struggle for socialism, these

appeals typically call on the bourgeois-controlled state as the historical subject to resolve problems within capitalism. Such claims, made by both social movements and state actors, engage people in addressing capitalism's problems in reified ways while not cultivating a conscious recognition of this reification.

Therefore, fabulation addressing the emergence of far-right orientations in such ways can be seen as a limited reimagination of the prevailing political culture, failing to move beyond the immediacy of its false necessities. This often results in quasi-apocalyptic crisis definitions that suggest everything is changing for the worse and that individuals have little or no influence on historical development, rendering the imagination of substantial emancipation impossible.

Nevertheless, dismissing these naturalized orientations as simply wrong would overlook the creative sense-making capacity of fabulation. Reification, as I will explain in more detail, is inescapable and embodies an epistemological value that can help move beyond the prevailing political culture. Viewed in this light, political orientations limited to the culture of despair are partially accurate, as they express a historical truth: no socialist development seems conceivable right now due to the absence of an organized, class-conscious proletariat. This condition can be drawn out because it is already implicit in such fabulations. Reflecting on the historical prototypes these fabulations use to imagine progress seems viable. It is important to contrast the employed prototypes with other possibilities, such as 1848, to avoid cultural pessimism and generate more substantial insights into the recurring problem of political imagination expecting progress and getting paralyzed by the failure of progress to manifest. The Frankfurt School has extensively reflected on this situation, particularly when not read in conservative ways but situated within the broader history of Marxism (Cutrone 2024; Dahmer 2019).

On the other hand, this culture of despair harbors significant ideology, making it difficult to rediscover political orientations as a problem of historically changing theory-practice relations. Social relations, the result of human practice, are reified in this culture to appear as unchangeable nature, rendering political emancipation unimaginable. As Lukács explains, this reification is not only 'in' consciousness but inscribed in societal relations, particularly given the absence of political forms that express the theory-practice relations of proletarian socialism, which could cultivate consciousness of this reification. Consequently, the conditions of capitalism – which always pose an existential threat, sometimes more sometimes less for someone than others – are currently exacerbated in the prevailing political culture. This is intensified by solutions claiming to mitigate existential threats.

This issue applies even to solutions with emancipatory intent. For instance, authoritarian state measures to combat the far-right, such as increased police presence ostensibly for security, actually contribute to collective insecurity. Similarly, 'leftist' notions that primarily see problems in the authoritarian 'character' place the blame on others, thereby reducing their own agency and concluding that subjectivity is incapable of self-rule and must be governed. Such a culture of despair, as I will outline in part 4 with Ute Osterkamp, provides

subjective credibility to far-right orientations that claim to save ‘the people’ from misery while simultaneously intensifying that misery.

Chapter 5: The contradiction of motivation – Consciousness Exceeding its Bounds

Understanding potential pathways to move beyond the prevailing culture of despair requires avoiding any form of naivety. Following the Marxist hypothesis, this task necessitates comprehending the development of motivations fort transcending the restraints of capital. As a starting point, I suggest examining the problem of motivation within the peculiarities of the societal situation of therapists to explore the contradictions inherent in the reified problems they encounter. This includes the issues that arise when they are confronted with far-right orientations in their workplace, which are subsequently interpreted and fabulated in reified terms.

5.1. The Contradiction of Motivation

Almost every therapy involves, in some form, the task of cultivating meta-motivation—that is, the motivation to change one’s motivation. This task is rooted in a historical contradiction that Ute Osterkamp (1975, 1976) and Kurt Danziger (1997) have independently explored. As summarized by Morten Nissen: “‘Motivation’ is whether, how much and why people want to do what they are required to do; it is subjectivity appropriated as the object of governance, primarily in industry and education; but – as an object of a putatively neutralpsychological science – it is conceptualized as if this framing power relationwere irrelevant” (Nissen 2019:473).

Marvakis (2019) reflects on this contradiction, pointing to a broader historical dimension in the development of subjectivity by investigating subjectivity as the development of the productive force of individuality. He emphasizes that the (re)organization of society both requires and enables historical forms of individuality. However, this should not be understood as a static situation but rather as a process in which the (re)organization of society and individuality are dialectically intertwined, potentially challenging the dominance of capital. Marvakis highlights this contradiction using a passage from the *Grundrisse*: “Forces of production and social relations –two different sides of the development of the social²³ individual – appear to capitalas mere means, and are merely means for it to produce on its limited foundation. In fact, however, they are the material conditions to blow this foundation skyhigh” (Marx 1857:706).

²³ A note on translation conventions: While Marx's term "gesellschaftliches Individuum" would be more accurately translated as "societal individual," I will adhere to the established convention and use "social individual" instead.

Since subjectivity and individuality are evolving societal products, they must be profitably organized to produce and preserve value in the form of capital, while potential subversive developments of subjectivity need to be restrained. This embodies a contradiction: “The profitable organization of actions by and of real subjects between autonomy and heteronomy constitutes a real contradiction, a real problem for those in power as they organize societal work. Formulated as a question, this contradiction could be: How can individual productivity and creativity be developed *and* exploited (or even developed *to be* exploited)? Or, as a slogan: No *value appreciation* (*Wertschöpfung*) of the productive force ‘individuality,’ without its simultaneous *appreciative evaluation* (*Wertschätzung*)” (Marvakis 2019:30f).

This implies that emancipatory developments cannot be situated outside this contradiction. Thus, Marvakis speaks of the dialectical unit of historical emancipation-alienation regimes: “It is not a question of choice in looking at emancipation or in looking at alienation. All subjects are included and thus are participating/contributing to this “dialectical unit” – even though in particular ways and forms! Nobody is just “emancipated” and/or “alienated” – looking from this point of view at the others!” (Marvakis 2015:140).

The critical question now is how this contradiction, embedded in the societal development of individuality, serves as the material condition to disrupt the foundation on which capital resides. How can this be discovered in psychology? Ute Osterkamp (1975, 1976) suggested reinterpreting and expanding the concept of motivation. “All through the ‘short 20th century’, new concepts of human needs would emerge that recognized individuals as ever more widely self-determining, in order to harness their subjectivity for purposes that were not to be questioned. Finally, the contradiction could be overcome by siding with the subjects and recognizing their need for participation in collective self-determination as true and expansive/generalized agency [verallgemeinerte Handlungsfähigkeit²⁴]; this, for Osterkamp, was the true concept of motivation” (Nissen 2019:473).

Osterkamp's and, following her, Holzkamp's (1983, 2013) depiction of expansive agency provides substantial insights that are grounded in Marxist theory, offering a perspective for overcoming the false necessity of opposed needs. Their methodology calls for using Marxist social theory and reinterpreted psychoanalytic concepts to investigate social problems and contradiction that are reified as psychological issues, which psychologists are commonly expected to address in their work. Building on their insights, I will provide suggestions for therapists in part four. However, their work does not discuss the concept of expansive agency in relation to the broader problems and discussions within Marxist theory and practice (Nissen 2023:126). As Marvakis (1996:65–78) pointed out, this can lead to paternalistic conclusions, like other aforementioned approaches, when addressing rejected political orientations.

²⁴ The original German term ‘verallgemeinerte Handlungsfähigkeit’ can, in some respects, be better translated as “generalizing agency,” emphasizing the development of agency that transcends the false necessities of opposed needs. However, I have chosen to use the terms “expansive agency” and “expanding agency,” as Nissen does, because this translation is more suitable in explaining far-right orientations.

Furthermore, their work did not engage critically with Marxism as a problem of historically changing relations of theory and practice. Consequently, they discuss the emergence of expansive agency only in general terms. They frame it as overcoming the immediacy of restrictions, such as competition, and the personalization and individualization of societal relations, by understanding the societal mediateness of problems in personal agency. However, they do not specify the problem to which the general and underdetermined concept of ‘mediation’ refers (Dreier 2006). Thus, the question remains unanswered as to how motives arise to cultivate substantial and sustained desires for expansive agency. It does not (adequately) discuss the problem of the transition from what is (restrictive agency) to what ought to be (expansive agency). Instead, this leads to the impression that the task is merely to move beyond the immediacy of situational experiences of problems, reinterpreting them within a Marxist framework to understand the societal ‘mediation’. However, the problem “is not a matter of formulating a correct theory and then implementing it in practice” (Cutrone 2010a).

Such an approach overlooks the self-contradictory temporality of bourgeois society dominated by capital as a society stuck in transition, which necessitates, within the societal antagonisms of capitalism, the standpoint of world history to overcome the false necessity of opposed but real needs, that this society produces. Considering my elaboration so far, we can reinterpret Osterkamp’s conception of the problem of motivation as a dialectical reversal, highlighting (but not explicating in her work) the subversive potential of this problem. Instead of asking from the standpoint of capitalism, “How to make people want what they are required to want?”, the reversal asks: “How do motives arise from the standpoint of the working individual for the collective ought (and practice) to move beyond capitalism? - to move beyond the immediacy of the false necessity of opposed but real needs?” This is important, because this immediacy is the most important precondition for right-wing orientations to appear convincing. Therefore, it is crucial for therapists to develop the capacity of imagining potential trajectories how individuals might overcome this immediacy. As I have argued, telling clients or assuming what their ‘true’ interests are is inadequate for this task.

5.2. Radical Needs and Surplus Motivation: Transcending the Limits of Capitalism

Drawing on the insights of Ágnes Heller (1976) and Georg Lukács (1923), I will argue that understanding the development of motives that point beyond the prevailing political culture toward collective self-determination can be advanced by understanding the development of surplus motivation or ‘radical needs’. These needs, produced by the requirements of capital to preserve its value, cannot be satisfied by capital and thus point negatively to the formation of a consciousness that exceeds its bounds.

As a first step, we must consider how reification impacts the consciousness of or orientation in the societal process. Reification, a key concept developed by Lukács (1923) in “History and Class Consciousness”, describes how social relations are transformed into relations between things, extending Marx's analysis of commodity fetishism. This process shapes all aspects of social life, including consciousness, leading to the fragmentation of societal relations and obscuring the underlying societal processes driving capitalism. Consciousness unconscious of reification is fixated on the immediacy of the false necessity of opposed but real needs. Individuals come to perceive societal structures as objective and unchangeable, adopting a passive, contemplative attitude and perceiving social processes as governed by immutable laws akin to natural forces. This breeds a sense of fatalism, inhibiting revolutionary consciousness and cultivating feelings of powerlessness and an incapacity to develop expansive agency. However, recognizing reification embodies the historical potential to move dialectically beyond these restrictions. Lukács capitalism as a totality that produces not only reification but also the consciousness of reification.

Ágnes Heller highlights, like Lukács, the importance of the recognition of reification to transition beyond capitalism, even though she uses the term alienation. Building on these ideas her book “The Theory of Need in Marx” (1976:97) discusses the transition problem as the problem of what is and what ought to be. “But if a system of needs is specific to a given social formation, how can the subjective forces arise which are to overturn this given society?” Heller argues that the cultivation of “radical needs” drives capitalism beyond its limits. Radical needs are produced by the contradictions of capitalism, “thus producing its own gravediggers” (Heller 1976:90). But it is crucial to understand, that these radical needs represent the being of bourgeois society in crisis. Not the ought to move beyond it. But radical needs express this ought negatively: “They are not the ‘embryos’ of a future formation, but ‘members’ of the capitalist formation: it is not the *Being* of radical needs that transcends capitalism but their *satisfaction*. Those individuals for whom ‘the radical needs’ already arise in capitalism are the bearers of the ‘collective Ought’” (Heller 1976:76f). Understood in this way, the negativity of radical needs serves in Heller's conception as the building block of “consciousness exceeding its bounds”, which embodies the collective ought to move beyond capitalism. Before further discussing the concept of radical needs, I will elaborate Heller's and Lukács' solution for the transition problem.

Consciousness exceeding its bounds, which Heller extracts²⁵ from Marx's Grundrisse, is similar to Lukács's (1923) “imputed consciousness,” emphasizing

²⁵ Heller extracts the concept of “consciousness exceeding its bounds” from a specific section of Marx's Grundrisse. I provide the full quote in Heller's translation as it effectively illustrates her line of thought: “The material which it works on [Marx is referring here to subjective “labour capacity”, not to the workers — A.H.] is alien material; the instrument is likewise an alien instrument; its labour appears as a mere accessory to their substance and hence objectifies itself in things not belonging to it. Indeed, living labour itself appears as alien vis-à-vis living labour capacity, whose labour it is, whose own life's expression it is. [...] Labour capacity relates to its labour as to an alien, and if capital were willing to pay it without making it labour it would enter the bargain with pleasure. Thus, labour capacity's own labour is as alien to it — and it really is, as regards its direction etc. — as are material and instrument. Which is why the product then appears to it as a combination of alien material, alien instrument and alien labour — as alien property, [...] the recognition of the products as its own and the judgement that its separation

that true revolutionary consciousness is not a spontaneous outcome of capitalist conditions. Instead, it requires building on the spontaneous experience of reification and contradictions a theoretical understanding of the contradictory totality of capitalism as a conscious recognition of reification. This form of consciousness transcends immediate hardships and recognizes the inherent alienation within capitalist social relations, desiring a fundamental transformation of these relations rather than merely improved conditions within the existing system. Both Heller and Lukács agree that this is not the naturally occurring orientation of the working class. Instead, it represents a potential that needs to be developed through the dialectics of theoretical engagement and practical politics, thereby transforming the working class into the standpoint of the class-conscious proletariat as a historical horizon for emancipation.

The theoretical understanding of the contradictory totality of capitalism cultivates a historical consciousness, possessing the capacity to exceed the immediacy of the false necessity of opposed but real needs. As such it can bridge the “unbridgeable ‘pernicious chasm’ of the present. The human must be able to comprehend the present as a becoming. They can do this by seeing in it the tendencies out of whose dialectical opposition they can make the future. Only when they do this will the present be a process of becoming, that belongs to them” (Lukács 1923:187 my translation).

Both Heller and Lukács argue that simply being conscious of the negative aspects of capitalism is insufficient for emancipation; the working class must develop a “consciousness exceeding its bounds” to transform itself into the proletariat as a collective subject, recognizing the need for fundamental societal restructuring. To unleash this potential is not merely a matter of debating and convincing others to do the ‘right thing’. While political debate is necessary, it is the self-recognition of reified consciousness as reified that drives the development of a consciousness exceeding its bounds. The theoretical understanding of the societal totality that this recognition entails cannot be achieved through pure intellectual will or diligence alone.

Rather, dialectical theory and practice must intensify the class antagonism, and particularly those contradictions that produce radical needs. Only political struggles can manifest these conflicts and contradictions as a historical experience in the societal arrangement of everyday life of the working class. Consequently, capital must react to this historical experience and organize itself politically as the capitalist class. This requisite – the historical experience of the antagonism between the proletarian standpoint and that of capital in everyday life – cannot be replaced by theory alone. But theory is necessary not only to manifest this contradiction politically but also to grasp the problem of capitalism dialectically. This is what is meant by the statement that “consciousness exceeding its bounds” must be developed dialectically through theoretical engagement and practical politics.

from the conditions of its realisation is improper — forcibly imposed — is a consciousness *which exceeds its bounds*, itself the product of the mode of production resting on capital and as much the knell to its doom as, with the slave’s consciousness that he cannot be the property of another, with his consciousness of himself as a person, the existence of slavery becomes a merely artificial, vegetative existence, and ceases to be able to prevail as the basis of production” (Marx 1857:463).

It would be fundamentally wrong and ideologically blinded to equate the revolutionary standpoint of the proletariat with the emancipation achievable within the confines of therapy. However, Heller's and Lukacs' solution for the transition problem is crucial because without it, the concept of radical needs might be misunderstood. Only an adequate comprehension of the development of radical needs in capitalism can clarify how their dissatisfaction within capitalism serves as a negation, pointing to a horizon for overcoming the immediacy of the false necessity of the self-contradiction of capital, producing opposed but real needs.

5.3. The Production and Cultivation of Radical Needs

For advancing the discernment of radical needs, it is essential to understand that needs which are produced and systematically dissatisfied within capitalism are not necessarily also radical needs. Needs that transcend the present due to their systemic dissatisfaction might only point beyond a specific historical regime of capital accumulation, such as Fordism or neoliberalism. Needs are not radical when they do "not transcend the system of needs as a whole, but only the "division" of it" (Heller 1976:97). Considering the preceding discussion on the problem of politics in capitalism, these needs can be understood as trajectories of politics being re-assimilated into the ideology of the third estate.

Some examples can illustrate this: Luc Boltanski and Eve Chiapello (1999) argued that in Fordism, the dissatisfaction of desires for individual and creative self-expression and individual initiative merged into a critique of capitalism that became a subjective force contributing to the renewal of capitalism as neoliberalism. In Marvakis's (2019) analysis, which I mentioned earlier in the context of the contradiction of motivation, this renewal is understood as a shift from a homogeneous (Fordist) mode to a differential (neoliberal) mode of normalizing subjectivity to develop and exploit individuality as a force of production. Additionally, Nancy Fraser's (2019) analysis of the political conflict between the far-right and the left-liberal 'progressive' camp shows how opposed and dissatisfied desires can point to a potential transformation of neoliberalism into either a more authoritarian or more 'progressive' neoliberal regime of capital accumulation.

Furthermore, transcending the "division" of the system of needs does not even necessarily mean moving beyond a specific historical formation of capitalism. It can also imply a subtle shift from more to less or vice versa irresponsible capitalist state dictatorship, such as replacing one government with another that serves the needs of a different capitalists. This shift will represent the discontents of a different section of the working class by prioritizing certain interests among the conflicting interests in social investment in capital. This phenomenon can be observed even at the municipal level, where conflicting desires might arise over priorities like cars versus cycling in urban planning, supporting intercity versus intracity commuters, or addressing the needs of the urban versus rural working class in metropolitan areas. The associated attempts

to preserve the value of capital are interconnected with the political representation of opposed needs and discontents of certain sections of the working class. While these discontents do not themselves represent radical needs, they might be indirectly connected to radical needs.

For needs to be radical, they must have the historical character that they could not previously have been satisfied by bourgeois society, which is dominated by the self-contradiction of capital. This points to proletarianization: "The need of the slave to be a free man is not a new need, because the society that enslaves him is a society of free men. The bourgeoisie's need to take political power is likewise not a new need; it is simply a demand for the satisfaction of a need which is already available to others, and for the elimination of the obstacles to this satisfaction. The radical needs of the working class created by capitalism are, however, different by definition. Their nature is such that they cannot previously have been satisfied in the given society, either by the bourgeoisie or by the proletariat" (Heller 1976:97). As such, considering the problem of politics in capitalism, radical needs can be seen as potential trajectories for politics moving beyond the ideology of the third estate.

Thus, only the radical needs cultivate through their negativity the collective ought, "in the interests of satisfying them, to bring about a social formation which is *radically*, 'from the root', different from the previous one, a society in which the radically new system of needs will be different from all earlier ones" (Heller 1976:98). This means that although capitalism necessarily produces its gravediggers, transcending capitalism is not a natural law but a potential embodied by the subjective force of radical needs. This clarifies that the "class interest" is not the motive that points beyond capitalism; rather, "the true motive, free from fetishism, is represented by the 'radical needs' of [mostly but not exclusively] the working class" (Heller 1976:60), cultivating the collective ought represented by the consciousness exceeding its bounds.

These radical needs are produced by the contradictions that arise out of the self-contradiction of capital. "The idea that radical needs are in some sense constituted from labour runs like a thread through Marx's work: either because surplus labour (performed for its own sake) becomes need; or because of the increase in free time, which gives rise to radical needs (and to the need for still more free time); or because of the need for universality which, having arisen in the form of mass production, cannot be satisfied within capitalism" (Heller 1976:90f). Heller – making no claim to be exhaustive – identifies three key contradictions from Marx's writings that drive this process (Heller 1976:81ff):

1. The 'contradiction of freedom and necessity': While capitalism offers the illusion of freedom and equality through commodity production and wage labor, individuals are ultimately subordinated to the economic system's quasi-natural necessity, generating alienation and the false necessity of opposed but real needs.
2. The 'contradiction of necessity and chance': The inherent unpredictability and uncertainty of capitalism further fuel the consciousness of alienation, as individuals recognize their livelihood is subject to uncontrollable forces.
3. The 'contradiction of causality and teleology': This contradiction between individual intentions and systemic outcomes leads to a recognition of the alienated nature of

societal relations in capitalism. Workers invest in capital hoping to produce goods for their subsistence, but increased productivity results in technologies that primarily generate surplus value. Capitalists intend to make a profit, but the inevitable result of increased productivity is the lowering of profit margins.

Additionally, Heller highlights the contradiction between societal wealth and societal impoverishment, explaining how capitalism constantly creates new desires, especially in the working class, which are impoverished by the needs of capital. These desires can only be temporarily satisfied during periods of expanded societal consumption, creating a radical need for universality. Ishay Landa (2018) makes a similar argument, noting that Marx viewed the expansion of needs entailed by capitalism favorably but saw capitalism as a system that subjugates use-value to the imperatives of profit accumulation, thereby limiting and constraining mass consumption. This drives the cultivation of radical needs that inherently point beyond capitalism.

It is crucial not to mistake radical needs as isolated entities. Radical needs help us understand motivational trajectories for overcoming the seemingly natural immediacy of capitalism. Needs, whether radical or not, do not exist in a vacuum; they are interrelated with other needs and do not emerge passively from conditions. Instead, needs, especially those that transcend the present, are always cultivated as the desire to expand agency by participating in social practices. Therapy is just one instance of such practices. This implies that radical needs are not simply identifiable as present or absent because the cultivation of needs is a social (and not individual) practice. Therefore, radical needs can always be expressed through other needs, particularly those transcending the present. Within limitations, these needs can be expanded by interpreting and cultivating them as radical needs by fostering a conscious recognition of their emergence from contradictions embedded in everyday life, that produce radical needs. This process is important for therapy. In part four, I will provide brief discussion of this complex process. However, a comprehensive discussion would exceed the scope of this article (see: Nissen 2023).

5.4. The Embodiment of Radical Needs in the Social Individual

To advance my argument and conclude the section on radical needs, I will discuss another concept that Heller draws from Marx's *Grundrisse*, the 'development of the social individual'²⁶. This concept deepens our understanding of the connection between societal contradictions and the emergence of radical needs that cultivate the desire to expand agency. Heller, much like Landa (2019) in his analysis of desires for emancipation emerging from 19th-century mass production, argues that the development of the social individual represents the foundation for an emancipation that moves beyond the bourgeois horizon. It embodies the radical "need for universality which, having arisen in the form of mass production, cannot be satisfied within capitalism" (Heller 1976:91). The

²⁶ While Marx's term "gesellschaftliches Individuum" would be more accurately translated as "societal individual," I will adhere to the established convention and use "social individual" instead.

emergence of the social individual embodies a political horizon capable of redefining the societal wealth, a transformation only possible through the historical overcoming of capitalism by appropriating capital's potential for freedom.

The emancipatory horizon of the social individual transforms bourgeois utopias of freedom and universality. However, it is insufficient to view the social individual as realizing the promises of bourgeois values undermined by capitalism. Radical needs embody their emancipatory potential only in their negativity, having not been satisfied in the given society. Bourgeois values became obsolete when bourgeois society entered crisis, and radical needs are historically newer, emerging only through this crisis. Thus, the social individual's utopia transcends the contradiction between bourgeois norms and industrial production, embodying the potential to revise the bourgeois measurement of societal wealth.

The universality expressed in the development of the social individual points to the general and free development of social relations, including the transgression of institutionalized social relations like family and gender relations. It embodies the potential to move beyond the immediacy of false but real needs, illustrated by the condition that free time in capitalism is only available for some at the expense of appropriating others' labor. Therefore, the concept of the social individual is closely connected to the radical need for free disposable time.

Understanding this requires revisiting Lukács's analysis of labor-time and reification. It encapsulates all the mentioned contradictions that produce radical needs. In capitalism, time is quantified as the commodity of labor-time. For capitalists, labor-time is purely quantitative, treated as a resource to be controlled and exploited. However, labor-time is not only the determining form of the commodity of labor power, that the worker sells, but of the workers' "existence as subject, as human being" (Lukács 1923:160). But this entails, that for the worker every quantitative change in labor-time holds a qualitative significance: "The quantitative differences in exploitation which appear to the capitalist in the form of quantitative determinantsof the objects of theircalculation, must appear to the worker as thedecisive, qualitative categories of the workers whole physical, mental andmoral existence" (Lukács 1923:159).

This experience of time as "the place of human development" (Marx 1865:144) bears the potential for workers to become conscious of alienation and reification, understanding how the free and disposable time of capitalists depends on their labor-time, thus restricting their free time. This realization may lead workers to become conscious of "the contradiction between the need to develop their personality to sell their labor-power and labor-time and the 'accidental' character of their subordination to [the false necessity of] thedivision of labor" (Heller 1976:90).

Marx emphasized in *Capital vol. 3* against naive conceptions of freedom that the subordination to the division of labor can only be overcome through the dialectics of the realm of necessity and the realm of freedom. He highlighted how the social individual, necessarily cultivated by capital, produces the historic potential for freedom:

In fact, the realm of freedom actually begins only where labor, determined by necessity and mundane considerations, ceases. Freedom in this field can only consist in socialized man, the associated producers, rationally regulating their interchange with Nature, bringing it under their common control, instead of being ruled by it as by the blind forces of Nature [or society reified as nature or natural law]; and achieving this with the least expenditure of energy and under conditions most favorable to, and worthy of, their human nature. But it nonetheless still remains a realm of necessity. Beyond it begins that development of human energy which is an end in itself, the true realm of freedom, which, however, can blossom forth only with this realm of necessity as its basis. The shortening of the working day is its basic prerequisite (Marx 1894:828).

Heller, similarly to Cutrone, emphasizes that it is not the class struggle itself, but rather its manifestations of contradictions that hold the true potential for emancipation, reaching beyond the limits of capitalism: “While the wage struggle, accordingly to Marx, is conducted for the particular interests of the proletariat, the struggle for freetime transcends particular interests and contains in principle ‘that which conforms to the needs of the species’. [...] When related to the need for free time, the character of “radical needs” is brought out in a particularly striking manner: it is produced by capitalism itself, by its contradictory character, and thus belongs to the very functioning of capitalism. (The reduction of labour time compels capitalists to increase their productivity constantly, and to give priority to relative rather than absolute surplus value; this basically represents a specific peculiarity of the capitalist production of surplus value.) At the same time, need itself mobilises the working class into transcending capitalism” (Heller 1976:91).

It is crucial to understand that the concept of the social individual goes beyond merely “seizing the means of production.” In his *Theories of Surplus Value Vol. II*, Marx writes that in capitalism the “development of the capacities of the human species take place at the cost of the majority of the human individuals and even classes, in the end it breakthrough this contradiction and coincides with the development of the individual” (Marx 1863:118). Heller clarifies that this process is not identical to “the ‘centralisation of the means of production’ and the ‘socialisation of labour’ [...] from the first volume of *Capital* (Heller 1976:84). Instead, the development of the social individual refers to a broader conception of appropriating capital's potential for freedom to develop the capacities of the human species. This is not “a mere consequence of the centralisation of the means of production and the socialisation of labour” (Heller 1976:84).

The social individual, as an embodiment of radical needs, reflects the historic potential of society to liberate itself from the restraining needs of capital, unleashing the free and universal development of the capacities of the human species and the pursuit of higher activities, made possible by free disposable time. This conception of wealth stands in stark contrast to the bourgeois focus on labor-time and capital's relentless pursuit of surplus value. In full agreement with Marx, Heller argues that this possibility is already foreshadowed within the structure of capital itself as an immediate historical potential:

Marx writes in his 'Grundrisse' that "the historic destiny (of capital) is fulfilled as soon as [...] there has been such a development of needs that surplus labour above and beyond necessity has itself become a general need arising out of individual needs themselves [...] hence where labour in which a human being does what a thing could do has ceased" (Marx 1857:325).

These developments would only be realizable in a future society that has abolished the wage-system and the law of value. Let us remember that the constant increase in productivity, which is needed to preserve the value of capital, also leads to the cheapening of labor, making labor less important for production, thus creating the potential for free, disposable time. However, this potential is not realized under capitalism but leads to proletarianization and impoverishment. Therefore, the contradiction between societal wealth and impoverishment holds a true potential for transforming and revising the bourgeois conception of wealth.

Heller argues, without delving into the specifics of her detailed discussion of Marx, that capital drives the development of subjective capacities but at the same time, this is restrained by the law of value. Capital also drives the development of disposable time, but only for some, by appropriating the labor-power and labor-time of others. Since in bourgeois society labor is seen as the sole source and value of wealth, the free development of capacities and disposable free time cannot appear as societal wealth. Nevertheless, capital drives the production of such, both cultivating and frustrating a different system of needs, embodied by the social individual, that serves in its negativity as the potential gravedigger of capital's dominance:

As soon as labour in the direct form has ceased to be the great well-spring of wealth, labourtime ceases and must cease to be its measure, and hence exchangevalue (must cease to be the measure) of use value. The surpluslabour of the mass has ceased to be the condition for the development of general wealth, just as the non -labour of the few, for thedevelopment of the general powers of the human head. With that,production based on exchange value breaks down, and thedirect, material production process is stripped of the form ofopenury and antithesis. The free development of individualities, and hence not the reduction of necessary labour time so as toposit surplus labour, but rather the general reduction of thenecessary labour of society to a minimum, which then correspondsto the artistic, scientific etc. development of the individuals in thetime set free, and with the means created, for all of them (Marx 1857:705f).

Thus, the contradiction of capitalism harbors its own overcoming, giving rise to the social individual, which represents a different system of needs capable of revising the bourgeois measure of societal wealth, as foreshadowed in the production of radical needs. In the next part, I will describe from a historical perspective how the concept of the social individual can be understood as an emancipatory horizon, embodying a utopia of freedom that emerged from the crisis of the bourgeois utopia of the free individual.

Part Three

Chapter 6: Historical Foundations of Today's Emancipatory Notions. The Freedom Utopias of Individuality and the problem of capitalism

6.1. Self-Consciousness of Bourgeois Society – The Utopia of Bourgeois Individuality

The basic idea I want to convey is that modern notions of emancipation emerged during the Enlightenment (Stapelfeldt 2014:289–324), but this development was only possible through the prior historical evolution of bourgeois society that preceded the Enlightenment (Spencer 2013). The Enlightenment marks the period when bourgeois society attained historical self-consciousness, expressed through historical theory-practice relations (Cutrone 2013a; Marcuse 1941). This newfound self-awareness found its prominent and assertive political articulation in Emmanuel Joseph Sieyès's pamphlet "What Is the Third Estate?" (1789), which played a crucial role in initiating the French Revolution by suggesting how the Estates General of 1789 in Paris should be constituted. Sieyès declared, "What is the Third Estate? Everything. What has it been hitherto in the political order? Nothing. What does it desire to be? Something".

This era introduced ideas such as the capacity of individuals to develop themselves to attain maturity, which I refer to as the bourgeois utopia of individuality, which embodies the importance of dialogue, self-criticism, and autonomy. Philosophically, this was famously expressed in Kant's essay "What is Enlightenment?" (1784a), where he defined enlightenment not as a period but as an emancipatory process. Kant described this process as humans developing their subjective faculties to "emergence from [...] self-imposed immaturity. Immaturity is the inability to use one's understanding without guidance from another. This immaturity is self-imposed when its cause lies not in lack of understanding, but in lack of resolve and courage to use it without guidance from another." Thus, Kant articulated a call to emancipation: "The guardians who have so benevolently taken over the supervision of men have carefully seen to it that the far greatest part of them (including the entire fair sex) regard taking the step to maturity as very dangerous, not to mention difficult."

In this perspective, successful living involves not submitting to authorities and traditions but developing a critical understanding of the world and questioning traditional authorities. For instance, for women today, this perspective might mean aspiring to a self-determined life by criticizing and resisting patriarchal norms rather than conforming to submissive roles. This also means actively participating in shaping social contexts rather than withdrawing into private life. This was prominently expressed by the impact of revolutionary and moderate bourgeois women in the French Revolution.

Any adequate treatment of the Enlightenment and bourgeois revolutions would necessitate an extensive discussion on how women shaped this history as active subjects. However, a thorough exploration of this topic lies beyond the scope of this article, as argued in the introduction. Nonetheless, it would be

remiss not to acknowledge the world-historical influence of several bourgeois radical women of the era, whose legacy continues to shape the cultural imagination of emancipation to this day.

Anne Louise Germaine de Staël-Holstein exemplified the role of women as active subjects in the French Revolution, as her presence at critical events such as the Estates General of 1789 and the Declaration of the Rights of Man and of the Citizen in the same year highlighted her engagement in political discourse despite not holding revolutionary standpoints. On the more revolutionary side, it is crucial to mention the Women's March on Versailles, also known as the October March of 1789, which was one of the earliest and most significant events of the French Revolution. Besides being revolutionaries, women played significant roles as spies, historical commentators, salonnières, playwrights, agents provocateurs, philosophers, intellectuals, abolitionists, and writers. They created and shaped institutions such as the first women-only organization in French history, the “Société patriotique et de bienfaisance des Amies de la Vérité” and the “Society of Revolutionary Republican Women,” where the most radical women organized as revolutionaries.

Among these revolutionaries were Theroigne de Mericourt, a well-known agent provocateur who tried to expand the revolution beyond France; Louise-Félicité de Kéralio, who edited the 14-volume “Collection of the Best French Works Written by Women” (1789); and Etta Palm d'Aelders, who presented her “Discourse on the Injustice of the Laws in Favor of Men at the Expense of Women” to the French National Convention on December 30, 1790. The most well-known of them today is probably Olympe de Gouges, who wrote the “Declaration of the Rights of Woman and of the Female Citizen” (1791) and was executed by guillotine in 1793.

However, not all revolutionary women advocated for women's rights. Marie-Jeanne “Manon” Roland de la Platière, for instance, was actively involved in the revolutionary process but argued, contrary to her own conduct of life, that women should play a very modest role in public and political life.

The Enlightenment also brought the discovery of history (Cutrone 2013a), shifting the view of society from a divine order to a human-made, historical process. This shift was famously expressed by Hegel (1837) in his lectures of 1822, 1828, and 1830 “On the Philosophy of World History”:

World history is the progress of the consciousness of freedom – a progress whose necessity we have to investigate. [...] But in contemplating history as the slaughter-bench at which the happiness of peoples, the wisdom of states, and the virtue of individuals have been sacrificed, a question necessarily arises: To what principle, to what final purpose, have these monstrous sacrifices been offered? [...] The Orientals knew only that *one* is free, the Greeks and Romans that some are free, while we [moderns] know that all men absolutely, that is, as men, are free. [...] Freedom is itself its own object of attainment and the sole purpose of Spirit. It is the ultimate purpose toward which all world history has continually aimed. To this end all the sacrifices have been offered on the vast altar of the earth throughout the long lapse of ages.

This historical shift from viewing society as divinely ordained to recognizing it as a human-made process with the potential for freedom implied that rules should only be followed if they are rationally justified and collectively agreed upon. Consequently, resistance against all forms of irrational and authoritarian rule became a moral imperative. Concepts such as self-determination, social contract, and democracy emerged, advocating for a society that ensures the universality of individual freedom.

This understanding of freedom also opposed the state, from which bourgeois civil and political rights had to be protected. Today, it is commonly accepted that the state protects and grants rights, but to the bourgeois radicals of the Enlightenment, this would be seen as an outrageous reversal of facts. This was articulated as the right of revolution in many prominent writings of bourgeois radicals, including John Locke's (1689b) "Two Treatises of Government", Jean-Jacques Rousseau's (1755) "On the Origin of Inequality", Immanuel Kant's (1797) "Metaphysics of Morals", John Stuart Mill's (1859) "On Liberty". In addition, imagine the liberation from feudal conditions during bourgeois revolutions, which involved fighting against the feudal state. This conception of freedom implies the development of a world society as Kant (1784b) famously argued in his, "Idea for a Universal History with a Cosmopolitan Purpose". These notions of freedom also mean recognizing oneself in others as the basis for living together, rejecting natural orders. Consider for example "the categorical imperative".

The bourgeois conception of emancipation envisions a self-regulating society based on free trade and production relations, inherently rejecting slavery (Spencer 2013). This perspective is foundational for modern notions of emancipation (Stapelfeldt 2014). Although Enlightenment thinkers like Kant held racist and sexist prejudices, their commitment to criticism and self-criticism inherently provided a potential pathway for overcoming these biases in the historical process. This notion of criticism is not abstract but grounded in social relations functioning self-regulatingly, as free trade and production relations.

A crucial point here is the concept of property for effective societal participation (Spencer 2013). Property was seen as a fundamental natural right, as articulated by thinkers like John Locke (1689b) in "Two Treatises of government". The primary natural right was self-ownership—the ownership of one's labor and its products. Labor was thus perceived as a means of emancipation, with everyone free to generate wealth through their labor. Bourgeois radicals highly regarded work, as exemplified by Adam Smith's (1776) "Wealth of Nations". This marked a genuinely modern development. That was grasped at that time. A well known example is Benjamin Constant's (1819) reflection "The Liberty of the Ancients Compared with that of the Moderns".

To grasp the historical shift, contrast these ideas with pre-French Revolution aristocracy or ancient Greek citizenship. Aristocrats displayed their wealth as birthrights, not earned through labor, while in ancient Greece, free citizens, equated with being male, were distinguished by their freedom from labor, reserved for slaves. This contrasts sharply with modern bourgeois ideals,

where influential individuals often emphasize having worked for their wealth, justifying their entitlement—a key aspect of modernity.

In the emancipation concepts of the bourgeois radicals during the Enlightenment, the principle was that everyone could achieve wealth through their labor (considering the ideas of Kant, Locke, and especially Adam Smith). This historical horizon of emancipation indeed functioned within bourgeois society—important to note, this discussion pertains to the period before the development of industrial capitalism. Labor operated as a means of emancipation from traditional relationships. Imagine the development of cities: individuals living in rural, patriarchal family structures. Individuals could attain greater freedom by moving to the city and pursuing a profession—primarily referring to male emancipation here.

However, the emergence of industrial capitalism introduced significant contradictions between bourgeois rights and societal relations, and the new industrial relations of production, leading bourgeois society into crisis. These contradictions would ultimately challenge the self-regulating notion of bourgeois society and its ideals of emancipation, paving the way for new social dynamics and tensions. These dynamics and tensions would be further explored and critiqued by the emergence of the workers' movement and its diverse historical theory-practice relations. I will explain this in the next section

6.2. The Crisis of the Utopia of Bourgeois Individuality and the Industrial Revolution

The utopia of bourgeois individuality and its associated emancipation concepts failed politically. I will explain this in three points: 1. The political failure of bourgeois emancipation concepts in the 1848/49 revolutions, followed by the subsequent crisis in the bourgeois conception of emancipation. 2. The political failure was both rooted in and actively expressed the historical emergence of a new, unstable societal condition. Bourgeois society entered a crisis due to the contradiction between bourgeois rights (civil rights) and societal relations on one hand, and the industrial relations of production on the other. 3. Out of this crisis and its underlying contradiction, however, emerged a new emancipation perspective: The utopia of the social individual.

Firstly, these emancipation concepts encountered the 1848/49 revolutions, which from the perspective of bourgeois radicals, failed. The bourgeois radicals, contrary to their hopes for the development of an emancipated world society, faced the development of new authoritarian state forms post-1848, which had social support bases where parts of the aristocracy aligned with population segments that should have had an interest in emancipation (according to Enlightenment thinkers). Symbolic of this is the bloody suppression of the June uprising and the subsequent election of Louis Bonaparte, who declared himself Emperor, Napoleon III, in 1852 (for a nuanced assessment of the revolutions from a contemporary perspective: Clark 2023; for the historical experience of the bourgeois radicals see: Davidson 2012; Landa 2019).

This constellation is referred to in Marxist literature as Bonapartism. Marx, as a contemporary, provided an impressive analysis in his work 'The Eighteenth Brumaire of Louis Bonaparte'. Here, we can find the historical starting point of the new right. The old (mostly) aristocratic right, which opposed the French Revolution, had no interest in developing or involving a social base for their politics. But with the development of democracy, having a social base became important to implement reactionary ideas. The 'new', modern right emerged out of this societal situation (Saul 2015; Saul et al. 2015)

Secondly, the social basis for the failure of these concepts is the crisis of bourgeois rights (civil rights) and the conditions of bourgeois society during industrialization (Cutrone 2024). Essentially, work became less important for societal production. Humans became appendages to machines, as Marx put it. Workers could no longer appropriate the products of their labor because they did not own the machines, the means of production, which played a crucial role in the production of social wealth. This had implications for social participation. The development of productive forces, such as technologies and machines, accelerated the societal production of wealth. However, it no longer directly correlated with the labor one invested. This changed the position in the production process for those who did not own means of production as well as for emerging capitalists: The latter were increasingly freed from the need to participate in the production of products through their own labor. In contrast, workers, including children and women, were forced to sell their labor power as appendages to machines to survive. They could not own anything but their labor power. This explains the 'normal' existential threat I mentioned earlier. Consequently, wealth was concentrated in the hands of a few, while the masses could not access it. Marx described this as the dominance of past, dead labor over present, living labor. Past dead labor ultimately represents capital (consider machines, which also need to be produced through labor). Here, the self-regulation of bourgeois society, the free trade and production relations, came into crisis. Only in this crisis did the modern proletariat and capital emerge. Ultimately, they represent two sides of the same coin: labor, whose products start to span a reified and alienated world. This world is the crisis of bourgeois society. Or in short, capitalism.

Another related point is the cyclical devaluation of labor power in crises, affecting both living labor and the produced wealth. In the latter regard, there were several such crises in the 1840s, representing the first collective experience of such crises. Regarding living labor: You may be familiar with the term de-skilling or de-professionalization. This means that as automation eliminates jobs, people who were, for example, tailors or many women who produced textiles at home suddenly become unskilled workers and mere appendages to machines. This phenomenon of cyclical mass unemployment devalues people and their bourgeois rights (consider the natural right to self-ownership and the right to the products of one's labor). I say 'devalues' to distinguish the failure of bourgeois emancipation concepts, based on these rights, from the political failure I mentioned earlier. I hope this brief sketch of the new social situation clarifies how capitalism cyclically exacerbates the 'normal' existential threat.

This new situation, its contradictions, and the crisis posed a challenge to the bourgeois perspective of liberation. It also entered into crisis, understood as the crisis of bourgeois political orientations as historical theory-practice relations. Historian T.J. Clark (1973) exemplifies this in his analysis of the painting 'Liberty Leading the People' by Eugène Delacroix. This painting depicts the last successful bourgeois revolution of 1830 in France. Delacroix was reputed to be 'the' painter of political upheavals in 1848. His works embodied the political culture. Consequently, he attempted and was commissioned to depict the 1848 revolution but failed. This episode symbolically represents the crisis of the bourgeois emancipation perspective. It could no longer represent the new situation, thereby failing to advance the revolution.

Historian Neil Davidson (2012) traces how this crisis shaped the liberal self-understanding post-1848. These discussions serve as a transition to the next section. The period following 1848 marked a significant shift in the political self-understanding of liberals. Prior to this, figures like Guizot envisioned a liberalism focused on constitutional limits on monarchical power and extending the franchise to the bourgeoisie. This vision was challenged by the 1848 revolutions, which exposed the growing fear of mass movements and the increasingly conservative nature of liberal thought. Before 1848, liberals saw themselves as advocates for progress and rationality, pushing for gradual reform and constitutional governance. They sought to limit the power of absolutist monarchs and extend political participation to the educated and propertied classes. Guizot's dismissal of "abstract principle" and "fanciful theory" demonstrates this commitment to a pragmatic, incremental approach to political change. The 1848 revolutions, however, profoundly shook this self-understanding. The specter of social unrest and the demands for more radical change, particularly from the burgeoning working class, led many liberals to retreat from their earlier embrace of reform. They began to see stability and order as paramount, fearing that further concessions to popular demands would lead to chaos and undermine the existing social order. Guizot's own reconsideration of his positions, prompted by the 1848 revolution, exemplifies this shift. His post-1848 writings abandon his earlier emphasis on social explanations for political change, instead focusing on a narrower conception of political events, devoid of deeper social causes.

This reflects a broader trend among liberals who, after 1848, began to downplay the significance of social forces in shaping political realities. This shift in liberal self-understanding reveals the inherent tensions and contradictions within liberalism itself. While advocating for progress and individual liberties, liberals also sought to maintain existing power structures and often resisted more radical demands for social transformation. The events of 1848 exposed this underlying conservatism, compelling liberals to recalibrate their political vision in a world increasingly shaped by anxieties about social stability and the rising power of the working class. Ishay Landa (2009, 2019) refers to this as the 'liberal split' in his books "The Apprentice's Sorcerer" and "Fascism and the Masses". This split forced liberals to either radicalize and align themselves with certain strains of the workers' movement to expand and transform their vision for

emancipation or to seek alignment with the new reactionary movements, thereby contributing to the emergence of modern conservatism and the far right.

I have described how this new situation, symbolized by the events of 1848, its contradictions, and the crisis posed a challenge to the bourgeois perspective of liberation. However, this also brought forth new political forms and utopias expressed in new political orientations, i.e., new historical theory-practice relations emerged as subjective moments of the social process. The proletariat, as a reaction to this new situation, dialectically embodied a new utopia. As a subjective moment in the social process, it represents the social negativity, for the proletariat is a contradiction that should not exist in bourgeois society as it embodies the ‘disenfranchised’ or ‘dispossessed’ condition and the social devaluation of labor (Cutrone 2024). As a negative moment, it points beyond the capitalist dynamic. Simultaneously, recalling the Marxist dialectical critique, it represents both the anticipation of a utopian future and the greatest potential for capitalism’s renewal during crises, thereby transforming its contradictions into new forms and projecting them into the future.

6.3. The Utopia of the Social Individual

Next, I will discuss how the societal contradictions that arose with industrialization and the resulting crises have given rise to a new emancipation perspective, forming a new horizon for transforming society. This perspective is the utopia of the social individual²⁷, which I have already outlined theoretically in section 2. For those who skipped this section, I will provide a brief description that does not heavily rely on theory. Please note that this overview will gloss over important complexities and may lack sufficient context to fully understand the historical quotes used.

This term comes from Marx’s “Grundrisse” (1857). Ishay Landa contrasts this term in his book “Fascism and the Masses” with the reactionary standpoints that also developed during this period. In his essay “Marxism and Philosophy”, Karl Korsch (1923) uses a similar term, the term “Sozietät” (societal association), to express the emancipatory character of those historical theory-practice relations that have most clearly been expressed by the emergence of the proletariat as a class. He contrasts this with the historical theory-practice relations that characterize the bourgeois class: Marx “did not merely criticize the inherited political economy of the bourgeois class *negatively*, but also *positively*, by opposing the ‘political economy of property’ with the ‘political economy of the working class’ In the national economy of the bourgeois propertied class, even theoretically, private property reigns over the entire social wealth, the accumulated dead labor of the past over the present living labor. In the political economy of the proletariat, *and thus also in its ‘theoretical expression’*, the economic system of Marxism, ‘Sozietät’, the society, reigns over its entire product, that is, living labor over accumulated dead labor or ‘capital’. According

²⁷ While Marx’s term “gesellschaftliches Individuum” would be more accurately translated as “societal individual,” I will adhere to the established convention and use “social individual” instead.

to Marx's insight, this is the pivotal point around which the impending revolution of the world must revolve; theoretically, therefore, a 'radical', that is, according to Marx, a 'grasping the root of the matter' confrontation between the bourgeois philosophy and science and the new ideas of the proletarian class rising to its liberation must revolve".

One central effect of the crisis that emerged from the contradiction between bourgeois social relations and capitalist production relations was that work ceased to be the central means of emancipation. The reduction of necessary labor by the capitalist development of productive forces diminished the importance of work for social reproduction. Consequently, the new conception of emancipation recognized the social reduction of labor time as a prerequisite for freedom. This dynamic unleashed by industrialization also created new forms of wealth, technologies, skills, and knowledge.

A significant aspect of these new productive forces is the constant development and renewal of social relationships and the associated subjectivity necessitated by the inherent instability of capitalist development. This can be seen in how, today, one no longer has a job for life and must constantly acquire new skills. The earlier depiction of the crisis in bourgeois society highlighted the destructive side of this process, expressed through de-skilling or de-professionalization, posing an existential threat. However, within this contradiction lies emancipatory potential. We continually enter into new cooperations with previously unknown individuals, undermining social differences that racism, sexism, and other forms of discrimination thrive on, such as gendered, traditional, and nationalist notions of humanity. Ishay Landa (2019) has described this as the emancipatory potential of the massification of society.

Only in capitalism can humanity become aware of its societal nature—or more precisely, the historical development of capital embodies the potential for humanity to become conscious of its societal nature. We can consider the factory system, where goods are produced through extensive cooperative relationships. Or think of commodities, in which the cooperation needed to produce them is objectified. Commodities of everyday life such as food and clothes are produced in global value chains, representing an incredible cooperative achievement despite being founded on exploitation. My point is that everyday objects of use constitute crystallized cooperation.

As another example we can consider the development of space travel in the 20th century. Around 400,000 people were involved in the first moon landing. The cooperation necessary to make this possible embodies a potential for liberation. Marx writes, "The productive forces and social relations—both different sides of the development of the social individual—appear to capital only as means, and are only means for it to produce on its narrow foundation. But in fact, they are the material conditions to blow this foundation sky-high" (Marx 1857:602). From this, one can conclude the necessity of the democratic reappropriation of the social production of wealth.

This perspective has also been further developed in feminist terms. Juliet Mitchell (1966), in "Women: The Longest Revolution", applied this framework to feminist emancipation. Similarly, John D'Emilio (1983) argued from a queer

perspective in his essay “Gay Identity and Capitalism.” Capitalism continuously produces new ways of life that represent new forms of freedom but simultaneously limits their full development due to its inherent conditions. Nevertheless, capitalism must continually reproduce this potential for liberation. This insight is eloquently captured in a well-known quote from Marx in the “Grundrisse” (Marx 1857:487f):

Thus the old [=ancient] view, in which the human being appears as the aim of production, regardless of his limited national, religious, political character, seems to be very lofty when contrasted to the modern world, where production appears as the aim of mankind and wealth as the aim of production. In fact, however, when the limited bourgeois form is stripped away, what is wealth other than the universality of individual needs, capacities, pleasures, productive forces etc., created through universal exchange? The full development of human mastery over the forces of nature, those of so-called nature as well as of humanity's own nature? The absolute working-out of his creative potentialities, with no presupposition other than the previous historic development, which makes this totality of development, i.e. the development of all human powers as such the end in itself, not as measured on a predetermined yardstick? Where he does not reproduce himself in one specificity, but produces his totality? Strives not to remain something he has become, but is in the absolute movement of becoming?

The Utopia of the Social Individual in Contemporary Political Culture

The liberation perspective embodied in the utopia of the social individual has largely disappeared from contemporary political imagination—even within oppositional leftist circles. It has been supplanted by the notion that socialism consists in the expansion of the public sector within capitalism. Horkheimer (Horkheimer 1942, 1943) critiqued this standpoint, which reappropriates measures of value of societal wealth (including subjective command over wealth) that have been made obsolete by societal development, in his essays “The Authoritarian State” and “On the Sociology of Class Relations”. Consequently, from this perspective, modern leftist notions are not significantly different from liberal or right-wing views, which focus on managing capitalism rather than fundamentally questioning and transforming its underlying structures, thereby unleashing the implicit emancipatory potential.

The utopia of the social individual has been replaced by a fixation on the immediacy of reified conditions, where individuals confront unwanted political developments in an alienated manner. By Leszek Kołakowski (1969) definition is hardly any political left remaining today. He interprets 'left' and 'right' not sociologically as is commonly done – i.e., not as a milieu or class – but negatively, as a negation of the present, embodying a concrete utopia of freedom (see Bloch 1959). This necessitates overcoming the historicity embedded in the prevailing political culture, including the culture of the oppositional left.

In Kołakowski's perspective, the left in capitalism represents the subjective moment driving the social process forward in an emancipatory way, while the

right embodies historical inertia. This does not imply that the right is incapable of instigating change. Indeed, it can bring about change with incredible brutality and barbarism, as seen in fascist political practices or imperialist wars. However, such right-wing revolutions are merely political revolutions and not fundamental social revolutions that consciously realize the emancipatory tendencies inherent in societal conditions.

For the political left to be meaningful in Kołakowski's sense, it must transcend the immediacy of the present, including the prevailing historicity of political culture. Lukács, in "History and Class Consciousness" (Lukács 1923:187), states: "The concrete here and now, dissolved into a process, is no longer a fleeting, ungraspable moment, the vanishing immediacy, but the moment of the deepest and most widespread mediation, the moment of decision, the moment of the birth of the new. As long as man contemplates his interest in a backward-looking way – be it in the past or the future – both are reified into a foreign being, and between subject and object lies the insurmountable 'harmful space' of the present. Only when man is capable of grasping the present as becoming, recognizing in it those tendencies from whose dialectical opposition he is capable of creating the future, does the present, the present as becoming, become his present".

6.4. The Far-Right as Negation of the Utopia of the Social Individual

I will now proceed to explain how right-wing radicalism can be seen as a negation of the utopia of the social individual. This insight is derived from the works of Ishay Landa, particularly "Fascism and the Masses," and Ute Osterkamp. The crisis of bourgeois society that emerged during industrialization has, in a sense, placed a price tag on the categorical imperative. Moral and emancipatory behavior is no longer easily affordable and can sometimes be so costly that it threatens one's very existence.

Consider the example of petty crime due to poverty. In such cases, individuals take from others, violating bourgeois rights, despite not wanting their own possessions taken. The violation of the categorical imperative is thus justified by poverty. These precarious conditions foster demoralization, rooted in the historical experience of existential threats posed by unemployment and social crises. By threat, I refer not to direct physical danger but to the threat to one's individual form of existence and lifestyle.

For example, in my work in psychiatry, I encountered small business owners and bar operators who suddenly became unemployed due to COVID-19 restrictions. Their businesses relied on a continuous flow of customers, which was no longer possible. Consequently, their individual forms of existence were realistically threatened or destroyed.

The psychological foundation of the power, potency, and persuasiveness of right-wing orientations lies not in the actual experience of existential threat but in the anticipation of such threats and the anticipated loss of agency. For instance, racist discourses often emphasize that migrants will take away "our" wealth,

cultivating a sense of anticipated existential threat. This anticipation is rooted in the inherent instability of capitalist development, although it is distorted through propagandistic, domination-based narratives, thereby negating the utopia of the social individual. The very existence of the political right depends on this dynamic. The political right, at least partially consciously, exploits this crisis of bourgeois emancipation perspectives, capitalizing on it politically. To address crisis phenomena, the right proposes authoritarian measures and individualizes or personalizes these crises by blaming specific groups of people – migrants, Jews, the poor, the left, and so on. These reifications intensify the general existential threat inherent in the capitalist dynamic, thereby positioning the political right (even more) as a viable savior from the misery it co-created.

This personalization, expressed through reified accounts of societal relations, hinders the open and honest articulation of life problems, as there is a danger of being held personally responsible for societal issues, further promoting personalization. The most extreme example is found in the Nazi-established ghettos, concentration, and extermination camps. In these settings, if inmates criticized the conditions as insufficient for survival, they would not receive kindness but rather drastic personal accountability, potentially leading to death. The slogan "Arbeit macht frei" (Work sets you free) embodies the fascist perversion of bourgeois emancipation notions. Today, a milder form of this rhetoric is seen among bourgeois politicians who assert that those who do not work should receive nothing, regardless of whether they can find a perspective in and for their work under current conditions.

The political right can be said to defend bourgeois rights in an exclusionary and reactionary manner by attempting to reappropriate capital, that is societal wealth, through measures of value made obsolete by the (ongoing) crisis of bourgeois society. They perceive the potential for the emancipation of the social individual as aexistential threat, viewing it as decline, degeneration, or undesired equalization. This opposition is rooted in a fear of losing traditional privileges and a reactionary desire to maintain existing hierarchies.

Now, I will turn to the therapeutic application of these reflections.

Chapter 7: Four Recommendations for Therapeutic Work from Critical Psychology

The concluding section presents four recommendations for therapeutic work. First, avoid understanding political orientation as an identity, personal characteristic, personal opinion, or character trait (for critiques of such conceptions, see: Bourdieu 1982, 2001; Markard 1984). Instead, view political orientation as a practice grounded in one's conduct of life within the social arrangement of everyday life (Dreier 2020; Marvakis 1996). This perspective helps move beyond unproductive distinctions between left and right, which often result in conflicts where one side is considered right and the other wrong. These conflicts are typically resolved by attempting to change oneself or the other, or by ignoring conflicting political orientations altogether.

Moreover, understanding political orientations as practice can help shift the focus from defining political orientations to recognizing them as a problem. Indeed, this approach frames political orientations as an unresolved socio-historical issue tied to societal emancipation. Part two has presented an account of this problem, illustrating political orientations as historically changing relations of theory and practice.

Second, an adequate understanding of changes in political orientations is essential. Ute Osterkamp's theory of agency and 'productive needs' (1975, 1976, 1978, 1991b) can describe changes in political orientations as problems of meta-motivation (Nissen 2023). Third, it is important to view the power, potency, and persuasiveness of radical right-wing orientations as a response to an anticipated, imagined yet real inability to act or powerlessness due to social existential threats. However, this should not be used as a simplistic interpretive schema applied to clients/patients; otherwise, there is a risk of misapplying critical social theory directly, thereby limiting emancipatory possibilities within therapy. It is also crucial to reflect on how one's own political orientation might contribute to the foreclosure of these emancipatory possibilities.

Consequently, my fourth and final recommendation emphasizes the challenge of developing specific meta-motivation to critically question one's own political orientation. This difficulty must be acknowledged not only in others, such as clients, but also in therapists themselves. This process involves recognizing one's own demoralization and acceptance of existing power structures – a recognition that cannot be achieved without adopting a new standpoint that facilitates such reflections. To elaborate, I will share some insights from Ute Osterkamp's work (1980b, 1982, 1996, 2008, 2018), where she describes such developments as a new morality. This new morality, I argue, can be seen in relation to the historical emancipation horizon embodied in the utopia of the social individual.

7.1. Political Orientation as Practice

I have suggested to understand political orientations as practice because this will help us to understand, referring to the Sartre quote in the introduction, the conditions under which people choose their political orientation – including ourselves. Understanding political orientations as practice is a first step to grasp political orientations from the standpoint of emancipation as problems historically changing relations of theory and practice.

What do I mean by my suggestion to understand political orientation as practice? According to Marvakis (1996:38–52), this refers to orientating oneself 'in' the societal space to uphold subjective agency in the long term. Agency, as conceptualized in Critical Psychology, involves the capacity to act and make choices within the constraints of the societal arrangement of one's own everyday conduct of life (Dreier 2020; Holzkamp 1983, 1996).

Let's start with a simple example (vgl. Marvakis 1996:38f): finding my way to a conference. I might rely on public transportation, assuming it works as

planned. If I miss my connection, I face an orientation problem, but one that can often be resolved straightforwardly—perhaps by catching the next bus or train.

Contrast this with political orientations, where problems are never straightforward. Political orientations address more complex societal questions, such as: “How should I lead my life to pursue my needs and passions in this world? What can I rely on?” For instance, consider the question: “What work skills should I develop that can be market effectively? Should I sell my intellectual skills or my manual labor? What is worthwhile? How do I respond if my way of life feels socially threatened or questioned? Who would support me? Which relationships should I build or avoid, and which institutions can I trust?”

These questions necessarily involve anticipating future developments, which are evaluated emotionally (Marvakis 1996:25–37). Therefore, political orientations must articulate a subjective vision of society; they are active imaginations rather than mere reproductions of societal images found in political culture (Marvakis 1996:59f). In part 2, I described the creative reimagination that precedes cognitive processes as fabulation and liminality. This anticipatory dimension of political orientations embodies the transgressing principle of hope in the sense described by Bloch (1959; Marvakis 2006, 2007): “What should society be like for me and others to lead satisfying lives?” This doesn't need to be universal; right-wing radical orientations, for example, but not only those, involve exclusion.

Political orientations also encompass ideas of political practice. Thus, political orientations, as I have suggested in part two, are always historical relations of theory and practice. The individual desire for emancipation is never invented from scratch but rests on the attempts of preceding generations to bring about emancipation. However, the societal conditions for emancipation are changed historically, not just by past attempts, but also through technological development. For instance, social media constitutes a more recent development in the public sphere. Furthermore, contemporary social movements and the form of institutionalized political will always play an important role in shaping the preconditions for individuals to draw and reflect on historical experiences and possibilities of politics. This will influence questions like: “How can I influence societal processes? Through elections, social movements, union activities, or engaging in class struggle theory and practice? Or do I become a political soldier of fascism?”

Thus, political orientations, as subjective relation of theory and practice, cannot be disentangled from subjective conceptions of historical relations of theory and practice that constitute subjective moments of the societal process. In other words, what is subjectively understood as political orientation is not only based on a form of theorization but also relies on the prevailing imagination of political orientations embedded within the dominant political culture. However, this characterization is still insufficient as long as it does not take into account the potential and promises for freedom of capital. For instance, the political management of the COVID-19 pandemic has led to a resurgence to work from home. This was only possible due to technological developments such as videoconferencing. This provided for some with big enough living spaces and

without responsibilities for child-care new experience of freedom, while for others the closing down of child-care services while having to work from home created new restrictions.

Based on the understanding of political orientations as historical relations of theory and practice that constitute subjective moments within the societal process, it follows that political orientations must involve abstraction, both as concepts and as the process of developing such concepts (Ollman 2015). This necessity arises because the societal process can never be immediately accessible (Marvakis 1996:53–64); it can only be grasped through abstractions and imaginations. This can be illustrated again, by example of the COVID-19 pandemic. A section of the middle classes experienced the restrictions as the state intervening against their will violently in their lives. A lot of small shop and restaurant owners got bankrupt. To make sense out of that, they had to revert to abstractions. In absence of a progressive political answer, to these restrictions, this resulted for some to employ conspiracy theories. This was less likely for others, who experiences those measures as liberating, or considered them as collective care-taking of people who are more vulnerable to COVID-19.

These abstract terms to make sense of society and its capitalist dynamic may not always be concepts in the strict sense but can include symbolic representations, myths, music, literature, films, (other) technologies and even gestures (Nissen 2023:149). All kinds of cultural objects can serve as orientation aids or political meaning-making resources (Nissen speaks of prototypes 2009, 2023:254–60; 2019). They are societally produced and integral to political culture (Marvakis 1996:50–63). This includes pamphlets, historical representations, political-ideological writings, and propaganda. In addition, there are conceptions and more transient imaginations developed in informal discussions among friends and social circles that meet more or less regularly. These informal discussions form part of the everyday fabric of how individuals orient themselves within society.

Furthermore, societal developments can never be understood purely from the immediacy of the present. However, some abstractions and imaginations function as more immediate orientation resources due to the prevailing political culture. For example, the utopia of the social individual, as embodiment of capitals potential for freedom, is largely erased from political culture today.

Lastly, we can only understand others' political orientations through the lens of our own political orientation. This is illustrated in the interesting articles by Paul Parin (1975, 1989), a Marxist psychoanalyst and pioneer of ethnopsychanalysis, about the role of the critique of society in the psychoanalytic process. He emphasizes the importance of integrating the critique of society into the psychoanalytic interpretation process, arguing through case studies that patients often experience a “pseudo-healing” by conforming to social groups and adopting their ideologies. However, this leaves a “residual neurosis” untreated unless the psychoanalyst also critically examines this social conformity. Parin argues that psychoanalysis will forfeit its potential if the analyst is blind to societal factors.

Paul Parin recounts an episode involving a white American analyst and a Black patient where the analysis stalled despite the analyst's efforts to address the patient's fears and mistrust rooted in social and racial dynamics. The breakthrough came when the analyst realized that offering the patient a lower hourly fee, compared to wealthier patients, reinforced the patient's sense of being undervalued due to him being black. After adjusting the fee to a higher rate, the analysis proceeded effectively. However, Parin criticizes this adjustment, arguing that it introduced a new parameter, changing the analytical setting and replacing interpretation with the analyst's acting out. He believes this missed the opportunity for deeper interpretation of the patient's transference issues and social context. Parin asserts that understanding and critiquing social realities and prejudices should be an integral part of the psychoanalytic process to overcome transference resistance and ensure a more profound therapeutic outcome. Parin proceeds by presenting case examples from his own work to explain how a Marxist critique can enhance the psychoanalytic process.

While I agree with Parin that psychotherapy can benefit from such a critique, it should be noted that his perspective is based on a specific interpretation of Marxism that warrants scrutiny. Parin assumes that he possesses the objective account of the problem of capitalism, but he does not engage critically with the Marxist tradition, which encompasses multiple interpretations of this issue. This assumption paradoxically underestimates the extent to which political orientations shape the therapeutic process and fails to take historical context seriously enough.

For Parin, political orientations can be categorized as right or wrong, more or less adequate. However, he overlooks the issue of political orientations as historically changing relations between theory and practice. In part two, I argue that we should understand political orientations as attempts to resolve and comprehend the problem of capitalism. This perspective emphasizes that the problem of capitalism remains unresolved and that past failed attempts to address it—both Marxist and non-Marxist—now shape the character of the problem itself. I contend that this has led to the alienated experience of modern life and that no Marxist account can claim to be beyond these resulting contradictions. Only dialectics from within these contradictions is possible.

Moreover, it is crucial to remember that political orientation is never purely an individual practice but always a social and historical one. Consider, for instance, party membership or discussions at the local pub, which inevitably involve the categorization of other political orientations. Similarly, education—both formal and informal—encompasses interactions with friends, participation in sports clubs, engagement with social media, and even therapy sessions. In these contexts, we form ideas about social conditions as possibilities and restrictions for living our everyday lives and relate those ideas to the ideas of others, either agreeing or disagreeing with them.

I have described these processes, briefly outlined here, in greater detail in part two, where I also propose additional concepts to enhance our understanding of these processes.

7.2. Political Orientations and the Desire for Agency

Understanding political orientations requires recognizing the desire to expand agency. However, individualistic accounts of agency are insufficient for this task as they reflect the alienated experience of modern life while remaining unconscious of this alienation. We do not merely live our lives under pre-given societal conditions; society is a product of collective action. We are never just participants in social practices but also contributors to their change—both individually and collectively. An adequate account of agency and desires for agency must acknowledge this dynamic.

A rich description of agency can be found in the theories developed in Critical Psychology. Agency, as defined by Osterkamp (1976) and later further developed by Holzkamp (1983, 1996), refers to the individual's ability to determine their living conditions by participating in the collective control over the social process. Morten Nissen (2023:118–29), in his reading of Osterkamp, suggested that this should be understood as participation in collective care, which is a “collaborative process of anticipatory care for the community and thereby for oneself” (ibid.124). This definition emphasizes what control over the societal process means from the standpoint of an individual whose existence necessarily depends on engaging with the societal process. I will illustrate what that means.

In a basic sense, agency understood as participating in collective care means finding ways in the everyday conduct of life to satisfy and cultivate one's needs. The everyday conduct of life entails engaging in social practices that constitute daily life (Dreier 2020). Throughout their lives, individuals participate in various social practices. Family life, work, and leisure can be understood as composed of diverse social practices. Therapy, too, can be viewed through the lens of social practice (Dreier 2008). By participating in these social practices, individuals develop subjective capacities, needs, and desires that define their humanity, emphasizing that needs are not pre-given, stable objects (Nissen 2023). Additionally, thinking, feeling, imagination, and desire are not empty capacities²⁸ but are always interrelated with and constituted through the culture and technologies that shape these social practices (ibid.).

The everyday conduct of life highlights that individuals actively lead their lives, ‘using’ their subjective capacities, needs, and desires to ‘choose’ which practices to engage in and how to engage in them. It also indicates that individuals are joined together by participating in social practice (Dreier 2020; Nissen 2023:130–43). The interrelation of these practices constitutes the societal process as collective care. Therefore, it is better to think of agency as a shared capacity. When individuals enter therapy, they often do not feel that they ‘choose’

²⁸The rejection of ‘empty’ subjective capacities marks a significant departure from many mainstream and some critical psychology approaches. This shift, influenced by recent advancements in the Scandinavian tradition of Critical Psychology and developments within the cultural-historical tradition, critiques the assumption of empty subjective capacities such as feeling, thinking, and motivation. This assumption creates the artificial question of how individual psychological life is mediated with society and culture (González Rey 2011; González Rey, Mitjáns Martínez, et al. 2017; Koch 1999). The issue of assuming empty subjective capacities reflects a reification of subjectivity, rooted in an alienated and contemplative stance toward the societal process (Lukács 1923).

their path but rather that their subjective capacities, needs, and desires dictate their choices, or they experience these as constraints on living the life they want, while some of their needs and capacities seem to desire a different life.

However, the practices that constitute everyday life are not only arranged by the individual course of life but are always arranged societally. This means that the agency of individuals is both limited and enabled by this societal arrangement. This arrangement is not stable but subject to the dynamics of capitalism, as described in part two. Individuals must continuously adapt to the changing social practices in which they need to participate to sustain their livelihood.

As individuals engage in changing social practices, a desire arises to expand their control over these changes. For most people in capitalism, this desire manifests as the pursuit of a crisis-proof job to provide an enjoyable life, having assets, maintaining health and well-being to be able to work, and developing their capacities accordingly. Alternatively, it involves being dependent on others who have sufficient assets, or in the case of children, hoping that adults have things under control. Others might rely on welfare state services, hope for their political party to serve their interests, or depend on the economy to favor their investments or sustain their family. However, the desire for agency can also lead to participating in politics, unionizing, and other forms of collective action.

The socio-historical dynamics of capitalism create manifold compulsions, compelling individuals to develop themselves and others to fit societal and social demands. Simultaneously, needs and desires arise that extend beyond those demands, resulting in conflicting needs and desires of which individuals are only partly aware. As discussed in other parts of this article, societal contradictions are the main drivers for the production of these opposed and conflicting needs and desires, not an ahistorical condition of human nature. This has been addressed in part two as the problem and contradiction of motivation.

Although psychoanalytic theory has not explicitly developed a theory of the desire for agency, it has a rich tradition of examining how family demands give rise to conflicting desires, which can overlap with other social practices and their distinct demands. Perhaps the most well-known example is how the tension between the desire for autonomy and dependence in childhood influences partnerships in adulthood. Additionally, the intergenerational conflict experienced by a child, whose desire for care is necessarily frustrated by the primary caregiver due to others' demands for care and affection, exemplifies how caregivers must adapt their lives to the demands of the societal arrangement of collective care.

Furthermore, understanding individuals as active subjects of their lives implies that they can collectively expand their agency by profoundly transforming the process of collective care. A profound transformation not only entails changing social practices collectively but also emphasizes the potential to overcome the false necessity of opposed needs, as highlighted by the term “*expansive (or generalizing²⁹) agency*” (Nissen 2023:129). This requires

²⁹The original German term ‘verallgemeinerte Handlungsfähigkeit’ can, in some respects, be better translated as “generalizing agency,” emphasizing the development of agency that transcends the false

decentering the understanding of conflictual demands in specific social practices, moving beyond the immediacy of situational understanding toward comprehending the totality of the societal arrangement of everyday life. Such an understanding necessitates a profound expansion of agency developed from the standpoint of the individual participating in social practices.

Thus, “*expansive* (or *generalizing*) *agency*” can be seen as a movement “of overcoming immediacy, of *generalizing* in the sense of reflecting how immediate actions of self and others are made possible by common social conditions and technologies and can be transformed collectively” (Nissen 2023:129). This movement presumes meta-motivation—the motivation to change motivation—because attempts to overcome limitations can never guarantee the intended outcome and always carry the risk of losing the available, albeit limited, agency. Expansive agency “also implies a self-overcoming, which at times may rupture or deny the developmental continuity in a kind of dichotomization, and even may imply the ‘little death’ of a dissolution of specific forms of agency” (ibid.).

The Problem of meta-motivation and productive needs

The question of how expansive agency emerges brings us to the problem of meta-motivation and productive needs, or the desire for agency. Abraham Maslow (1967) introduced the term metamotivation, indicating “that we need *meta-motives* to drag us free: *Motives for transforming our motives*” (Nissen 2023:4). Thus, we can say that the problem of meta-motivation is frequently encountered in psychotherapy. When we encounter political orientations in therapy that restrict freedom, we need an adequate conception of the problem of meta-motivation.

Is Maslow’s account of meta-motivation sufficient? His concept describes the motivation of individuals to reach their full potential or, in other words, the motivation for individuals to achieve freedom and emancipation beyond the realm of physical necessities. His hierarchy of five sets of needs suggests that lower-order needs must be satisfied for higher-order, or meta-needs, to emerge, ranging from physiological needs to safety, belongingness, esteem, and finally, the meta-needs of self-actualization (Maslow 1967). Maslow’s individualistic conception suggests needs as more or less stable entities that serve as individual properties, and self-actualization refers only to the potential of individuals. However, beyond Maslow’s focus, we also need to think of meta-motives as cultivated collectively (ibid.).

Maslow’s conception of meta-motivation is insufficient for understanding political orientations because it does not address how the desire arises for individuals to intervene in the societal process to satisfy and cultivate their needs. This is crucial for understanding political orientations, as they imply how individuals can exert influence on the societal process to satisfy their needs.

necessities of opposed needs. However, I have chosen to use the terms “expansive agency” and “expanding agency,” as Nissen does, because this translation is more suitable in explaining far-right orientations

Thus, political orientations always refer to the dialectics of individual and societal emancipation. Under capitalism, free, disposable time—the precondition for Maslow’s self-actualization—is only achieved by some through appropriating the labor-time of others. The unfree labor of the majority, driven by the compulsion to sustain their livelihood, is the necessary condition of freedom for a minority. Collective care is organized restrictively under capitalism. The motivation to challenge this condition politically implies the motivation to change one’s own motivation for participating in the restrictive organization of collective care. In other words, it implies the motivation to change one’s political orientations.

Ute Osterkamp (1976) developed the term ‘productive needs’ to describe the desire to intervene in the societal process of collective care to satisfy and cultivate one’s own needs. The concept of productive needs helps us understand the problem of meta-motivation in an open way, not limited to specific motives, while recognizing the dialectics of individual and societal freedom. Productive needs point to motives for having or developing a motive to expand agency, or motivation for being motivated to expand agency, while recognizing the societal production of needs or motives. However, productive needs do not refer to some stable innate capacity but are grounded in the dialectics of the metabolic relationship between societal development and nature.

Innate “potentials and proclivities for developing such “productive needs” for agency was the emotional-motivational aspect of how humans are willing and able to participate in anticipatory care. This, then, was Osterkamp’s version of “desire” [...]. Desire for agency (productive needs) directed motivation at the exercise and enhancement of agency as an infinite process, since the cultural development and individuation of societies is an ongoing process that incessantly produces new possible activities with their specific purposes and thus possible motives and kinds of motives” (Nissen 2023:124).

Productive needs or the desire for agency do not automatically result in the development of expansive agency, as we will see shortly when discussing far-right orientations. How does this meta-motivation for expansive agency emerge, pointing beyond the immediacy of false necessities of opposed but real needs? In part two, I described how needs emerge, pointing to a transformation of society when they cannot be satisfied under current conditions. Their dissatisfaction serves as a negation of the present condition, which cultivates motives to take risks in transforming the conditions.

The dissatisfaction of needs is crucial in generating motives to transform local social practices, such as individual therapy sessions viewed as collaborative and evolving practices. Transforming local practices differs because they are less rigid, highlighting that performative aspects like reframing the practice and participating in it significantly impact understanding and cultivating the participants’ motives. A well-known example can illustrate this: individuals compelled to attend therapy against their will, who then discover ways within therapy to address this compulsion, thereby changing the practice of therapy itself. This indicates that the *“reflectivity of activity is not ‘within’ a given activity, viewed statically as a given form or frame, but neither is it ‘outside’ of*

activity, in a ‘res cogitans’ or inside the skull. It is the creative, continuously developing complexity of activity itself (Nissen 2023:145).

However, not all needs whose dissatisfaction point to a different future embody the potential for a profound societal transformation of the immediacy of false necessities. In part two, I described how 'radical needs' for universality and free disposable time emerge from the labor process. These needs are different because they have never been satisfied in capitalism and thus embody the potential to cultivate the desire for expansive agency.

It is crucial not to confuse needs or motives with stable entities. The distinction between radical needs and those pointing to the future is a theoretical distinction that helps us understand how needs and motives arise. Needs and motives are always cultivated by participating in social practices, and this cultivation is also a practice in itself, involving the creative sense-making of ourselves and the world we live in. Needs and motives do not exist separate from meaning-making processes, including so-called physiological needs.

For example, consider a person who is starving to death because they stopped eating, driven by the delusional fear that the CIA has poisoned their food with radioactive material. This situation cannot be sufficiently understood by simply assuming that their physiological needs are unmet. This would imply that physiological needs are separate entities that can either be met or not met. It would also be insufficient to grasp this as merely the internalization of cultural discourses about intelligence services to rationalize pre-existing fears, with the rationalization increasing their fears and overriding the experience of their physiological needs. While this explanation is better, it is still limited by theoretical preconceptions about needs, fears, rationalization, and internalization.

If we consider this example as the cultivation of the meta-motivation to stop eating, we can advance our understanding. However, this would require a thorough discussion of how to conceptualize the subjective process of meaning-making (González Rey 2017, 2019c, 2021; González Rey, Mitjáns Martínez, et al. 2017). While this is beyond the scope of this text, I will make some brief remarks that are important for the subsequent discussion of the persuasiveness of far-right political orientations.

It is crucial not to reduce subjective processes of meaning-making to discourse alone, nor to an inner fictional or fantasy world that is opposed to and more or less well-adapted to the outer objective reality. Instead, subjectivity should be considered a complex mesh of subjective processes involving emotional, conceptual, and symbolic aspects that constitute motivational systems (González Rey 2018a). Thus, subjectivity is an *objective* hallmark of all human life. Human “processes and realities are fictional, not because they are non-objective, but because they are new realities invented by human beings, which progressively separate them more and more from nature” (González Rey 2018b:348).

This theory of subjectivity extends beyond social constructivism and psychoanalysis, advancing our understanding of subjectivity as a “cultural-historical formation,” which includes its theoretical articulation. This position is more adequate because subjectivity “is not anchored in a universal condition of

individuals” (González Rey 2021:40). For instance, the concept of the unconscious allows us to reflect on and cultivate motives. The desire for agency encompasses the production of cultural artifacts such as the concept of the unconscious. These artifacts function as prototypes through which we generalize our understanding and cultivation of our motives beyond situational immediacy (Nissen 2009; Nissen and Mørck 2019). Thus, subjectivity can only be understood theoretically, to grasp the dialectics of theoretical accounts of subjectivity and the cultural-historical production of subjectivity and related cultural artifacts.

Human nature must be understood as inseparable from a complex mesh “of different facts and conditions that are not controlled by individuals or social instances; this fact defines all human processes and realities as objective. Nonetheless, human realities, processes and facts share a qualitative attribute that does not exist in the rest of natural phenomena; their subjective character turns human beings into creators, making them capable of creating new, original realities and processes within which, in turn, subjectivity emerges” (González Rey 2018b:348). Thus, subjectivity ‘distorts’ reality by creating reality.

This account of the subjective desire for agency goes beyond the creative performativity of action and meaning-making in situational contexts. It is understood here as concretely mediated by societal-historical conditions, including inherent contradictory societal development tendencies. While this distinguishes this understanding from poststructuralist and similar theories that primarily focus on meaning-making – even when conceived as ‘unconscious,’ as in psychoanalysis – it does not reject psychoanalytic insights but rearticulates them.

7.3. Power, Potency, and Persuasiveness of Far-Right Orientations

The process of adopting far-right orientations can illustrate the problem of meta-motivation, providing insights into the persuasiveness and power of far-right ideologies. We can start with the assumption that far-right orientations accept violence as a necessity of life and view it as a justified means to expand one’s agency. For an individual who experiences empathy towards people being harmed – those who are the ‘natural’ targets of far-right violence – adopting a far-right orientation will present a subjective problem. This individual will experience their involuntary empathetic responses towards their ‘enemies’ as a meta-motivational problem.

To successfully adapt to the far-right orientation, they must cultivate the meta-motivation to change their involuntary motivation of empathy. They might consider this empathetic response a weakness of character and discuss it as a problem with their new comrades. They may be introduced to fascist ideas about character development that might ‘help’ them discipline themselves. Alternatively, they might develop a personal ‘training’ regime to at least not show their compassion but restrain it, creating a feeling of dissonance. This could even be necessary for them if they inadvertently displayed clear empathy for an

'enemy' during a meeting with their comrades, potentially resulting in being targeted themselves as having a weak character.

For another illustration, consider the example of a young woman who believed it was her 'female' duty to prioritize the needs of men above her own, resulting in a role of patriarchal subservience. In her teenage years, she starts desiring a 'male' profession, dreaming of becoming the boss of a small company. Without having the funds herself, she devotes herself to moving up the ranks in a small consulting company. Having developed extensive empathy to orient herself towards the wishes of others, she becomes a successful agent dealing with customers. However, to move up the ranks, she needs to develop assertiveness and unlearn empathy towards her colleagues. This constitutes a problem of meta-motivation for her.

Both problems of meta-motivation harbor the potential to move towards expansive agency, however unlikely such a trajectory might be. Simply failing to solve the meta-motivational problem in intended ways might create a cascade of further problems, constraining the everyday conduct of life. The contradiction might evolve into feminist consciousness or, in the first example, towards questioning the far-right orientation. However, what will result from that is contingent and highly dependent on the cultivation of the desire for agency to overcome the meta-motivational problems. It will be crucial in which practices and with whom the desire for agency will be cultivated. It might also lead towards the foreclosure of emancipation.

Osterkamp (1980b, 1980a, 1982, 1996) suggests a dialectical conception of far-right orientations as foreclosing emancipation. However, such orientations do not subjectively appear as such; instead, they present themselves as viable trajectories to expand agency, offering a powerful desire to overcome misery. The far-right, as a collective orientation or movement, intensifies societal misery and despair, making itself appear more viable as a solution by proving that life is nothing but a struggle for power. Osterkamp (1982:157) argues, using fascism as an example, that the "effectiveness of fascist" orientations lies in "offering, within the power and domination constellations that arose with fascism, an albeit perverted, expanded possibility of controlling one's own living conditions, i.e., more effectively asserting one's own interests against others. Fascism presented itself as a way out of the situation of powerlessness and lack of perspective of existence that it largely caused, while simultaneously binding people actively to its system through the 'salvation' from the misery it co-created".

The capitalist dynamic is a continuous crisis of society, entailing a permanent existential threat that manifests as proletarianization and has the potential to explode during crises of capital value. Nothing is safe; everything can dissolve. The historical experience of capitalism provides the conditions in which the far-right philosophy of life as struggle is rooted, as is the fascist morality of power. Far-right orientations raise the price tag for humanistic moral behavior, which capitalist competition has already imposed on the everyday conduct of life. This exacerbation of societal "demoralization" (Osterkamp 2008) can only appear as a solution within the immediate reality of the false necessity of opposed but real needs resulting from the crisis of bourgeois values under

capitalism. While the categorical imperative expressed the truth of bourgeois society, industrial production has rendered it obsolete as a horizon for emancipation, as explained in parts two and three. Right-wing political practice generalizes and naturalizes this historical experience of the false necessity of capitalist reality.

However, it is important to remember that this conception of the political Right is not identical to the distinctions that define the Left and the Right by values, as explained in part two. Thus, people or political movements that define themselves as left might inadvertently exacerbate societal demoralization against their intentions. Nevertheless, the cultivation of the desire for agency will take different cultural forms.

The foreclosure of emancipation involves cultivating needs that foster accommodation to power relations. To this end, the externally determined conditions are subjectively idealized and obscured. In the example of the far-right, motives such as discipline and loyalty might serve as a denial of one's own subjugation to power structures, in the hope of securing one's own existence. Thus, one submits to a leader, hoping for some benefit, but does not openly admit this; instead, they claim to be particularly loyal and disciplined. Idealism and self-sacrifice might obscure the evaluation of others for one's own benefit, pretending to sacrifice oneself for the greater good of the 'Volksgemeinschaft' while actually hoping for personal gain.

Lastly, it is crucial to understand that the cultivation of the desire for agency is not necessarily driven by the actual experience of existential threat but rather by the subjective anticipation of it, socially cultivated through far-right imagination and practices. The cultivation of these motives relies on the precondition that alternative ways to address the anticipated existential threat cannot be imagined, such as cynicism or alternative political orientations. In other words, for far-right orientations to appear convincing, not only must an existential threat be anticipated, but also the loss of agency. This raises the question: How can meta-motivation emerge and be cultivated to contradict those motives in the face of the subjective reality of anticipated loss of agency? This emphasizes the need for an adequate conception of subjectivity.

7.4. Conclusion: A New Morality and the Meta-Motivation to Develop the Social Individual

It is unrealistic to assume that someone would question their political orientation simply because someone else disagrees with them. Questioning political orientations requires a strong enough contradictory desire because substantially questioning one's own political beliefs will inevitably result in feelings of shame and guilt. This is especially true for far-right orientations, as it involves admitting that idealistic and heroic motives were merely justifications for comparatively meager motives to secure one's livelihood under externally controlled conditions. Therefore, we need to frame the problem in a way that acknowledges these

difficulties while being cautious not to limit ourselves by theoretical assumptions about subjectivity or preconceptions of our own political orientations.

Framing problems in therapy as issues of meta-motivation can provide a pathway to overcome theoretical limitations. Entering therapy can itself be considered a problem of meta-motivation, as it often involves the anticipation or experience of a loss of agency (assuming therapy is chosen freely). As we have seen, anticipated loss of agency is a crucial subjective aspect that makes far-right orientations appear convincing. From this perspective, we can try to understand the client's viewpoint by asking how they might have chosen therapy over regaining a sense of agency (albeit perverted) through far-right orientations. By identifying how far-right orientations might have failed to fulfill their subjective promises, we can gain insights into transforming this initial problem of meta-motivation into a motivation to question one's political orientation as an adaptation to power relations.

However, this approach requires acknowledging the subjective reality of the anticipated existential threat that makes far-right orientations appear as a reasonable solution for gaining control over one's everyday life. This subjective reality cannot simply be questioned because therapists attempting to do so might be perceived by right-wing clients as delusional or out of touch with societal reality. This situation highlights the false necessity of opposed but nevertheless real partial standpoints. Overcoming this restrictive situation involves taking shared responsibility for such a meta-motivation to emerge. Therapists, too, must question their own political orientations to at least acknowledge the partiality of standpoints as subjective reality without falling into relativism. It is crucial to understand that these difficulties are not solely on the client's side; such a process also presents substantial challenges for therapists.

Osterkamp's reflections provide valuable insights into taking shared responsibility for cultivating motives strong enough to question one's motivations expressed in political orientations. We can understand the challenges of this task as the cultivation of a 'new morality'. This term suggests a trajectory for the desire for extended agency, emerging from the struggle with the 'perverted' expanded possibility of controlling one's living conditions by more effectively asserting one's interests and needs against others. As argued, such 'perverted' expansion of agency is encouraged by the personalization of power relations.

Osterkamp (2008) developed the term 'new morality' in her analysis of literature by Holocaust survivors, including works by Kertész (1993), Krall (1993), and Levi (2002). She examined how the hierarchical and privilege systems in ghettos, concentration, and death camps were deliberately designed by the Nazis to break solidarity among inmates and foster demoralization—a term she adopted from Primo Levi's (2002) book *The Drowned and the Saved*. book *The Drowned and the Saved* For example, by providing insufficient food for survival, inmates were forced to take food from others, making death more likely for those others. Another strategy was the creation of a prisoner functionary system, where aspiring for a higher rank required exerting control over fellow inmates in exchange for privileges that provided a postponement of death,

disguised as the promise of better odds for survival. For a detailed description of these systems, see Wachsmann (2015).

Osterkamp reflects on the survivors' testimonies about these demoralizing strategies as effective means for breaking resistance. She observed that "many former concentration camp inmates did not allow themselves to be tempted to justify their behavior (and thereby the conditions that 'suggest' it) and/or to console themselves with the even greater demoralization of others. Instead, they sought to conceptualize the social mechanisms and functions of their humiliation [...]. In this way, they regained their agency and subjectivity, at least in retrospect" (Osterkamp 2008:16). Osterkamp concluded that this proves—in reverse—the "thesis that a personalized view is always in the interest of existing power relations, by obscuring the social conditions of respective behaviors and thereby largely preventing individuals from articulating their problems to avoid being held personally responsible for them" (ibid.).

Subsequently, the concept of 'new morality' conveys a possible trajectory to overcome the personalization of power relations. To ensure that "demoralization' of people is not seen as an individual failure [thus avoiding personalization], but as a violation of personal integrity and a highly effective means of breaking their subjectivity and 'resistance'," it requires a "radical revision/revolution of 'normal' thinking [...]. Such a new morality, as many former concentration camp inmates emphasize, becomes reality to the extent that we see ourselves as co-responsible for every humiliation inflicted on others – instead of evaluating from a safe distance the different ways they cope with it morally" (Osterkamp 2008:16).

The Task of a New Morality in a Society Dominated by Capital

We can learn from Osterkamp's reflections that it is important not to personalize the adaptation to externally determined conditions, subjugation to power relations, and demoralization. If one accuses right-wing clients of their right-wing orientation as a personal failure of having adapted to power relations, such clients are unlikely to agree with such a view. This approach would fail to acknowledge the subjective reality of their anticipated existential threat and loss of agency. Moreover, giving up far-right orientations necessitates developing a different form of agency, which always implies significant changes in the conduct of everyday life.

Furthermore, assuming from one's own political orientation that only the right-wing orientations of others lead to the subjugation to power relations will hardly contribute to the emergence of a motive to question one's political orientations. This is because the therapist will implicitly display to the client that they are expecting something from them that they are not willing to do themselves.

Instead, it is essential to understand the conditions under which violence against others appears justified and even necessary. It is crucial to have at least some insight into how capitalism promotes the false necessity of opposed but real

needs, encouraging individuals to use others for their own benefit. This condition is exacerbated by the anticipation of threat and loss of agency. Interestingly, entering therapy might also be motivated by the anticipation of the loss of agency.

Understanding political orientations as historically changing relations of theory and practice can provide further insights into the frustration of the desire for agency. For instance, one might assume that the state will provide its 'volk' or 'nation' with sufficient means of subsistence. However, the threat or experience of proletarianization, or perhaps even 'only' deskilling, might lead to the conclusion that this is due to the government not caring for the 'real' 'volk' or 'nation' but instead aiming to destroy the nation. Viewing political orientations as historically changing relations of theory and practice helps to understand this not as delusion but as a specific comprehension and attempt to solve the problem of capitalism by competing over social investment in capital.

Additionally, one must recognize that questioning the adaptation to power relations is ultimately driven by seemingly insignificant yet real selfish motives that negate the utopias of individuality, as outlined in part three. Questioning political orientations in this regard will inevitably involve feelings of guilt and shame, necessitating a counter standpoint to navigate these emotions. Developing a 'new morality' is essential, not just for others but for ourselves as well. Without this, we risk perceiving the adaptation to power relations as a personal failure.

The concept of the 'new morality' acknowledges the absence of simple blueprints for ethical behavior under capitalism. It highlights the crisis of bourgeois emancipation under capitalism, emphasizing the high cost of ethical behavior. Osterkamp's 'new morality' is a negative conception, underlining the contradiction that a 'successful' life can only be achieved at the expense of others. It reveals that the price tag of modern life, which encourages demoralization, must be paid by someone. Osterkamp's reflections do not suggest being more ethical, progressive, or trying harder in the face of demoralization but rather to deny less our own accommodation with power relations.

This approach is crucial because it helps to understand the interrelation of restrictive societal conditions and the everyday conduct of life without personalizing these conditions. It serves as a foundation for taking responsibility for one's own actions. Furthermore, it provides a pathway to move beyond viewing political orientations as identities or character traits, which assume an alignment of theory and practice. Instead, this perspective promotes understanding political orientations as a problem of historically changing relations of theory and practice, emphasizing the distinction between theory and practice. This is a vital precondition for understanding emancipation adequately as a socio-historical problem from the perspective of world history, as I have argued in part two.

Ute Osterkamp's concept of a new morality tasks us, living in a society dominated by capital, to consider for ourselves first what such an endeavour – cultivating the meta-motivation to critically question one's own political motivation – would mean, before we request this from others, no matter how

strongly we might be disgusted or repulsed by political orientations we wholeheartedly reject. Moreover, every therapist knows that we are very limited in our effectiveness when we request clients or patients to engage in potentially troubling and disturbing experiences that we are not willing to participate in ourselves.

The starting point must be to seriously consider the externally determined nature of societal conditions under the dominance of capital. Recognizing 'the price tag' comprehensively emphasizes that not only the right-wing 'other' is affected by demoralization but also ourselves. This means acknowledging the externally determined conduct of our own everyday life and our accommodation to power relations. Ultimately, our own reproduction, secured through our work, relies on others' problems.

Helping professions represent 'troubled person industries,' as Joseph Gusfield (1989) puts it, whose historical genesis is closely linked to the development of the public sector of state capitalism. These professions have emerged from historical attempts to 'solve' the problem of capitalism and to mitigate the effects of proletarianization (see part two for details). Consequently, individuals working in helping professions are always, in the current historical context, urged to pursue the interests of their profession.

However, the pursuit of interests by those working in the helping professions is rarely described as a struggle to secure a livelihood and existence in capitalism. Instead, it is often framed as noble motives, such as solving societal problems, mitigating suffering, and contributing to the greater good of society. This must be questioned, as I have shown in part two. The culture of vulnerability that has emerged from the development of the troubled persons industries has deprived political culture of its vocabulary to understand and articulate societal problems, replacing it with the language of individual subjectivity, thereby personalizing societal issues (Frawley 2024; Haslam et al. 2021; Hilgartner and Bosk 1988; Stone 1989). We must seriously consider how we are urged to justify our own accommodation to power by framing it as progressively helping others with their suffering.

This significant challenge must not be misunderstood as simply adopting a general attitude of gratefulness or being conscious of our privileges. Such an approach would merely personalize power relations. It would not take seriously the task of developing 'a new morality' as a response to demoralization but would instead conflate theory and practice rather than investigating the relationship between the two by recognizing the difference between theory and practice. Therefore, the task is to understand the power relations to which we are subjected as a precondition for 'doing our job' and how we are urged to justify them.

It is crucial to clarify the distinctions in what adapting to power means for oneself compared to others, such as far-right clients. While we all face the overarching condition of living in a society dominated by capital, the social arrangements of everyday life, as expressed in one's own life management, can vary greatly. Additionally, different pathways for cultivating the desire for agency must be recognized. The desire for agency will be expressed in varying political

orientations and might lead to vastly different conducts of life. All of this must be considered to understand the difference between our own adaptation to power relations and the ways in which clients do that. These distinctions should not be reduced to political orientations as identity categories alone.

Considering the preceding elaboration, we can now not only concretize the task that Osterkamp has conceived under the rubric of ‘new morality,’ but also generate a broader outlook beyond her insights. Although Osterkamp’s account provides valuable perspectives, it does not explain how motives emerge for undertaking the incredibly difficult task of developing a new morality. In part two, I suggested investigating the emergence of needs that point beyond the false necessity of opposed but real needs. This discussion has led us to the concept of the social individual.

I contend that the development of the social individual can clarify the task of the ‘new morality’ Osterkamp points to. While it should be obvious, it is nevertheless important to reiterate that psychologists and therapists will not be the vanguard of societal transformation. However, therapists can still play a role in societal emancipation by embracing the task of the new morality. Taking this task seriously might lead us to question how we can take shared responsibility in cultivating the system of needs that the social individual embodies, thereby moving beyond the demoralizing price tag of life under capitalism.

I will conclude the manuscript with two quotes from Ute Osterkamp. These quotes illuminate the distinction between the political fight against right-wing extremism and fascism, and the role of psychology and therapy in this struggle. The latter should prioritize theoretical and historical self-clarification rather than focusing primarily on changing others by psychological technologies.

Osterkamp (1982:170) states, that the “fight against fascism” must not be reduced to being opposed towards fascist or far-right organisations or to protest far-right politics. It must include “the fight against all mystifications of fascism [and the far-right], i.e., against all attempts to deny the objective causes and subjective complicity in fascism, which can only be understood in the context of objective [...] alternatives” (ibid.). Neither a commitment to non-fascist values or democracy nor an abstract opposition to oppression is sufficient. Rather, the political alternative must point beyond the demoralizing constraints of everyday life. It must be recognized that, on “the subjective side, fascism begins with adapting to general conditions” that limit or constrain emancipation, “i.e., the ‘renunciation’ of articulating one’s own dreams and life aspirations. These dreams and aspirations are not eliminated but instead find expression in a distorted form and are, in this form, withdrawn from subjective self-determination and development” (ibid.).

Thus, the “fight against fascism does not primarily mean improving education or revising people’s right-wing orientations, but essentially the fight against external determination, the fundamental insignificance, and insecurity of individual existence, as is typical of capitalist conditions, that finds its intensification in fascism. The aim is to win as many people as possible for this struggle, i.e., to indicate and help create the conditions under which people can overcome their own shadows, their fear, and resist the temptations to arrange

themselves with the prevailing conditions, thereby actively participating in their own and others'" foreclosure of emancipation (ibid.).

Osterkamp (1980a:231) clarifies that the "role of psychology in the fight against fascism is subordinate, though not insignificant. Depending on whether psychology reproduces [externally determined conditions and demoralization] in its theories and methods, or whether it reveals its nature and function, it can either hinder or support the fight against fascism", which should be understood as the fight for emancipation.

What emancipation means will always be a subject of debate. I urge caution in equating emancipation solely with fighting oppression. As argued in part two, such a perspective would suggest an abandonment of broader societal emancipation. I have emphasized that true emancipation, from a Marxist perspective, should mean progress and collective freedom.

Imagining the possibility of freedom requires moving beyond the restrictive political culture of the present. Thus, I have suggested a careful reconsideration of the tasks posed by the problem of capitalism and a critical discussion of the history of failed attempts to move beyond it. Accounts of emancipation that ask for self-limitation in the name of the greater good will likely employ an insufficient political imagination, stuck in the immediacy of capitalist reality and the false necessity of partial standpoints and needs. Therefore, I argue that emancipation must involve moving beyond capitalism by appropriating its potential for freedom. The system of radical needs of the social individual already embodies this possibility, pointing the way forward to a liberated future.

Racism and Nationalism

System Justification Theory: A half-critical psychology?

Thomas Dohmen

Abstract

System Justification Theory (SJT) researches the foundations of highly relevant societal issues: the defense of a destructive status quo ‘from below’, the ‘inertia’ to take action against injustices and threats to human livelihoods.

At first glance, there are various parallels between SJT and German Critical Psychology (GCP¹, Reimer & Markard, 2013; C. Tolman, 2013) regarding scientific interest and fundamental considerations of the social psychological subject matter: Individuals are considered to be actively and motivationally involved in the legitimation and reproduction of (domination- or exploitation-) systems that are partly to their own disadvantage. Both approaches want to contribute to emancipatory solutions of societal conflicts. To this end, both refer to Marxist analyses, among others. The SJT tries to synthesize “social theory in the Marxian tradition” and “experimental social psychology” (J. T. Jost & van der Toorn, 2012, p. 314). GCP, on the other hand, seeks to develop its methodology for empirical research based on Marxist concepts, which leads away from the ‘mainstream’ of experimental psychology.

In my discussion of SJT I want to show with the help of GCP in which respect the synthesis does not succeed: SJT oscillates between two unintegrated psychologies which are not clearly distinguished by SJT-proponents:

1. The first (more theoretical) psychology can conceive complex nexuses and has a ‘historical intuition’ that is at least partially aware of the dependence of its own object of research on historical/political balances of power.
- 2) The ‘second’ psychology has a methodology based on fallibilism and therefore tends to more strictly falsifiable (and thereby less complex) hypotheses. Overall, it clearly holds the upper hand in the scientific approach of SJT.

This split results in ambiguities in theoretical concepts and empirical research that I will try to outline. Nevertheless, SJT raises crucial questions about the obstacles to solutions of societal crises. Its theorizing and research are worth discussing. My paper aims to raise possible lines of thought for this discussion.

¹ In German this approach is referred to as Kritische Psychologie (written with a capital K)

Keywords

System Justification Theory, false consciousness, objective interests, Critical Psychology, reinterpretation, analytical concepts and empirical concepts, theorizing in psychology, reason discourse

Introduction

Theoretical understandings of the research subject: parallels in SJT and critical psychology

System Justification Theory researches the foundations of highly relevant social issues: the defense of a destructive status quo, the ‘inertia’ to take action against injustices and threats to human livelihood.

At first glance, there are several parallels between the perspectives of SJT and GCP: individuals are seen as actively involved in the legitimation and reproduction of a (domination- or exploitation-) system that is (at least in relevant aspects) to their own disadvantage; and they do this driven by their own ‘motivation’. To address this, both refer to Marxist analyses from which they derive a notion of *objective* social interests and conflicts of related interest groups (e.g., Holzkamp, 1985, pp. 199; Jost, 1995, p. 400; Jost et al., 2019, p. 386). SJT and GCP investigate the benefits and individual costs of violating one's objective interests. Both approaches strive to contribute to emancipatory solutions of societal conflicts. These societal conflicts do, on the flipside, also represent (potentially unrecognized) problems on the level of the individual conduct of life, thereby constituting psychological problems in the narrower sense.

Theoretical aspirations of SJT

SJT aspires to bring together and integrate two “theoretical traditions”: “one coming from philosophy and social theory in the intellectual heritage of Karl Marx [...] and the other coming from social psychologists such as Kurt Lewin, Gordon Allport, Henri Tajfel [...]” (Jost, 2019, p. 264)².

Jost originally set out with the SJT to make the concepts of false consciousness and ideology, borrowed from Marxist social science, fruitful for experimental social psychology. The concept of false consciousness enabled Jost and Banaji to adopt the interpretive perspective of the first publication within SJT (1994). Here an explanation for negative, consensual stereotypes was provided: Disadvantaged people actively shared negative stereotypes about

² Jost locates SJT in an impressive family tree of theories (J. T. Jost, 2019; J. T. Jost & van der Toorn, 2012). On the Marxist side there are e.g. Marx, Gramsci, Lukaczs, Adorno, Elster on the social psychological Lewin, Festinger, Lerner, Tajfel. Rather than a reference of the sources from which SJT was systematically derived, this family tree indicates, where in one way or another one can find similarities in perspective, terminology or scientific approach.

themselves. This was explained as driven by the purpose of consolidating the status quo and thereby simultaneously their own disadvantage. According to this interpretation, this is a case of *outgroup favoritism*. The article succeeds in pointing out a phenomenon that can plausibly be considered an instance of false consciousness and cannot be explained by Social Identity Theory (SIT), whose research data are reinterpreted by Jost and Banaji. SIT concentrates mainly on a positive orientation towards one's own group (ingroup favoritism)³, but not on the favoritism of an outgroup. SJT postulates, in addition to the scope of SIT, the system level as a distinct psychological level of reference. Motives and emotions, which are not confined to the continuum individual-group, refer to it. In this framework the concept of false consciousness allows SJT to think of a contradictory behavior that tends to be (group) self-esteem-damaging but *at the same time motivated*.

With the concept of false consciousness SJT addresses a blankspace in experimental social psychology: the deceptiveness and self-deception of people is a common object of research. The fact, however, that in the concrete world these are related to social interests, which can be judged on a scientific basis, must seem impertinent to mainstream social science and its ways of thinking that aim at alleged neutrality. With its definition of this concept, the SJT decides to consider the abolition of oppression and discrimination as a scientific task that is related to 'scientific truth', as opposed to being purely normative and thus unscientific. The SJT's understanding and concept of social interest is, contrary to an everyday understanding, independent of the interest being consciously adopted or even agreed with; it is an *objective* interest deriving from social positions in societal structures shaped by inequality. Based on its emancipation-oriented orientation towards the subject of its research, SJT decides to consider the objective interests of disadvantaged groups as theoretically important. SJT does so despite the fact that group interests are often unrecognized by group members themselves and are not immediately useful for predicting or measuring behavior, even according to SJT (Jost & van der Toorn, 2012).

Thus, the SJT quite boldly brings certain aspects into the mainstream debate that have been banished from there due to a false sense of neutrality and a constricting methodological approach.

In its further development, SJT addresses system-stabilizing biases using implicit measures to capture self-deprecation. It examines the extent to which this provides psychological relief to the disadvantaged. It investigates which situational factors elicit System Justification (SJ). It examines various motivational foundations related to SJ (see below). It postulates social psychological models of action that intend to show tendencies to overcome the status quo (activism, collective action).

³ SIT investigates, among other things, how situations (and perceived qualities of overarching systems) shape individual group behavior, specifically identification with groups and thereby individual concept of the (group-)self. Of great importance is the relation of ingroup vs. outgroup. It is one of the key theories in mainstream social psychology, cf. Schnur in this volume.

On a theoretical level, Jost explicitly does not classify the SJT as a competitor to SIT, which conducts research on similar issues. SJT is concerned with supplementing and suggesting corrections (J. T. Jost, 2011).

Thematic areas of application of SJT include environmental awareness, various forms of discrimination, protest motivation, nationalism and anti-racism, conservatism research, utopian thinking.

My approach to the subject matter: reinterpretation, critical review

My discussion of the SJT is guided and informed by the approach of reinterpretation with the concepts of GCP, as conceptualized by Markard (1994). My basic questions and concerns are, first, delineation and immanent critique of SJT based on its own aspirations: How coherently does the integration of different theories succeed? What is made possible by this attempt at integration? Second, discussion with the help of GCP-concepts: what are the scope and limits of SJT viewed through the lense of critical psychology's understanding of the nexus of the individual and society?

Why this approach? Deviating from the common approach in psychology, I assume with GCP that it is important to *analyze* concepts or constructs. GCP argues this is necessary because, among other things, concepts are a *prerequisite for* empirical research. One the one hand, theoretical concepts influence what becomes observable in the first place and, on the other hand, they determine how the observed can be interpreted (cf. Markard, 2015, pp. 168). Accordingly, concepts are a *necessary* foreknowledge. Therefore, it should be understood decidedly as a scientific task in psychology to clearly explicate and clarify theoretical concepts. From this point of view, taking terminology from everyday language and tacit knowledge or keeping conceptual understandings merely implicit, is not a scientifically sound approach. However, this is partly a common approach of psychological concept formation (cf. Kessler & Fritsche, 2018, p. 15; Markard, 1991).

Critical psychology develops basic psychological concepts through interdisciplinary, i.e. the so-called *empirical-historical analysis*⁴. The basis of this method are studies in evolutionary and social history. Here the assumption applies that the developmentally earlier (in the sense of phylogenetically or historically earlier) is the *conceptually more general*. I.e. a minimal definition (e.g. of emotion) is not obtained from the overlapping areas of different definition attempts. It is rather determined by the phenomenon's earliest developmental precursor as reconstructed by historical analysis of the human psychophylogenesis. GCP further analyzes the historical process of interaction in which the individual and society both have evolved and how, within this historical process, said precursors of psychological functions have further developed qualitatively, finally constituting the human psyche in its specificity.

⁴ GCP distinguishes between *historical empiricism* and *actual empiricism*. The former refers to its method of conceptualization, which is based on historical reconstructions of the development of mental functions. The latter refers to research with people in the present and corresponds more or less to the common understanding of empirical research. For detailed accounts see Holzkamp, 1985; and in English Tolman, 2013.

Thereby a foundation of psychology and its basic concepts is proposed (in detail: Holzkamp's *Grundlegung der Psychologie* [Foundation of Psychology] 1985)⁵.

In this progression of historical analysis, the mediation relationship between the individual and society in the current 'state of development' of capitalist societies is deliberated. GCP analyzes this on the basis of Marxist social theory. It provides an elaborate repertoire of concepts to psychologically grasp the relationship between individual and society. GCP makes a proposal as to what is *essential* about the subject matter of psychology (specifically regarding humans, Holzkamp, 1985, pp. 513). In its application the GCP is intended to help analyze "experience and action" regarding "the extent to which certain social demands and constraints are [covertly or unconsciously; TD] expressed in them" (Markard, 2012, p. 67⁶).

On this basis, other psychological theories can also be examined as to what extent they do justice to the essential aspects as understood by GCP. For this purpose, a *reinterpretation* in critical-psychological terminology is carried out. Its aim is the explication of the epistemological substance ("Erkenntnisgehalt", Markard, 1994, p. 126) of the examined approach. In my text, the reinterpretation elements will be used to give a new perspective for a reflection on SJT (cf. Dohmen, 2021).

SJT does not exist systematically *as a coherent body of theory*. Theoretical concepts, as well as their function and relations among each other, and other apriori assumptions are scattered among: review articles that rather additively summarize research results, discussion sections of study publications, and debate papers disputing with other approaches. Also, Jost's first monograph on SJT, entitled "A Theory of System Justification", published in July 2020, does not contain a 'theory section' in the narrow sense. Here, too, the theoretical concepts of SJT are mainly to be found in the context of reviews of various, own research projects. They remain unintegrated within the book⁷.

It was therefore necessary to compare and relate statements of the SJT, to explicate implicit assumptions⁸ and to confront this with self-portrayals of the SJT.

It is not clear which statements are to be regarded as theoretically pertinent and which, for example, stem more from the 'political intuition' of individual authors (especially Jost's). Nevertheless, in order to appropriately receive the theoretical thrust of the SJT, I think it is essential to consider several of these theoretical statements by Jost and colleagues as a substantial part of the SJT. They are statements about the foundations of theoretical concepts, statements that clarify the (historical) scope of the SJT, contain demarcations and lines of

⁵ This distinguishes it from evolutionary psychological considerations, which do not focus on this process of qualitative further development

⁶ Quotes from German texts were translated into English by me.

⁷ E.g., the fourth chapter on prejudice is mainly based on Jost & Banaji (1994) and Jost (1995), whose ideas on false consciousness were later modified and simplified to facilitate operationalization (see Jost & van der Toorn, 2012, p. 322). This is, however, not taken into account in this book chapter.

⁸ Accordingly, my engagement with the SJT has, if you will, a partly hermeneutic quality: I had to try and make implicit things explicit. This reflects some ambiguity of the SJT itself. On the other hand, this explicative approach is partly speculative and a potential attack surface of my work.

connection to other approaches, and statements in the vein of social theory and, to a certain extent, political statements within the framework of SJT.

To trace what SJT does, it is necessary to distinguish different 'conceptual qualities': Drawing on ideas of German Critical Psychology, I have tried to trace the internal hierarchy of concepts of SJT by distinguishing *categories*, *analytical concepts*, furthermore *single-theoretic assumptions* ("einzeltheoretische Annahmen" (Holzkamp, 1985, p. 28), e.g., regarding how the subjects of analytical concepts are interrelated) and *descriptive concepts* ("Beschreibungsbegriffe" *ibid.*, p. 513). *Categories* are the overarching basic concepts of an approach⁹, which constitute it and structure how it empirically approaches the world. They determine which aspects of the "infinite fullness of aspects of reality" (*ibid.*, p. 509) are prioritized, what constitutes their essence, their 'intrinsic logic', and how they must be researched accordingly. From the point of view of GCP, there is no theory without constituting categories, whether or not they are made explicit.

Crucial in this context is the *quality* of analytical concepts. They do not serve the purpose of assigning observed phenomena under an 'umbrella term' (i.e. descriptive concepts). Analytical concepts in psychology are a "means to identify the essence of psychical phenomena and to be able to grasp the variety on the level of outward appearance as their different manifestations"¹⁰, (Holzkamp, 1985, p. 327). Another facet of this idea is that aspects that are analytically distinguishable may, 'in fact', not occur separately in the empirical material and are also not clearly separable (e.g., emotion and cognition).

A: Theoretical SJT

In section A, I will outline aspects of the "theoretical half" of SJT and its problematic transition to the "empirical half."

***False consciousness* in SJT as a category and analytical concepts derived from it: the lack of conceptual clarity in SJT**

In the early stages of STJ Jost (1995) defined false consciousness based on two criteria: "the holding of [1] *false or inaccurate beliefs* that are [2] *contrary to one's own social interest* and which thereby contribute to the maintenance of the

⁹ Or of the single scientific discipline. Holzkamp's *Grundlegung der Psychologie* (Foundation of Psychology) aspires to work out the categories of the discipline of psychology thereby clarifying its subject. Where single scientific disciplines are fragmented in themselves (quasi pre-paradigmatic), however, the fragments have their own categories, whose scientific dignity obviously has to be discussed because of said fragmentation.

¹⁰ My lay translation of this short quote may give the false impression of a flowery language related to a spiritual search for a 'true essence' and 'deeper meaning' that can be found in certain areas of psychology. Holzkamp's writing style is, to the contrary, very meticulous and technical. The theoretical point of reference here is rather an epistemological differentiation of essence and appearance that is expressed in an exemplary quote by Marx: "But all science would be superfluous if the outward appearance and the essence of things directly coincided" (Marx, 2010, p. 592).

disadvantaged position of the self or the group” (p. 400; emphasis and brackets: TD). The aspect of factual falsity [1] is later deliberately dropped (cf. Jost & van der Toorn, 2012, p. 322). For Jost, the concept has the following directed function against oppression, i.e., it is not ‘neutral’: “The concept of false consciousness [...] helps to identify inaccurate beliefs of subordinates which serve to perpetuate their social, economic, or sexual domination” (1995, p. 400). Oppression is a characteristic of the status quo, or “historically situated, enduring systems of inequality and exploitation” as Jost and colleagues say (Jost et al., 2019, p. 384)¹¹. Jost thinks of false consciousness as being ‘generated’ by interaction of “bottom-up” and “top-down” processes (2019, p. 265). Top-down processes in this sense are, for example, the impact of the dominance and pervasiveness of published opinion siding with the interests of social elites: “elite communication” (ibid.). This elite communication, he argues, addresses ‘conformist needs’ in people. The focus of SJT, however, is on bottom-up processes; meaning a motivational readiness that, in a sense, ‘seeks’ to realize itself in a conformist fashion (ibid.).

Beyond the semantic definitions given above, false consciousness is a crucial concept for the *epistemological interest* of SJT (i.e. being a tool for emancipation) and the internal structure of the theory. As a *category* (see above), it prompts investigation of cases in which people harm their own interests through their very own subjectively motivated behavior which stabilizes societal conditions to their disadvantage. Finding out how this motivated legitimization of ‘the system’ comes about (the eponymous *System Justification*) is what sparks the interest of SJT. Only the quality of *false consciousness* and the associated ‘self-harm’ make *system justification* an urgently relevant topic that concerns social emancipation.

Below I will demonstrate how the concept of false consciousness, as a *category*, structures the arrangement of SJT’s theoretical concepts at lower levels of abstraction. In the course of my discussion, it will also be shown that a certain understanding of the concepts of *justification* and *group status* necessarily implies that they are in fact analytical concepts. Their analytical quality is, however, not systematically understood in SJT’s theorizing.

A theoretical perspective unfolded from the concept of false consciousness

A starting point to come to grips with the internal structure of SJT is the reconstruction of the way the concept of system justification relates to the category of false consciousness.

The concept of system justification, respectively system justification motivation, is central to SJT. Jost gives the following definition: “System justification is the social psychological process whereby an individual perceives, understands, and explains an existing situation or arrangement in a way that legitimizes and maintains the status quo” (Jost, 2020, p. 83).

¹¹ The quotes are also meant to illustrate the emancipatory impetus found in some remarks in SJT publications.

The extent of SJ (or SJ motivation) varies by *situation* and *individual disposition* according to SJT.

Situational factors include threat to the system, dependence on the system, perceived inevitability of the system, and long existence of the system (cf. Jost, 2020, p. 64).

Important individual dispositions are, first, the individual “chronic” disposition of the SJ-relevant motivational foundation¹²: i.e. a) epistemic motives: reducing ambiguities in understanding; b) existential motives: security; c) relational motives: securing social relations and experiencing shared reality (cf. Jost 2019, p. 275). Second, political orientation. Political orientation according to SJT is, however, to be conceived of as motivated cognition and therefore not independent of said motivational foundations (Jost et al., 2017). For a digest of studies exploring the impact of situation and disposition on SJ see Jost 2019, pp. 268.

SJT embeds SJ in a domain spanning phenomena of socially motivated cognition. These have been explored by various social psychological theories with different emphases. With regard to these theories, SJT sees itself as a complement and extension:

Analogous to system justification, “ego-justification” (EJ) defends the behavior and position of the self; it captures “the need to develop and maintain a favorable self-image and to feel valid, justified, and legitimate as an individual actor” (Jost, 2020, p. 102). This is, for instance, attributed to the focus of *cognitive dissonance theory*. “Group-justification” (GJ) defends the interests of one's social group (Jost & Banaji, 1994, p. 2f.). It refers to the “desire to develop and maintain favorable images of one's own group¹³ and to defend and justify the actions of fellow in-group members” (Jost, 2020, p. 102). This is regarded as the subject matter at the center of *SIT*.

For members of privileged groups favored by the system, it can be assumed that justifying the system is also in their favor on the group and ego level. For members of marginalized groups, on the other hand, ‘psychical processing’ of a situation resulting in SJ affirms a system that disadvantages the group members at the ego or group level: here SJ, GJ, and EJ are not in harmony. These disharmonious aspects represent a ‘dissection’ of false consciousness into motivational forces and counterforces on different psychical levels of reference. Together they constitute a motivational contradiction. The levels of justification (ego/group/system) are supposed to make it possible for SJT to map the tension of ‘individual justification’ (J. T. Jost, 2011 p. 230): By disaggregating the ‘contradictory’ false consciousness into EJ, GJ, and SJ (and group status), it

¹² This is subject to possible internal differentiations ‘within’ the various needs: “It is conceivable that distinctive operationalizations of epistemic, existential, and relational needs—such as needs for certainty vs. control, fear vs. anxiety (or even conscious vs. nonconscious sources of anxiety), and belongingness vs. shared reality—may produce different effects on ideological endorsement.” (Hennes et al., 2012, p. 682); and ambiguities about how the different needs regarding SJ are related (ibid.).

¹³ At this point, the SJT perspective on groups and group justification still *seems* to be in line with SIT. In the course of my discussion it should become clear that this is, in fact, not the case when SJT addresses objective group interests. The selection of “one's own group” can be flexible, but not every group can be the bearer of a social interest as theorized by SJT (see below).

should become psychologically conceivable *without contradiction*. This should ultimately make it possible to translate what seems contradictory into empirical research that requires unambiguity.

Against the background of this dissection into different aspects (EJ, GJ, SJ), which is intended to amount to a sort of 'theoretical operationalization', *false consciousness* can be understood as a *mediation category* ("*Vermittlungskategorie*" in German (Holzkamp, 1985, p. 192): as such, it is intended to address the intersection/mediation of objective and subjective tensions and contradictions. SJ (or SJ-motivation) and GJ are the concepts which in SJT concern the subjective side of this relation; interest and group status concern the objective side.

At this point the following must be emphasized: *these* justification concepts that conceptualize false consciousness can only be understood as *analytical definitions* of an action/motivation directed exclusively at one pole: SJ → system interest; GJ → group interest. They are not identical with *empirical actions* that actually, among other things, justify the system or the group in the real world.

Explicating implicit conceptual qualities: disambiguation of multiple justification concepts in SJT.

I argue that there are actually several, different concepts of justification in SJT. They are, however, treated as if they were one unified concept. These differing concepts are not explicitly elaborated, but are implied in various definitions or conceptual constellations (e.g. the relation between false consciousness and justification).

According to my analysis, SJT uses justification concepts in an analytical function any time it is dealing with false consciousness as a violation of objective interests. This applies especially to the assumption that system interest and group interest are in principle incompatible for the marginalized, which is why SJ has negative consequences for them. In this analytical function, these justification concepts serve to reflect the opposite poles of an objective contradiction (vs. classify empirically present behavior). In the context of false consciousness, the Justification concepts *SJ* and *GJ* are linked to the respective interests (i.e.: conformism and support of the system vs. representing group interests against the system). Only in this way can SJT assume that SJ takes place *without* "self-interest or group-interest" (Jost & van der Toorn, 2012, p. 339). It is, however, not made clear exactly how abstract this statement is. Before anything else this statement makes sense if one understands group interest vs. system interest (and GJ vs. SJ coupled to it) as analytical poles in which these interests are addressed in 'purest form' and ultimate consequence. In this context, gradual 'mixed forms' are not conceptually valid (see figure 1).

Empirically, however, interests or actions directed at interests do not occur separately and in 'pure form' - they are located 'between' the ideal types spelled out by the analytical poles. Therefore, the statement that SJ is undertaken without "self-interest or group-interest" (Jost & van der Toorn, 2012, p. 339) is not

readily applicable to empirical reality. Moreover, it is also not readily possible to determine interests in a concrete and positive way and to know in advance whether attempts to pursue them will be successful. There is the possibility of pursuing interests that are mistaken for one's own (group) interests. This is not considered GJ in the narrow (analytic) sense in SJT analytic justification concepts. This is due to the fact that GJ in the narrow sense *excludes* false consciousness.

Thus, these 'pointed' *analytical* concepts cannot be utilized to clearly classify *empirically present* actions that relate to group and system interests whilst retaining their original meaning and purpose. The idea of pursuing one's own group interest *in the final analysis* is an *analytical* 'determination of direction'. The pursuit of one's own group interest in concrete and practical terms, on the other hand, is complex, demanding, and involves challenges in understanding the world and acting in it. A necessary condition is to identify oneself as a group member of the 'correct group' in the first place.

SJT attempts (however not theoretically or methodologically explicated) to take the leap from an analytical level to the empirical: for low group status, the analytical is equated with the empirical, consequently SJ would 'measure' false consciousness in the case of the disadvantaged. From the above analysis, it is understandable that this entails difficulties. First, the coupling of objective interest and particular motive quality 'in pure form' as conceived in the concept of false consciousness is primarily an analytic pole. Second, it is unclear how individual actions and statements are 'psychically founded and composited' and how exactly they relate to which interest. Where *justification* is to be operationalized and measured, this ambiguity of actions and statements with respect to interests cannot be so easily realized. A consideration in Jost and colleagues (2017) points in this direction: Contradictory tendencies from EJ, GJ, and SJ would potentially generate a tense relationship at any moment: "political actors may be motivated by a complicated mix of system-justifying and system-challenging concerns, depending (at least in part) upon the social system that is in question" (p. e19). The very same result of action can thus be influenced in many ways. It could be contradictory in its reference to interests; i.e. the ultimately futile attempt to pursue group interests of marginalized people and system interests at the same time. An action result could also be only a snapshot of a process that is moved by opposing motivational forces. On the basis of the superficial appearance, the 'motivational composition' is not necessarily clear. Judging from this view, statements about the system that are supposed to determine the 'extent of SJ' in SJ likert scales (e.g. "Economic positions are legitimate reflections of people's achievements"; Jost & Thompson, 2000, p. 225), can be further investigated regarding their respective individually different motivational bases. Further below I will elaborate on the issue of individually distinct motivational bases from a perspective of GCP-explanations of the psychological relevance of *reasons for action*.

An example for the conflation of analytical and 'empirical' concept is Osborne, Jost, and colleagues (2019) where ethnic minority group identification is used as a proxy for GJ (e.g., "Being a member of my ethnic group is an

important part of how I see myself”, p. 248). This is done in a constellation where the authors expect GJ to oppose SJ and be a predictor of protest. The reference of GJ to interests is defined on the categorical level and thus forms the basis of the hypothesis of the contradiction between GJ and SJ. However, in its empirical implementation as group identification, the reference to interests is unclear. Empirically, there is a wide range of ‘group actions’ that are not, or only supposedly, in line with group interests. Moreover, their distance to the group interests may vary. This transfer to empiricism is imprecise because the premises of the analytical concepts represent polarities and constellations that are *means of analysis*. They do not immediately describe the phenomena of reality.

Figure 1

The relationship of group justification (GJ) and system justification (SJ) among marginalized groups to objective interest

Annotation. The figure uses *group identification* as an auxiliary construct to clarify the relationships between the concepts. Group identification is *conceptually presupposed* for GJ actions (but not for the existence of group membership and objective interests). A relevant range of ‘group actions’ emerges that do not, or only on a surface level, correspond to group interests (bottom right, SJ). This encompasses a wide range of different actions with varying distance to the group interest.

Abandoned trains of thought in SJT

There are some relevant theoretical implications and desiderata that are inherent in explanations of SJT but have not yet been pursued. These have the tendency to lead away from the methodological approach of the psychological mainstream even more openly.

‘False groups’ – fruitful implication of SJT for analysis & problem for empirical research?

Where SJ, GJ, EJ theorize false consciousness, the group level in SJT is not identical with the group level in SIT: it only addresses groups that meaningfully imply social status (this is not the case, for example, with a conservative party in which workers are organized with multi-millionaires or even billionaires). In this narrow sense, ‘group’ is not a descriptive term, but corresponds closely to the concept of interest. The advantage of this narrow understanding is: *subjective* group identification can thusly also be analyzed as a mechanism of SJ and as false consciousness. Jost shows this exemplarily for national identification (cf. 2019, p. 281). With SIT, one would instead rather grasp national identification as group-ego and assume a corresponding (extended) self-interest.

SJT does not have an *explicit* concept of ‘false groups’ yet. The ‘non-false’ groups with ‘clear status’, in turn, are also not clearly empirically determinable (who belongs to them? What is the concrete group interest?). False and non-false groups are in this respect also *analytical ideas*. A ‘status-mixed’ group constituted by ‘values’ cannot be unambiguously classified ‘as a group’ in this sense. This is because the group members of the status-mixed group would have different, objective group interests. Thus, the SJT considers e.g. the ‘group membership’ of working class conservatives in conservative parties, at least partly, as an expression of false consciousness rather than as group membership in the strict sense (since they would tend to cut their own flesh e.g. by conservative social policy)¹⁴. Where SJT theorizes false consciousness, conservatives (liberals, etc.) are therefore not an ‘actual’ group. Conservatism is subsequently seen as an individual political ideology (with strong implications for attitudes to the status quo) – even though it remains unquestioned that it instigates ‘group practice’.

Here, a group has a clear status and interest that could be pursued with GJ only in the *analytical sense*.

According to SJT, the group interest of marginalized groups is only determined negatively as ‘directed against the system’ and against their own disadvantage. Positive attempts at definitions are (necessarily) abstract: Jost and colleagues (2019), for example, regard objective interest merely as “what is in the rational self-interest of a given social group” (p. 386). Jost, Hennes, and Lavine (2013, pp. 856, 863) and Jost, Banaji, and Nosek (2004, p. 884) understand interest primarily as immediate economic (self-)interest.

Jost and colleagues note in a more recent publication (2019, p. 389) that individuals are themselves ‘status mixed’. They may be discriminated against with respect to multiple social dimensions (e.g. gender, sexual orientation, ethnicity...) and privileged with respect to others.

¹⁴ Jost explains these pitfalls of the group level impressively with the example that in the USA poverty is a relevant factor that ‘motivates’ people to join the armed forces. This is romanticized, he argues, when it is framed as the pursuit of self-interest at the level of the nation's own group (2019, p. 281). In this example, the nation an aspect of social reality, as well as reference point of false consciousness. The concept of false consciousness allows SJT to capture this simultaneity.

Focussing on a ‘narrow set of questions’, however, it seems more easily possible to discern a single criterion that uniquely defines a marginalized group. For example, Osborne, Jost, and colleagues (2019), in order to substantiate their *general* model of protest prediction, examine a problem in which a *particular* status group has a group interest that is specifically directed against that problem: racial discrimination ‘produces’ ethnic minorities as a marginalized group. Here too, however, there may be relevant ‘internal’ group distinctions that may impede action towards the common interest; e.g., class differences. In its empirical research, SJT uses the logic of ‘narrow questions’ to enable assignment to a low-status. However, in its theoretical statements, SJT speaks of “low-status and high-status groups” (Osborne, Jost, et al., 2019, p. 264) in a general sense without this limitation.

Authors of SJT are well aware that groups beyond these status groups practically ‘exist’, such as conservative political groups (with group processes). The concept of false consciousness does not structure all theory parts of SJT. Where SJT is concerned with political attitudes variously related to SJ, it acts differently. Here, SJT also thinks of political attitudes as constituting groups in a broader sense. E.g., there is research with left wing activists as test subjects of a field experiment (J. T. Jost et al., 2012). Their group identification is raised as a predictor of protest, their ‘social status composition’ is not taken into account. They are primarily interesting as specimens who are critical of ‘the system’ and participate in protests. Also, protest as a *group activity*, which does not require shared status in the narrow sense, can be of interest as the dependent variable in SJT research. *False consciousness* is less central to SJT’s conception of said empirical phenomena. The area of interest is rather the predictive quality of individual SJ; in Osborne, Jost, and others (2019), for example, as a mediator of protest activity.

False needs?

The chronic and situational expression of relational, existential, and epistemic needs are an aspect in SJT to explain how the status quo is legitimized ‘from below’. Here the question arises why conservatism has advantages in satisfying said needs subjectively though not necessarily objectively (Jost et al., 2017 p. e9; also Hennes et al., 2012). This also results from the fact that conservatism is focused on clear, simple rules and traditions (Jost et al., 2017). This advantage also exists when conservatism is not hegemonic (it’s structural hegemony would currently, however, be the rule).

There are passages in papers where it is taken into consideration that, for example, self-deception can be the prerequisite for satisfying one’s need for security with conservative positions: “even if conservative politicians are themselves responsible for increasing levels of threat” (Jost & Hunyady, 2005 p. 264).

Unlike to its discussion of consciousness SJT (so far) does not draw an explicit connection from the basic need level to objective interests. One could,

however, think about ‘motivated need constitution and need accentuation’ analogously to motivated cognition. Then one could ask where something is falsely declared to be a need or where one is deceived about one's own needs (being aware that this perspective could also take problematic paths).

Integrating an analysis of societal structures

At various points, Jost has pointed out the need for analyses of societal structures within the framework of social psychological theory (Jost & Kruglanski, 2002, p. 180; Jost, 2020, pp. 30, 83):

What is needed is a sophisticated social psychological understanding of what Bourdieu [...] characterized as “the dialectical relationship between the objective structures and the cognitive and motivating structures which they produce and which tend to reproduce them” (Jost, 2011, p. 252).

SJT has not yet complied with this.

From German Critical Psychology's reference to Marx, it could be learned that societal structures ‘suggest’ objective thought forms (stereotypical ways of thinking about societal relations if you will) that are themselves ‘false’ (e.g. the “fetishism of commodities”, cf. Marx, 2015, pp. 47). *False consciousness* could therefore present itself as an entangled relationship between motivated cognition, on the one hand, and an objective epistemic problem regarding the comprehension of societal processes and one's own interests, on the other hand. Accordingly, possibilities of action and thought ‘embedded’ in societal structures (in their societal mediatedness) should be analyzed in a specific research step. Regarding the question of SJT, this would also imply: analysis of the specific and non-specific determinants of the respective systems, their suggestiveness (in the above sense) and the system-immanent possibilities for action; furthermore, analysis of the integration of a system into the overarching societal system. This would have to be put into relation with an interesting consideration of SJT: To what extent are objectively different structures/systems (or ‘subsystems’) reacted to with identical ‘psychical modes of reaction’; defended as status quo; or mistakenly considered to be an independent system? Interrelating these aspects could help explore societal prerequisites for the application of interventions that SJT has speculated about.

B: ‘Empirical’ SJT

Section B deals with aspects of the more ‘empirically oriented’ part of SJT.

Integration of Marx and Mainstream: Incompatible understandings of science?

In addition to finding conceptual inspiration, John T. Jost also refers to Marx in order to elaborate on the theory of science. In a 2007 article with Lawrence J. Jost, he presents a fallibilism-oriented social psychology as the only valid empirical research:

Marx's own intellectual development led him to abandon 'pure' or 'speculative' philosophy in favor of a search for empirically grounded forms of investigation that resemble those of today's 'mainstream' sociology and psychology. (L. J. Jost & Jost, 2007 p. 299)

Jost & Jost find it ironic that the "critical psychology movement" would instead be purely philosophical; merely a negative critique of psychology that does not practice positive, empirical science (p. 299). Elsewhere, however, they concede that Marx did not simply adopt "a strictly positivist conception of science" (ibid., pp. 315). Their initial argument does not include this concession. The criticism of speculative, metaphysical approaches may be justified. But it is merely negative and does not speak specifically in favor of the authors' own approach.

Jost and Jost neglect Marx's *empiricism directed towards conceptualization* and object analysis and its methodological foundation. German Critical Psychology, on the other hand, attaches great importance to it (cf. Markard, 2017) which, in turn, leads to a different foundation of empirical research. The result of the object analysis of critical psychology and its methodological implications is in a nutshell¹⁵: Societal *conditions* are *possibilities (and impediments)* to act from the standpoint of the subject. Individuals are not determined in their concrete action. They rather must develop in these conditions, relate to the conditions, participate in them and produce them in order to exist. In doing so, they reproduce and change these conditions (albeit to varying degrees, some of which may be barely noticeable). Rather than of "stimulus" or "environment" GCP speaks of a historically collectively produced, meaningful, societal world when dealing with psychological issues at a decidedly human level. The individuals' *objective* possibilities to act¹⁶ are subjectively perceived and appropriated as *premises* of each individual's own action. According to GCP, individuals act within this 'framework' of objective possibilities to act in a way that is subjectively grounded or based on "subjective reasons for action" (Holzkamp, 2013, p. 47). "Based on subjective reasons" in this sense does not mean 'rational' or conscious (but can be made conscious; Holzkamp, 1986, pp. 227). Instead, it designates a certain 'mode' of *mediatedness* ("Vermitteltheit") between the individual and the world that is qualitatively distinct from the notion that the environment or stimuli *condition* behavior, that behavior is the *effect* of stimuli (in the sense of a stimulus-response relation). This mediation level ("Vermittlungsebene") of reasonable action, according to GCP, is the standard

¹⁵ For more details see Holzkamp, 1985; and also Markard, 2012; in English e.g. Holzkamp, 1992; C. Tolman, 2013, but currently there are more key texts in translation.

¹⁶ In this context, for Critical Psychology, there is the *psychological* necessity of an analysis of social conditions, noted above as a desideratum of SJT. In terms of GCP: analysis of meaning structures.

basis of societally mediated individual existence. Therefore, GCP regards the associated so-called “reason discourse” (Holzkamp, 2013, p. 47) as the linguistic basis of psychological theory that is required to formulate theory and hypotheses addressing specifically human psychology. In the instead common “conditioning discourse” (ibid.) and its empirical discussion, crucial factors are neglected: *subjective determination* (vs. objective determinacy) and the *mediatedness of individual action (through reason and objective possibilities for action)* with the societal process.

Misinterpreting reasons for action in social psychology & the reason discourse as a medium of psychological theories.

From the perspective of Critical Psychology, a fundamental critique of social psychology by Klaus Holzkamp can be applied to the ‘empirical half’ of SJT: the misinterpreting of reasons for action (Holzkamp, 1986; 2013). According to this critique, social psychology errs when it assumes contingent, testable effects of the world on human action as an if-then statements. Furthermore, the theoretical considerations of social psychology would, in actuality, even if only *implicitly*, presuppose subjective reasons for actions¹⁷ as the relation between ‘stimuli’. As a consequence, according to Holzkamp's argumentation, the hypotheses of such theories do not deal with contingent conditionalities. Instead, they ‘only’ deal with an *example of* a connection between a) individual interpretations of the possibilities to act in a societally embedded situation (premises) and b) subjective reasons for action. Holzkamp calls these connections of premises and reasons “reason pattern” (1986, p. 221; 2013 p. 50). Reason patterns, he argues, are the standard mode of mediatedness of the world and individual actions in human psychology.

What this can mean for theorizing (i.e., also interpreting data) is illustrated by the example below.

Reason patterns in a study on “System-Sanctioned Change”.

In the study by Feygina, Jost, and Goldsmith (2010), correlational and experimental questionnaire studies are conducted that address attitudes towards a) the climate crisis and b) possible counter measures. In particular, a focus is placed on whether climate action is seen as a threat to the existing “system”, which would be in line with a typical reaction of SJ. The concept of *system sanctioned change*, however, attempts to frame the introduction of stronger climate action (i.e. societal change) as being in accordance with the (spirit of the) status quo. In the questionnaire of the experimental group, this idea is

¹⁷ Motivated cognition can often easily be reformulated as grounded in subjective reasons. Because it is also categorically based on the fact that a certain thought (in the social context) is formed on a certain motive or need basis: *In order to achieve something*, something is thought and done.

implemented in such a way that climate protection/environmental protection is framed as patriotic. The authors try to find out whether this can cancel out the known effects of SJ on climate change denialism and opinions on environmental behavior.

The examined context of the study can be reformulated in the reason discourse. The interpretation of the study is: *if reframing, then acceptance*. However, the research hypotheses actually implies that a certain reaction will be shown to be *subjectively reasonable*: *if* pro-environmental statements subjectively fit their own political opinion and purposes (e.g. patriotism)¹⁸, *then* they *reasonably* (!) experience stronger approval. A contrary case would be theoretically and subjectively unsound.¹⁹ This is why the empirical relation could not be grasped by contingent if-then statements. It is rather be represented by “linguistic-implicative (i.e. in the widest sense, “definitional”) statements” (Holzkamp, 2013, p. 51). The consequence of this for psychological methodology is that the relation of world and psyche cannot be comprehended in the “conditioning discourse” (ibid., p. 47), that is, of effect. Thus, effect can no longer be *tested*. Consequentially, the premise of scientific procedure of fallibilistic theory production that is based on testing would be called into question by the implicit theory common in social psychology. Assuming that reason patterns are adequate, empiricism deals with analyzing exemplary cases of ‘application’ of theories instead of testing them. Reason patterns are nevertheless not obvious, not even to the subject that acts based on them. Their reconstruction is demanding and needs a certain amount of scientific (psychological) knowledge.

In the context of the experiment, one could also further investigate how questionnaire items themselves are interpreted in the first place and why people answer in the way they do. Since the reason discourse formulates a specific ‘mode of mediatedness’ for psychology, this approach would go beyond a social psychology of the experiment.

In SJT, this study and its idea of reframing is cited several times when discussing SJT-based intervention options (J. T. Jost, 2015, 2016, 2020; J. T. Jost et al., 2015, 2018). My discussion of the study gives an idea why the application of its results might be problematic. A further reservation towards this: the study was not an “applied experiment”²⁰ by conventional measures. Thus, no statement

¹⁸ More general: If subjects adopt the manipulation as premise of their actions, in the way intended by the researchers

¹⁹ If the study were to show that national framing tends to have no consequences, this would not contribute to the verification of the original hypothesis. It would ‘only’ not have found an example of it. E.g., because the concerns about short-term national competitiveness were too serious for the manipulation to be convincing (this style of thinking that is also used in exhaustion attempts is indicative of the reason discourse applying). If both reason patterns were found with different frequency, the more frequent pattern would not disprove the less frequent. They would be two examples of reason patterns that are not necessarily in competition.

²⁰ An experiment (or correlation study) tests the theory. Only the theory, not directly the case studied in the experiment, serves to interpret and process the real world (Mook, 1983, S. 380; Wilson et al., 2010). This is also described by Douglas M. Mook in 1983 in his widely cited methodological essay “In Defense Of External Invalidity”. He distinguishes, first, the experiments that do not want or need to be externally valid. They serve the purpose of finding conditions that can show that a theory does not (always) hold. Second, he speaks of “applied experiments” (p. 380): “The experimental setting resembles, or is a special

about the “real world” is substantiated with it. The preconditions of application and transfer were not investigated and hardly discussed²¹.

Outside of the need to found a contingent relationship for a journal, the reframing-approach can also be viewed more circumspectly:

“There is a danger here of playing word games, avoiding the ‘real’ issues, and postponing necessary sacrifices, but-from a practical perspective-it would be foolish to ignore powerful forces of ideological defensiveness [TD: i.e. SJ] [...]” (Jost, 2020, p. 246)

Concretizing Reason patterns in the context of SJT

Empirical studies could deal with the problem unfolded above by concretizing their objects of research as reason patterns. This possibility is hinted at in a rare qualitative study in the context of SJT by Godfrey and Wolf (2016). Here, the complexity and contradictoriness of individual attitudes toward the status quo are revealed. The empirical data flesh out this contradictoriness in exemplary ways: poor ethnic minority women name structural causes of poverty yet blame the poor themselves; sometimes in the same train of thought (ibid., p. 99). The more precise subjective backgrounds remain speculative because the data is only interpreted by the researchers ‘from the outside’. Nevertheless, the study provides relevant impulses for SJT. And it does so precisely by providing indications of *possibly given/available* reason patterns.

The contradictoriness and changeability in individual consciousness could, for example, indicate that the complementary relationship of SJT and SIT (and other theories, see e.g. Jost 2019, p. 285) could be conceived of and researched as interchangeable modes *within* individual subjectivity in the very same situation. The reason discourse provides an obvious basis for this, but one that leads away from current methodological paradigms and brings with it new methodological problems different from those already faced by (social) psychology.

C: Misunderstandings in the reception of SJT

What sets apart SJT from other approaches is mainstream social psychology is that SJT allows itself some ‘degrees of freedom’ to incorporate theories on politics and history that partly shape the formulation of hypotheses and interpretations in SJT. Accordingly, SJT formulates some *historically-relative hypotheses* instead of *universal statements that are strictly falsifiable*. In the

case of, a real-life setting in which one wants to know what to do” (ibid.). These specifically try to address the transfer to real-world situations.

²¹ Whether such a framing would be socially effective is, for example, a question of power relations: in acute social conflict situations, in which environmental protection is possibly also an established enemy stereotype, the reframing attempts of moderate reformers are probably quickly seen through as an attempt at manipulation. In the debate within the SJT, which is mainly focused on empirical research, this discussion given here is a gap, even if I assume that authors of the SJT are easily capable of filling it.

‘mainstream’ reception of SJT several misunderstandings happened because more narrowly fallibilistically oriented colleagues or competitors tend to have difficulties with understanding these ‘degrees of freedom’ when engaging in debate with the SJT.

This can be seen in the discussion of the “strong” SJ hypothesis (J. T. Jost, Pelham, et al., 2003). It states that disadvantaged groups legitimize the system to a greater extent than dominant groups. According to cognitive dissonance, they thereby psychically compensate for the fact that they gain little material advantage from their SJ. According to Jost et al., however, group- and self-related motives usually stand in the way of this phenomenon. This means it will *not always* manifest itself. Their study should only *demonstrate* that the effect is *possible* (ibid. p. 17). The hypothesis was partly assumed by proponents of other theories to be theoretically central for SJT. Thus, an attempt was made to refute SJT as a whole by challenging this hypothesis in the sense of a competition of theories. The theoretical classification by the SJT was not taken into account (J. T. Jost, 2019, p. 282).

An explicit historicization of the subject of SJT is illustrated by Jost and Banaji’s statement that “One potential trigger [sic!] of the system-justification response might be the absence of a revolutionary ‘class consciousness’” (1994, p. 16)

In the debate on conservatism as motivated cognition (started by J. T. Jost, Glaser, et al., 2003), the critique of SJT again failed to consider the theoretical elaborations. Instead, it referred solely to a narrowly understood, formalist core definition of conservatism: pro inequality and contra change. This made restorative, reactionary movements appear to Greenberg and Jonas (2003) as ‘*pro change* conservatives’ and thus counter-examples. They miss that Jost, Glaser et al. (implicitly) assumed a scope that takes into account historical power relations and developmental trends (2003). Thereby revealing the *restorative* and in this sense ‘pro-(old)-system’ character of these movements.

Other than that, the given historical relativity in the definition of conservatism points to a limitation regarding the settling of this question with a simple, falsifiable hypothesis and ensuing empirical evidence. Such an attempt produces an empiricist misunderstanding: the observation that conservatives are more inclined (in a historically contextualized way) to SJ is in fact a *definitional relation* that is treated as if it were empirically open. But supposed conservatives who deviate substantially from this relation would only evidence their idiosyncratic definition of conservativeness.

It is certainly of interest to investigate how (e.g. motives, interests, etc.) conservatism arises and exists, which manifestations and nuances and developmental potentials it has. But: In such politically charged areas one will not be able to reconcile scientific neutrality, the non-binding nature of freedom of opinion and political ideological criticism, as the SJT sometimes tries to do. Political arguments cannot be settled with the ‘neutral’ scientific proof that conservatism is somehow wrong, narrow-minded or stupid. Jost in a way implies this himself: he attributes the social scientific question of whether leftists are not equally rigid and conformist as rightists to a neoconservative intervention in

social science (Jost, 2006, p. 667). The existence and relevance of the question in scientific discourse is thus dependent on the power of certain political interests-groups to intervene – it is as Holzkamp put it “the ideational aspect of societal class struggles” (1985, p. 31).

Discussion: Two types of theory, partly blurring

According to my analysis, SJT consists of a fallibilist psychology and a more social science-based psychology and social theory.

The former tends towards more clearly falsifiable hypotheses. Methodologically, it clearly holds the upper hand within SJT. ‘Alternative’ methodological approaches are prematurely rejected in SJT (L. J. Jost & Jost, 2007). The results produced here that are discussed regarding their application are too simplistic; e.g., ‘system sanctioned change’ (Feygina et al., 2010). Nevertheless, SJT raises crucial questions about the obstacles to responses to societal crisis and its results are worth discussing; especially in the context of efforts trying to further the (thus far insufficient) theoretical synthesis.

However, the SJT's hypothesis formulation sometimes fails to be fallibilistic. On the one hand due to a common tendency that wants to confirm hypotheses rather than to reject them. On the other hand, this can be explained by a historical and analytical ‘intuition’ of the research subject pushing through from the ‘theoretical half’ of the theory (see below). This results in existential hypotheses with a historical expiration date: according to SJT, whether and how strongly disadvantaged groups react with SJ is also an expression of societal power relations that cannot (be) clearly determined. SJ can *simultaneously* have both a palliative function and be self-damaging. Whether something is a system or group is context dependent; whether a group(-identity) is primarily a case of false consciousness is up for debate. This ‘blurring’ allows SJT to retain theoretically complex relations and concepts and a ‘sense of historicity’ to some extent, and to ask interesting questions. However, this blurring poses challenges to operationalization that more rigorous mainstream methodologists misunderstand.

The second, ‘more theoretical theory’ considers more complex relations and has an inkling that its own object of research depends on historical power relations. It relates to (not easily measurable) objective interests and uses concepts that have an analytical function rather than one of operationalization and measurement. These ‘second theory’ aspects are exceptional for a mainstream psychological theory. However, they are not sufficiently explicated.

The unclear relation between the two halves causes theoretical problems resulting in unnoticed duplications of the conceptual terminology: SJ can be understood as *analytical* concretization of false consciousness in SJT; then reflecting different levels/qualities of interest reference and their contradictory interrelation (even within individual actions). Where SJT treats SJ *as a measurable variable*, however, SJ loses the clear reference to objective interests. This unresolved difference between ‘analytical SJ’ and ‘SJ as a variable’ leads to

unclear statements. For example, the thesis that SJ cannot be motivated by genuine self-interest in marginalized people is understandable on a categorical level, but less understandable in relation to empirically present actions.

It is also clear to the theoretical half that there is a problem of intervention capability for the other (empirical) half. With its proposals of discourse intervention, it cannot reach the historical scale in the experiment. This scale, however, would be the prerequisite of societal change becoming a realistic possibility of collective practice (i.e. not merely symbolic). How to transfer present results to other historical circumstances remains an unresolved challenge.

Insofar as one agrees that relevant aspects (or, as I have assumed, with false consciousness even a constituent category) of SJT are located in the ‘second half’, SJT has a problem in its communicability. This is because these aspects are not explicated clearly enough. I assume that the perspective of GCP could help SJT reflect on its approach to its subject matter in terms of its own epistemic intention. At the same time, GCP also poses a challenge that makes it difficult to remain in the psychological mainstream.

Afrophobic hypernationalism: Unpacking the anti-black logic of #PutSouthAfricansFirst

Suntosh R. Pillay

Abstract

There is persistent xenophobia in South Africa and social media is used to promote negative stereotypes against migrant communities. The hashtag #PutSouthAfricansFirst expresses anger at the perception that foreigners are criminals and ‘steal jobs’ from locals. Social media is a dialogic site of micro- and macro meaning-making, identity formation, and ideological contestation. Online and offline communities are mutually constitutive, as intersecting discursive spaces that (re)produce, amplify, and resist nationalist discourse on the treatment of migrants and citizens. Using a reflexive, quasi-ethnographic approach, I conducted a critical discourse analysis of a related Twitter (X) discussion. I unpack these racialized utterances to understand their psychopolitical positioning within a context of enduring coloniality. I identify four intersecting discourses that prop up xenophobia: patriotic citizenship; law and order; localised marginality; and pre-colonial indigeneity. In a context of poverty, inequality, and unemployment, I argue that these discursive tensions contribute to a violent meta-discourse of ‘Afrophobic hypernationalism’, which locates itself within a historically divisive, anti-black ontology that perpetuates an apartheid-era logic, in which hierarchies of blackness are reinforced and discursively justified with great speed by anonymous social media communities.

Keywords

Afrophobia, coloniality, nationalism, social media, South Africa, xenophobia

Introduction

Rising xenophobia across South Africa intersects with diverse psychosocial, economic, historical, and political factors (Akinola, 2018). Cross-border migrants¹ are consistently the target of negative prejudice and stereotypes

¹ There is unresolved practical and conceptual debate on terminology. I am opting to use the umbrella term ‘migrant’ (see UNDESA, 2020) to refer to all documented and undocumented foreign nationals, stateless people, refugees, asylum seekers, and economic migrants, from countries outside of South Africa currently residing in South Africa. The discourse in South Africa more often uses the term ‘foreigners’.

(Gordon, 2015). In March 2019, President Cyril Ramaphosa launched the 'National Action Plan to Combat Racism, Racial Discrimination, Xenophobia and Related Intolerance'. Yet, anti-migrant attitudes flourish (Human Rights Watch, 2020), especially on social media (Mpofu & Barnabas, 2016; Lunga, 2021). In 2020, the hashtags #PutSouthAfricansFirst and #WeWantOurCountryBack expressed anger at rising unemployment and the perception that migrants 'steal' jobs from locals. Given South Africa's history of brutal violence towards migrants (Valji, 2003) and global anti-immigrant discourse (Kreis, 2017), these phrases were not innocuous expressions of frustration.

In keeping with a critical social justice orientation, and decolonial imperatives, some South African psychologists increasingly participate in these public debates, moving away from 'neutral' positions that prevent psychologists from taking public positions on controversial social issues. To disrupt this hegemony of 'neutrality', some psychologists – myself included – now speak beyond academia and engage actively in mainstream- and social media, in line with a critical psychology position that silence – in the context of injustices – is an act of violence itself (SR Pillay, 2016). Increasingly, the internet is “the scene of politics” and social media is its most accessible mode of engagement (Çetinkaya, 2020). There were 22 million active social media users by July 2020 in South Africa (37% of the population) (TalkWalker, 2020).

Within this context I chose to personally intervene on Twitter (now called X) by posting a brief critique² against xenophobia. I felt that a discourse to put South Africans 'first' and an interpellation into the bravado of ethno-nationalism would quickly translate into mob violence. Indeed, our “identitarian dysfunctionality” often manifests as “a uniquely South African hostility towards other African immigrants” (Lamola, 2018, p.72). I tweeted my misgivings on January 2, 2021. It read:

#WeWantOurCountryBack and #PutSouthAfricansFirst reinforce a vocabulary of violence. These xenophobic, fascist, hyper-nationalist slogans drive lazy scapegoating of 'ethnic others'. History warns us what happens next.

Most replies were explicitly xenophobic and racist, fuelling a “discursive spiral of hate” that social media tends to evoke and enable (Kopytowska, Grabowski, & Woźniak, 2017, p.68). In this article, I offer a critical discourse analysis of this ensuing online discussion. I contend that this is a valuable mode and site of analysis for three reasons.

Firstly, there is a lack of autoethnographic approaches researching racism, xenophobia, and nationalism, due to the obstinate illusion of political neutrality. I am deliberately embedding myself into this analysis vis-à-vis my participation and provocations in the tweets under investigation, parting ways from existing scholarship on social media and prejudice that renders the researcher invisible (Matamoros-Fernández & Farkas, 2021). Insofar as an autoethnographic lens

² As a micro-blogging app, a single tweet only allows 280 *characters*. Posts must therefore be succinct and catchy.

“lets you use yourself to get to culture” (Pelias, 2003, p.372), I explore the cultures of racism, xenophobia and nationalism that are amplified on Twitter. This disrupts supposedly ‘objective’ (conservative, mainstream) analytic frames, enabling a nuanced, embedded, situated political subjectivity in academia. Secondly, social media is a dialogic site of micro- and macro meaning-making, identity formation, and ideological contestation (KhosraviNik & Esposito, 2018). Online and offline communities are mutually constitutive (Bouvier, 2015), as intersecting discursive spaces that (re)produce, amplify, and resist nationalist discourse and political positions on the treatment of migrants and citizens. An analysis that explores these psychopolitical realities can improve our understanding of these layered and entangled sites of meaning-making (Kopytowska et al., 2017). Thirdly, I theorize the intersectional violence of racism, nationalism, xenophobia, patriarchy, and coloniality in South Africa, by proposing a model of ‘Afrophobic Hypernationalism’.

(Re)Articulations of anti-black racism

‘How did it come to pass that in the imagination of an African nation [South Africa], Africa and Africans represent the negativity of Otherness?’ - Matsinhe (2011, p.298)

An obvious starting point for any analysis of social friction in South Africa is race. ‘Race’ haunts our lives despite the formal end of apartheid in 1994. ‘Race trouble’ naturalizes itself into daily discourse (Durrheim, Mtose & Brown, 2011). Our failure – or resistance – to evolve from, or undo, colonial categories of racialised subjectivity has left us without exit points to make sense of our identities (Maré, 2014). Despite disrupting white political rule, post-1994 life has achieved neither its early romantic notions of racial reconciliation, nor its pragmatic plans of black economic empowerment. Almost three decades later, the inscription of black poverty as a normative condition of black existence reinforces the anti-black ontology of colonialism and apartheid. Khanyile (2019, p.2) offers an apt provocation:

I would like to persuade you to consider the possibility that we, Black and Brown people, living in South Africa today are not living in a post-apartheid society. We are living, instead, in an advanced stage of economic and racial domination that began in 1652 shortly after the arrival of Jan Van Riebeeck in the Cape.

Drawing on the work of Anthony Borges’ theory of how repetitive historical trauma creates catastrophic social, bodily, and psychic wounds, Khanyile (2019) argues that these wounds have warped the identities of Black and Brown³ people in South Africa, rupturing and perverting relationships with each other. Despite a post-1994 discourse of ‘freedom’, he asks, “Why though, do our historical

³ Brown includes South Africans classified as Coloured (mixed race) and of Indian/Eastern/Asian ancestry. Both these ‘Brown’ categories have complex sociohistorical genealogies and are used, contested, (re)constructed, and problematized in multiple ways.

wounds still gape and ache and our scabs itch as if we are still living under the sword of racial domination?" (p.7).

When black citizens gained political power in South Africa through the democratic election of the African National Congress (ANC) in 1994, the 'new' nation-state emerged as a proud symbol of collective black identity and as an opportunity to speak back to- and resist coloniality. With Nelson Mandela as president, his globally iconic status ushered in a discourse of exceptionalism, to distinguish 'us' from 'other' failed post-colonial countries (Matsinhe, 2011). This optimistic feeling of political security shifted our collective gaze outwards, beyond our borders, in search of new threats. Through this paranoid turn, people who threatened the quasi-stability and quasi-freedoms of our promising nation-state were constructed as the new enemy⁴ (see Neocosmos, 2010, for a detailed account of this state-driven discourse of nationalist exclusivism).

Nyamnjoh (2006, p.1) argues that the anxieties of globalisation also catalysed "an obsession with citizenship and belonging and the re-actualization of boundaries through xenophobia". Ironically, the hegemony of whiteness and its invisible economic power meant that the objects of this paranoia became the *obviously visible*: displaced black Africans fleeing Other⁵ countries. As coloniality at work, this anti-black self-hatred reinscribed *die swart gevaar*⁶. Amusan and Mchunu (2017, p.10) note:

Caucasian foreigners are perceived and accepted as 'tourists' and 'investors' who have everything positive to offer South Africa, while African foreigners are perceived and rejected as 'makwerekweres', 'throw-aways' and *personae non gratae*...

Despite Africa's collective wounding from colonialism and warnings from Fanon (1964) and Biko (1978) about the dangers of fragmentation amongst black people, the nervous conditions of 'post' apartheid life favoured paranoia instead of solidarity. The foundational myth of a 'rainbow nation' became a discursive proxy for an emboldened ethno-nationalist identity (Valji, 2003). Symbolic boundary-making became interwoven with social identity. These psychosocial arrangements were iterations of positive ingroup bias and outgroup hostility, seen routinely in the social psychology of intergroup relations. As many African countries struggled to achieve stability, erupting into civil wars, violent tribalism, or financial collapse, thousands of Africans fled their home countries and came into ours, as a matter of survival, to benefit from the opportunities being created by the influx of global capital into the 'new' South Africa. Compared to 49.6 million South Africans, two million migrants were recorded in the 2011 census, most being black African (71.7%), mostly from Zimbabwe and Mozambique, and 4.2% of Asian ethnicity, mostly from Pakistan and Bangladesh (Statistics

⁴ Scholars like Biney (2018) attempt to curb historical amnesia, by writing about the role African countries played in the anti-apartheid struggle.

⁵ I deliberately capitalize Other to signify the *othering* processes in our construction of *other Africans*, i.e., those who are not South African.

⁶ *Die swart gevaar* is an Afrikaans term for 'the black danger' – a phrase used during apartheid to describe racist fears and anxieties felt by white South Africans towards black South Africans.

SA, 2012)⁷. This created a perfect storm: a context wherein historically wounded black South Africans with new psychosocial and political power, encountered a group of wounded Others without such power. Post-1994, Congolese and Nigerian migrants complained that South Africans “make our lives hell” (Morris, 1998, p.1116). A new hierarchy emerged – one which stratified black Africans based on nationality, ironically maintaining an anti-black ontology.

South Africa soon developed the highest rate of anti-immigration bias in the world (Mattes et al., 1999) and during 2003–2012, African nationals were consistently identified as the most undesirable migrants, with Nigerians being most disliked (Gordon, 2015). For these reasons, some scholars theorize South Africa’s brand of xenophobia as Afrophobia (Lamola, 2018), to enunciate the particular prejudice against black Africans⁸ – an easy target for misplaced “pent up anger and frustration” at continued poverty (Wilson & Magam, 2018, p.103).

Afrophobia fuels anti-black prejudice against African migrants as a divisive colonial continuity. Grosfugel (2004, p.325) is instructive here when he argues that “there is no ‘post’ in colonial/racial hierarchies in the world today. Instead, there are cultural and political processes that reproduce a ‘colonial situation’ without the presence of a ‘colonial administration’”. He argues such continuities are “not fundamentally about skin colour but about a location within a colonial relationship” because “social power today is still informed by criteria built over a long colonial history” (Grosfugel, 2004, p.328). Such prejudices by black South Africans against black African nationals reproduce this colonial anti-black ontology, repurposing racist hierarchies from colonialism and apartheid.

Afrophobic myths

A common stereotype is that ‘foreigners steal our jobs’. South African news media fuel these moral panics (Banda & Mawadza, 2015; Moyo & Mpofu, 2020) and are used in electioneering by political parties such as the Patriotic Alliance. However, Chaskalson’s (2017) analysis refutes this Afrophobic myth. Using the 2011 census data, his regression models show that migrants are *creating* jobs at the lower levels (e.g., as cleaners, labourers, factory workers), albeit at tiny percentages. However, as the level of skill or education needed for a job increases, migrants may be preferred in some sectors, such as sales, services, and other professional industries (again, at only between 0.03 – 0.1%). More often, migrants are entrepreneurial.

In a study in Cape Town, Kalitanyi and Visser (2010) found that 82% of 120 African migrants *employ* South Africans in their businesses and transfer entrepreneurial skills to their South African employees. The Global Entrepreneurship Monitor South Africa (GEM SA) 2019/2020 report found that business ownership rates increased from 2.2% in 2017 to a mere 3.5% in 2019, far below the average for other African countries and developing nations. Vandoor

⁷ Updated census statistics were released while this paper was in press. See StatsSA (2023).

⁸ Others have challenged this hypothesis (e.g., Freeman, 2020; Tewolde, 2019) or called for a more nuanced analysis (e.g., Dube, 2018). For the purposes of this article, Afrophobia makes conceptual sense.

and Frank (2016) suggest that “public money may be better spent on building incubators for migrant entrepreneurs than on building border walls”. Unsurprisingly, we rank 119 out of 141 in terms of the quality of our education system, according to the Global Competitiveness Index 2019/2020. The South African 2011 census data also shows that although migrants and locals have similar years of schooling, more migrants have a tertiary education compared to locals (Chaskalson, 2017). Despite these statistics, Afrophobic myths endure, cause mental distress amongst migrants (Thela et al., 2018) and erupt into acts of physical violence.

Inequality, desperation and violence

The gruesome lynching of Mozambican national, Ernesto Alfabeto Nhamuave, symbolizes the atrocities endorsed by Afrophobia, which flared up like raging wildfire in May 2008. Nhamauve was stabbed, beaten, and set alight by South African men in a township called Ramaphosa, in Gauteng province. Over 60 people were killed, including locals, and 100 000 people displaced in two weeks (Hassim, Kope & Worby, 2008). Photographs of “the burning man” stain our collective memory and remove any illusions of exceptionalism propped up by nationalist mythologies. Hopes for an inclusive ‘rainbow’ citizenship – as promised in our progressive Constitution – were all but shattered (Mupotsa & Kreutzfeldt, 2016).

However, violence is often an expression of economic desperation in South Africa, which holds the notorious label of being the most unequal country in the world (UNDP, 2014). Swiftly betrayed by broken political promises, alienated black citizens are understandably frustrated: 49.2% of the country lives in poverty (Statistics SA, 2015), wealth remains firmly racialized and dominated by a white minority (Anwar, 2017), and unemployment is at 42% (Stats SA, 2020a). Afrophobic violence – discursive and physical – can be located within this matrix of colonial continuities that keep most black South Africans stuck in contexts of desperate hopelessness.

This inequality fuels hostile inter-group relations (Mamabolo, 2015) and our crime levels bear testament to this: between April 2019 and March 2020, there were 21 325 reported murders, 18 635 attempted murders, 53 293 sexual offences, 165 494 assaults, 51 825 common robberies, 59 883 cases of shop lifting, 46 921 vehicle robberies, and 205 595 burglaries at people’s homes (SAPS, 2020). With a murder rate of 35.8 per 100 000 population, interpersonal violence also shapes processes of identity formation (Judge, 2018).

In the context of the COVID-19 pandemic, South Africa shed 671 000 jobs (-6,6%) in June 2020 compared with June 2019 (Statistics SA, 2020b). Between the first and second quarter of 2020, the number of employed persons decreased by 2,2 million, causing a 2.3% higher unemployment rate of 42% and a youth unemployment rate of 55% (Statistics SA, 2020b).

Yet, South Africa remains a relatively attractive destination for migrants. Recent reports estimate that 4.8% of South Africa's population are migrants (i.e.,

2.8 million people at a median age of 34) (UNDESA, 2020). The majority of immigrants are male and young adults aged 20–44 (Statistics SA, 2023). Political stability, better socioeconomic opportunities relative to Other African countries, temperate geographic climate, porous borders, and a progressive Constitution and Bill of Rights, epitomizes a country of paradoxes: of poverty and possibility. However, Afrophobia – like coloniality and racism – is discursively resilient and mutated onto social media in 2020 under the hashtag #PutSouthAfricansFirst. This became the tenth most trending phrase by July 2020, with 414 400 mentions across varied social media, according to TalkWalker.com, a private company that tracks social media trends. By comparison, the number one most trending phrase was # COVID19, with 1.3 million mentions (TalkWalker, 2020).

Against this socio-historical background I return to my initial Tweet and the online reaction it generated, as this forms the central pivot of my inquiry. The explicit – even proud – Afrophobia, racism, and echo chamber of rage provoked by my post is an exemplar of the discursive hate that often precedes physical violence. As a point of inquiry, my aim was to explore the discourses informing these utterances and understand their positioning within a context of coloniality.

Methods

Design and data collection

This was a retrospective, quasi-ethnographic, naturalistic observation study of digital discourse on Twitter, a publically accessible social media platform. The dataset was a discussion thread I generated by critiquing the #PutSouthAfricansFirst hashtag. The Tweet had a modest reception. By March 2, 2021, the tweet was seen by 14 485 people and had 771 engagements, including 33 retweets, 71 likes, and 34 replies. At this point, two months later, all engagement had stopped and I formally saved the responses for analysis.

Data analysis

In keeping with a social constructionist epistemological position, I used a critical discourse analysis (CDA) approach to analyse the data. CDA focuses on the “semiotic dimensions of power, injustice, abuse, and political-economic or cultural change in society” and unpacks how language is used to construct particular social realities and inequalities as self-evident, thereby (re)producing relations of power and self/other (re)presentations (Fairclough, Mulderrig & Wodak, 2011, p.357). By focusing on a single discussion thread, it enabled an interactional but contextualised account of how identities and positionalities come to be discursively constructed in emotionally contested online communities (Bouvier, 2015).

Ethics

The ethics of this study is embedded in a range of uneven power dynamics afforded to me by my intersecting positions as participant/observer, researcher, and author. Ethical tensions arose as I made inferences, assumptions, and value-judgments about the data. I imagine that some Twitter users may have reservations about their tweets coming under scrutiny, despite them freely engaging in a public platform whose very purpose is to solicit observation and attention. Given the heated public exchange that took place, my ‘final’ position as author(ity) renders this analysis in need of continuous reflexivity, despite using data in a public domain.

Reflexivity

The choice of focusing in depth on a single Twitter exchange that I had personally started, and I am embedded and implicated in, renders my own identity and politics pertinent. This autoethnographic gaze foregrounds constructions of (my)self and its entangled interactions with others within a socio-historical context. Self-reflexivity, despite its ability to enrich a CDA, is missing in most research on racism and social media (Matamoros-Fernández & Farkas, 2021). I offer some reflections on how others who may not personally know me could potentially have ‘read’ my online identity when engaging with me.

I am a South African cisgender man of historical Indian ancestry (fourth generation, born and raised in South Africa) and would be easily ‘raced’ as Indian based on my full name and picture on Twitter. My profile has a ‘blue tick’, showing others that Twitter has verified me as a real person (this was prior to blue ticks being a purchasable commodity). I had about 5000 ‘followers’. I self-described as a psychologist and researcher living in Durban. People could correctly estimate my age and could position me as middle class based on my profession and related assumptions. One could Google my name if they wanted to know more. My politics are therefore accessible to anyone wanting to engage further. I am not a ‘blank slate’ but my online identity is curated as professional. The option to directly message is available for private dialogue. Against my own background of writing and voicing socio-political commentary in the media for over 15 years, I have developed a ‘thick skin’ for public criticism, and I am not easily incited or triggered by provocative feedback, discerningly choosing the types of public dialogue I consider valuable. However, given the subject matter and the politics of difference across a greatly unequal society, my socio-economic privilege cautioned me to proceed with “methodological humility” (Narayan, 1988, p.37).

Findings

I identify and discuss four intersecting discourses that are embedded in the data: (1) patriotic citizenship, (2) law and order, (3) localised marginalities, and (4) pre-colonial indigeneity. I demonstrate and argue, overall, that these discursive tensions contribute to an emerging meta-discourse of ‘Afrophobic hypernationalism’.

(1) Patriotic citizenship

A dominant response to my critique of #PutSouthAfricansFirst was for respondents to (re)frame the hashtag as nationalistic duty and pride, drawing on a discourse of patriotic citizenship to counter accusations of xenophobia. In this brief exchange, a user called ‘Wisani’ who self-describes as ‘A Patriotic South African and A Humanist’ bemoans the constraints placed on him for expressing his patriotism, supported by Tshepo and Alunamda⁹.

Wisani: You see SAns. Being a patriot in your own Country is illegal. Very Sad!!

Author: Patriotism and xenophobia are two different things.

Wisani: but you people seem to confuse the two words

Tshepo: Patriotism puts citizens first

Alunamda: That is very much clear. Seems like you are the one who had difficulty understanding the two

Wisani’s interpellation of South Africans (“You see SAns”) serves to distance my identity as a South African – despite writing in direct reply to my tweet, he does not address his reply to me, and in his second response refers to me as “you people”. This Othering effect constructs me as outside citizenship, given my perceived lack of patriotism (or, as I later discuss, based on the precarity of Indian identity in South Africa). By discursively revoking my right to speak as a citizen, Wisani uses my Tweet to decry how “being a patriot” is “illegal” – an ironic attempt to reconstruct my criticism as a violation of *his* legal right to freedom of expression. When I point out that patriotism and xenophobia are “two different things” he counters with the exact criticism, that I am confusing “the two words”. Alunamda supports him and Tsepho offers a definition of patriotism that “puts citizens first” – implying that citizens are not currently prioritized. Wisani’s defeatist expression of “Very sad!!” is an affective strategy drawing on a cultural politics of emotion (Ahmed, 2004), accentuating emotional attachments to nationalism. Lefa attempts a similar strategy:

Lefa: Mr.Pillay, you should not be opposing this campaign. You should be a part of it as a patriot. Your sympathies are misplaced

⁹ All tweets have been reposted verbatim, with spelling, formatting, and grammar errors, etc. to preserve the ethnographic element of this investigation. Where some clarity is needed, it is corrected for in parentheses.

By inviting me to join “this campaign” as “a patriot”, Lefa is clarifying the limits of where a patriot’s “sympathies” must lie, by suggesting that my emotional positioning alongside migrants is “misplaced” and therefore unpatriotic. A discursive binary is constructed between sympathetic, supportive patriots (citizens) and unsympathetic, oppositional traitors (non-citizens). Read in isolation, it may appear that Lefa is at least addressing me as a fellow South African, but as I later show, Lefa’s strategy includes a paradoxical mix of racist exclusion and ethno-nationalist inclusion. Defiantly, some people called themselves “proud xenophobes” and made no attempt to reframe their feelings as misunderstood patriotism.

Blizzard: Was watching this documentary on Al Jazeera ryt now about Hungarians they too are tired of immigrants from Germany, Russia etc and nobody calls them xenophobic

Author: Yeah, people rarely see xenophobia, tribalism, racism, etc. for what it is until its too late. Germany, Rwanda, Burundi, Uganda, Cambodia, Myanmar, Kashmiri... The list is endless.

Blizzard: You tell us what it is then. We don't care anymore we are proud xenophobes

Blizzard’s comments are unsurprising and capture the localized iterations of a global phenomenon. Unquestioning patriotism has become a major dividing line in political discourse around the world. For example, there are similarities with the phrase #PutSouthAfricansFirst and #AmericaFirst – the latter being the official foreign policy position of the United States under Donald Trump, and the theme of both his presidential campaign and his inaugural address in 2016. Trump’s use of Twitter as his primary means of public communication is implicated in bolstering his “politics of debasement” (Ott, 2017). Indeed, if the medium *is* the message (McLuhan, 1967), the rise of anti-immigrant propaganda cannot be separated from the immediacy and ubiquity of Twitter. Trump’s explicitly xenophobic and isolationist approach to American nationalism was fuelled by a hyper-instant social media platform that imperialised global political discourse, as more and more countries retreated into itself by reasserting their borders and identities – seen dramatically after the 2016 Brexit vote and the UK’s authoritarian turn (Webber, 2021). A discourse of patriotic citizenship therefore finds fertility in xenophobic utterances and right-wing rhetoric, exemplified by Trump’s ideological peers such as India’s Narendra Modi, Brazil’s Jair Bolsonaro, Slovenia’s Janez Janša, Turkey’s Recep Erdoğan, Russia’s Vladimir Putin, and – as Blizzard implies – Hungary’s Viktor Orbán. Patriotism intersects with and feeds off this swelling language of nationalism (and fascism) desperate for oxygen (Roy, 2020). I refer to this as *hypernationalism*.

One respondent, Kedi, rebuked me for not doing my “research” and posted news headlines to defend this hypernationalism: “British jobs for British workers”; “2021 Budget: We will put Nigerians first, says Gbajabiamila”; “Zimbabwe tops number of arrested foreign nationals in Joburg”; and a picture of a man holding a “Ghanaians first” placard. These articulations draw on a global

anti-migrant discourse, with anti-black particularities in Africa: Nigeria and Ghana oppose migration from neighbouring African countries, and Kedi focuses on Zimbabwean criminals – despite pervasive criminality in South Africa (SAPS, 2020).

(2) Law and order

Tebogo (self-described as ‘Patriot’) constructs patriotism as protecting legal citizens from illegal migrants and frames the #PutSouthAfricansFirst movement as necessary for restoring law and order in the country.

Tebogo: Label each & everyone of us xenophobic. That title no longer scares us or will make us submit. We will no longer allow privileged individuals to talk down or "manage" us & the realities of millions of SAns who realise our country is under invasion. Illegal immigration is a crime.

Author: What's your plan?

Tebogo: Replace the ANC government with a government that has the necessary political will to enforce South Africa's immigration and labour laws. It's really that simple. There is nothing xenophobic with pointing out that these illegal immigrants are in reality economic migrants. Or?

Tebogo's assertion that “Illegal immigration is a crime” foregrounds a discourse of criminality that affects the “realities of millions of [South Africans]”. He writes that if government lacks “political will”, then citizens must “Replace the ANC government”. “It's really that simple” tries to reduce complexity into a single-issue problem, i.e., a weak government unable to implement its own “immigration and labour laws”. Tebogo's frustration at the ruling political party, the African National Congress (ANC), expresses disappointment that social and political power did not translate into economic power for black South Africans (Statistics SA, 2015). The ANC is now at its weakest point since 1994, with only 57.5% of voter share. Widespread corruption, poor policy implementation, and the “moral rot” of the ANC (Gobodo-Madikizela, 2013) has contributed to this. Ironically, Tebogo's “simple” plan to “replace the ANC” ignores his scapegoating of “illegal immigrants” – an easy target for misplaced “pent up anger and frustration” (Wilson & Magam, 2018, p.103). This frustration is felt in Dimpho's short tweet:

Dimpho: South Africa is not a Banana Republic... LAW & ORDER!!!!

Lefa reframes xenophobia as a will to eradicate lawlessness, due to a lackluster government.

Lefa: For the record, #PutSouthAfricaFirst challenges the rampant lawlessness effected by foreigners and allowed by gvt. Is that not a worthy cause? Are we not suffering enough as Africans as a result of terrible African leadership? What you see in this thread is no fluke. Its real

Lefa expresses a politics of pain and suffering by asking “Is that not a worthy cause? Are we not suffering enough...?” by implying that “rampant lawlessness” is a result of foreign criminality and government ineptitude. He adds to Tebogo’s disillusionment with the ANC. The claim that “terrible African leadership” is responsible for the continued suffering of African citizens draws on Fanonian theory that anti-colonial movements morph into post-colonial agents of oppression, having internalized the anti-black logic used by colonial authorities (Fanon, 1964). Lefa went on to post nine news articles, screenshots, and videos of African migrants allegedly involved in illegal activities, including accusations that illegal migrants use fake Identity Documents (IDs) to get low-wage jobs in restaurants. Migrant criminality is propped up by bias-confirming examples of job-stealing Africans, a common Afrophobic stereotype despite counterevidence (Chaskalson, 2017).

Tebogo’s war metaphor (“our country is under invasion”) intersects with fears of losing jobs *and* the nation-state to migrants. Gqola (2008, in Hassim et al., 2008) draws attention to the aggressively patriarchal nature of xenophobia and its intersections with masculinist violence, as expressed here through military discourse. This discursive maneuver serves two functions: it creates an image of an invading enemy trespassing on our national sovereignty, threatening law and order, and it inversely deploys a discourse of foreign criminality as justification for violence to protect the nation-state from these imagined enemies – if we are “under invasion” then violence is permitted under war conditions. This aspect of hypernationalism is fear-based: aggressively driven by nationalist anxieties of losing control (“lawlessness”) and local anxieties of losing material resources like jobs to “economic migrants”. A discourse of law and order helps citizens like Tebogo, Dimpho, and Lefa to gain agency and power over these problems.

Returning to Tebogo’s initial discursive move (“We will no longer allow privileged individuals to talk down or ‘manage’ us”), he strategically excludes me from the “millions of [South Africans]” affected by foreign criminality and rescripts me as an outgroup of “privileged individuals”. The discursive binary of oppressed insiders and privileged others draw a dividing line of class and location to separate those who are perceived to be affected by foreign criminality and those who are not. In so doing, a discourse of law and order intersects with a discourse of localized marginality.

(3) Localised marginality

Some people expressed a position of unique disadvantage and despair constructed as experientially out of reach for people perceived to be unaffected by migrants.

Wisani: I see that many people misunderstand our movement #PutSouthAfricanFirst but its fine. Let us be steadfast and protect our beloved nation [...] stop trying to villify a movement that speaks for the marginalized South African

Wisani demarcates “*our* movement” and “*our* beloved nation” with socio-economic boundaries. A discourse of patriotism intersects with a discourse of localized marginality. In the latter, citizens are included in the logic of hypernationalism as a precarious, *classed* patriotism insofar as they are “*the marginalized South African*”. Like Tebogo’s assertion in the previous section that “privileged individuals” cannot understand the “realities” of the suffering majority, these discursive tactics construct critics – like me – as lacking the moral and epistemic authority to have an opinion about migrants because I am not “marginalized”.

Ekhaya: Tweeting from a point of privilege tends to obscure reality. South Africans are unemployed and state resources are uncertain stretched because of the influx of foreigners, not all can afford medical aide like your privileged self. Keep hiding in your own jail with highwalls

Bra Bob: [Author name], the height of arrogance is trying to discredit a cause simply because it's objectives don't benefit you personally. Illegal immigration doesn't affect you negatively because you live in a gated community, allow those who are affected space to Address it

MaNdosi: Listen we don't care about what you and your views. We are the ones who live with these people not you ! You live behind high walls and probably hire them so you can exploit them. You probably go to malls and not to cbd so just keep your mouth shut !

Several racial, geographic and class divisions inform these tweets, creating a dividing line between those who experience (a particular) “reality” and those who “obscure reality”. Ekhaya dismisses my tweet as rooted in a “point of privilege” that cannot comprehend marginality. Unemployment and poor access to healthcare is blamed on “the influx of foreigners” that stretches “state resources”, drawing on Tebogo’s earlier depictions of a country “under invasion”. This epistemic tension works to exclude universalizing opinions from privileged outsiders. Constraints are placed on the possibilities of who can access knowledge about the material effects that immigration has on the lives of *marginalized* South Africans. The implication here is that “those who are affected” by migrants – via common physical and social spaces – have a grassroots view, perhaps what Narayan (1988, p.31) called “an epistemic privilege of the oppressed” as insiders to a particular experience that I – as a presumed outsider – do not have epistemic access to.

This discourse is accomplished by respondents using the “gated community” as a symbol of middle-class privilege and epistemic disavowal. Drawing on Michel Foucault’s notion of heterotopia as a disturbing space of otherness, a world within a world, Hook and Vrdoljak (2002, p.199) explore and critique the rise in gated communities in post-1994 South Africa as spatio-discursive dualities in which “already powerful class and race divisions are reinscribed in concrete terms, in barred-off roads, unpassable walls, electrified fences, booms and razor-wire”. MaNdosi’s point that “We are the ones who live with these people not you” asserts a geopolitics of proximity embedded in a

raced and classed social (dis)order. These enduring urban spatial divisions reinscribe apartheid-era housing, land, and transport inequities (influencing choices of going to “malls” versus “cbd”/central town) that are intimately linked to socio-economic transformation and safety. These exist in the nexus of crime, violence, fear, and social exclusion that impact urban development (Landman & Schönteich, 2002). Insofar as poverty limits democratic freedoms, Ekhaya describes securitized residential zones as prisons divorced from “reality”, thereby flipping assumptions about a “privileged self” by constructing economic privilege as an ironic curtailment of freedom (a “jail with highwalls”).

Indeed, I do live in a private, suburban complex with electric fencing and 24-hour security guards. I have secure employment and my own car. Bra Bob’s accusation that “illegal immigration doesn’t affect you negatively” is perhaps true. I cannot think of many situations where I have explicitly and personally been disadvantaged because of migrants. My “sympathies” – critiqued earlier by Lefa – are partly routed through positive experiences with refugees in a community psychology partnership and in my job in [organisation] wherein I encounter psychosocial oppression every day, affecting both locals and migrants. Nevertheless, I am on the epistemic margins of migrant communities and poorer South Africans directly affected by such migration, despite my personal, political, and professional attempts at working across and with such differences (Narayan, 1988).

(4) Pre-colonial indigeneity

My name and photo on Twitter ‘race’ me as person of Indian ancestry within the logic of South African racial classification. Several responses to my tweet were explicitly racist and leveraged a discourse of localized marginality to bolster a cruder wave of anti-Indian racism. This was a paradoxical strategy to defend a cause by turning *against* certain citizens. I opt to use the term *pre-colonial indigeneity*¹⁰ to describe this racist discourse, because it is underwritten by a fantasy that romanticizes a return to an original, pre-colonial country inhabited by its indigenous peoples. Although the comments are crudely racist, to frame them entirely *as* racism would be to miss the socio-historical genesis of this prejudice. Several extracts are needed to fully illustrate this point.

One reply came from General Mike. ‘He’¹¹ described himself as a “radical activist” from Midrand, Gauteng province. His profile pictures included a South African flag in the shape of a heart, and a soldier holding a gun. He responded to my Tweet at 11.30pm, a few hours after my original post.

¹⁰ See Neocosmos (2010) for an alternative analysis of how the imagination of citizenship as indigeneity has its historical roots in the apartheid-era migrant labour system, whose dismantling ironically created the conditions for post-apartheid xenophobia.

¹¹ I am making assumptions based on the pseudonym but could be wrong. Likewise, almost all racist comments directed at me came from Twitter users with names and pictures that imply they were black South Africans, but it is impossible to know for sure, but can be reasonably assumed when the thread of replies is looked at in its entirety.

General Mike: Go to hell. Who do you think you are? You should be concentrating on the Christmas curry left overs. We don't expect to be questioned by Koolies in our land¹².

Coolies – correctly spelt – is a racist slur with a history of being used to dehumanize people of Indian ancestry, including the ±152 000 indentured Indians shipped to South Africa in the 1860s by British colonialists (Hughes, 2007; K Pillay, 2017). It is obviously hurtful to be called a coolie – in as much as it goes without saying that using the K-word against black South Africans or the N-word against African Americans would be unacceptable. General Mike's reference to "Christmas curry leftovers" invokes stereotypes about Indian food, and the use of "We" and "our land" asserts the imagined boundaries of inclusion and exclusion within a hypernationalist logic. The fact that "Coolies" were lured into this country to work the land as agricultural labourers, and that land dispossession is a colonial driver of contemporary poverty and existential angst, underscores the affective significance of the phrase "in our land". Others keenly supported him.

Kholwani: Shut up and go back to India you fucking coolie! [...] These coolies are fucking parasites!

Patriotic: Go home chief... South Africa is very xenophobic and if you're uncomfortable with that you can leave but you won't leave because you're enjoying the fruits of South Africa..We can see you're a double agent when it comes to nationality you swing in two different directions" [...] Fake South African

Nelly Ngwenya: You have dropped your brain after you crossed so many seas to come and reside in South Africa. The spices and banana have replaced your brain now you should go back where you came from. As an origin South African I want my country back from aliens. [#WeWantOurCountryBack](#)

These comments foreground the precarity of nationality. Despite most South African Indians being fourth or fifth generation citizens and making up ±2.6% of the national population (1.5 million people), we suffer contested identities, with national loyalties frequently called into question. "Go back to India", "Go home", "You can leave", "Fake South African", and "Go back where you came from" all resist the inclusion of Indians as bona fide citizens with a local heritage and lineage, foregrounding links to colonial India instead. I am constructed as foreign and my critique of xenophobia is interpreted as self-serving, because I am seen as "a double agent" with dual loyalties and the option of living somewhere else.

These politics of place-identity and belonging are rooted in historical separations, tensions, and resentment between black and Indian South Africans (Hughes, 2007). The divide and conquer logic of coloniality deliberately fueled animosity amongst the oppressed majority, with tensions often erupting between Indian and black citizens in KwaZulu-Natal province. Lefa uses Gandhi as an exemplar of these divisions.

¹² This tweet was reported and subsequently removed by Twitter for violating its guidelines.

Lefa: Now here is a man of Indian descent who should swear by the preachings of Mahatma Ghandi, the same Ghandi who fought for Indian rights exclusively & rejected the African as kaffirs (the unholy); Oh my, how history repeats itself in the most obscure of ways? I am lost for words

Author: Why should I swear by Gandhi?

Lefa: Oh, so you don't appreciate the stereotyping you slavishly dish to South Africans who oppose the swamping of their country by illegal immigrants when it is directed at you?

Gandhi, an Indian lawyer and activist, stayed in South Africa between 1893 – 1914 and became a leader for indentured Indians, fighting against racist and colonial laws. However, despite global acclaim, his legacy during British colonialism reveals an ambiguous figure whose anti-black opinions fractured historical relationships between local Indians and local black Africans in then Natal (Desai & Vahed, 2016). Lefa draws upon these conceptions of Gandhi-the-racist in his efforts to homogenize all Indians. Lefa's phrasing that I am stereotyping "*South Africans* who oppose the swamping of *their* country" tries to discursively distance me from citizenship by constructing me as outside the nation-state, a perpetual migrant (K Pillay, 2016).

Historical anger and wounds about unfair access to land, codified in the racist Glen Grey Act of 1894 and the Natives Land Act of 1913, contour contemporary relations between black and Indian South Africans. This discourse, a romanticised desire for pre-colonial life, is therefore linked to the growing impatience around land redistribution, because land ownership is seen as a means of undoing the racialized spatial asymmetries and inequities caused by centuries of property dispossession (United Nations Development Programme, 2014; Neves, 2006). Land is deeply and intimately intertwined with a sense of place, space, and identity, which is further entangled with notions of inclusion/exclusion and insiders/outsideers. A discourse of pre-colonial indigeneity is therefore a primal longing for stolen land, despite its racist articulation.

Towards a discursive model of Afrophobic Hypernationalism

I propose that an emerging meta-discourse of 'Afrophobic Hypernationalism' may help us understand how and why South African citizens express anti-migrant sentiments on social media. These articulations, foremost, be located as manifestations of colonial continuities rooted in a historically divisive anti-black ontology. I summarize the four contributing discourses to this model (see Figure 1).

Figure 1. A discursive model of Afrophobic Hypernationalism

Patriotic citizenship: Here, I demonstrated how people accentuate nationalistic duty and pride to resist or embrace accusations of Afrophobia. Using affective appeals, a binary is constructed between sympathetic patriots and unsympathetic non-citizens. ‘Non-citizens’ may legally be South African, but this discursive strategy is a paradoxical mix of racist exclusion of minorities – like myself – and nationalist inclusion of black citizens, despite the ironic anti-black ontology informing the meta-discourse.

Law and order: Here, I demonstrated how people construct patriotism as protecting legal citizens from illegal immigrants by framing Afrophobia as necessary to eradicate lawlessness and foreign criminality. This aggressive patriarchy intersects with masculinist- and military discourse. A vicious cycle of fear and anger is created: fear of losing control (lawlessness and unemployment) and anger at government’s inability to secure its borders and create jobs.

Localised marginality: Here, I demonstrated how people construct positions of unique disadvantage as experientially out of reach for people perceived to be privileged and unaffected by migrants. Geographic and class boundaries become the dividing line for who has the moral and epistemic authority to have an opinion about migrants and who does not, thereby placing constraints on the possibilities of who can access knowledge about the material effects of migrants.

Pre-colonial indigeneity: Here, I demonstrated how people construct a romanticised desire for pre-colonial life inhabited by indigenous peoples. This is linked to impatience around land redistribution following colonial land dispossession. This includes a paradoxical strategy to defend hypernationalism through racism, by turning against minority citizens who may have access to land, because land ownership is racialized and embedded in spatial asymmetries and inequities.

Each of these discourses intersects with the other as mutually constitutive. Taken together, they form a discursive model that goes beyond straightforward

xenophobia, racism, or ethno-nationalism. It is inherently anti-black and closer in its articulation to colonial-era and apartheid-era discourse. Social media speeds up the dissemination and transmission of this meta-discourse – via hashtags and hyperlinks – faster than ever. As such, I propose we think about this as not only xenophobic but *Afrophobic*, and not only nationalistic but *hypernationalist*.

Concluding remarks

Hassim et al. (2008) wonder whether our rainbow nation metaphor should be replaced by an onion: the outer layer reflecting the most vulnerable strata of society, such as foreign nationals; beneath them other politically peripheral groups; and eventually the innermost, protected core, those deemed ‘worthy’ of psychosocial dominance. In this ethno-nationalist reimagining of what inclusion and belonging looks like in South Africa – as compared to what we hope and mythologize it to be – we are left with an ‘Onion Nation’ that is hardly as romantic or appealing to the project of nation-building, inclusive citizenship, or democratic cosmopolitanism. It is, however, an apt conceptualization of our country. Building on this metaphor, I would add – tragically – that our violent peeling and slicing of this onion leaves many of us in tears. In a context of economic desperation, persistent poverty, and pent-up rage, in the most unequal country in the world, it is perhaps unsurprising that migrants are scapegoated for broken political promises. By hailing an imagined online community with shared anti-migrant sentiments, the proponents of #PutSouthAfricansFirst believe they are advocating a just war to gain a life of dignity and economic emancipation. A truly decolonized nation-state, however, requires us to think far more radically about what it means to live in harmony beyond the binaries of settlers and natives (Mamdani, 2020). As this article has demonstrated, the #PutSouthAfricansFirst movement is embedded in a discursive model of ‘Afrophobic Hypernationalism’ that rearticulates anti-black coloniality and impedes South Africa’s democratic journey towards liberation, freedom, and decoloniality.

Urban “problem neighborhoods” – problems for whom? Marginalized youths’ lived experiences and the *right to the city*

Grete Erckmann

Abstract

On a societal-political level, urban so-called “problem neighborhoods” are a designated problem. Hegemonic discourses about these neighborhoods are mainly characterized by deficient, problematizing and racist positions. Various approaches and interventions have been developed on different levels of society to get rid of the problem of “problem neighborhoods.” The most influential and widespread social policy and urban planning response has been to promote the concept of “social mixing” through the influx of non-racialized, *non-migrantified* middle-class residents into “problem neighborhoods” by making the neighborhoods more attractive to these new residents. The attempt of understanding the problem(s) of “problem neighborhoods,” young people’s lived experiences of inequality, and their collective and individual actions/“behavior” should include two perspectives: On the one hand, the complex perspective of “the society” on these neighborhoods, their inhabitants and their actions, the historical development of these marginalized neighborhoods, the political and urban planning decisions that shape people’s lives today and which is an important frame of reference for all the actions, feelings, plans and self-images of their inhabitants. On the other hand, the perspective of the youth themselves. In their *everyday practices*, they have to refer directly or indirectly to all these social interpretations of themselves, of their actions and to the structural conditions derived from these interpretations. German Critical Psychology (Holzkamp, Markard) as a subjective science in the Marxist tradition provides the analytical category of “generalized vs. restrictive capacity for action” to conceive analytically this double possibility in human activity between adaption to existing conditions and resistance in order to dispose of the conditions. The basic assumption is that people do not only live “under” conditions, but are also able to change and relate to them. In the first section, I present the problems *with* “problem neighborhoods” as they historically have evolved, been created, and exist today in major German cities. In the second section, I use excerpts from ethnographic field notes and biographical interviews from the research project *Living Youth in a migration society: Dealing with social inequality* in the city of Berlin to interpret young people’s perspectives on dealing with problems in their neighborhoods. In the final section, I discuss the significance of (the)

problems for the community and the question of a possible realization of the *right to the city* in Lefebvre's sense.

Keywords

social inequality, urban studies, migration society, youth research, biographical research, ethnographic research

Introduction

The town itself is peculiarly built, so that a person may live in it for years, and go in and out daily without coming into contact with a working-people's quarter or even with workers, that is, so long as he confines himself to his business or to pleasure walks. This arises chiefly from the fact, that by unconscious tacit agreement, as well as with outspoken conscious determination, the working people's quarters are sharply separated from the sections of the city reserved for the middle class; or, if this does not succeed, they are concealed with the cloak of charity. (Engels, 1993 [1845], p. 57).

This quote by Friedrich Engels (1993 [1845]) from "The Great Towns" refers to Manchester in the 19th century, but can easily be applied to most European cities at the time and is still valid today. People living in the city's *middle-class neighborhoods* and *villa districts* live their daily lives largely unaffected by the existence of the poorer population living in these segregated former "working-people's quarters." Their children and young people attend different schools, use different recreational facilities and other amenities of public life. Even if there has been a political will for *social mixing* (Bridge et al., 2012; Lees et al., 2012; Rinn & Wiese, 2020) in Germany since the 1990s with regard to the dimensions of inequality of *race*¹ and class – we will come back to this in more detail –, this is rather a *one-way street*. The neighborhoods of the poorer population are supposed to be made attractive for people with a *middle-class background*, but not the villa neighborhoods for the poorer, *racialized* and *migrantified*² (El-Tayeb, 2016; Mecheril, 1997) population. The designated "problem neighborhoods"³ are the neighborhoods of poorer, marginalized residents, not the

¹ I am using the term *race* italicized because it is at times necessary to address *racism* as a *social mediation in societies*. I am aware of all its horrible connotations, but freezing in speechless impotence in the face of this term, sometimes tempts one to mask contexts, relations and experiences and thus (inadvertently) contribute to the silencing of experiences of *racialized* persons (within European societies). See also: Sarbo, B. (2022). Rassismus und gesellschaftliche Produktionsverhältnisse. Ein materialistischer Rassismusbegriff. In E. R. Mendivil & B. Sarbo (Eds.), *Die Diversität der Ausbeutung. Zur Kritik des herrschenden Antirassismus*. Dietz.

² I use the terms "racialized" (*rassifiziert*) and "migrantified" (*migrantifiziert*) for people who experience racism (regardless of whether they were born in Germany or not) to make clear that it is primarily an *invocation and ascription of identity* and "otherness" by society, which is referred to and dealt with in everyday practice in different ways.

³ In what follows, I will use the term urban "problem neighborhoods" in quotation marks. Firstly, to establish a critical link to the hegemonic (racist and classist) discourse on these neighborhoods, and

villa neighborhoods – accordingly, no government-funded *social mixing projects* are implemented there.

However, the existence of these segregated, formerly “working-class neighborhoods” – which today, in the age of neoliberalism, are often referred to as *marginalized* and urban “*problem neighborhoods*” – comes to the attention of society when certain incidents occur involving their residents. The reactions of the bourgeois press and the staged surprise that these neighborhoods and their inhabitants (still) exist confirm Engels’ aptly formulated statement. For a brief moment, these neighborhoods are in the spotlight. For a brief moment, the voices of people who have worked there for years as social workers, community psychologists, youth workers and the voices of residents are made audible and heard – albeit mostly within the framework of the *hegemonic racist and classist discourse*, while voices outside of this discourse remain largely marginalized. Shortly thereafter, these neighborhoods disappear again from the general societal attention and are forgotten – after some measures were taken that supposedly solve “the problem” once and for all.

One of these *brief moments of societal attention* for the existence of these neighborhoods was the “riots” on New Year’s Eve 2022/2023 in Berlin. A burning tour coach in the immediate vicinity of apartment blocks of one of the so-called urban “problem neighborhoods” in Berlin-Neukölln attracted particular media attention. It was reported that people had to be evacuated from their homes and that police officers and firefighters were attacked by youths when they tried to help – a headline in almost all major mainstream media outlets. “41 injured police officers,” “145 people from 18 nations arrested,” “45 suspects were German, followed by 27 suspects of Afghan nationality and 21 Syrians,” and “355 initiated misdemeanor and criminal proceedings” – these were the figures subsequently published by Berlin police and picked up by the media.⁴ The statement that the arrested persons suspected of committing a crime were predominantly *young, male, and non-German* immediately sparked a heated debate about *integration* and alleged “problem neighborhoods.” These original figures were revised downward significantly by the Berlin police two weeks after the New Year’s Eve on Jan. 16, 2023.⁵ But the initially published figures had already triggered a *fierce media debate* that could not be stopped⁶. A broad media discussion revolved around *youth, youth culture, youth violence, urban “problem*

secondly, to illustrate that there are indeed social and collective problems associated with living and growing up in these neighborhoods, although they may differ from those ascribed from the outside.

⁴ For example: <https://www.berliner-zeitung.de/news/silvester-in-berlin-ueber-100-randalierer-wieder-auf-freiem-fuss-li.303354>

<https://www.sueddeutsche.de/politik/silvesterkrawalle-festgenommene-polizei-weniger-1.5728666> (retrieved November 01, 2023)

⁵ The figures originally published referred to all people arrested for various crimes in the city that night, but not necessarily linked to these so called “riots.” The new figures published on Jan. 16, 2023 were as follows: 102 criminal charges related to attacks against “emergency personnel,” 59 of them against police, 43 against firefighters and rescue services. Criminal complaints were leveraged against 39 suspects. 14 persons had German citizenship, another 10 persons had dual citizenship. See: <https://www.zdf.de/nachrichten/panorama/silvester-boeller-angriffe-berlin-polizei-100.html> - retrieved November 01, 2023

⁶ See: <https://www.deutschlandfunkkultur.de/silvester-krawalle-berlin-fakten-polizei-100.html> - retrieved November 01, 2023

neighborhoods," values of togetherness, and failed urban policies. The main topic in all these discussions was the *failed integration* of *migrantified* (young) people into "German society" and the revival of commonly known *racist resentments*. The discussions thus moved *fundamental questions of togetherness* in a *migration society* (*Migrationsgesellschaft*) to the center of the debates (Broden & Mecheril, 2014a)⁷. The Berlin district of *Neukölln* received special social and media attention in this respect.

Neukölln is traditionally referred to as a *working-class district of the Western part of the city*, i.e. as one of the districts in which Berlin's industry was already concentrated before the Second World War. The *greater district of Neukölln* is one of the most densely populated inner-city areas in Germany. Today, the district boasts a population of 330.284 inhabitants, of which 4.9 % have a so-called *migrant background* (*Migrationshintergrund*)⁸ and 28.0 % are *foreign passport holders*⁹. In 2022, the *unemployment rate* was 9.3% (Berlin average 4.9%). The *at-risk-of-poverty rate* is 29.4% (Berlin average 18.6%). The share of the population receiving benefits from the minimum welfare programs (*Mindestsicherungssysteme*) is 22.3% (Berlin average 15.6 %) – with poor, unemployed people increasingly concentrated in certain *new housing estate neighborhoods* (Amt für Statistik, 2022). As early as the 1930s – as a result of the Great Depression of 1929 – *media coverage of unemployment* shaped *Neukölln's* image in Germany and abroad. In the context of Hitler's seizure of power and during World War II, *Neukölln* became known as a *resistant district* in which the National Socialist German Workers' Party (*Nationalsozialistische Deutsche Arbeiterpartei*; NSDAP) was unable to achieve a breakthrough despite its other electoral successes. *Post-Fordist deindustrialization* and increasing *globalization*, moreover, dissolved traditional local and economic structures, and low-income people and welfare recipients increasingly concentrated in *Neukölln* (and other traditional working-class neighborhoods of the city). With the fall of the Berlin Wall (*Mauerfall*) in 1989, formerly peripheral districts – like parts of the greater district of *Neukölln* – suddenly became attractive as *central, inner-city areas* for both *real estate speculators* and a *new young alternative (former) student scene* moving to Berlin from all over Germany and Europe (Heinen, 2014; Soederberg, 2017). Strong *gentrification* processes have been taking place until today (Döring & Ulbricht, 2016; Holm, 2011). *Real estate speculation* and

⁷ The term "migration society" (*Migrationsgesellschaft*) was shaped in Germany in the 1990s and 2000s and increasingly used to describe the fact that *migration* is an integral part of societal reality. Societal debates relating to the fact of a migration society are accompanied by questions of identity and of which social context is and should be the relevant political-symbolic reference unit (See: Broden & Mecheril, 2014a).

⁸ "A person has a *migrant background* if he or she or at least one parent was not born with German citizenship. Specifically, this definition includes immigrant and non-immigrant foreigners, immigrant and non-immigrant naturalized citizens, (late) Aussiedler (ethnic German repatriates) and the descendants of these groups born as Germans. The displaced persons of the Second World War have a separate status (according to the Federal Displaced Persons Act); therefore, they and their descendants do not count as part of the population with a migrant background." (transl.: G. E.) Statistisches Bundesamt, F. S. O. o. G. (2023). *Definition Migrationshintergrund*.

⁹ Population register statistics Berlin June 30, 2023 (Einwohnerregisterstatistik Berlin 30. Juni 2023), data from the Berlin-Brandenburg Statistics Office (Amt für Statistik Berlin-Brandenburg), retrieved October 30, 2023.

rising rents have led to an influx of people with higher income and education, especially into the district's old neighborhoods (*Altbauviertel*) near the city-center. Low-income and unemployed people, the former residents of these neighborhoods, are more and more displaced out of the city into the new housing estates (*Neubausiedlungen*) of the district, which increasingly receive (media) attention as so-called "problem neighborhoods" with designated societal problems.

After New Year's Eve 2022/2023, one of these *designated problems* was *youth violence*. Accordingly several *summits against youth violence* were convened in Berlin to draft *interventions for the prevention of youth violence* and attended by representatives of non-governmental organizations (*Freie Träger*), youth education centers, politicians and other education experts, as well as selected Berlin youth themselves. The result of the second summit was 29 concrete measures in *four pillars*, in which 90 million euros are to be invested in the years 2023-2024: *first*, in parental work and school social work; *second*, in youth social work; *third*, in strong neighborhoods and venues for youth; and *fourth* in clear consequences for criminal offenses and boundary violations (repressive measures against juvenile delinquency such as better networking between police and youth welfare services and new positions in the youth departments of the public prosecutor's office).¹⁰

The political debate in Germany triggered by the *scandalizing coverage in the mainstream press* as well as the measures taken in the form of these youth summits are reminiscent of Nelida Fuccaro's (2016) conclusion to her analysis of violence and cities in the Middle East:

In short, treating violence as contingent on place and the rhythms of urban life can reveal how the physical, material, and immaterial qualities of the city become enmeshed with various forms of state and social power. At a basic level, it problematizes simplistic binary understandings of the relations between state and society, between rulers and ruled, and between citizens and the government. [...] This reading exposes the interface between urban activism and state repression; between street violence and security regimes; between urban norms and institution building; and between civic identity, nationality, and citizenship (Fuccaro, 2016, p. 11).

It is evident that in this renewed debate in Germany and in the reaction to it (which ties in with existing hegemonic discourses), violence has not been treated as a *problem for society as a whole*, not as a *relationship between conflicting parties*, not as part of the ongoing struggle for the *right to the city*, but has been located exclusively among young people from certain places of residence/neighborhoods and ascribed countries of origin or religious affiliations. *Youth violence* thus became a *problem of "the others"* – and *one of the main*

¹⁰ Concrete measures for the prevention of youth violence for the years 2023 – 2024. Second summit against youth violence at the invitation of the Governing Mayor of Berlin on February 22, 2023 (*Konkrete Maßnahmen zur Prävention von Jugendgewalt für die Jahre 2023 - 2024. Zweiter Gipfel gegen Jugendgewalt auf Einladung der Regierenden Bürgermeisterin von Berlin am 22. Februar 2023*) https://www.berlin.de/rbmskzl/_assets/aktuelles/ergebnispapier-zum-2-gipfel-gegen-jugendgewalt-am-22-februar-2023.pdf?ts=1698053766 (Retrieved October 30, 2023).

problems that needs to be solved by societal intervention to prevent such unrest from recurring. Existing societal problems have been *individualized* (partly psychologized and pathologized) and *depoliticized*. *Political* and *social power*, *urban poverty* and the reference to *everyday state repression*, *gentrification* and *displacement* from inner-city areas have been marginally addressed in this heated debate, but have had no influence on interventions against the diagnosed problem of *youth violence*.

To gain a more comprehensive understanding of the current situation in major German cities and of people living in urban "problem neighborhoods," it is necessary to place the *problem constellations* relating to urban "problem neighborhoods" into the context of *society as a whole* – taking into consideration the *overall societal mediatedness* (*Vermitteltheit*) of *individual existence* (Holzkamp, 1985)¹¹: *Which societal conditions, interventions and hegemonic discourses shape the lives of people growing up in urban "problem neighborhoods"?* *What are the lived experiences of the people themselves?* In the next sections, I will therefore first discuss very briefly *the problem(s) with urban "problem neighborhoods"* as they have historically evolved, been created and exist today in major German cities. It quickly becomes clear that approaches such as *social mixing* and *measures against youth violence* only shift the problems by contributing to the *marginalization*, *othering* and *displacement* of the poorer population from inner cities. In this way, these approaches not only fail to address the problems of the people in urban "problem neighborhoods," but actually exacerbate them. Secondly, after a short introduction to the Critical Psychological approach (Holzkamp, 1985; Markard, 2009) and the methodology of the research biographical-ethnographic project *Living Youth in a migration society: Dealing with social inequality*, I will use excerpts from ethnographic field notes and biographical interviews to interpret *young people's lived experiences of dealing with problems in their neighborhoods*. In the last section, I will discuss the significance of certain *collective ways of dealing with problems* of inhabitants in urban "problem neighborhoods" and the question of a possible realization of the *right to the city* in Lefebvre's sense.

The problem(s) with urban "problem neighborhoods"

According to Henri Lefebvre (2006 [1996]), the emergence of today's *urban problematic* is closely linked to *industrialization* as its trigger. Cities, of course, existed before the onset of industrialization – for example, the oriental city associated with the *Asiatic mode of production*, the antique city associated with

¹¹ However, this overall *societal mediatedness* (*Vermitteltheit*) of individual existence (Holzkamp 1985) can never be fully captured – especially not in this spatially limited paper. In the following, I will only (be able to) to place the emergence of today's urban "problem neighborhoods" in a larger world-historical context in very abbreviated form, focusing primarily on Germany, in particular on the Federal Republic of Germany. My reference points are based on the interconnections and contradictions that the *co-researchers* themselves address or that I myself have come across in the course of my *participant observation* in these urban "problem neighborhoods" in the Western part of the city of Berlin – in line with the research style of *Grounded Theory*.

the *ownership of slaves*, and the medieval city embedded in *feudal relations*. But the imposition of the *capitalist mode of production* and the emergence of an *industrial bourgeoisie* led to a significant concentration of power in the cities. David Harvey (Harvey, 1975, 1985) speaks of an *urbanization of capital*.

In Germany, the period after World War II was characterized by large *migration movements*, predominantly to the cities with their large factories and industrial plants (Brinkmann & Sauer, 2016; Krummacher, 2017; Oltmer et al., 2012). At that time, economies in all regions of the world were managed by “*state-centered regulatory regimes*”¹² (Evans & Sewell Jr, 2013, p. 35). Partly because of the shortage of male workers after the Second World War, *recruitment contracts* concluded in the Federal Republic of Germany (FRG) with Italy, Spain, Portugal and Yugoslavia, and later also Greece and Turkey (Rass, 2012) and in the German Democratic Republic (GDR) with its “brother states” Algeria, Angola, China, Cuba, Mongolia, Mozambique, Poland, Hungary and Vietnam. At that time, there was no *communal integration policy* in either the FRG or the GDR – the focus was on *temporary integration into the labor market*, rather than on a comprehensive social integration concept (Bendel & Borkowski, 2016).

Due to increasing *immigration* and the *many buildings* that had been *destroyed* during the Second World War, the preferred housing model between 1950 and 1970 was the *large housing estate* to create functional, modern living spaces for as many people as possible. During this time emerged the very neighborhoods that today are referred to as “social hotspots” or “problem neighborhoods/districts.” The *suburbanization trend* with *large housing estates*, on the one hand, and *owner-occupied homes in the countryside* on the outskirts of the city, on the other, contributed to the new composition of the population in the inner-city areas – mainly the unemployed, the poor, migrant workers and their families (Rinn, 2016, 2018). However, this planned *functional restructuring of the city* failed due to several factors according to Rinn (2016, 2018): First, it came into conflict with the *crisis of the Fordist social formation* – I will discuss this topic in more detail below – which led to falling tax revenues, rising government spending (e.g. on social transfers and subsidizing shrinking industries) and a crisis of the urban budget. Secondly, at the same time it met with *resistance from local residents*. The planning of peripheral large housing estates was closely related to the *speculative decay of inner-city residential areas* that were to be cleared for demolition. There, neighborhood initiatives organized against clear-cut redevelopment and “resettlement.”

As already indicated, an important turning point for the economy, urban policy, labor market policy and “migration policy” was the *energy and economic crisis in the 1970s* – which turned out to be a *general crisis of capitalism* that was not overcome until the early 1980s. Advanced capitalist economies saw the *decline of heavy industries* – such as coal mining, steel and shipbuilding – and at the same time an *exchange rate system* was introduced in which the price of a

¹² In *capitalist countries*, the economy was based on “free markets” and private property, regulated by Keynesian welfare states. In *real-socialist countries*, the economy almost exclusively took place between state institutions. See also: Evans & Sewell Jr, 2013

country's currency was determined by the relative supply and demand of other currencies, *new electronic trading technologies* emerged, and the reinvestment of the enormous wealth created by high oil prices in Middle Eastern¹³ countries opened new opportunities for financial speculation of all kinds, especially in the "City" of London and on Wall Street – to name just a few of the most important aspects of this *global crisis* (Merten, 2017; Wilson, 1987). Together with stagnant industrial production, these speculative activities made the *financial sector* the leading "industry" in the United States and the United Kingdom until the mid-1980s. "Perhaps the most distinctive mark of the deep capitalist crisis of the 1970s was the phenomenon of 'stagflation', a puzzling and troubling combination of persistently high unemployment and persistently high inflation that seemed immune to the remedies on offer from the then dominant Keynesian economics. The conundrum of stagflation threw the economic policies of the major capitalist states into disarray" (Evans & Sewell Jr, 2013, p. 41). As a result of this *crisis of Fordism*, the *improved productivity of machines* and increasing *globalization*, a process of *deindustrialization* began in the Western industrialized countries. The metropolises changed from *places of industrial production* to *centers of administration and services*. New jobs were created in the *service sector*, but most of them required a high level of education. At the same time, simple jobs with low educational requirements disappeared more and more from urban areas (Merten, 2017; Wilson, 1987).

As a consequence, a *recruitment stop* was imposed in West Germany (FRG) in 1973, which meant the temporary end of legal "non-European" labor migration. The so-called *guest worker regime* was replaced by other forms of migration, mainly *family reunification* and *asylum migration* (Oltmer et al., 2012). "*Guest workers*" who left Germany at this time received severance pay. For those who decided to stay, there was, up to a certain point, the possibility to bring their families. The number of foreign workers initially fell as a result of the recruitment stop, but the total number of immigrants continued to rise (Herbert, 2001).

Marcel Berlinghoff (2012) points out that the *oil price crisis* was a welcome opportunity in Western Germany to finally put long-standing plans for restrictive labor migration policies into action – following the politics of other Western European countries like Switzerland, Sweden, England and later also France. The characteristic feature of "*guest worker employment*" was the *temporary length of stay* of the labor migrants; however, as the volume of labor migration increased, so did the length of stay of people who came to Germany as "guest workers." This led to increased family reunification in the second half of the 1960s, which had an impact on the *housing market* and the *conception of schooling* and raised

¹³ High oil prices in the Middle East and the resulting prosperity, particularly in what is now Saudi Arabia, Qatar and the United Arab Emirates, enabled the development of long-term economic stability in the region. Revenues from oil sales were invested not only in health care, education, housing, and social security for their own populations, but also in infrastructure development such as roads, airports, ports, and telecommunication networks, which attracted foreign investors. Many Middle Eastern countries have established sovereign wealth funds to manage and invest their oil-derived assets. These funds invest in various sectors worldwide, including real estate, equities, bonds, and infrastructure projects. In addition, Middle Eastern countries often provide financial assistance and investment to other countries, particularly in the global south.

questions of *legal and political participation*. The contradictions of the *immigration reality*, on the one hand, and the *discourse on temporary labor migration*, on the other, were soon discussed throughout Europe under the collective term “problem of/with foreign workers,” as were economic aspects of migration and integration and control policies¹⁴ (Berlinghoff, 2012, p. 152 ff.). While “alien employment” was still seen as a guarantor of rising prosperity and the containment of inflation in the 1950s and early 1960s, the infrastructural costs of recruitment came increasingly to the fore as the decade progressed (Berlinghoff, 2012, p. 153).¹⁵

In the advanced capitalist world, the late 1960s and 1970s were simultaneously a time of *cultural and political crisis*. This period was marked by great disillusionment with the status quo. The *youth and student movements* of the late 1960s were critical of the prevailing social order and the bureaucratic state, and they experimented with *new political options and lifestyles* – inspired by socialist, communist, egalitarian, bohemian, and libertarian strains, among others. In addition, a new *environmental awareness* raised doubts about unlimited economic growth as a sociopolitical ideal (Evans & Sewell Jr, 2013, p. 42). The struggles for *rights of and justice for* workers, people with disabilities, women, trans, gays and lesbians shaped this period, as did those of *racialized and migrantified* people – the former “guest workers” and their children (Bojadzije, 2012).

The *understanding of citizenship* in the 20th century was characterized by a major contradiction – on the one hand, the *aggressive demand for assimilation of foreigners* without “German blood” and, on the other hand, the conviction that such *assimilation was de facto impossible* for *racialized* persons because the term “German” itself was extremely racialized (El-Tayeb, 2016). Two strongly polarizing and mutually exclusive positions characterized the migration discourse: Germany is a “multicultural society” vs. Germany “is not a country of immigration” (Brodén & Mecheril, 2014b). In the 1990s, the towns of Hoyerswerda, Rostock-Lichtenhagen, Mölln, Solingen and others became the scene of *the most massive racist (arson) attacks and murders* by neo-Nazis and other right-wing extremist groups/individuals in Germany since the end of the Second World War. The *right to asylum*¹⁶ was restricted in 1993 – many of the regulations passed¹⁷ at that time are still valid today (Nuscheler, 2013). However, the amendment of the Citizenship Act in the year 2000 can be seen as *a symbolic step towards the official recognition of migration in Germany as a fact* (Brodén & Mecheril, 2014b, p. 8) and as a paradigm shift in integration policy. The

¹⁴ The following statement by Max Frisch (*1911 † 1991) has become well-known and is still frequently quoted until today to characterize the “guest worker period”: „*Wir riefen Arbeitskräfte, und es kamen Menschen*” (Max Frisch, 1965) – “We called for workers and people came.” – first mentioned in the preface to the book “*Siamo italiani – Die Italiener*” by Alexander J. Seiler, Zurich: EVZ 1965.

¹⁵ As a result, *cost-benefit calculations* were made throughout Europe to find a quota up to which the employment of foreigners would be economically worthwhile – without any satisfactory results for economic representatives and politicians (Berlinghoff, 2012, p. 153).

¹⁶ In 1949 the *right to political asylum* was enshrined in the *Basic Law* of the FRG and in the *constitution* of the GDR.

¹⁷ For example, the so-called “third country regulation” (Art. 16a para. 2 GG) was passed: People who enter Germany via an EU country or a “safe third country” are not legally entitled to asylum.

principle of descent (ius sanguinis), which until then had been the sole principle, was supplemented by the *principle of place of birth* (ius soli), which made it possible to acquire German citizenship. Naika Foroutan and others (El-Tayeb, 2016; Foroutan, 2016, 2021; Siouti et al., 2022; Yildiz, 2017) characterize Germany's society today as a *postmigrant society*¹⁸. Foroutan (2016, 2021) affirms that *postmigrant* stands for an *analytical perspective* that addresses the conflicts, identity formation processes, and social and political transformations that begin after migration and after *recognition as a migration country*. Questions of *national identity*, *belonging* and *representation* are raised anew, including matters of "national-ethno-cultural (multiple) belonging" (*natio-ethno-kultureller (Mehrfach-) Zugehörigkeit*) of citizens (Mecheril, 2003).

The associated *paradigm shift in integration policies* is reflected particularly in the *integration policy of cities* (Häußermann & Kapphan, 2008). To this day, it is not the state, but the city and the *social space* in the district/neighborhood that is considered the decisive level of action for integration policy (Bundesregierung, 2007). Robert Pütz and Mathias Rodatz (2013) analyze this paradigm shift from the perspective of *governmentality analysis* and place it in a context with superordinate processes of a "neoliberalization of the urban" (Pütz & Rodatz, 2013, p. 166). In the words of Peter Evans and William Sewell, Jr.,

Neoliberalism as theory, ideology, and policy has also had diffuse but powerful effects on the global social imaginary. The neoliberal social imaginary extols entrepreneurship, self-reliance, and sturdy individualism; equates untrammelled pursuit of self-interest and consumer satisfaction with human freedom; glorifies personal wealth; sees volunteerism as the appropriate way to solve social problems; and associates government programs with inefficiency, corruption, and incompetence. The neoliberal social imaginary shapes individual goals and behavior while simultaneously making neoliberal political ideology and policy paradigms seem 'natural' (Evans & Sewell Jr, 2013, p. 37/ 38).

All these aspects are reflected in the *integration policies of cities* and their implementation. According to the analysis by Pütz and Rodatz (2013), the transition from a deficit orientation to a *potential orientation* with regard to migration leads to a *diversity-related district policy* in the sense of *diversity mainstreaming*, which includes the organization of administrative action and questions of political control. The need for political intervention is accordingly derived from the *benefits for the city* (Pütz & Rodatz, 2013, p. 170). In contrast to *hierarchical control* (city administration), political control now takes place *horizontally* with *network-like processes* (urban governance). Civil society and private sector actors are increasingly involved. The strategy relies on *self-*

¹⁸ Paul Mecheril (2014) argues that the term *postmigrant* distances itself from the wrong object. As with *postcolonialism* or *postmodernism*, "post"-constructions have an empirical and a political-normative dimension. The use of the word *postcolonialism* articulates, for example, both the empirically justifiable collapse of individual colonial regimes and the legitimacy of colonialism in general, thus also a critique of colonial-imperial practices of superiority. But German society at present is about the political, cultural and epistemic occupation of the social aspects of migration/migration society, not about overcoming migration.

governance through strategic incentives, e.g., project-based funding of NGOs (Freie Träger), which in turn aim at *activating existing resources* and *self-integration* on the ground (Pütz & Rodatz, 2013, p. 174) – anything else is considered uneconomical (Rose 2000, 96f.). *Integration policy* has become one of the *central tasks of municipal politics* with new models of administrative control: integration management systems with monitoring and evaluation tools. Through *potential orientation* – as a central element of this new understanding in integration policy – municipalities become *moderators* of integration policy measures; they shift their responsibility for the participation opportunities for migrants to civil society. As it is highly *spatially oriented*, civil society and private organizations are strengthened, explicitly including migrant organizations and religious migrant communities, which are seen as having great “potential” for the city. Migrants are no longer seen as a “special burden on the welfare state”; rather, a normalization of the state’s response to migration is taking place (Pütz & Rodatz, 2013, p. 173). In the neoliberal logic of *promoting and demanding*, all people are to be activated, not just migrants. *Diversity* is seen as a *resource of governance* towards the dream of a city „that would almost govern itself“ (Rose, 2000, p. 95). The municipalities strategically link their *integration policy* with neighborhood-related measures and programs for the development of “disadvantaged neighborhoods,” e.g., the federal-state program “Neighborhoods with Special Development Needs – Socially Integrative City,” (Soziale Stadt) launched in 1999. *Activation and awareness strategies* are designed to lead residents of marginalized neighborhoods to successful economic, social, and cultural self-management or self-integration (Pütz & Rodatz, 2013, p. 173) – in line with the idea of an *activating welfare state* (Evans & Sewell Jr, 2013; Lanz, 2009). With its *interdepartmental* and *neighborhood-based steering orientation*, the program has three central components: The *structural* upgrading of the housing stock and the residential environment, the *improvement of social, cultural and educational infrastructures*, and the *image of the neighborhood*.

In this way, *urban poverty* is reinterpreted today as a *problem of disintegration*, concentrated mainly in large housing estates on the outskirts of the city, but also in old housing estates near the city center (Rinn, 2018) – rather than one of *intersectional class relations*, or of a *lack of disposal of the means of production*, or as the result of a continuous *class struggle from above*, nor as a result of continuous *exploitation of the global South* by the global North. According to this line of reasoning, poor people in urban areas would find themselves in a *self-reinforcing downward spiral* (Rinn, 2016, 2018): the outflow of the middle class worsens the quality of life of the “disadvantaged population groups” that remain behind, e.g., by increasing the burden on economic, social and educational infrastructures. These neighborhoods thus become an additional *factor of disadvantage* for the (remaining) people living there. *Socialization deficits*, “welfare dependency” and *spatial-social neglect* would multiply, if the immediate neighborhood lacked those residents who – according to the inherent logic of the argument – represent the norms of *education- and wage-work-oriented “Western” bourgeois lifestyles* and who could also campaign for better living conditions and investments in their neighborhood (Rinn, 2016, 2018).

"Disadvantaged" residents who are problematized because of their class situation, ascribed *origin*, *religion* or *culture* are to be socially integrated (Rinn & Wiese, 2020).

In the hegemonic discourse, the coherent response to *poverty as an integration problem* is to promote *social mixing* (Bridge et al., 2012; Rinn & Wiese, 2020) in neighborhoods with poor populations. The concept of *social mix* has become an important urban planning and policy goal in North America and in many Western European countries. Although specific programs have evolved in different countries' policy contexts, which differ in their historical references, promoting *socially mixed neighborhoods and communities* by attracting *middle-income people to low-income neighborhoods* is at the heart of all these programs (Lees et al., 2012). Political-administrative actors work to direct investment and middle-class residents to those neighborhoods where upgrading and re-composition of the residential population is still desired. "As they currently exist, mixed-income housing policies are largely based on the (hegemonic) mantra that low-income people themselves are the problem, and that a benevolent gentry needs to colonize their home space in order to create the conditions necessary to help the poor 'bootstrap' themselves into a better socioeconomic position" (DeFilippis & Fraser, 2010, p. 136). It is assumed that living conditions for the poor improve when people with higher incomes or from the middle class live nearby (which in turn should reduce urban poverty in general). James DeFilippis and Jim Fraser argue that there is a "fundamental confusion about space and society" (DeFilippis & Fraser, 2010, p. 137) in this reasoning. Recognizing that the *spatial concentration of poverty* can exacerbate the experience of poverty is by no means equivalent to assuming that the spatial concentration of poor people *causes* poverty. It is also considered that middle-class or affluent people do not benefit from proximity to the poor because the poor themselves do not (cannot) contribute to improving conditions in the neighborhood. The reasons for the *marginalization of places* are seen in the characteristics of the (poor) people, while the *upgrading of a marginalized place* is associated with overarching political-economic forces of urbanization – the (poor) people already living there then play no role at all in this explanation. Although *segregation* is an *obstacle to social justice*, it does not necessarily follow that integration (per se) is a solution. According to the authors, it is unclear whether the spatial proximity of rich and poor leads the rich to perceive, to interact and try to understand the poor at all.

Those who live in mixed-income environments do not escape the reality that "communities" are raced, classed, and gendered. These identities have a long history of being made important in larger society and play out in the workings of mixed-income neighborhoods. The criteria that are implemented on a daily basis to distinguish those who have legitimate claims to the "right to the city" (to inhabit and create urban space) usually undercut subsidized renters in obvious ways [...] How can we not expect those practices to bleed into the social relations between proximate residents and their unequal sense of the right to be in place? This is because the key issue remains the unequal power relations involved in people's access to the space – people's ability, in short, to claim a right to be in the place (or, more broadly, a right to the city). For mixing to have a role in

making our cities more just, the people being mixed need to be in proximity on their own terms and those terms need some level of equivalence or comparability. (DeFilippis & Fraser, 2010, p. 144)

The ability to represent one's own needs and desires in shaping *community processes* and *negotiating social norms* is also inextricably linked to the question of *available cultural capital* (Bourdieu, 1986). Thus, in conflict and negotiation processes, some people succeed quickly and skillfully in using and activating resources outside the neighborhood for the interests of the neighborhood and for their own – others less so (DeFilippis & Fraser, 2010, p. 145). Residents with greater *social, economic, and cultural capital* (Bourdieu, 1986) appropriate so-called “disadvantaged” neighborhoods by *generalizing their own norms and requirements*, for example, for togetherness in the neighborhood or using public space. “The ideal of social mixing refers to hegemonic middle-class values of individual achievement, capacity and lifestyle and thereby stabilizes existing power relations” (Huning & Schuster, 2015, p. 741). *The right to the city* in Lefebvre's sense is thus a call, a demand, and it includes a right to connect to inner-city infrastructures, networks, scenes (centrality), to political participation in decision-making, to bringing differences together in relation to each other, and to thinking and developing collectively alternative possibilities and utopias:

The right to the city cannot be conceived of as a simple visiting right or as a return to traditional cities. It can only be formulated as a transformed and renewed right to urban life. It does not matter whether the urban fabric encloses the countryside and what survives of peasant life, as long as the ‘urban,’ place of encounter, priority of use value, inscription in space of a time promoted to the rank of a supreme resource among all resources, find its morphological base and its practico-material realization. (Lefebvre, 2006 [1996], p. 158).

Moritz Rinn (2016, 2018) raises the question whether current general changes in urban policy, such as *new housing programs*, instruments such as the *rent brake*, or approaches to *restrict investments in gentrification areas* indicate a *break with urban neoliberalization* or whether they should even be evaluated as *progressive strategies* towards a *city for all*. He (Rinn, 2016, 2018) analyzes the effects of these new *urban policy re-regulations* since the 1970s, using the city of Hamburg as an example (which I regard as easily transferable to other major German cities). He concludes that there are few potentially progressive changes that can be positively described as *social*. The observed *more social* policies are not in opposition to *entrepreneurial-neoliberal policies*; rather, both share central, historically developed normative-strategic foundations that constitute an “urbanism of inequality” (Rinn, 2018, p. 10). This entrepreneurial-integrated urban development policy works primarily with neighborhood-based, *middle-class-oriented normalization strategies* and a population policy of *social mix*. The political-administrative promise of a *city for all* is thus to be realized primarily through strategies of “bourgeoisification” (Rinn, 2018, p. 10) of urban spaces that drive exclusion and displacement and reinforce social inequalities

instead of counteracting them – even if there is no direct economic displacement pressure in these neighborhoods.

The complex perspective of “society” on these neighborhoods, their inhabitants and their “behavior”/actions, which can only be outlined here as an overview, is an important *frame of reference* for all *actions, feelings, plans* and *self-images* of the young people growing up in those “problem neighborhoods.” In their everyday practices, they have to refer *directly* or *indirectly* to the social interpretations of themselves and their actions, and to the *structural conditions* derived from them. In the following, I will focus on the *lived experiences* of young people living in urban “problem neighborhoods” in the former Western part of Berlin – after giving a brief overview of the Critical Psychological approach (Holzkamp, 1985; Markard, 2009) and the methodology of the research project *Living Youth in a migration society*. Using excerpts from recorded conversations and biographical interviews with (young) residents, I will select a few problems as examples that arise from certain narrated incidents in the neighborhood and reflect on *how people deal with these problems*. In conclusion, I will discuss these findings in the framework of realizing the *right to the city*.

***Living Youth in a migration society* – research project and methodology**

All field note and transcript excerpts interpreted and analyzed in this paper are part of the research project *Living Youth in a migration society: Dealing with social inequality*, a *biographical-ethnographic* research project in the tradition of the *Berlin School of Critical Psychology* (Holzkamp, 1985; Markard, 2009). The claim of Critical Science and thus also of the Marxist subject-scientific approach of Critical Psychology (Holzkamp, 1985; Markard, 2009) is generally that it contributes to *(self-) enlightenment* and thus also to the critique of ideological shapes of thinking in the inhuman system of capitalism. That means we are talking about a unity of *epistemic interest* and *change*. The basic assumption is that individual human existence is mediated by society as a whole: In general, individuals do not only live *under* conditions, but actively produce them and can act on them to change them (in cooperation with others). The concrete individual finds her*self of course not in relation to *society as a whole*, but only to those parts of social reality that are relevant for her* life. Not all these societal fields have to be consciously accessible any time – on the contrary, processes of *becoming aware of one’s own mediatedness* (*Vermitteltheit*) in society take place especially when societal *crises* (financial, environmental, pandemics, wars) occur, which set in motion processes of change and subversion on various levels that (also) concretely affect one’s own life. It follows that individual behavior cannot be derived from the social conditions captured by social theory, but that these *social theoretical analyses* are indispensable because individual behavior can only be understood by taking into account the *social conditions affecting the individual’s life*. Both the *objective determinacy* (by conditions) and *subjective determining* of human existence must be taken into account. Accordingly, both are necessary in order to understand people’s actions, *social theoretical analyses*

of societal conditions – as I have (briefly) undertaken in the first part of this paper – and *subject scientific empirical research* in order to gain an understanding of how these conditions can be interpreted and acted upon – as will be illustrated in the following.

Klaus Holzkamp (1985) establishes *two levels of mediation* between the individual and the society: “position” and “life situation” (*Lebenslage*). While *position* refers to the individual's contribution to social production/reproduction in the overall organization based on the division of labor and the associated possibilities and limits of influencing her* life circumstances, *life situation* is conceived in a much more comprehensive way. It includes the social *position*, but goes substantially beyond it. Holzkamp refers here to *actual real living conditions* of an individual; exemplarily, he mentions love relationships, leisure time, engagement in political parties and associations. However, assuming that the global capitalist mode of production is based on *gendered* and *racialized* relations and that *racist* and *patriarchal ideology* are an integral part of the *global capitalist system*, it is not sufficient to locate *position* only within the framework of an economic relationship of exploitation, as Holzkamp suggests. It is necessary to expand the horizon of *position* to include an *intersectional perspective* (see also: Riegel, 2016). It must be possible to mark and name the *social positions* from which certain experiences can be made and others cannot – at least in relation to *class*, *race*, *gender* and *dis/ability*. As a *subjective science* in the *Marxist tradition*, *Critical Psychology* (Holzkamp, 1985; Markard, 2009) provides the *analytical category* of *generalized vs. restrictive agency* to conceive analytically this *double possibility in human agency* between *adaption to existing conditions* and *resistance* in order to dispose of the conditions. Picking up on this concept, Athanasios Marvakis (1996) speaks of “subjective orientations” for acting/ behavior, feeling, thinking, which can either be rather “conventional” and not question the given, dominant meanings, or “transcendent,” if attempts can be reconstructed in the *subjective orientation* to exceed the hegemonic social orientation meanings (Marvakis, 1996, p. 56).

Methodologically the research project relies on *empirical-reconstructive research methodology* (Strübing & Schnettler, 2004), particularly *ethnography* (Breidenstein et al., 2015) and *biographical research* (Dausien, 2015; Dausien & Kelle, 2009). For the methodological implementation, a method of *triangulation* of *ethnographic field research methods* (LeCompte & Schensul, 2013; Spradley, 2016), *expert interviews* and *biographical-narrative interviews* (Rosenthal, 1995; Rosenthal & Loch, 2002) was used, as well as elements of *autoethnography* (Roth, 2005). The *research style* as well as the analysis of data is based on *Grounded Theory methodology* (Glaser & Strauss, 2017; Strauss & Corbin, 1990) and its advancement into a *Constructing Grounded Theory* (Charmaz, 2014) – complemented by *sequential analysis* (Rosenthal, 1995). The excerpts¹⁹ from *interview transcripts* and *field notes* analyzed in the following sections were obtained from field research in an urban “problem neighborhood” in the city of Berlin.

¹⁹ All excerpts have been translated into English and anonymized.

Dealing with problems in urban "problem neighborhoods"

"But what really unites people here is the process of gentrification. That's mainly what all the people are affected by or have been affected by, and that's why they came here. They've all moved here from different regions of the city because rents have gone up and so on. A lot of them moved here because they can afford to live here, and that's why the rents here have gone up to some extent."

"Here, too, already?"

"Now it's starting here too. Here, for example, you can't get an apartment anymore if you have a Turkish-Arab name and not even if you have a lot of children. There are already big apartments here, but they'd rather rent them to seven to eight students than to a family."

"Really? Here are student shared apartments, too?"

"Yes, yes, by now there are. Everything is changing here. And that's increasing here now, too."

In this transcribed excerpt from an interview conducted during field research in a "problem neighborhood," Anas, a resident, summarizes what currently sets his neighborhood apart and what is the common point of reference for all people actually living in this neighborhood. Most of the current residents had already been displaced from other inner-city neighborhoods, because they could no longer afford the rents. But this *process of displacement* is not yet complete; it is slowly taking hold of this neighborhood as well. If we understand displacement with Rinn and Wiese (2020, p. 24) as a *selective change in the appropriation and use of urban resources* such as *housing, neighborhood infrastructures, or public spaces, social mixing strategies* contribute to the *exclusion of marginalized residents*. This mixture-oriented urban policy, which Anas refers to, actively works on a "loss of place" (Davidson, 2008, p. 2402) and thus on *displacement* for especially *racially problematized residents* (Rinn & Wiese, 2020). Anas is aware that this process has already begun in his neighborhood and that it will bring major changes – which will not make his life or the lives of others who live here any easier. The selection of new tenants is now based on *racial characteristics* – this is the first noticeable step. The move of a *student shared housing community* into one of the large apartments that used to be available to families with many children is just the beginning.

What does this societal framework mean for the everyday practices and lived experiences of young people growing up in their neighborhoods? Taking the examples of *three problem constellations* – the *problem of noisy neighbors*, the *problem of challenging existing social rules* and the *problem of protecting the community from external threats* – I will analyze which values and norms of togetherness in the neighborhood are negotiated in these problem constellations. *Who has which problem and what significance do the problems have?*

The “problem of noisy neighbors”: *Touching values of togetherness*

Leila and I are sitting in the family’s living room. In front of us on the table is a huge bowl of sweets, chips, nuts. We drink tea and eat ice cream. She begins to talk about life in the neighborhood and that there are often police operations, but “that the beauty of living in the neighborhood is that you always hear sounds and noises. It’s never quiet, you always hear people, all the time: children, adults, music.”

I notice that there is a Hollywood swing on the balcony, which is actually too big for the balcony. It fills it completely and is turned inward. When you sit on it, you look into the living room. From the outside you can’t see if someone is sitting on the swing or not. She bought this Hollywood swing for herself, with her own money. She loves sitting on it, studying for her university degree, and listening to the people (sounds) in the neighborhood, she tells me.

For Leila, one of the most important aspects of the *beauty of the neighborhood* is always hearing people. She even has her Hollywood swing set up so that she can *hear*, but not see, what’s going on outside. She herself *cannot be seen from the outside* when she is sitting on the swing studying for her university degree. In this way, she is connected to the neighborhood when she is engaged in an isolated activity such as studying, but without being actively involved.

A staff member of the federal-state program “Socially Integrative City,” (Soziale Stadt), however, frames the “problem of noisy neighbors” quite differently:

And the neighbors complain, who want their peace and quiet because they might be going to work. Our Muslim families are also used to living outside until 11 pm. But when you go to work, you want to have your peace at 9:30 pm at the latest. So there are also arguments among Muslim families because one child is screaming downstairs and the other child is sleeping upstairs. That leads to neighborhood conflicts.

She speaks of *disturbance of the peace and quiet* as the cause of “neighborhood conflict,” which conveys the ideal of a *quiet, conflict-free neighborhood* that is not (yet) being achieved. Three aspects are worth highlighting in the community worker’s statement, which show how the *entrepreneurial-integrated urban development policy* outlined above with *neighborhood-based, middle-class-oriented normalization strategies* and a population policy of *social mix* (Rinn, 2018, p. 10) is reflected in her interpretation of the problem of “noisy neighbors”: *First*, the reference to religion in “our Muslim families” stands out. Although “our” suggests a community to which the community worker counts herself (i.e. not a “parallel society of Muslims”), she nevertheless feels the need to mark “the Muslims” in particular and to portray them as a *closed homogeneous group* with specific needs and cultural practices that is opposed to another group, the *less problematic norm-conforming “non-Muslims.”* She places *these values* of “our Muslim families” *in the context of religious practices* of Islam, without further specifying the role of religion in the context of “disturbing the night’s quiet.” *Second*, she speaks in a *paternalistic way* about the neighborhood in which she

herself does not live, but for which she feels responsible such that she believes she knows the people who live there as "her" people – not personally, but as a *homogeneous group with shared (problematic) values*. She speaks from a position above things in which she herself is not personally involved. She feels obliged to keep order, educate the residents and lead them to a better life – she knows what is good and right for the residents. *Third*, the relationship between *wage work* and the need for quiet after 9:30 pm is striking. Of course, this is very reminiscent of house rules – in Germany, it is customary to sign house rules as part of the rental agreement. The night's rest stipulated in the house rules usually starts at 10 pm – after that, noisy activities are to be refrained from. The "Muslim families" probably regularly exceed this regulation by one hour – this is how it has been reported in the form of complaints to her. A connection is made between *working for wages, having to get up early* – and correspondingly *wanting to rest early* – and *not being Muslim*. Quite apart from the fact that this statement seems somewhat outdated in relation to wage labor in the age of neoliberalism, with lived practices of *shift work, home office*, and increasing *workplace flexibility*, it sets the *working, non-Muslim middle class*, with its ascribed needs for peace and quiet, as *the norm for neighborhood togetherness*. In support of her thesis of the existing problem of noisy neighbors, she cites Muslim neighbors who also feel disturbed by the failure to observe the night's quiet – but not because of wage labor, but because of their children's sleep.

Further insight into residents' lived experiences of "neighborhood conflict," noise, and disruption is provided in the following section from the interview with Leila:

I: Here in the house you know everyone?

L: No, you actually say hello and know each other. People also talk from one balcony to the other. Here is quite a different mentality. I don't want to be racist, but it's different than with Germans. It's simply the case that people greet each other here and ask "how you're doing?" out of politeness, even if you're not interested. Then you just listen for five minutes and you move on. And that's how you get to know each other – or because of the kids, who are annoying because they scream through the halls and then you have to talk to the parents. I don't know, we have a neighbor downstairs, for example, whose child knocked over our clothes rack. I don't know, the kids explained that it was an accident. But I was really angry at the child at first, and then I told my mother, and my mother told their mother. But (she laughs) then I said to my mom, because the boy is actually really nice, he was really polite, and he also apologized. "Why are you tattling on him?" I don't know, we know each other through stories like that. Then I said to the mother: "No, he wasn't that bad, he tripped over the clothes rack". Or neighbors smoke shisha on the doorstep. And that's how you get to know each other a little bit. And then we also sit down on the doorstep, like in Lebanon actually, but still a bit more distanced. Not in a way that you visit each other all the time.

Leila speaks here as an expert for her neighborhood, for *neighborly togetherness*, not only for her own perspective on neighborhood relations. This phrasing "I don't want to be racist, but..." is a common opening into racist statements – from

the part of the *non-migrantified, non-racialized people* towards the *racialized* ones. She herself – contrary to the common practice of this introduction – does not devalue “the Germans,” but uses “the German mentality” to abstract from it the *mentality in her neighborhood*. She assumes that the German mentality, unlike the mentality in her neighborhood, does not require explanation – she is talking to a non-migrantified, non-racialized interlocutor. There is a *common horizon of experience* of the people in the neighborhood to which she refers, a certain bond. It’s about *belonging* and *identity* and about differentiation from “the Germans,” who do things quite differently. A “mentality” is lived that differs from the “German” one, but also from the “Lebanese” one. It is a *hybrid mentality, a hybrid space*, in which influences in the sense of *closeness and distance in neighborly relations*, from *both reference mentalities*, are combined in a new kind of *specific local community mentality*. Not as close as in Lebanon and not as distanced as German neighbor relations.

This very specific *neighbor relationship* described here, is about being *polite*, not sharing your whole life with the neighbors. It’s about *appropriateness* and *negotiating closeness and distance*. Five minutes of listening is *appropriate* to be considered *polite*. In this example of a concrete conflict about the clothes rack between neighbors, the *violation of politeness* as an *order of interaction* is resolved with *politeness* – with a polite apology and forgiveness. It is about *loyalty* and *trust*. A high value is to be able to trust each other, to be loyal and not to snitch. Moreover, this small example shows that the conflict is dealt with *collectively* and not individually. There are *parallel communication channels* – between the mothers, between her and the kids – with different meeting points and complex overlays. Relationships are established through these kinds of conflicts between neighbors. They are occasions to get to know each other – at a specific distance.

The problem of challenging existing social rules: *The negotiation of norms of togetherness*

Leila recounts the following incident she observed from her apartment:

I was here once and was eating (*in her family’s second floor apartment with windows and balcony overlooking the small neighborhood shopping center*) when we heard noises from outside. It was young people and these young people met two other people. And then a lot of them joined in and they were talking and then they were arguing. And then they were really arguing. And started hitting each other and stuff. And my German neighbor who recently moved in was really funny, started yelling out the window “No, I saw that” and so on, and “I’m going to report that” and the woman downstairs was also given a slap and then she screamed “Can someone help me? Can someone help me?” – “Yeah yeah, I’ll help you. I’m going to report this.” And then I went to her and said to her, “If you want to live here for a long time, close your mouth before the young people here break also into your apartment. Because they’ve all seen you.” Because she is so crazy, screams out of the window and when she so obviously says that she will

help her, I thought to myself that she is putting herself in danger. Then she thanked me a thousand times "Thank you, thank you".

I: But what kind of people are they? Younger people?

L: I don't know. A couple. They are together, maybe married, a man and a woman and two cats, and I had to laugh, I thought it was funny that she dares to say, "Yes, I will report it" in front of them.

[...]

I: I'm still a bit hung up on this story with the woman.

L: It's not about the fact that she's a woman, it's more about the fact that she's just sticking up for the enemy of the one, that she wants to support the woman downstairs and thus makes enemies. Because the police are simply not welcome. Anything that has to do with accusations, they prefer to sort out among themselves. And when the police came, their parents also came and settled the matter with these people who were here. Then they probably settled the matter among themselves and the charges were withdrawn.

In this narrated incident, too, everything starts with *noises* coming from outside, from other residents of the neighborhood – which, in contrast to the community worker's perception of the neighborhood conflict, are not problematized per se, but are the *reason for wanting to understand what is going on* – and possibly intervene, feel responsible. These noises are the starting point for *opening different channels of communication and interaction* and for *collective solutions*, which in this example leads to a new concrete interaction between newly arrived non-racialized German neighbors. Leila gets to know these new neighbors a little better through this incident with other neighbors on the street outside her window. In the narrated incident itself, there is the *mode of watching* and the *mode of hitting*. Violence needs legitimacy. There is something that happens *rightfully*, and if one does not know who is *in the right*, it is better not to interfere. To interfere means to *hit* or to *be hit*, to put oneself in *danger*. The neighbor follows her *German-bourgeois understanding of order* in accordance with her socialization, and interprets the situation she observes as one that requires her *moral courage*. She does not know that the *conflict parties* know each other, that in her new neighborhood everyone knows everyone (from a distance), that there are *strict rules of social interaction*, ways of *resolving conflicts*, and that many people who are not visible at first glance are ultimately involved in this conflict, can intervene at any time and are standing by in the background. She doesn't know that it is a *collective way of conflict resolution* that is lived here, where values like *loyalty, trust, no snitching to the police* are lived. Things are resolved independently, in a way that is legitimized by the community. In this way, the parents of the young people are involved and the police are relieved of their "duty." The statement "the police are simply not welcome" is a *collectively shared tacit comprehension*, which can be interpreted as an indication of a *collective horizon of experience* with police interventions to the detriment of the residents of the neighborhood.

Rida's biographical narrative also picks up on these *strict social rules of togetherness* in his neighborhood – from a different context:

I never sold to older people because the older people here buy from the core folks, because it's also like, if someone sells here, you can't just go to the same place and sell there. You see? Otherwise there will be a fight. So, for nothing, and in the end, they'll also say, "You're not in the right because he was there before you.", you know? Nobody will stand on your back, that's why. But there are places, for example the Moon Shadow Path, where there are also many people who sell, but there is no one who is dangerous, you know? There are people here who are dangerous. So, what does "dangerous" mean? You are not afraid of them, but it is better not to get into trouble with them, you know?

Similar to Leila, Rida speaks as an expert who knows his neighborhood well, the places, spaces, social rules and keeps an eye on them – in terms of selling drugs. He shares his inside knowledge: There are rules set by the people *who first appropriated the space* about who is allowed to sell drugs in this place and who not. He himself is not one of those who have taken a fixed place, he tries to find his niche without getting into trouble with others. There is the *right of the first* and *of the elder*. The one who comes first sets the rules and permits others to sell drugs in this certain space. The first one is always *in the right* and is supported by all others in enforcing his right. Those who come later or are younger have to be subordinate. There are "dangerous" people who have appropriated spaces and "non-dangerous" ones, which means that they either grant others, new and younger people, the right to sell drugs in "their" spaces, or that they do not immediately and violently enforce their right when others sell there; they tolerate others. It is a *tense* situation when new people try to sell drugs in the same places. It can be very dangerous for the person to try to disregard the rights of the first and eldest.

The problem of threats to the community

L: Yes, that is also something positive about this area. It's like the kids can usually play outside. But for example, there were two boys riding their bikes and then somehow two men tried to take both boys away. That was recently. That was so blatant, I was there in my exam period, studying. And they really tried to take the boys by force. And they managed to take one and not the other.

I: To pull him into a car or how?

L: Just to take him with them. I don't know. I didn't see that. Because there was a lot of hullabaloo. I've never seen the neighborhood like that. That was so blatant, how everybody got up and ran around. It was really so intense. It was like there was a war going on. But the people, I saw them stick together when it came to something like that. And then they called the police. A man had kind of beaten up the boy. Somehow, that's what happened. Supposedly the man said that the kids had been ringing his doorbell, playing pranks, and that's why he wanted to slap him or beat him somehow, he and his wife. But then they caught them and confronted them. Then they took the boy to the hospital.

I: But you were here?

L: I was here at home and then my mother came. No, she called me, that's how it was, and then she came. And I was just studying for an exam. Because I had no

time left and I was completely cut off from everybody and I had to study all the time, I wasn't out at all. And then I noticed it and I thought, "Oh my God, what's going on?" and then I looked out the window and all these people were walking around. I didn't notice it at first because the windows were closed. Then I heard people yelling and saying, "The son of such and such," I don't know. That's when I asked what happened. "A boy was kidnapped"

I: Did you ask out the window?

L: Yes, right. Then I went down for a minute. Then they told me the same thing. There were people everywhere, and it was really strange. Because all the people gathered here, where the boy was kidnapped. They were all there right away. You have to imagine that. I was like, "Oh my God, what is this?" Everybody was asking, looking, I don't know. This is an area where you can rely on others. For example, if you walked by here and somebody was hitting you, they wouldn't just watch. But if you were an enemy, they wouldn't just watch either, you know? Then they would all hit you, too.

In this incident, again the different *channels of communication and interaction* between neighbors immediately become evident – the people on the street, the mother, she herself is asking people in the street. There are *rumors*, everyone knows approximately what happened, but no details, few have observed what happened, but *everyone is involved*. This concerns everyone, everyone is leaving everything and helps where and how they can. A child is being snatched from the community, and that is not a legitimate act. Order is disturbed, a "war" breaks out. It is an attack on the *entirety of the community*, on the *safety* of all children and all families in the neighborhood. The problem is a *collective* and *supra-individual* one. Many people, beyond the core family, are involved, many feel affected. A *common space* is created by *affects*, which does not stop at closed windows and apartment doors. The police are called and come because the usual framework of sorting things out themselves and within the neighborhood is exceeded. Anyone who helps is now welcome – but the police are not more important than anyone else. They are one of many actors trying to find the boy and restore order.

Rida reports another threat to his neighborhood, the presence of junkies and alcoholics:

I told you earlier that there's no heroin here, there's no cocaine here, because they chase these people away. They don't want that. It's also official because these people want the pot business to burst here. And when they sell heroin here, there are heroin junkies walking around. You have to imagine that there used to be heroin junkies everywhere, but now when you look at the main square and so on, you don't see so many alcoholics and heroin junkies hanging around. They chased them all away. You're starting to see heroin junkies here on the forest path, you know? And they chase the dealers away, too. The pushers know, "It's too hot here, we have to go somewhere else," and the junkies are where the dealers are. The pusher is not where the junkies are. With pot it's something else, here you have your place. Everybody knows that this is your place, nobody comes in there. People know they can only buy weed from you. Everything is chill. Everything is serious. You know what I mean? But if there's some junkies walking around and you meet junkies, you know somebody's selling heroin here.

(...)

In this flower meadow park, Afghans used to go at night and sell heroin, and after a week they noticed, and then there was a big brawl. Everybody had stabbing injuries. And now you don't see them anymore. That's just the way it is.

In the neighborhood there are *strict rules*, not only who is allowed to sell in which place, but also which drugs are allowed to be sold in general. Space is appropriated according to *strategic interests*. There are people who *chase away* and there are people who *control*. The spaces overlap, where different interests are negotiated. There is a rule that says junkies and alcoholics are not wanted in the neighborhood, and as junkies are following the heroin pusher, selling heroin is not allowed in the neighborhood. Only the sale of marijuana is allowed for certain people in certain places. The neighborhood should remain free of junkies and alcoholics, and children should be able to play outside safely and unmolested. There is the *serious* drug trade in a fixed place, which everyone knows, and the *unserious* drug trade, which is associated with neglect, with junkies and alcoholics. The *neighborhood as a collective* uncompromisingly distances itself from the latter. Nevertheless, if there are attempts from outside, from other groups and contexts, to undermine this rule, for example at night in the park, the presence of the junkies betrays the presence of the dealers. The dealers are expelled with the use of physical force with knives - and remain with stabbing injuries.

Conclusion

The *first part* of this paper provided a brief overview of the problem(s) with urban "problem neighborhoods" as they have evolved and been created *historically* and how they exist in major German cities today, in order to show the main *societal conditions*, *interventions* and hegemonic *discourses* that shape the lives of people who grow up in so-called urban "problem neighborhoods." In their *everyday practice*, they have to refer directly or indirectly to *social interpretations* of themselves and their actions as well as to the structural conditions derived from them. Hegemonic *urban planning approaches* that are currently being practiced in major German cities, such as *social mixing*, only shift the problems by contributing to the *marginalization*, *othering* and *displacement* of the poorer population from inner cities.

In the *second part*, the focus was on the *lived experiences* of the people themselves. The transcript excerpts of interviews and field notes interpreted were collected during field research as part of the research project "*Living Youth in a migration society*" in an urban "problem neighborhood" in the city of Berlin, Germany.

In summary, this neighborhood is still at the very beginning of *social mixing*. There are strict *social rules of togetherness* in the neighborhood, that protect people and keep dangers away (e.g. junkies, alcoholics, and child abductors). However, the rules differ from the rules of togetherness of people

from the *non-racialized middle class*. The newly arrived middle class residents (students, a couple) are in the minority and are introduced to the rules of the community by the long-term inhabitants, also to grant protection and freedom from danger for them. The *middle-class values* of quiet, compliance with house rules, appropriate use of public space have so far been represented by the community workers, not (yet) by the newly arrived middle-class residents themselves. What is opposed here are two *sets of rules* that operate according to different modes. On the one hand, there are *house rules*, general ideas of an *ideal quiet and conflict-free neighborhood*, rules designed to prevent people from having to negotiate their own needs, so that problems, disputes or conflicts do not arise in the first place. It's about rules that protect *individual peace and privacy*. On the other hand, there is the *lived practice of dispute and reconciliation*, of boundary violations, defense, (physical) violence and demands for being committed to values of *loyalty, politeness and trust* in neighborly relations and in the community. Through problems, conflicts and disputes, people get to know each other; *neighborly togetherness* is lively, noisy and "beautiful," and offers the feeling of being connected and the feeling of *individual security* through seeing and hearing others. It's about rules that ensure *the security and peace of the community*.

What is the purpose of the problems in this urban "problem neighborhood"? There is a *common subject/theme*, which keeps people busy, problems are productive, they are solved collectively. Patterns are interrupted. It is not only about the solution, but also about new acquaintances that are made, *values* that are renegotiated and tested for their validity, through *collective problem solving* with *different channels of communication and interaction*. New members of the community are introduced to the community through the *collective problem-solving process* and thus learn the values and social rules.

Can this lived community of collectivity and support be understood as an attempt to realize *the right to the city* in Lefebvre's sense? On the one hand, without a doubt, urban space is appropriated and used according to the community's own rules. A strategy to use, shape and *inhabit* the neighborhood is realized. Central to Lefebvre's theory (Lefebvre, 2016) is the distinction between *habiter*, which means -in the sense of *vita activa*- the way of living and *habitat*, the residential area, the urban housing program. Urban life involves both. It provides living space (*habitat*) and enables the inhabitants to inhabit it (*habiter*). In this tension, according to Lefebvre, lies the potential for *urban revolution*. As described in the first sections of this paper, the neighborhood is a *large housing estate* that should oppose urban order – along with single-family homes. Lefebvre argued that the *capitalist city* houses its inhabitants in sterile, meaningless spaces, to monitor them, order their lives, and constantly reinforce their roles as *workers* and *consumers*. The findings of this research in a concrete urban "problem neighborhood" counteract this. Even if large housing estates are designed to realize *habitat* instead of *habiter*, people succeeded to realize *habiter*, *vita activa*, a community life, which means *security for the community*, for each individual, for children and families. In the words of Marvakis (1996), "transcended orientations" can be identified because attempts can be

reconstructed in subjective orientations that *transcend* hegemonic *social orientation meanings*.

On the other hand, a mode of use seems to be emerging that does not mean freedom for all, but is based on a *strongly collectively defended and enforced consensus* – if necessary with strong physical and verbal violence. Challenging and breaking these social rules means *danger* for the person or the group. It is the *right of the first* and the *eldest* which is realized. Some of these people who hold these positions of power are “dangerous,” others less so. But in any case, there are *hierarchical structures*. There are people who provide protection, who defend, who chase others, who are empowered to enforce the norm. It is a *hierarchical form of space use*, where a few allow the others to use the space. *Togetherness in the neighborhood* is permeated by structures and power relations that require a certain amount of insider knowledge in order to find one’s way around, but which also offer *protection* from external threats. Problems are solved within the neighborhood according to *its own rules*, which serves not only to *strengthen togetherness*, but also to *reproduce existing power relations in the neighborhood*. Above all, this *collectivity* is strongly *patriarchal*. The *pressure from the neighborhood* preserves *existing gender relations*²⁰, which is an important topic for feminists in Turkey for example (Somersan, 2011). Already these short transcript excerpts show differences in the *appropriation of spaces* by “men” and “women.” The spaces outside the blocks of apartments tend to have a *male connotation*, while the spaces inside the apartments are mostly *feminine*. Also, the *symbolic spaces of courtesy*, of *everyday social interaction* between neighbors, tend to have a more *female connotation*.

If we return to the “riots” on New Year’s Eve described in the introduction, it becomes clear that there is a lot of *frustration, anger* and *dissatisfaction*. *Racism*, poor chances in the (legal) *labor market*, *gentrification*, *discrimination* from growing up in these urban “problem neighborhoods,” social stigmatization – to name only some – are the sources. The strong *social isolation* of young people growing up in these neighborhoods during the *Coronavirus pandemic* in recent years is also relevant in this context. Most families did not have sufficient financial and spatial resources to provide (all) their children with several separate, quiet and undisturbed, technically equipped *homeschooling workspaces*, which resulted in many students dropping out of school and further education. This has exacerbated the already high level of social exclusion. There are societal problems that affect the life of the people growing up in these “problem neighborhoods” that cannot be solved within their own community.

It becomes clear that the problem is not *poverty* per se, but the *social isolation* (Merten, 2017; Wilson, 1987) that accompanies it. It is this *social isolation as a collective* into which people are pushed and into which they have to go, far away from the villa districts and the purely bourgeois old town. Every family, every individual has to find a way to cope in the world inside and outside

²⁰ The negotiation of *gender relations*, the *doing gender* in neighborhood relationships in so-called urban “problem neighborhoods,” can only be briefly touched on here, because it was not the focus of this paper. It is certainly worth an *in-depth analysis* with further excerpts from the research data material – in the framework of an additional stand-alone paper or a comparable publication.

the neighborhood. *Education* is not seen by many as a realistic possibility for social advancement, which would be a way to stay connected to "the outside world." Leila is certainly an exception here. Drawing welfare or selling drugs thus become alternatives for making a living. Spatial isolation creates *social isolation*. In addition, there is the increasing external threat of *state-sponsored gentrification* and *racial discrimination in the housing market* through the imposition of concepts such as *social mixing* at various levels. These cannot be combatted through physical violence and people living in urban "problem neighborhoods" today are not protected by the means available to them.

In all of these problem constellations, *normality* is being struggled with. How many people should live in one apartment? How many children should a family have? Who is responsible for the safety, the care and education of the children? The police? The community? When does someone have the ability to choose where they live and when do they not have that choice? When is someone considered "integrated"? Integrated into what? What is to be learned? What should people from urban "problem neighborhoods" learn and from whom? It is about the whole, about fundamental questions of our *migration society*. But as long as summits against youth violence and concepts such as *social mixing* remain the response to the frustration and rage that were taken to the streets on New Year's Eve 2022/2023, as long as people are talked *about* and not talked *to*, powerlessness, social isolation and the realization of protection needs in strictly hierarchical segregated structures maintained with violence remain a realistic possibility for action.

Grete Erckmann is community psychologist, youth social worker and PhD student at University of Vienna, Department of Education (Bildungswissenschaft). Her biographical-ethnographic doctoral research project is about the lived experiences and the dealing with social inequality (class, race, gender) of young people growing up in so-called urban "problem neighborhoods" in the context of the German migration society. Currently she is completing her dissertation. In recent years, she has been a visiting scholar at several universities

in Palestine/Israel. She has earned her Diploma (equiv. to B. Sc. & M. Sc.) at Technical University Berlin and studied Critical Psychology at Freie University Berlin, Germany. She was a member of the organizing committee of the Summer School Critical Psychology for many years. Email: grete.erckmann@gmail.com

How are the Kurds problematized and addressed by psychology theses in Turkey? A thematic analysis

Ümit Eser, Aydın Bayad, Kenan Alparslan & Ercan Şen¹

Abstract

The Kurdish issue and the representation of the Kurds have generally remained a relatively neglected topic among Turkish psychologists. We have recently demonstrated that a common lack of interest is closely related to the political atmosphere of the country. Despite this general neglect, there are a few researchers who have been interested in the Kurdish question recently. In this article, we investigate the language and discourse of these studies – one way or another – related to the Kurds in order to reveal the knowledge-power production relations in Turkish psychology. To this aim, we subjected psychology theses on Kurds, written between 2000 and 2019 to thematic analysis and examined how psychology deals with and defines the Kurds. As a result of the preliminary analyses, we have found that the distribution of theses is quantitatively concentrated in the social change period called the ‘Peace Process’ in Turkey (i.e., 2009-2015) with a diversity of topics, methods, and content. Thus, we selected a total of 32 theses; three of which correspond to the period before the Peace Process, fifteen correspond to the period of the Peace Process and fourteen correspond to the period after the Peace Process for the thematic analysis. The results show that the Kurds are mainly discussed within the meta-themes of “Kurdish Issue” and “Defining Kurdishness”, respectively. The Kurdish Issue consists of *State Oppression/Tyranny*, *Turkish-Kurdish Relations*, *the Kurdish question/problem*, and *Conflict & Violence* themes, respectively. On the other hand, Defining Kurdishness consists of *the Kurds*, *the Ignored*, *the Ethnocultural Minority* and *the Subordinate Group* themes, respectively. In this paper, we delve into a more elaborate picture of the results with examples from emerging themes and the transformation of these themes during the changing political atmosphere. We also address the relationship between authority/state and knowledge/academia in light of the hegemonic discourse of Turkishness in the Turkish Republic.

Keywords

Turkey, psychology thesis, the Kurds, the Kurdish issue, thematic analysis

¹ We have no conflict of interest to disclose.

The Kurds are recognized as the world's most populous 'stateless nation' with an estimated population of 25-30 million concentrated in the region along the borders of Turkey, Iraq, Iran, and Syria (see, MacDonald, 2012). Although their problems and goals differ in almost every issue from the alphabet they use to citizenship rights, from political representation to social struggles due to their political life in separate nation-states, Kurds have been one of the subjects of significant political and social tensions in the Middle East since World War I. This situation has resulted in the Kurds being at odds with the nation-states they are residing in throughout the 20th century. Scattered within the borders of four different countries, most of the Kurds live in areas within Turkey's borders. And Turkey differs from the other nation-states not only because it hosts this large Kurdish population, but also, its persistence in armed struggle against Kurdish movements. Especially with the emergence of the PKK (*Partiya Karkerên Kurdistan*), there was a serious increase in the securitization policies against the Kurds, many Kurdish settlements were evacuated in the 1990s and hundreds of thousands of people were forced to migrate (Gürses, 2018; A. Yılmaz, 2014). As of this day, it is estimated that more than 40 thousand people have been killed by paramilitary groups or in clashes between the Turkish armed forces and the PKK during this period of conflict (Işık, 2021). As a matter of fact, this conflict corresponds to a process defined by official authorities as a 'low-intensity war' and a political solution has yet to be implemented (Çiçek, 2018; Gürses, 2018; Kurban et al., 2008; Yılmaz, 2014).

Behind this heavy losses of life and property comes the Kurdish issue, one of Turkey's ethno-political problems which is as old as the modern republic (Yeğen, 1999). Due to the perception of homogeneous identity in Turkish nationalization, the Kurdish language was banned along with many other minority languages throughout the 20th century, Kurds were subjected to forced migration within the country and their political representation was tried to be obstructed with practices such as electoral threshold (Yeğen, 2013). This situation has been reflected in inter-ethnic relations as well; othering, exclusion, violence, and mass lynching attempts have been exercised towards the Kurds (Bora, 2021; KONDA, 2011; Şen, 2017). Although there have been state interventions against the severe human rights violations and systematic violence, these were improvements that completely ignored the ethno-political aspect of the issue and approached the problem with the assumption of 'regional underdevelopment', inevitably making the problem even more complex. In this sense, the Kurdish issue, which has been subjected to suppression and cover-up policies throughout the history of the Turkish republic, is a multi-layered social problem, and continues to be the most vexed issue of the Republic of Turkey. Although there has been a relative *détente* in the state's Kurdish policy since the 2000s, a new spiral of violence has been emerged with the failure of peace talks in Oslo between the PKK and state officials, and pressure on the Kurds' political and social rights have continued to increase with the coup attempt in 2016 (Ercan, 2013; Yılmaz, 2016).

Despite the burning nature of the Kurdish issue and its constant occupation of the country's agenda, academic studies on the Kurds are still limited (Scalbert-

Yücel & Ray, 2006). Undoubtedly, Turkish academics' close relationship with the founding doctrine of the republic (i.e., Kemalism), in which it has developed and flourished, has played a crucial role in this lack of interest. This close relationship between the founding doctrine of the republic and Turkish academics have also affected scientific approach to events, facts and problems to ensure that the academics are interested in certain questions and problems while they are not interested in seeing and hearing other ones (Ünlü, 2018). Therefore, the current situation of Kurds in academic studies is problematic (Çevik, 2019) and the space they occupy in psychology studies is also very limited as psychologists also prefer to ignore the Kurdish issue (Göregenli, 2010). In a systematic research we conducted recently, we have found that the indifference in psychology theses written between 2000-2019 is closely related to the political atmosphere; nonetheless, there are a limited number of graduate theses about Kurds written in different periods (Bayad et al., 2022). In another study, through texts written by leading figures in psychology throughout the 20th century, we scrutinized that Turkey's psychology community's lack of interest towards the Kurds is not actually something new, rather it was closely related to the modernization efforts of the Ottoman Empire, which was the predecessor of the Republic of Turkey, and it originates from a kind of 'domestic colonialism' (Bayad & Şen, 2023).

Despite the limitations of available studies, with the paradigm shift in Turkey in the 2000s (Aytürk, 2015), there has been an increase in academic interest in the Kurds even though it was a few. Examining these existing studies - by going beyond historical neglect- could help us to understand how the Kurds are reflected in psychology as a modern science and its academy as a community (see, Duncan et al., 2001). Although scientific practices are legitimized through claims of independence, scientific knowledge production is ultimately a sum of discursive practices as well, just like politics since scientists are also part of the broader society (Brown & Malone, 2004). Thus, the available studies in psychology, one of the areas where socio-political disinterest towards Kurds in Turkey is well hidden, are still of great importance to guide subsequent studies in terms of showing what language and discourse the academic community uses and revealing the transformation of knowledge-power relationship operating in the background of scientific practices (Vergin, 1999). Following this rationale, we aim to show how the studies about the Kurds on a scientific level problematize the Kurds, and how they represent them. For this purpose, in this article we discuss the relationship between authority and knowledge production in Turkey by revealing how the Kurds are problematized and represented in postgraduate theses written in the field of psychology via thematic analysis.

Knowledge-Power Relationship in Turkey and the Kurds

The relationship between knowledge and power forms the basis of post-structuralist thought (Gordon, 1980). According to this school of thought, the power to determine right and wrong is inherent in knowledge, especially modern

scientific knowledge, and it is an illusion that scientists are detached from it (see, Olympian Detachment, Reicher, 2001). It has been demonstrated through studies conducted in different contexts and times in the field of psychology, as in other areas of social sciences that scientific knowledge is a power in itself which is closely related to political authorities and ideologies (Bhatia, 2018; Duncan et al., 2001; Foucault, 2006). The focus of these studies is how political ideologies and authorities dominate scientific production in order to achieve their goals (i.e., via scientific institutions, via research and texts produced by scientists). Because political powers - mainly modern nation-states - need knowledge and people who produce knowledge to strengthen and legitimize their authority and position (Arslan, 1999). Within this context, throughout the 19th and 20th centuries, when nation-states began to take their place on the historical stage, they did not hesitate to use scientific institutions and communities – especially universities - in their current form to build a certain ‘national culture’, to train elites who would take part in the state administration and to protect the existing status quo (Duman, 2018). However, the academic community (hereafter, *academia*) producing and distributing scientific and artistic activities became on the hand an indispensably supportive or legitimizing milieu for nation-states, and on the other hand, it was also able to function as a space to question the legitimacy under the question and challenge the authority. Therefore, academia, which gained legitimacy with the support and approval of nation-states, quickly became the focus of social and political opposition (Vergin, 1999). Hereupon, governments felt the urge to keep universities under control and surveillance either openly or implicitly as a protective measure against academia’s resistance tendency and the threat it posed to their governance (Vergin, 1999). Despite the fact that the control and surveillance mechanisms of the state are more implicit and complex in liberal democracies with relatively independent and integrated academia, in anti-democratic countries where the basic motive is to protect the current political authority, such regulatory mechanisms can be more obvious and direct.

In this sense, the very introduction of modern science or scientific knowledge in Turkey with the modernization process is directly related to the nation-state formation, that is the strengthening of central political power (Dölen, 2010). For example, according to some researchers, the founders of modern science in Turkey are not scientists but bureaucrat intellectuals (see, Arslan, 1999; Duman, 2018). The symbiotic relationship between universities and the state in Turkey continued after the establishment of the republic and political powers were able to directly intervene in the university by purging many scientists at various intervals (Günel, 2013). Hence, Duman (2018) states that the ‘Turkish’ academics, seen as a ‘republican intellectual’ during the establishment phase of the nation-state, was assigned by the political power with the mission of ‘enlightening’ the people. According to him, Turkish intellectuals tried to establish ideological, philosophical, and historical foundations for the modernization project with the emergence of the republic and played an active role in social engineering conveyed by the republic. For example, historian Kılıç (2016) shows how psychological knowledge was instrumentalized for republican modernization via intelligence tests through its institutional history during this

period. On the other hand, Maksudyan (2005) documents how scientific racism has gained ground and developed in Turkey through anthropological academic writings.

Looking from this general perspective, it would not be wrong to say that the researchers who were punished most severely by the authorities were those who studied on the Kurds or the Kurdish issue. For example, İsmail Beşikçi was not only expelled from his position at the university and Turkish academia for his seminal work suggesting that ethnicity, as an analytical category, is a determining factor in social life but he also faced juristic trial many times and paid a heavy price by being kept in prison for many years (Ünlü & Değer, 2011; van Bruinessen, 2011). Apart from this individual case, after the petition campaign² calling for a cessation of military operations against the Kurdish movement in south-eastern Turkey in 2016 and a return to a peace negotiations, hundreds of academics were expelled from universities and were faced a ‘civil death’ (Gencel-Bek, 2018; Özgür, 2022). Another recent example is the case of Güllistan Yarkın, who completed her sociology doctorate in the USA in 2017 with her study on Turkish-Kurdish relations but her doctoral equivalence validity in Turkish universities was rejected on the grounds that some concepts and expressions used in her thesis ‘could constitute a crime’ (Yarkın, 2022). As can be understood from these examples, political power’s intervention in scientific knowledge can be much more direct and harsher in Turkey, especially when it comes to Kurds and the Kurdish issue (Scalbert-Yücel & Ray, 2006). But where does this intolerance towards scientific activities about the Kurds come from?

Kurds of Turkey as an ‘Issue’

Although there are many different ethnic and cultural groups in Turkey, the Kurds, constituting the largest group after the Turks, are the biggest minority despite the fact that their political and cultural rights were not recognized (Çevik, 2019). However, there is no consensus on the number of the Kurdish population living in Turkey since ethnic affiliation has not been asked in population censuses since the 1960s (Aslan et al., 2015). Nevertheless, according to studies based on representative sampling techniques, the Kurds make up about 19% of the society (KONDA, 2022). Despite having such a large population, the Kurds along with other ethnic and religious groups were either ignored or overlooked by the unitarian political structure of the newly established republic and its nationalist and authoritarian ideology, Kemalism (Aktürk, 2015; Yeğen, 2013). In fact, the newly established state was registered as a unitary state, the citizenship definition was restructured as "Turkish", and Turkish was determined

² The petition campaign initiated by a group of academics in 2016 is known to the public as the ‘Academics for Peace’ case because it aimed to return to the Peace Process that ended in 2015 and to stop the military operations that were ongoing at that time. When the campaign was signed by over 2000 academics and attracted attention in national and international public, signatories faced reactions from President Erdoğan himself. Subsequently, many signatories were subjected to administrative and judicial investigations and punished in various ways (see, <https://afp.hypotheses.org/>; <https://barisicinakademisyenler.net/English>).

as the official language with the 1924 Constitution. In 1925 with the Law on the Maintenance of Order (*Takrir-i Sükûn Kanunu*) tens of thousands of Kurds who rebelled under Sheikh Said's leadership were killed and thousands were exiled to the west of Turkey. In 1934 with the Settlement Law (*İskân Kanunu*) a new assimilation policy was implemented through collective and compulsory resettlement for non-Turkish minorities. Subsequently, with the Provincial Administration Law in 1949 (*İl İdaresi Kanunu*) Kurdish place names were Turkified. With another law in 1972 speaking and reading in Kurdish and giving Kurdish names to children was banned (McDowall, 2004; van Bruinessen, 1992). The state of siege, which was declared for all of Turkey after the military coup in 1980, was changed into a state of emergency (i.e., OHAL) in 1987 only for the Kurdish dominated cities. The state of emergency which lasted for 15 years left behind evacuated villages, millions of displaced people, and still unsolved unidentified murders (Işık, 2021; Kurban et al., 2008).

Due to understanding of the nation and definition of citizenship in Turkey - founded on Turkishness- the systematic assimilation practices exemplified above, the pressure and ignorance towards groups, continued to increase in the following years, even if the political powers have changed (Bozarslan, 2008; Üstel, 2004). Even though Turkey's citizenship regime, putting Turkish identity at the centre of national identity and ignoring ethnocultural differences, is a problem for many groups, it would not be wrong to say that the greatest discontent and reaction came from the Kurds. Because of the construction and domination of the Turkish national identity, the regime's intervention or restrictions on the places, lifestyles, culture, and language of the Kurds caused objections and from time to time various conflicts (van Bruinessen, 1992). However, the social destruction caused by the 1980 military coup, the violence it created, and the torture exercised in the Diyarbakır prison resulted in massification, regionalization, and armament of the Kurdish political movement, which until then consisted only of student movements or local uprisings, marks the beginning of the longest armed conflicts in the history of the republic (Gürses, 2018). On the other hand, the long-standing military and political conflict has resulted in social tension and polarization between the Turkish and Kurdish ethnic groups, the impact of which is still ongoing (Bilgiç et al., 2014; Bora, 2021; KONDA, 2011; Şen, 2017).

This problem, which mostly the Kurds are exposed to but concerns the whole society in Turkey, still remains on the agenda of the country with various denominations by different segments such as “the Kurdish Problem”, “the South-eastern Problem”, “the Terror Problem”, “the Economic Underdevelopment Problem”, “the Democracy Problem”, “the Turkish Problem”. On the other hand, Yeğen (1999, 2013) showed that the Turkish state also defines the Kurdish issue with the technical and bureaucratic terms like “reactionism”, “tribal resistance”, “banditry”, “foreign provocation” and “regional underdevelopment” that as if it does not require a social change by excluding ethnopolitical scope of the problem. This dominant discourse represented by the state denies the connection of the issue with Kurds or their cultural and political rights and also prevents a possible interaction between the Kurdish political movement and the Turkish

society. Therefore, it can be said that one of the main reasons for the academia's lack of interest in the Kurdish issue is that the state imposes a security-oriented approach by 'terrorizing' the matter. However, there is a direct relationship between the emergence of this problem and Turkey's modernization adventure spreading over the last two hundred years of social history and consisting of major social processes such as centralization, nationalization, and secularization (Yeğen, 2007, 2013). As a matter of fact, 'Kurdish issue' is a grand problem that cannot be reduced only to Kurds, Turks or activists working on this issue. This problem corresponds to the largest social segment in the society since it covers the two most populous ethnic groups of the society, the Turks and the Kurds (Mutlu, 1996; Zeyneloğlu et al., 2011), to the state-citizen relationship, which functions as the building block of the society due to Turkey's unitarian nation-state ideology (Aktürk, 2015) and furthermore considering the military operations and expenditures since the republic's history, it is among one of Turkey's costliest social problems (Khalid & Habimana, 2021). This social problem, which has such a sociological scope and historical depth, has undoubtedly attracted the attention of researchers from many disciplines from sociology to political sciences, from history to geography, from literature to art and has been the subject of many scholarly works until today (e.g., Beşikçi, 1969; Cemal, 2003; Hassanpour, 2005; Jwaideh, 2014; Şen, 2019; van Bruinessen, 1992; Yeğen, 2006; Zeki, 2014). However, academia of psychology, that claims to have a universal and non-ideological approach prefers to keep a conscious distance towards the Kurdish issue and stay silent to this problem despite having a relatively long history in Turkey (Avcı, 2015; Bayad et al., 2022; Göregenli, 2010).

Academia of Psychology and the Kurds

Although its history in Turkey dates back quite a long time, the introduction and development of modern psychology into Turkey have always remained in the shadow of political authority (Batur, 2003; Bayad & Şen, 2023). For example, McKinney (1960) states that despite being modern, early started psychology education in Turkey was not able to fully develop because of the authoritarian education system. Because, republican modernization preferred to discipline all universities as well as psychology departments with a top-down fashion in line with Turkish History Thesis³ and from early on silenced dissenting voices like Muzaffer Şerif Başoğlu who had explicitly anti-fascist ideas (Batur, 2012). Moreover, psychology was used as a disciplinary tool for the education reforms of the era rather than dealing with social problems (Kılıç, 2016).

³ According to the Turkish History Thesis formed in the early 1930s under the leadership of a series of Turkish intellectuals and politicians, the cradle of civilization is Central Asia. And Turks migrated to various regions of the world carrying civilization to places they went, leading the formation of the world civilization (Sivrioğlu, 2015).

While agricultural policies implemented in line with the Marshall Plan⁴ along with the country's largest enclosure movement in the 1960s, dissolved traditional Kurdish lifestyle and caused mass migration waves towards city centres and western provinces (McDowall, 2004) which brought the first public encounter with Kurds in the west of the country (Natali, 2009). Although the social and cultural change was a research topic in psychology departments during this period (see, Turhan, 1964), these studies generally aimed at disciplining groups that were not Turkish, urban and modern with an assimilationist perspective in line with republican reforms (Bayad & Şen, 2023). On the other hand, albeit rare, social psychology studies were conducted on the Kurds during this very period (see, Başaran, 1969). These were studies that completely ignored the ethno-political aspect of the issue and evaluated the matter from the perspective of regional "underdevelopment and isolation" (Yeğen, 2006). Similarly, after the military memorandum in the 1970s, the lack of institutionalization and social organization to meet the changing social structure led a constantly growing economic crisis and political polarization that turned into blood feuds across country (Natali, 2009). However, throughout this process, social psychologists preferred to work mainly on family and culture models that 'constitute an obstacle' for the modernization process (see, Kağıtçıbaşı, 1973).

While during 1980s, on one hand state universities were brought under the state control through The Council of Higher Education (YÖK) which was established after the military coup, on the other hand the state paved the way for popularization of private universities by allocating public lands and funds to foundations (Aslan, 2014; Birlir, 2012). The reflection of this structural change in psychology manifests itself with the instrumentalization of academic psychology (Namer et al., 2015). The instrumentalization of academic psychology can also be seen through the increase in the number of private universities and students. As a matter of fact, the study conducted by Er and Duman (2001) clearly presents this situation. According to this study, by end of the 1990s the number of students enrolled in psychology departments increased by 6-7 times compared to the 1980s (Er & Duman, 2001). According to Gülerce (2006) the spread of consumer behaviours as well as individualistic capitalist values in society during these years transformed applied psychology into a manipulative power and engaged it in pop culture. On the other hand, psychologists, who had been content with -just- observing modernization until then, concentrated on raising 'good citizens' by focusing on child-rearing practices and mother literacy with the support of the government and society at the time. But interest in actual social problems was very limited during this period due to politics shaped by military dictatorship, neoliberal economic policies and YÖK's supervision of universities. Especially social problems like intensifying war, displacement, or disappearances in custody especially in

⁴ The Marshall Plan which Turkey joined following its NATO membership brought along a large mechanization movement targeting agricultural activities. For example, even in the first period covering 1948-1956 both agricultural motor vehicles and the amount of cultivatable land increased incredibly (Özer, 2014). According to Tekeli (2008), agricultural mechanization, not only by creating new landless peasants but also by subjecting rural life to structural transformation, has explanatory power for the large-scale migration from village to city.

regions where Kurds densely live, did not attract the attention of the academia of psychology.

The Justice and Development Party -AKP- (*Adalet ve Kalkınma Partisi*) government, which has a different political tradition from the founding elites of the republic, started the 21st century with various reforms and ended the state of emergency in 2002, which had been in force in the cities where the Kurds live since 1987. At the same time, with the influence of the liberal political atmosphere provided by European Union membership negotiations, the AKP government started ‘the initiative movement’ known as the Peace Process⁵ in public. This process aimed at confronting the official paradigm based on denial and rejection towards minorities, especially the Kurds, to initiate a social peace with these groups. These developments, which reached their peak with declaration of Peace Process, positively reflected not only on the lives of the Kurds (Çiçek, 2018) but also on the field studies conducted on the Kurdish issue that led a growth in knowledge production under the lead of non-governmental organizations (Scalbert-Yücel & Ray, 2006). Similarly, awareness about social problems also increased within the academia of psychology. For example, during this period critical psychology studies started (Batur & Aslıtürk, 2006), the Association of Psychologists for Social Solidarity (TODAP) - prioritizing social problems - was established (Kayaoğlu & Batur, 2013) and criticism about silence on the Kurdish issue has risen (Göregenli, 2010). Nevertheless, the AKP government’s return to policies within the framework of the state security brought along an authoritarian understanding and distanced Turkey from the EU harmonization process (see, Sertdemir Özdemir & Özyürek, 2019; Yılmaz, 2016). And re-emergence of state violence in the Kurdish regions suppressed both social and academic life again more than ever.

As it can be seen from this brief historical evaluation, the tendency seen in a large part of the Turkish academia has also manifested itself among psychology researchers and the academia, that is, they have preferred to close their eyes to certain problems and questions. This implicit agreement that prevented the production of information about ethnic and religious minorities such as the Kurds, Greeks and Armenians as well as their role in social life (Ünlü, 2018), caused limited academic production about groups outside the official identity (Çevik, 2019). This limitation decreased relatively during the Peace Process and psychological knowledge production was also affected by preference and discourse changing according to the periodic policies of the political authorities (Bayad et al., 2022). However, it has not yet been examined how studies, conducted at certain intervals and in limited numbers on this issue that have been suppressed for so long, problematized and represented the Kurds. For the future of social sciences and the disciplinary self-reflection, it is of utmost importance to reveal how knowledge production in the country in question was affected after long authoritarian regimes (see, Bhatia, 2018; Duncan et al., 2001). Due to the

⁵ It is the official proceedings and negotiation process carried out between 2009-2015 to end the long-standing military conflict between the Republic of Turkey and the PKK. Different definitions for the same period such as *the Solution Process*, *the Kurdish Initiative*, *the Democratic Initiative* are also used by the public (Çiçek 2018).

fact that the Peace Process implemented in Turkey caused relative academic freedom -at least on the Kurdish issue- between two different repressive periods, this might allow us to understand to what extent different political authorities influence scientific knowledge production. That is why in this study, we examine theses written about the Kurds as a reflection of the academia of psychology following the political authorities. The main purpose of examining these theses is that they are controlled, and their frameworks are drawn by university administrations and academic advisors as executives or subjects of political authorities in the academia. Scientific theses are important in a sense that they show which subjects are popular or which subjects stand out and they reflect the academic understanding of the discipline, that is, what knowledge is produced in the relevant discipline, which functions it fulfils and what knowledge is preferred to be produced (Finlay et al., 2012; Sevinç, 2013).

Method

In this study, we subjected 32 psychology theses, which we previously obtained in a descriptive analysis covering the years 2000-2019 (Bayad et al., 2022), to thematic analysis (Braun & Clarke, 2006). Thematic analysis is a qualitative method frequently used to take into account the intertextual political and historical context while mapping out prominent subjects or themes in a given literature or field (Clarke et al., 2015; Shukla et al., 2019).

The texts analysed here were included in the dataset from the Higher Education Council National Thesis Centre (YÖKTEZ)⁶ database by examining the titles, abstracts, or contents of 3952 theses registered in the psychology department. We chose those directly or indirectly refer to the Kurds in their sample, research question or problem for the thematic analysis (see, Bayad et al., 2022). Despite the fact that about half of the theses in the dataset was written in the social psychology departments, research on the Kurds is also coming from the sub-fields of clinical, developmental or general psychology. This disproportion across the sub-fields shows that the Kurds have been mainly a subject of social psychology research through identity and recognition dimensions, as it is a politicized issue, rather than other psychological processes. However, instead of a specific examination of the role or influence of sub-fields in this study, we tried to reach an overarching discourse that represents or spreads across all psychology studies. The main purpose of choosing this method is to show whether these studies on Kurds, written in different times, universities, and sub-fields of psychology, have a pattern that goes beyond the theoretical and methodological preferences, stylistic and linguistic features of the texts which covers the general knowledge production of psychology in Turkey. We also aim to reveal the relationship of such pattern with the political authority during social transformation processes, namely Peace Process.

⁶ YÖKTEZ is an open-access electronic database for postgraduate theses within the framework of the provisions of Article 40 of the Higher Education Law No. 2547 aiming to contribute to science and support scientific research and activities.

Analytical Strategy

We started the thematic analysis by (1) examining the dataset consisting of theses according to the six-stage analysis process proposed by Braun and Clarke (2006). In the first stage, we noticed that during the Peace Process the distribution of theses over time diversified both numerically and in terms of content of the subjects, so we divided the dataset into three groups: *before* the Peace Process (BPP, 2002-2010), *during* the Peace Process (DPP, 2011-2015) and *after* the Peace Process (APP, 2016-2019). Although this periodic classification is not representative, it corresponds to both the paradigm shift and social transformations in the historical trajectory summarized above. For example, BPP is the period when the Kemalist paradigm of the republic is still in power, DPP is the period when founding paradigm begins to wear out and social opposition strengthens, and APP is the period when a new authoritarian paradigm is consolidated (see, Aytürk, 2015; Çiçek, 2018). In the second stage of the analysis, the first author performed the initial coding that lasted until a saturation was achieved. (2) At this stage, instead of focusing on the whole dataset we selected a total of 13 theses: two representing theses written in BPP, five representing theses written in DPP and six representing those written in APP. Again, instead of focusing on the theses entirely, the *introduction* section, where general information is given for the purpose of the research, the *historical background* section, where references are given to historical issues related to the Kurds, the *literature review* section, where the research problem is conceptualized and associated to sampling, and finally, the *method* section, where participant/sampling information is presented were subjected to inductive coding through the Atlas.Ti program. At this stage, we generated 23 codes. Although the material to be analysed was determined by pre-selection and certain parts of texts were prioritized in order to limit the scope of initial coding, selected thesis and sections were examined thoroughly during the initial coding. For instance, all the passages referring the concept the Kurd(s) were carefully assessed by focusing on how the authors problematize Kurds. However, as we continue, we realized that a certain ‘Kurdishness’ was also defined in the theses alongside the problematization. Thus, we included the notion how Kurds were represented as a secondary focus in the analysis. (3) As a result of the discussions carried out with other authors, obtained initial codes were categorized to reach out the first code system consisting of two meta-themes, nine themes and 15 sub-themes. (4) Then, the authors, who did not take part in the initial coding, coded the remaining 20 theses based on the first code system according to the deductive coding principle. However, new codes and themes were also suggested at this stage, though in small numbers. (5) Finally, after all the authors got to know the material and learned the code system, a total of 27 codes - with the additions during stage four - were placed in the final code system consisting of 16 *sub-themes*, 8 *themes*, and 2 *meta-themes* as a result of final discussion and consensus. In addition, at this stage we applied cross-tabulation to the code system based on years and the periodization determined in the first stage of analysis in order to make periodic comparisons. (6) In the final stage, after the

general evaluation where all authors participated, the final forms of concepts and wording used in the code system were determined, and the thematic analysis was completed by selecting quotations for reporting (see, Table 1).

Analysis & Results

The Kurds are mostly discussed in the meta-themes '*the Kurdish Issue*' and '*Defining Kurdishness*' in the psychology theses. While acquired themes in the first meta-theme correspond to historical, social, and political dimensions of the Kurdish issue, themes in the second meta-theme can be seen as an effort to define the Kurds as a group correspond to dominant positions in psychology literature. Furthermore, the distribution of the repetition of themes (i.e., frequency) calculated from the number of coded segments (i.e., quotations) over years and periodisation also shows that both the dimensions of the Kurdish issue and the positionings in defining the Kurds have changed over time. Below, we explain and exemplify themes along with quotations from relevant psychology theses by prioritizing those with high-frequency. This choice does not mean that low-frequency themes are unimportant. However, we give priority to comprehensive themes so that we can show in which issues the Kurds are mainly represented in psychology theses.

1. The Kurdish Issue

In psychology theses, the Kurds, though sometimes going beyond, are generally discussed with their geographical, social, and political presence in Turkey. This situation, when discussing the Kurds, brings about the highlighting of various problems associated with them rather than dealing with them just as a population. Although the Kurds are mostly presented as the victims of these problems, the 'problems' surrounding the claims of social and political rights of the Kurds are discussed in a context that highlight the negative influence on them and sometimes even goes far beyond them. Therefore, the meta-theme of '*the Kurdish Issue*' refers to the problematizations, of which the Kurds are sometimes subjects and sometimes objects, and that are applied for justification of the research question and design in psychology theses. However, the 'problems' associated with the Kurds in psychology theses have a very wide variety covering historical, sociological, and political domains since what is considered as a problem (or not) varies according to the time when the theses were written and the ideological position of the authors. That is why, while naming this meta-theme, we preferred to use the word *issue* that goes beyond their current problems and the numerical volume of the Kurdish population (see, Yeğen, 2007).

Table 1. The themes show the problematization and representation forms of the Kurds in psychology theses and their frequencies according to the Peace Process periodization.

Meta-theme	Theme	Sub-theme	BPP	DPP	APP	Total
The Kurdish Issue	State Oppression / Tyranny		1	91	39	131
		Assimilation / Denial	1	36	17	54
		Against Kurdish civilians		40	13	53
		Towards Kurdish politics		15	9	24
	Turkish-Kurdish Relations		1	60	39	100
		Nationalism and Polarization	1	14	8	23
		Intergroup relations		10	18	28
		Discrimination & Othering		36	13	49
	Kurdish Question / Problem			48	17	65
		Defining the Kurdish quest.		21	7	28
		Peace- Solution- Initiative Pro.		27	10	37
	Conflict & Violence		5	32	21	58
		Deprivations		19	13	32
		Forced migration	5	13	8	26
Sub-total						354
Defining Kurdishness	The Kurdish		2	60	41	103
	The Ignored		2	17	43	62
	The Ethnocultural Minority		11	26	32	69
		Ethnic minority	7	22	31	60
		Cultural Minority	4	4	1	9
	The Subordinate Group		3	10	23	36
		Disadvantaged Group	2	5	11	18
		Social Identity	1	5	12	18
Sub-total						270
Total						624

Note: BPP refers to Before the Peace Process (2002-2010), DPP refers to During the Peace Process (2011-2015) and APP refers to After the Peace Process (2016-2019).

This meta-theme was formed from the *State Oppression / Tyranny*, *Turkish-Kurdish Relations*, *Kurdish Question / Problem* and *Conflict & Violence* themes respectively (see, Table 1). All of these ‘reasons’, used for the presentation research problem in the theses, are generally utilized strategically depending to the purpose of the research rather than forming a consistent wholeness or continuity across the dataset. In other words, just one or sometimes more of these themes are used in psychology theses to provide a background, a social or political justification for the conducted research. For example, a thesis written on the trauma due to forced migration pays more attention to the conflict and violence emerged in Kurdish areas, or the pressure imposed by the state on civilians, while another thesis on intergroup relations puts more emphasis on the practices of exclusion and discrimination between Turks and Kurds in metropolises of Turkey. Below, we explain these themes by considering their scope across all theses and their transformation over time.

1.1. State Oppression / Tyranny

This theme corresponds to an assessment of the Kurdish issue through assimilation-denial of the Kurdish civilians or the institutionalized state oppression towards the Kurdish politicians. In other words, in this narrative problematized in the psychology theses, the backbone of the Kurdish issue consists of the systematic policies that directly target or ignore the Kurds and the Kurdish identity as an autonomous group. For example, practices like the Turkification of city and village names, the prohibition of traditional Kurdish clothing and educational activities based on Turkification that target or ignore the identity markers of the Kurdish people, are frequently mentioned with their historical references. Except for one particular study reporting that assimilation of Kurdish culture and identity has been carried out by other states, this narrative generally considers this oppression and tyranny to be associated with the history of the Turkish Republic. Furthermore, although the narrative of state oppression generally has continuity, this narrative takes up more space proportionally in the theses written during the period covering the Peace Process (i.e., DPP). Besides, in the theses written during this period not only on the symbolic and political consequences of the state oppression, but also its applications towards civilians and nature were more frequently emphasized. It would not be wrong to say that with this change, though just at the level of narration, the Kurds have experienced an equalization with other elements of the nation-state on the basis of rights. The following excerpt, from one of the theses written during the Peace Process, includes these wide range of wrongdoings which the Kurds were exposed to as a result of forced migration:

DPP-2014-6/28; ... during this period, more than three million people from about 3700 settlements had to leave the areas where they lived against their will. In the sixteen years of conflict, not only were settlements burned down and evacuated, but also going to highlands was banned and thousands of acres of forest were burned. In the evacuated, burned down and destroyed settlements, basic

infrastructure facilities like roads, water and electricity have also been destroyed. Fields have become unusable. Fruit gardens have been destroyed and the trees have been cut off....

Another tendency in quotations forming this theme is to focus on policies targeting the political representation of Kurds. Along with the pressure applied to the Kurdish civilians, the psychology theses also include the experiences of institutions, associations, and politicians, who are prominent because of their closeness to the Kurdish political movement. For example, the banning of political parties at various times or the imposition of political restrictions on politicians are frequently mentioned. Because in this narrative, bans or restrictions imposed on Kurdish parties and associations in Turkey are considered as an intolerance towards the existence of Kurdish identity in the public space as a parliamentary democracy. Similarly, especially in the theses written during the Peace Process, we come across more space and more up-to-date details in this regard. Below is an example of the oppression on the Kurdish political movement from a thesis written during Peace Process:

DPP-2014-3/17; ...during the 1990s and 2000s, Kurdish political parties were closed down by the Constitutional Court; while the existing political parties did not consider the demands of Kurds. Human rights violations, mass arrests of politicized Kurds, and restrictions on the political representation of Kurds continued throughout the 2000s...

The state oppression/tyranny theme usually emerges as a narrative that highlights policies targeting both Kurdish civilians and Kurdish political actors by the Turkish state. However, while this theme was very obscure before Peace Process, we found that it increases and diversifies proportionally with the Peace Process. During this period, official negotiations made between the state officials and the different actors of the Kurdish movement, particularly the PKK, brought along the legitimacy of political actors in psychology literature as well (Çevik, 2019; Çiçek, 2018). Although it is still used after Peace Process, we found that recently the emphasis on the *assimilation* dimension in the state oppression/tyranny narrative has increased while the violence narrative towards civilians and politicians has decreased.

1.2. Turkish-Kurdish Relations

It is possible to say that the Turkish-Kurdish relations theme also covers a considerable space in the way the Kurdish issue is handled in psychology theses. In this narrative, rather than the role of the state as a subject in the Kurdish issue, the negative attitudes, and behaviours of the Turkish and the Kurdish people towards each other are problematized in the context of *nationalism-polarization*, *intergroup relations* and *discrimination-othering* respectively. Even though the Turks and Kurds have been in close relationships both geographically and historically, the political developments in the last two centuries have also

affected the relationships between the two groups (Bilgiç et al., 2014; Bora, 2021). However, it seems that naming and framing unfavourable relationships between parties is based on a certain hierarchy. For example, although empirical studies have shown that the Turks have more negative attitudes towards the Kurds both quantitatively and qualitatively (Şen, 2019; Yılmaz et al., 2018), the most preferred manner in psychology theses is to bring forward the responsibility of both sides through nationalism and polarization involving a certain level of reciprocity. In this narrative, reactive Kurdish nationalism is assumed to be a threat to social coexistence though it is generally emphasized that the Kurds have been subjected to marginalization and discrimination under the name of Turkish nationalism throughout the history of the republic. As can be seen from the excerpt below, ongoing conflictual environment is shown as a reason for the rise of mutual nationalist attitudes of both groups:

DPP-2014-4/68: ...In short, the 30-year conflict and violent environment have become a serious threat to social harmony. The loss of life and damage caused by conflict and violence has increased social and political polarization; it has raised Turkish and Kurdish nationalism...

This narrative, which problematizes nationalism in general, has increased considerably during the Peace Process, it has been used less frequently afterwards. On the other hand, after the Peace Process, we observe that the emphasis on 'Intergroup Relations' increases in accordance with psychology terminology. This narrative specifically features many psychological factors such as intergroup contact, in-group favouritism, partisanship and stereotypes that aim to reducing social tension between the Kurds and Turks rather than nationalism. By doing so, it prioritizes micro-level explanations for the solution of the Kurdish issue. In the excerpt below, from a thesis written after the Peace Period, the focus is on the micro level relationships between Turkish and Kurdish students:

APP-2019-9/20: ...Within the scope of this thesis study... attitudes that can change, intergroup friendship, positive-negative contact, anxiety, empathy and contact towards out-group members... among the Turkish and Kurdish university students sharing the same room were examined...

Examining the Kurdish issue through discrimination and marginalization experienced by the Kurds constitutes the least preferred narrative. Although this narrative increased and became dominant during the Peace Process, it continues to remain the least preferred theme in terms of Turkish-Kurdish relations after the Peace Process. Taken as a whole, the Turkish-Kurdish Relations theme corresponds to a narrative that blurs the historical, political, and social power hierarchy of the parties and equates the Kurds with the Turks in terms of 'wrongdoings.' Furthermore, this narrative, along with a set of concepts compatible with psychology terminology such as 'intergroup relations', shows an increasing trend implying it gets a relatively little impact from the termination of the Peace Process. This situation might be indicating that the Kurds and Kurdish

issue are examined more and more via a concept of ‘social polarization’ that disconnects the matter from its historical and political context, which is also quite prominent among the international community of psychology (see, Van Bavel & Pereira, 2018).

1.3. Kurdish Question / Problem

Another frequently mentioned topics in psychology theses when talking about the Kurdish issue is the very *Kurdish question / problem* (see, Akpınar, 2009; Yeğen, 2013). Because just like in the broader literature, it is possible in the psychology theses to come across different perspectives and a continuous attempt to define what the Kurdish issue is. In this sense, it cannot be said that there is a definition of the Kurdish issue which all researchers agree on or on which a consensus is reached in theses. Nevertheless, efforts to define the problem, as can be expected, diversifies as expectations of political solution is increased - for example during the Peace Process - and then decreases afterwards. Although the examples we have are limited, after the Peace Process this diversity decreases relatively and the ‘problem’, which spread to the political field in terms of ending the armed conflict waiting for a solution, began to become the main source to define the Kurdish issue. In the excerpt below, in a thesis written after the Peace Process, the Kurdish question / problem found itself a place in the historical narrative as an extension of the Kurdish issue:

APP-2019-13/26: ...The conflict between Kurds, who are probably the group that encounters Turkish security forces most often, has been maintained for many years and has been named as “Kurdish Question,” “Kurdish Issue” or “Kurdish Problem.” Some analysts think it is a problem stemming from Kurdish military forces and some others assert it is a critical issue to be solved by listening to each group...

Besides, we see that the Peace Process in recent years, where we witnessed political steps taken towards solving the Kurdish problem, also found itself a place in theses. Again, as expected, the use of this theme increases during the Peace Process and decreases afterwards. Since the authors of the theses use this process as a legitimate ground for solving the ongoing tense and problematic Kurdish issue or as a current reference for problems outlined in the thesis, we can see this narrative as a reflection of current discussions shaped around the Kurdish issue in theses. For example, in the excerpt below, there is a direct reference to Peace Process as a burning issue:

DPP-2014-4/61: ...In order to eliminate this threat, various initiatives have been taken by governments until today to solve the problem. The last of these initiatives is the peace/solution process that started at the beginning of 2013...

However, the efforts to define the Kurdish issue and the frequency of using the Peace Process as a current reference framework has decreased with the end of the

process in question, though it is possible to see an increase again, especially since 2019. This finding shows us that the Peace Process has ceased to be a legitimate political ground for scientific research and has begun to be interpreted as a short period of broader the Kurdish Issue and historical development between the parties. In the excerpt below, the Peace Process has become a missed opportunity in the past:

APP-2019-11/19: ...In 2013, a negotiation and ceasefire period started, raising hopes for lasting peace; however, negotiations ended and armed conflict resumed in 2015...

The Kurdish question / problem theme represents a short and highly political aspect of the Kurdish issue which is spreading to a wider extent. Yet, though it lasted short in terms of Turkish political history, started and ended at the political level without having the chance to socialize, we can say that it occupies a considerable space in psychology theses. This situation can be seen as a socio-political ground for scientific studies in the theses as well as an effort to define and make sense of the 'problems' that occur around the Kurds.

1.4. Conflict & Violence

The last narrative that makes up the Kurdish issue is to focus on the destruction especially resultant of the military dimension of the issue, which is problematizing the impact of conflict and violence on people. The focus of this theme is the forced migration of the Kurds from the places they lived, and the deprivations related to accommodation, health, and education which they faced in the places they migrated. Unlike other themes that make up the meta-theme of the Kurdish issue, the Conflict & Violence theme is a narrative that was in use even before the Peace Process. When we consider the practices that spread over a long period of time and resulted in the displacement of the Kurdish population, it can be argued that problems such as forced migration and ghettoization in western cities have found their place in psychology as a 'depoliticized realm'. Indeed, in theses written before the Peace Process, the Kurds or the Kurdish issue are seen more as negative consequences of 'low-intensity war' conducted by the state rather than a problem on its own. In the excerpt below, forced migration is problematized as a result of the war:

BPP-2002-2/1: ...The main type of migration that determines the internal migration movement in the last 10-15 years is forced migration. Low-intensity war that has continued in a part of Turkey (Eastern Anatolia and Southeastern Anatolia regions), policies to prevent low-intensity war and the negative social, economic and cultural conditions caused by low-intensity war have led to the forced migration of an estimated 4 to 4.5 million people...

However, in the following years the interest and emphasis on this issue remained at a relatively low level and was limited to historical background since forced

migration practices were the result of military operations back in the 1990s. Yet interest in and emphasis on deprivations experienced after displacements continue to increase in psychology theses. In recent studies, unlike previous ones, deprivations are more openly associated with the Kurdish issue and narrated with the influence of the relatively liberal atmosphere experienced with the Peace Process. For example, in the excerpt below, forced migration and problems experienced with this migration are linked to forcefully displacement of people:

APP-2019-11/33: ...Between 1986 and 2005, around 1 million people were displaced from these cities (Hacettepe University Institution of Population Studies, 2006). During this period, many families migrated from the conflict zone to urban areas which posed other difficulties such as socioeconomic adversity, discrimination, child labor, and an increased instance of drop-outs from schools (e.g., Basak Culture and Art Foundation, 2010; Sevim, 2001; Yüксеker, 2011). These difficulties were accompanied by problems in adaptation, language and communication, and psychological well-being (Basak Culture and Art Foundation, 2004) ...

Taking together, it can be said that the Conflict & Violence narrative focuses on victims rather than the Kurdish people as a whole since it focuses on people directly affected by the conflict and the problems they are exposed to. For this reason, we observe that this narrative concentrates on sub-fields such as clinical and developmental psychology rather than social psychology which constitutes the majority of the theses. Nonetheless, this narrative, which has found itself space in psychology since the early 2000s, can be evaluated as an effort to highlight the victimization in order to break the silence about the Kurds in the field of psychology.

2. Defining Kurdishness

While examining how the Kurds are problematized in psychology theses, apart from the socio-political problems associated with them, we noticed that there has been a considerable change both among authors and over time in naming and defining the Kurds as an autonomous group, including those participating in the research. We knew from both relevant literature (Scalbert-Yücel & Ray, 2006) and our own experiences as researchers working in this field that this situation could be explained by (auto)censorship, that is frequently encountered in Kurdish studies. However, we are not yet aware of a study showing that the (auto)censorship mechanism, beyond scientific research practices, is evident in naming the participants.

That is why, in psychology theses that make up our dataset, we paid special attention not only to the structure of the language and choice of vocabulary used to define the Kurds, but also, to the changes in these definitions over time. Since the indicators to point out Kurdishness ranging from the regions Kurds live to the language they speak, or from cultural differences to their positions in the ethnic hierarchy, are instrumented as adjectives or explanations that define the Kurds,

we named this meta-theme as ‘*Defining Kurdishness*’. This meta-theme consists of themes *the Kurdish*, *the Ignored*, *the Ethnocultural Minority*, and *the Subordinate Group*, respectively (see, Table 1).

In the psychology theses, the Kurds are usually introduced on the grounds that they constitute a case or an example for a given research question or approach, to make them suitable to test the preferred theories and approaches. For example, in a thesis focusing on processes between social minorities and the majority, the Kurds are marked as an ethnic or cultural minority -despite they are not recognized as having a minority status in any legal regulation in Turkey-, while in another thesis focusing on identity formation or development processes, they can be defined as subordinate group. In the following sections, we explain these themes in an order taking into account their scope across all the dataset and the changes they have undergone over time.

2.1. The Kurds

This theme directly corresponds to marking the Kurdish people as ‘the Kurds’ without going into any other adjective or explanation while describing Kurdishness. This narrative, which is widely used in theses under the question, is rarely used before the Peace Process that is utilized mostly introducing the sample and providing information about the participants. Moreover, we observed that Kurdish people’s official relationship with Turkey through citizenship were especially emphasized in this period:

BPP-2009-26/1: ...in Turkey, while Kurdish people can identify themselves with all citizens in Turkey...

During the Peace Process on the other hand, with the Kurds themes reaching its highest frequency of use, it is possible to see various uses of Kurdishness as a social category, autonomous group identity and reference frame in many fields from the people to society, from identity to history, from politics to language:

APP-2019-11/16: ...Kurds are the largest non-Turkish ethnic minority group in Turkey, constituting 17.2% of the overall population, and mainly reside (60%) in the eastern part of Turkey...

After the Peace Process, although the frequency of use of this theme decreases slightly, the diversity in its use continues.

2.2. The Ignored

When forming this theme, we noticed that neutral expressions to impersonalize the sample such as “*participants, local people, regional people, population*” were used to hide the Kurdish identity and Kurdishness, even though there were indicators such as the region they lived in or the language they spoke indicating

that the sample subject to research was somehow Kurdish. What the authors of the theses do not say or what they avoid saying while naming something is also important for our analysis. Because not using a specific term or concept is an attempt to hide what is otherwise obvious by expressing it with some other words. For example, we can talk about a Kurdishness that is covered up or deliberately ignored through the concept of *citizens*. Since citizen is a legal concept defining not only the Kurds but everyone living in the geographical region in question, this way of expression serves as a kind of ignoring function in theses when it is needed.

The Ignored narrative intensifies in the method sections, where individuals recruited for the research are defined, rather than in other parts of the theses. Because we can say that here is where the authors are somehow forced to define Kurdishness while it is not necessary to indicate the Kurds in other parts of the theses due to fact that introduction of participants take place in methodology. In this sense, we frequently encountered the Ignored theme throughout all theses and the examined time frame (i.e., 2000-2019). For instance, the word “participants” exemplified in the excerpt below is a common strategy:

DPP-2014-6/32: ...The research population consists of participants who migrated to Istanbul from the Eastern and Southeastern Anatolia Region between 1980 and 2000; its sample consists of 33% (N=53) women and 67% (N=107) men, a total of 160 people...

However, we noticed that with the influence of the increasing political pressure, the frequency and variations of the usage of this narrative showed a constant increase throughout the time frame under the question, especially after the Peace Process. When the political and ideological positionings of the concepts are considered, despite being symbolic, words such as ‘population’ that purify people from their cultural, social, and historical characteristics have only emerged in this period:

APP-2019-10/1: ...In this context, the subject of the research is the evaluation of the population living in Eastern and Southeastern Anatolia in terms of executive functions and complex attention and revealing possible differences...

When considered as a whole, the narrative forming the Ignored theme can be considered as an effort not to see Kurds as an autonomous group. Furthermore, when it is necessary to identify the Kurds, this narrative defines a sphere of existence for them by resorting to the region and local names determined by the nation-state, that is, it conceals their autonomous existence (e.g., Southeastern Anatolia).

2.3. The Ethnocultural Minority

Another framework used when indicating the Kurds is referring to ethnocultural hierarchy. In this narrative, the Kurds are mentioned as an ethnic or cultural

minority compared to the Turks who constitute the majority in Turkey. Although the Kurds are traditionally quite heterogeneous in terms of language, religion and culture and do not have an official minority status in Turkey, in this narrative it is assumed that Kurdishness functions as a collective identity in a society where Turks are politically and culturally superior or dominant. This tendency can be seen together with the rise of the multiculturalism debate in Europe and the focus of social psychological research on the social integration of minorities (see, Verkuyten, 2007). However, it is not possible to talk about a consensus on what determines minority status in psychology theses. For example, speaking Kurdish, self-reported identity, the region Kurds lived in, or being a member of the numerical minority compared to the Turks can be used by different authors and at different times as indicators of the Kurdish minority. Still, if we make a temporal comparison, it is possible to say that before the Peace Process, Kurds were represented among existing minorities through being part of cultural diversity in Turkey or speaking a different language. For example, in a thesis written before the Peace Process, the Kurds were defined as one of the non-Turkish groups:

BPP-2002-1/7: ...Some group members in Turkey define themselves differently and claim that they are subjected to discrimination in society... Based on Atatürk's statement "Turks are not the only ones living in Turkey; Circassians, Kurds, Lazes and Arabs live here as well," in the Grand National Assembly in 1920, [in this thesis, we] worked with these ethnic groups...

With the Peace Process, we can say that this ethnic framework to approach Turkish society has expanded to include the Turks into ethnic hierarchy. During this period, psychology theses start considering Kurdishness as an ethnic category like Turkishness and concentrating on self-report identity definitions rather than cultural and essentialist references. For example, in a thesis written during the Peace Process all ethnic groups are conceptualized through self-report identification:

DPP-2014-4/55: ...Firstly, 2 persons who did not specify their ethnic identity, 18 persons who identified their ethnic identity with an identity other than Turkish or Kurdish (for example, Arab, Circassian, human), 5 people who did not complete their scales and 14 persons who misunderstood manipulation were excluded from the analyses...

When all of the psychology theses and themes are considered, it would not be wrong to say that the Ethnocultural Minority theme, whose usage increased constantly after the Peace Process although it is not the most frequently used narrative, is an easily referred representation for historicizing the tension between the Turks and the Kurds and used in almost all sub-fields of psychology. On the other hand, it is important to remember that this trend of defining people by cultural and essentialist categories rather than their class and social positions is increasing with globalization (Bhatia, 2002; Gülerce, 2006) and has become mainstream tendency in international academia of psychology either (see, Verkuyten, 2007).

2.4. The Subordinate Group

In constructing the last narrative used to define Kurdishness, we have used the concept of subordinate group, which encompasses concepts mostly used in the literature on social identity. Because in this narrative, it is assumed that the tension as a result of the historical, social and political background creates a disadvantage for the Kurds by affecting their psychological processes. This narrative, that can be seen as a reflection of the ‘sociological’ oriented social psychology school that is also new for European and American social psychology, emphasizes the impact of social and political context on psychological processes (Hogg & Abrams, 1998; Tajfel & Turner, 1979). In this sense, Kurdishness is considered as *disadvantaged*, *despised* or a *subordinated* group. For example, in the following excerpt, it is claimed that Kurdishness has regressed to a disadvantaged position over time:

DPP-2015-17/15: ...Kurdish groups that contain this much diversity have started to come together as a disadvantageous group, based on speaking Kurdish or not being able to speak Turkish, and see themselves differently from the Turks...

Despite the fact that the scope of this narrative is quite limited when considering the entire dataset, its main difference from the other themes is that it builds the common identity content of the Kurds on a negative representation (Alparslan & Kuşdil, 2020). In other words, apart from being a numerical or cultural minority, the Kurds become subject to psychological research as a ‘marginalized’ group. Besides, this narrative has spread increasingly to the field and the theses after the Peace Process. Yet again, after the Peace Process, it seems that the terminological aspect of the issue, that is, the cognitive mechanism (i.e., the social categorization) corresponding to Kurdishness as a subordinate group has come to the forefront of conceptualization. For example, in a thesis written after the Peace Process, the social identity framework, as a cognitive representation of being a group, was used to indicate ethnic groups:

APP-2019-9/6: ...When looking at the intergroup contact process of the Turkish and the Kurdish social identity groups in Turkey, it is seen that the group members reside in certain neighbourhoods of the metropolises because of economic and cultural reasons and have less contact with each other...

Taking together, the Subordinate Group theme makes the Kurds a searchable subject due to the psychological burden created by Kurdishness, namely their negative identity. In this sense, it would not be wrong to say that Kurdishness continues to find itself a place in psychology studies through the subordinate group narrative that frames Kurdishness as a victimization experienced by the Kurds.

Conclusion

The scientific knowledge production and politics in Turkey have been intertwined with the modernization project since the foundation of the republic (Dölen, 2010). The academia, whose first representatives were largely bureaucratic intellectuals, still maintains its close relationship with the political authority (Arslan, 1999; Duman, 2018) and it is shaped by the pressure and purges of political authorities (Günel, 2013). This close relationship between the authority and the academia determines in which areas the universities can produce knowledge and which fields they can turn to; in short, this relationship determines the course of the academia. This situation also manifests itself in the scope of the studies on the Kurdish issue, one of Turkey's most fundamental problems (Scalbert-Yücel & Ray, 2006), and this can be clearly observed within our field of study, psychology. We are trying to describe and document this situation in psychology in recent years (Bayad et al., 2022; Bayad & Şen, 2023). In this study, we discussed how the Kurds were problematized and represented in psychology theses written on Kurds through the qualitative change over the last 20 years. Undoubtedly, for such a temporal comparison, the Peace Process was a good milestone, and we examined our dataset in three groups: before, during and after the Peace Process.

The first meta-theme we generated, “the Kurdish Issue”, corresponds to how the troubles which have turned into a knot of problems spreading to every domain of social life around the Kurds are defined and addressed, rather than directly addressing the Kurds. And just like in state discourse, differences emerge in problematizing the Kurdish issue in psychology theses (Yeğen, 2013). As we have shown before, along with the increase in the number of studies carried out (Bayad et al., 2022), we have revealed that there has been both positive and negative change in the language used and approach to the issue before, during and after the Peace Process. For example, we found that both the social and psychological destruction caused by the conflict and violence around the Kurdish issue and the parties to the conflict are discussed much more and more diversely during and after the Peace Process. Furthermore, we can say that the censorious language of the dominant paradigm prior the Peace Process has been eroded, the direct reference to the Kurds as an autonomous group has increased and their subjectification based on ethnocultural rights has normalized. On the other hand, while the *State Oppression / Tyranny* narrative, which is the most frequently used one when talking about the Kurdish issue, is mostly addressed through assimilation and denial during the Peace Process, with the end of the Peace Process however, the emphasis on state responsibility decreases and the Kurdish issue starts to be problematized and psychologized mostly within the context of Turkish-Kurdish relations. Likewise, although the Kurds gained a relatively significant visibility within psychology during the Peace Process, invisibility of the Kurds increases again with non-referencing (i.e., The Ignored) due to the increasing (auto)censorship after the termination of the Peace Process. Therefore,

along with the intervention of the political authority and the encouragement of the social atmosphere, the Kurds, whom the academia of psychology started to notice during the Peace Process, are once again not recognized after the termination of Peace Process. And even if they are noticed, they are mostly depicted through their victimizations.

All these findings can be evaluated as a clear indicator that the academia largely determines its direction in the shadow of nation-state politics. However, we can still say that the quantitative and qualitative change the Peace Process provided has exceeded certain boundaries in psychology both in defining the Kurds and in discussing the Kurdish issue; it determined both the autonomous existence of Kurds and the methods and possibilities of working with them in the field of psychology albeit based on just human-rights or victimization. Göregenli (2010) said that psychology would have to face the challenge with the Kurdish issue by confronting class backgrounds of psychologists, political authority in Turkey and an increased communication with civil society. Looking back after a decade, we can say that there has been an improvement both in the number and quality of academic studies with the provision of a positive political climate as in the case of the Peace Process. Yet, despite all this accumulation, scientific interest and attention is both temporary and limited in order to provide a real confrontation covering both personal and disciplinary self-reflection for the Kurds and Kurdish issue in the absence of mechanisms to protect researchers from (auto)censorship when the political climate changes again (see, Bhatia, 2018; Duncan et al., 2001).

Acknowledgement

We would like to express our sincere gratitude to the reviewers; Yasemin Gülsüm Acar, Ersin Aslıtürk & Göklem Tekdemir, for their valuable feedback and insightful comments that have considerably contributed to improving the former version of the manuscript. Their comments have helped us to refine our ideas, clarify our arguments, and enhance the overall quality of the final version of this article.

Ümit Eser, who is currently completing his doctorate at Istanbul University, conducts academic studies on Kurdish identity, nationalism and marriages between Kurds and Turks. In addition to his studies at the Alice Salomon University of Applied Sciences in Berlin, he conducts psychosocial studies for minority groups in the field of migration and refugees in various non-governmental organizations. He conducts his studies mainly with the qualitative methods. Email: umiteser30@gmail.com

Aydın Bayad (PhD) is a social psychologist specializing in minority political socialization and participation. His research spans topics like (dual) identification, discrimination, coping, and peace psychology, utilizing both qualitative and quantitative methods. He has recently expanded his research focus to include the history of psychology in Turkey and issues of decolonization and neoliberalisation while working as a postdoc at the TransMIGZ project supported by the German Ministry of Science Education and Science (BMBF). Email: aydin.bayad@uni-bielefeld.de (*Corresponding author*)

Kenan Alparslan (PhD) is a social psychologist specializing in intergroup relations. He is currently a faculty member at the Department of Psychology at Muş Alparslan University in Turkey. Her research interests include ethnic identity, disadvantaged group membership, religiosity, prejudice and discrimination. Email: k.alparslan@alparslan.edu.tr

Ercan Şen (PhD) received his BA in Guidance and Psychological Counselling from İstanbul University in 2006 and PhD in Social Psychology from Ankara University in 2023. His research interests include intergroup processes, social identity, and peace and conflict studies. In February 2017, he was dismissed from his post at the Ankara university by decree law due to a declaration to the government to end violations in Kurdish cities. Şen and other academics who were dismissed are not allowed to work in universities in Turkey. Email: ercansenn@gmail.com

The limitation of clinical trauma discourse in socio-political contexts with regard to the Russian invasion of Ukraine and some considerations on the traumatization of children

Pia Andreatta & Gianluca Crepaldi

Abstract

The aim of the present paper is to examine trauma related issues raised by the current war in Ukraine, with a special focus on traumatization of children and young people brought about by forced migration and through experiencing conflict and war close up. Based on observations during several deployments and international operations (participatory observation), a further objective is to offer some reflections on the significance of trauma for integration and relationship development work conducted with children and young people who are refugees. Post-traumatic stress disorder (PTSD) will also be discussed and subjected to critical scrutiny, since it may not cover all the complex social, cultural and political dimensions of trauma. The authors explore alternatives to the present trauma discourse on the basis of the experiences and findings which have emerged from involvement with children and young people in areas afflicted by conflict and war but also according to relevant research literature. This paper arguments conclude that traumatising structures affecting refugees who have fled war and armed conflict may persist in host countries until such time as decision-making and areas of action that permit assumption of control and (co)determination are put in place.

Keywords

trauma, war, forced migration, PTSD, Ukraine

Background Information

The most recent reports of the UNHCR (2022a) speak of millions of people who are currently forced to migrate from their homes or have applied for asylum in another country. The global scale of flight and displacement caused by war,

violence and persecution reached its highest level ever recorded in the middle of 2021 and is reaching a new peak due to the war of aggression in Ukraine; the figures are continuously adjusted upwards. A total of 82.4 million people were forced to flee their homes. Among them are almost 26.4 million refugees under UNHCR mandate, about half of them are under 18 years of age. The trend continues to rise. In addition, at this point, about five weeks after the start of the war of aggression on Ukraine, more than 4 million people have already fled the country, the majority of them women and children. Approximately 6.5 million people are currently displaced within Ukraine and 13 million are in need of humanitarian assistance (UNHCR, 2022b). According to UNICEF, more than half of all children in Ukraine have already been displaced from their homes. 1.8 million of these children have fled to neighbouring countries (UNICEF, 2022).

The war has caused one of the fastest large-scale flight of children since World War II. This is a grim milestone that could have lasting consequences for generations to come. Children's safety, well-being, and access to vital services are threatened by the incessant horrific violence. (C. Russell, UNICEF Executive Director 2022)

Our society now faces the major task and challenge of integrating children and young people who have been forced to migrate, and such a process directly raises issues with regard to the traumatization they may have suffered. Before moving onto a consideration of the definition of trauma and some of its consequences, we would like to cast a glance at the contexts faced by children and young people in regions that are torn by war and strife.¹ Many societal structures suffer massive restrictions and collapse during times of war and conflict. When they are living within a context of strife, armed struggle and forced migration, children and young people are in many cases confronted with situations which are highly unusual and stressful. Such settings may also be traumatic. They experience acts of war, bombardment and persecution. They do not fail to notice that people disappear without trace. Expulsion and maltreatment are everyday occurrences in areas affected by war and conflict. It is not rare for children to be in a position where they witness violent death and injury at close hand. This gives rise to feelings of persecution, intimidation inflicted by repressive power structures, a sense of being uprooted, alienation, precariousness and loss of prospects. Adolescents are directly affected by all of this. Younger children tend to arrive at an indirect perspective of events via the way in which their environment or family members are impacted. Children will, for example, notice human rights abuses without having any specific socio-political understanding of what is occurring. They have no cognitive comprehension of the situation and cannot

¹ Besides the discussion of literature, the first author of this paper would also like to draw upon her own experiences of being stationed in conflict zones to provide psychosocial support to traumatised individuals and to use these to inform the present discussion. These deployments encompassed several months in Syria (Azaz, Aleppo Province) in 2013, one month in the summer of 2014 spent in the Gaza Strip during the last war (referred to by the Israeli armed forces as Operation Protective Edge), stays of several weeks in Lebanon in 2015 and a six-month stint in Sri Lanka in 2010 shortly after the civil war there. The case examples provided in this paper come from these deployments.

name it as such. People become brutalised in war settings. Often only a few months will elapse before threat gives way to massive anxiety, and aggression may also arise within families. Children's development is inevitably stunted. The fear felt by their parents instils rigidity, restriction and violence. An increasing propensity towards the use of force, particularly in the form of domestic and sexual assault, are common ramifications within the family, at least on the basis of what I have observed in the countries where I have been deployed. This is accompanied by a reduction in resources, in the ability to cope and in resilience. Neglect and lack of supplies are consequences of war and conflict. Malnutrition and hunger are specific shortages which may occur. These then pose an existential threat. The experiences in areas of armed conflict have taught that the dangerous scenarios which may occur are multifarious. Direct incidences of fighting, the use of firearms, bombardment from the air, threat of chemical or even nuclear weapons, kidnappings, torture, disappearances and omnipresent surveillance via constantly buzzing drones are all part of everyday life. Particularly tragic in war contexts was the observable decrease in bonding affinity, particularly on the part of mothers:

Case example 1: When I was serving alongside Médecins Sans Frontières, a one-year-old child with a life-threatening gunshot injury was brought in. Little Siad had been hit in the underbelly by a “stray” bullet whilst being carried on his father's arm. The surgical team set to work to try to save the child's life. My main focus, both immediately and in the coming weeks, was to provide support to the parents. Siad's mother was completely overwhelmed emotionally. She shouted, wept and screamed for hours before falling into a state of exhaustion, quite literally worn out by the struggle enveloping her child. Of course, such a catastrophic experience and such devastating fear left me doubting everything. The one thing I did not doubt was her strong maternal love. Ultimately, however, I was forced to come to the conclusion that this mother had not resumed her relationship with the child in the “passionate and loving” way I had expected. Renewed bonding did not take place after the five endless hours of the emergency operation, nor did it happen in the days and weeks thereafter. She remained distanced, almost apathetic. The result was that little Siad also did not thrive. In the final analysis, this mother seemed to me to have completely given up on her relationship with her child against the background of his severe injury.

The only interpretations we have been thus far been able to find with regard to this and other similar observations are as follows. (1) Willingness to forgo a bond with one's own child serves the purpose of providing protection against imminent separation through violent external influences. (2) The maternal “care function” is “damaged” by traumatization of the mother. In accordance with the concept propounded by psychoanalyst Masud Khan (1963), the mother then fails to be a “protective shield” for the child, that is subsequently exposed defenceless to inner and outer stimuli, which are too intense for the infantile psychic structure (Andreatta & Crepaldi, 2021). The consequence of this is a development of cumulative trauma [of the children], because the sense of security derived from the feeling of being able to protect the child has been deeply shattered or destroyed (Grubrich-Simitis, 1984).

The question of traumatization via confrontation with war and forced migration is frequently posed against the background of issues of how traumatization can be recognised, whether traumatised persons need different types of care to non-traumatised individuals, whether they exhibit more unpredictable modes of behaviour or whether they require particularly careful treatment. When we are dealing with children and young people who have undergone severe strain or traumatization, practice shows that we are frequently disconcerted and worry about making mistakes, about inflicting harm and additional suffering through an apparent lack of psychological training and, inversely, about overlooking their injuries and the damage done to them. Often emerges the concern that enquiries about the history they have experienced will lead to unintended re-traumatization or that failure to question a child will render any possible “catharsis” impossible (the ability finally to tell someone all about it). A series of implied assumptions often linger in the background: (1) Trauma represents a “category” that can be delimited. (2) An explicit difference should be made between psychological stresses experienced and actual traumas. (3) Traumas possibly happen in war and whilst a person is fleeing, but *no longer* occur in the country of arrival or country providing asylum. (4) Traumatization experienced cannot be processed until it is narrated. (5) People who have suffered may become “dangerous” for others. And, not least, all the worries mentioned help create a certain breeding ground for (positive or negative) stigmatisation. The discussion as to what trauma means is thus opened.

What does trauma mean? Alternative discourses on trauma

We should begin by emphasising that – even within clinical psychology – there is no unanimity amongst experts as to what trauma is, where it takes place and how its consequences should be treated. Numerous approaches with only a few matching points exist within various traditions. Sometimes, even fundamental issues may be contradictory (Becker, 2006), which leads us to a brief critical reflection on other relevant trauma discourses. In his book *The Politics of Trauma*, Brunner (2014) differentiates six discourse strands around trauma. There is a *public* and explicitly *political discourse*, which is primarily led by the state, governments or political parties, which addresses and regulates issues of victim/perpetrator and friend/foe via generated moral outrage and political activism. In this context it is set and defined who is seen as a victim of trauma. In a *collaborative discourse*, civil society actors draw attention to fates and demand solidarity. The third discourse is the reception of trauma within *popular science*, which is primarily based on media representations of post-traumatic disorders to strengthen the imagination about suffering (e.g., reportages, talk shows, media appearances of experts and “affected persons”). Moreover, there is a *legal discourse*, which decides who receives asylum (due to traumatization) or who is held accountable for injustice and how. *Empirical research* on trauma is a further discourse, in which it should be determined who is traumatized and who is not to produce valid epidemiological statements. Finally, Brunner mentions the

clinical-psychological or *psychiatric* discourse, which is very central for our discussion on PTSD, especially since the war in Vietnam. Against this background, the clinical-psychological aspect will be considered again in more detail in the following and an alternative model will be addressed.

Despite prefixing these remarks with the above relativisation, the intention is to explore what trauma could mean. In their psychodynamic approach Fischer and Riedesser (2009) define trauma as a

vital discrepancy experience between threatening situational factors and individual opportunities to overcome these, which is associated with feelings of helplessness and defenceless abandonment and thus brings about permanent breakdown in self-understanding and understanding of the world. (p. 84).

This definition contains a number of key elements for the definition of trauma. Subjective experience and objective facts and circumstances interlock, because trauma only encompasses the inner perspective of the individual. The inherent paradox of trauma (as defined by Fischer & Riedesser, 2009) is that no appropriate action can be taken to deal with situations which threaten a person's very existence. And this brings us to a common "core" of traumatization. A situation which can no longer be outrun via individual action options because of the existential threat it poses and from which no escape is possible leads to defenceless abandonment to the threat. This causes a person to experience total ineffectiveness and to undergo massive loss of control, anxiety and helplessness. These experiences are like *death suffered intrapsychically* (Becker 2006, p. 53), and Fischer & Riedesser (2009) describe them as the decisive pathogenetic moment of traumatization. This further leads to permanent breakdown of self-understanding and understanding of the world, a rupture within the self- and object-representations of the individual's psychic structure. The traumatic experience results in a conceptual collapse in both socio-cognitive and emotional structures. The subsequent (over)generalisation of this experience brings about a lasting breakdown in sensory and action reference points, in interpretation structures and in communicative reality principles – in short, a shaking of the trust in oneself, in the world and in the relationship between them (Janoff-Bulman, 2002; Andreatta, 2014). This leads to the complete disillusionment of the individual and to a survival or continued existence that is governed by prerequisites that have undergone full (psychological) change.

A fundamental distinction is drawn between type I and type II trauma (Terr, 1995), and this differentiation in itself points to very different manifestations of traumatization. One-time events such as accidents, the sudden death of a close friend or family member or natural disasters are designated as type I trauma. Apart from individual dissociative moments, it is usually possible to recall such incidences in detail. In psychological terms, type I traumas are most likely to leave behind the classic symptoms of acute or post-traumatic stress disorder (PTSD). We will return to this condition later. By way of contrast, type II trauma is the result of complex and longer-term happenings. It thus comprises multiple or chronic traumatization. Examples of events triggering type II trauma are repeated abuse, neglect, serious chronic illness, violence in the family, war and

political violence, persecution and torture. Individual attempts to ward off such occurrences and personal coping strategies lead to deep-seated alterations to personality which are much too comprehensive to be mapped by a diagnosis of PTSD.

The central factor is, however, that situations and contexts exert a strong influence in terms of helping to determine whether events are of a traumatic nature. Let us take “death” as an explanatory example. Death is not traumatising *per se*. But the particular circumstances that arise within the context of war put things in a different light. Unlike in times of peace, death in war is violence. This violence is also witnessed by a child. It includes the targeted killing of individuals and a large overall number of injured or dead. It is *significant* whether the cause of death can be ascribed to “nature”, chance or the despotism of others (“collateral damage”). Suffering that has been caused and inflicted by humans (man-made disaster) shatters our trust, our self-understanding and our understanding of the world in a way which causes particularly serious consequences and brings about radical disillusionment. This disillusionment is accompanied by a feeling of defencelessness and vulnerability. A natural mourning process is also frequently not possible. This affects the (traumatic) experience, because a feeling of security is required in order to mourn and process events. Fear, menace, expulsion, persecution and forced (internal) displacement all stand in the way of mourning. There is no scope to shape positive experiences and joint rituals. A number of particular characteristics are also revealed in the case of children. A child’s concept of death passes through several stages of development from magical thinking to a more sophisticated understanding (Juen et al., 2015). Confrontation with war violently breaches the magical component of a child’s thoughts.

There is something else to add to the debate surrounding trauma. Criticism needs to be levelled at the fact that current trauma discourse is predominantly led by clinical and medical considerations. This means that the discussion of symptoms following a trauma is also faulty. The first result of this is an inadmissible conclusion regarding the traumatization of persons. The frequent presumption is that those who are traumatised should display certain clinical symptoms. By the same token, persons not exhibiting these symptoms are not traumatised (cf. DSM-5; APA, 2013, a manual which applies internationally). Secondly, the predominant trauma discourse also ignores both the aetiology and the socio-political context of traumatization. However, when we speak of traumatization, the latter should be just as much an object of focus as *trauma symptoms*. Things which happen take place in a specific political context. Becker sets this out in the following terms: “*Individual pain [...] is first of all part of a societal process. The core of traumatization is always social, [...] and to this extent the traumatization suffered forms part of a specific societal context*” (Becker, 2009; p. 67). The implication is that dealing with the crimes committed is more crucial for processing and for the perspective of victims than the degree of severity of traumatization (Becker 2009, Stamm & Friedman 2000). This also makes it clear that traumas are not events which are easy to delineate. The time at which they occur can also not be determined, as is suggested by the formulation

post-traumatic stress disorder. In this respect a theory of trauma, especially in the context of war, must consider the intertwining of subjective (psychological) factors with an "objective" social, cultural and political reality. To do justice to this, Brunner (2021) refers to the so-called *spatial turn* to complement a critical theory of trauma, that takes into account the specific *place* and geopolitical context where traumatization occurs.

The model of sequential traumatization (Keilson, 1979; as developed further by David Becker) should be presented as one alternative to the clinical trauma discourse. This model relates to the impact of traumas caused by social policy and reveals that traumatization is multi layered. Several interrelated sequences are described. (1) Indications of pre-traumatic conditions are already in place prior to the beginning of the traumatic process. Development of tension and poverty increasingly leads to anxiety, dejection, concern and worry. Even at this stage, children and young people are directly or indirectly adversely affected too, for example via their parents. These traumatic preconditions have been evident for years throughout the whole Ukraine, without any expectation of the recent invasion (annexation of Crimea as well as the events around Donetsk and Luhansk/Lugansk back in 2014). (2) The beginning of persecution then takes place. The conflict continues to escalate. This sequence started on February 24, 2022, with the attack of the Russian Federation against the sovereign neighboring state of Ukraine. So-called orientation trauma (Fischer & Riedesser, 2009) may arise in children and young people, resulting in the confusion of communicative categories. Parents justifiably develop traits such as anxiety and behave in a much more authoritarian manner towards children and young people. In a further sequence (3), acute persecution and direct terror come to the fore. These contain the existential traumatic experience that occurs in the wake of undergoing or witnessing arrest, torture and murder. This sequence is also characterized by internal displacement, forced migration within their own country and accommodation in camps. The (psychological) sequences (2) and (3) almost coincide in the current war of aggression. The moment of traumatic collapse is difficult to identify. Chronification (4) is a common further development of this sequence. Phases of waiting thus occur amidst acute persecution, and this is where the terror unfurls its full psychological effect. The unfolding of the shock over the rapid developments in the attack on Ukraine, are at this stage already becoming visible. Due to siege, encirclement, repeated shelling, as well as great restrictions and threat of death, many Ukrainian citizens are forced to hold for several weeks in unheated basements or bunkers, in uncertainty about the immediate and further future. We also observe this phase when troops withdraw from combat zones. In these moments, the catastrophe of the battlefield comes fully to light. Such phases would also exist in the case of a negotiated ceasefire. (5) Periods of transition and initial future considerations or further upheavals may set in. Decision-making phases leading to personal crises are a predominant feature of this period. Uncertainties and insecurities unleash their own traumatic effect. Although the sequence at the end of a war (6) means that acute threat no longer exists, it does not spell the end of the traumatic process to the extent that a

ceasefire does not yet produce peace and security. The people affected in Ukraine have not yet arrived there, but thousands of them are on the run.

The decision to flee and the fact of forced migration can be developed into further separate sequences. Forced migration in itself contains inherent traumatic potential because of the lack of alternatives. The sequences initiated by forced displacement are revealed to be (1) stress factors before and during migration, (2) stress factors in the host country and (3) stress factors caused by the chronification of the provisional nature of events. Let us look at this in greater detail. In the period prior to forced migration, individual experience contradictory emotions in the form of despair and hope, an absence of alternatives, a sense of giving up and acceptance of flight as the only way out and the wish to save themselves (Becker 2006, p. 193). Specific reasons why children and young people may need to migrate include loss of one or both parents, forced labour, a forced marriage, impending conscription as a child soldier, modern slavery involving children for the purpose of sexual exploitation and demands made by families for economic assets to be produced. Assumption of responsibility which is not appropriate to age and stage of development is characteristic. In the case of unaccompanied minors in particular, migration may often take weeks and months and involve exposure to (life)threatening conditions. Children and young people may easily become victims of violence during the migration process. Stress factors in the host country include uncertainty about the present and the future, acculturation pressure and stigmatisation (positive and negative discrimination). Children and young people may also develop emotions connected with reactions to mourning and trauma such as flashbacks, nightmares, feelings of alienation and guilt and a sense of incompetence that arises from unsuccessful attempts to make themselves understood. One unaccompanied minor stated: *"We are all turning into stones here"* (Kusturica, 2009). This gives powerful expression to the chronification of the provisional nature of the situation. Despite the shock of losing everything, they still need to summon up the strength needed to pursue an objective. Adaptation, integration, the retention of cultural identity whilst assuming a new one all throw up huge and multifarious challenges for the young generation. Children become key intermediary persons between cultures and act as cultural bridge builders.

Our argumentation of what trauma means has thus come full circle. To reiterate, trauma means loss of the ability to influence an existentially threatening situation via one's own actions. It also means powerlessness, helplessness and defencelessness – in other words, loss of control by an individual and thus a permanent breakdown of self-understanding and of understanding of the world. "Turning into stone", as the above quotation makes clear, also means that a person will remain in this state. In many cases, refugees identify with precisely this socially determined lack of influence, non-participation and helplessness which has already been the origin of traumatization. No assumption can therefore be made that the psychological trauma effect has come to an end. Keilson (1979) even emphasises that the time *after* the end of war can be designated as the most intrusive and painful period and that people frequently become caught in this

sequence. The enormity of what has been inflicted on children and young people often does not become apparent until much later.²

Consequences of the traumatization of children and young people

Psychotraumatology never tires of emphasising that the consequences of trauma are normal reactions rather than pathological reactions in the face of extreme situations. For this reason, the term psychological *reaction* is often preferred to the notion of *disorder*. Equally, however, psychotraumatology also never tires of predominantly summarising the consequences of traumatization via the formulation of post-traumatic stress disorder and then offering international comparisons. This is a matter of regret for some researchers and practitioners (Becker, 2006; Argenti-Pillen, 2000), and we share this view, that the PTSD as “the great equalizer” is a questionable western standard, that is at times ignorant towards other cultural expressions and political circumstances. Post-traumatic stress disorder (PTSD) was mainly developed on the basis of consequences of trauma suffered by Vietnam veterans. It entered the diagnostic and statistical manuals for the classification of psychological disorders in 1984, the relevant manual at the time being DSM-III. The current issue (DSM-5; APA, 2013) has been expanded to include a diagnosis version for children. PTSD encompasses three groups of symptoms. (1) *Intrusion* – recurring forceful memories and dreams, sudden actions as if the event is returning, i.e., trauma-related emotions with recognisable content. Recreating events via play, nightmares including without specific content and post-traumatic play are particular symptoms amongst children. (2) The group of *avoidance symptoms* encompasses circumvention of thoughts or feelings which are associated with the event. After a car accident, for example, an attempt is made to make a detour around the place where the accident took place. Perhaps a decision to give up driving is even taken. Feelings, conversations and memories are suppressed. This process is linked with a lessening of interests, of body awareness and of emotions and is also accompanied by feelings of alienation. In the case of children, we see a flattening of general responsiveness, social withdrawal, regression, a feeling of boredom and emptiness and restricted ability to play. A switch between phases (1) and (2) is a normal part of working through and processing traumatization. These phases are also designated as the bi-phasal course of trauma reaction (Fischer & Riedesser, 2009). Group (3) includes *overexcitation*, i.e., excessive responses to stress, irritability, outbursts of fury, sleep disturbances, concentration difficulties and exaggerated startled reactions. Symptoms described for children are nocturnal awakening, fear of going to bed, disobedience and aggressiveness, extreme and rapid mood swings, provocation

² This is something which the first author can confirm from her experience of deployment in areas of conflict: Many months after the ceasefire in Sri Lanka, during a period in which the population had a growing confidence that the armistice would hold, traumatising events and the individual traumatising stories individuals had experienced gradually began to emerge under a wave of emotional pain. The severe stresses were revealed accordingly. Witnessing all of this is appalling, even if one only hears people talk about events in the common room of a refugee shelter somewhere (Andreatta, 2012).

of corporal punishment and infliction of pain. These reactions or symptoms must occur to a certain extent and above all need still to be present four weeks after the trauma in order for the disorder to be diagnosed as such (APA, 2013). The subtype of PTSD for children aged up to six was described in terms of behaviour in order to take account of a child's capacity for verbal expression. Since the introduction of DSM-5 in 2013, rates of PTSD amongst children are now between three and eight times higher compared to the previous DSM-IV version. We mention this so that, alongside the criticism of PTSD, the meaningfulness of the statistical rates is not overestimated.

Klingman (2002) collates a large number of studies focusing on children and young people *in* the conflict regions. He states that the dispersion of PTSD rates of children and young people is between 8% and 75%. Supplementary mention will now be made of a number of studies into PTSD in the conflict regions. In an investigation into 197 children aged between 6 and 11 in the Gaza Strip, Thabet et al. (2008) arrive at a PTSD rate of up to 70% of the children. The Lebanese War Studies investigated 25 schools three weeks after the ceasefire and indicated a PTSD rate of 24% amongst those aged from 6 to 19 (Itani et al., 2014). In Israel, PTSD was identified in 19% of children aged between 5 and 10 following a rocket attack. In our view, this makes it clear why these figures are able to provide us with so little guidance. The dispersion rate is scarcely lower in the case of studies conducted *in the host country* with refugees who are unaccompanied minors. In a study carried out in England in 2008, Hodes and his colleagues found a PTSD rate of 61.5%. An investigation in Belgium into 166 unaccompanied minors revealed PTSD in 37% to 47% of cases. 40% of unaccompanied minors in the Netherlands display PTSD one year after arrival in the country as a refugee. After two years, the same group even exhibits an increase compared to the previous year as the rate rises to 41% (Smid et al., 2011). A study carried out in Vienna arrived at a PTSD rate of 17% of unaccompanied minors (Völkl-Kernstock et al., 2011).

More complex study designs and long-term investigations remain absent in many instances. We also regret the fact that the way in which PTSD is diagnosed clearly draws no distinction between ongoing conditions of war and incidents such as a dog bite. The diagnosis of PTSD drawn up after accidents is just the same as that prepared after years of traumatization through war. This fact alone renders it useless (Becker, 2009; Eissler, 1984). The range of traumatic situational experiences is ultimately large, meaning that a standardised trauma syndrome can scarcely be expected (Fischer & Riedesser, 2009). A sequential interpersonal traumatization cannot fundamentally be mapped in a PTSD diagnosis. Also, the traumatic consequences at a symptom level are sometimes not revealed until a latency period of months or years has passed (late-onset PTSD). In the case of children and young people, consideration further needs to be accorded to transgenerational traumatization, i.e., transmission processes via parents and caregivers as a result of the structure of the relationship with the parents or identification of the children with parents. This would not be mapped in a PTSD diagnosis either.

At this point, we would like to introduce a number of observations from war regions. We first present a clinical recording of symptoms of individuals brought to the psychological care centre in A'zāz (Syria), which was carried out by the first author of the present paper between August and October 2013. We will select a statistical observation period of 14 days in August 2013. The objective criteria of war traumatization, namely direct threat to life, were present in all new persons awaiting consultation or diagnosis (N = 60, of whom 31 were male, 27 female, 2 unknown). And yet, despite all the symptoms which could be found, only four persons showed signs of PTSD. The others were by no means symptom-free. They mainly displayed a clinical picture of depression (20%), followed by severe anxiety disorders (17%) and psychosomatic consequences. Their stages of their disorders were too extensive to be covered by a PTSD diagnosis. The following observation should illustrate the problem.

Case example 2: The mother of a 7-year-old Syrian child brought him to the clinic stating that he had been suffering from epilepsy for several weeks. She described that he would suddenly become unresponsive before lapsing into unconsciousness and falling over. No further information was obtainable, and in any case, it would not have been possible to carry out the necessary medical investigations at this particular clinic, which only has basic minimum equipment. I played with the child on the floor together with the Arab-English interpreter using the few utensils which were available. Surprisingly, the game began to incorporate elements which I believed to indicate trauma. Intrusive moments were revealed. I then asked the boy about his attacks. He said that he did not lose consciousness, as his mother had described. He would always hear something from outside, just like the time when – to put it in his own words – the aeroplanes came over and hit his village and the house of his relatives. There was blood, and it was very loud. Whenever he heard the rumble of machines coming closer, he went on to say, he would be like a stone (numbing) and would then probably fall over (dissociation). In my opinion, this described a traumatic emergency reaction rather than epilepsy. This cannot be treated in the midst of war. All that remained to be done, at least this was my approach, was to prepare for an emergency. We practised how to behave in an emergency. He returned after the next two air raids. His mother reported that the attacks had ceased. He had talked about how he had behaved and related that he had taken his sister and the toys they shared into his hiding place.

The consequences of the stresses experienced by children and young people who come to us from regions of war and conflict are revealed in a wide variety of ways. Relevant clues are exhibited in the children's behaviour and in particular by the way they experience things. They show difficulties in concentrating and sometimes display so-called dissociation or states in which the feeling of the traumatic threat returns. Overtiredness because of sleep disturbance and nightmares may occur. Small children react more irritably. School children react by displaying various regressive behaviour such as clinginess or anxieties including fear of the dark and fear of being abandoned. Experiences are often repetitively re-enacted. Sometimes children and young people suffer panic attacks or react with significant terror to aspects such as objects in the air (large

helicopters or nearby aircraft) and sensory fragments such as a bang. They will occasionally show mood swings and aggressiveness against themselves. Younger children may engage in war games with a high degree of violence. Difficulties with peers or loss of self-empathy and empathy for others might also occur. Other traits to mention are depressiveness, thoughts of suicide and feelings of guilt extending as far as psychotic symptoms. Consequences for children and young people are revealed in the area of identity and in self-understanding and understanding of the world. Negative expectations regarding the future are frequently prevalent amongst unaccompanied minors. A low level of interest in everyday life and a lack of enthusiasm are conspicuous aspects here. Depending on their underlying behavioural style, young people may tend to become extroverted or introverted (e.g., withdrawal, “emotional silence”). At a physical level, psychosomatic disorders are often displayed instead of open symptoms of fear.

Concluding remarks on dealing with trauma and the idea of resilience

The first thing to be said is that, when we confront trauma, we will have to accept achieving a much more modest understanding of traumatic relationships and developing action alternatives accordingly (Becker, 2006). We wish to emphasise a statement made by Van der Hart in an interview with Huber:

I believe that the core of every traumatization lies in extreme loneliness, in a sense of being totally abandoned. This means that traumatization of relationships and of the ability to form relationships is frequently involved. In the event of a violent trauma, this is always the case. A loving relationship, which in some regards simply offers security, will be indispensable in order to be able to recover from a trauma at all (Huber, 2007; p. 61).

In our view, these relationship aspects also include “virtues” such as recognition of injustice suffered and attestation of pain that has been afflicted. One thing which affords us a certain scope to exert a positive influence on the situation faced by children and young people and which represents a positive piece of news to the extent that we feel able to grasp the point – to highlight this one more time – is that dealing with traumatization and the crimes is often more significant for processing and for the health prospects of the victim than the degree of severity of the traumatization (Becker, 2009; Stamm & Friedman, 2000). What opportunities are then available to us from a social, pedagogical and psychological perspective?

After the stress of forced migration and trauma, the initial focus is best placed on imparting security and the possibility of recovery. Trauma and stress reactions often fundamentally overlay the mourning process to begin with, and organisation of life in the host country is also paramount. This means that traumatic stress is not a signal for reappraisal within the context of confronting the trauma. It is a signal – and here we are consciously repeating ourselves – to provide security and a safe setting to the extent that these are available and to

facilitate a sense of perspective and recovery. With regard to the fundamental attitude underlying an attempt to exert a positive influence, we should remark that chronification of the provisional nature of the situation and insecurities in the host country are (re)traumatising to the extent that they once again impact directly on the core of traumatization that has now been outlined several times. This is the impossibility that individuals can change themselves via their own actions, which in turn leads to helplessness, abandonment and ultimately to loss of controllability. The traumatically shaken self-understanding and understanding of the world thus remains intact in its generalised form. The catastrophising perspective which originates from real experiences rather than from the fantasy of the individual (this signifies the paradigmatic shift from neurosis to trauma) is often contrasted with ideas of hope and healing which are often virtually irrational – within the context of endeavours to compensate for the trauma (cf. Fischer & Riedesser, 2009) – as protection against further damage. This is sometimes reflected in the fact that “new arrivals” are full of gratitude. They emphasise how well things are going for them here. Or unaccompanied minors gain new hope that things can only get better.

As far as supporting children is concerned, it is important to stress that cognitive development is crucial. Children and young people endeavour to find explanations. They blame themselves or undertake childish rescue attempts. Addressing new questions at every stage of development is part of this process (Juen et al., 2015). Children also have limited abilities to tolerate emotional pain and negative emotions (for a long period of time). The painful process of mourning is thus regulated via distraction and play. They have limited abilities to verbalise their feelings and mourn discontinuously. With regard to support, this means that everyday routines in particular are able to provide children with initial security. Children pay close attention to the way in which their (new) environment and adults react to a traumatic experience, and these thus exert a significant influence. Some young people, and adults too, speak about their experiences. If the cathartic effect of relating a trauma is to be successful in the first place, then this will not happen until an individual finds the right conditions, i.e., an everyday life and relationships that are sustainable enough to allow “speaking about it” to take place. In this case, an attitude of empathic listening, a recognition of what has happened and the recognition and expression of a person’s own helplessness which listening can trigger helps to form a significantly more favourable interpersonal stance than that created by “evidence-based therapeutic tricks”. The actual traumatic stories frequently remain guarded until sufficient “growth” has taken place to enable the individuals themselves to stand up to the effect of the traumatic memory in the present time.

The encouragement of resilience is a popular approach at the moment and requires

measures aimed at achieving stabilisation and the regaining of self-confidence, individual processing of development tasks, support in coping with everyday routine and everyday life, the fostering of resources and areas of potential and clarification of the treatment required (Zito & Brandmaier, 2010; p. 165).

Focus on resilience means orientation towards needs instead of concentrating on trauma symptoms, and internal and external places of safety have a key part to play in this. The main elements encompass a focus on (1) connections. Stability and guidance may be provided by self-esteem and social relationships and in particular by places of shared social experience. Some progress can therefore be made in terms of countering feelings of alienation and a broken sense of identity. (2) Children need stable environments in order to allow recovery to occur. Stabilisation via everyday routines, participation and structure, such as transparency, regularity, a clear overview and involvement in planning processes, and the facilitating of action and action decisions are all key. Encouragement to express feelings via media may be offered. For children, creative expression takes precedence over verbal methods. The former include painting pictures, games, writing, group activities, theatre, music etc. They do not regain their strength via confrontational questioning. The Cologne Treatment Centre for Torture Victims and Refugee Counselling is carrying out a project to foster resilience amongst migrant children. The four main levels on which this work is being pursued are the creation of lasting ties, education, and awareness of self-efficacy and building blocks of good memories (Irmeler, 2011). The return of decision-making and action areas to enable (co-)determination are thus crucial to the ending of ongoing traumatising structures.

“Let brothers not fight!”: Youth work and nationalist ideologies among young migrants in Europe

Sertan Batur

Abstract

Right-wing parties and ideologies are gaining more and more importance in European societies. Racist ideologies are functional on the one hand to regulate the labor market and social services, on the other hand to mobilize the masses for neoliberal transformations. People in the European migration, as victims of racist ideologies, develop different ways of dealing with discrimination in the absence of strong anti-fascist political structures. A current phenomenon among young migrants is a “long-distance nationalism” through which they construe themselves in the position of power in a distant country, while staying away from mainstream politics in the country where they live. This discusses this issue using an example from Vienna. In 2020, Turkish nationalists attacked a Kurdish rally in Favoriten, a working-class district of Vienna. For three days, there was an extraordinary state of affairs in the district with heavy police deployment. We, as a group of youth workers, developed a film project on the subject together with young people who were involved in the clashes in various forms. This example shows how youth social work can reflect together with young people on their reasons for acting and bring about a change in stereotypical actions. The article concludes by explaining some important working principles in (psycho-) social work with young people who tend towards right-wing ideologies.

Keywords

racism, right-wing ideologies among migrants, youth social work

In June 2020, a Kurdish information booth in Favoriten, the 10th district of Vienna, fell victim to an attack orchestrated by Turkish nationalists. The booth, originally set up as a protest against violence against women, sought to highlight the plight of Kurdish activists and female freedom fighters who had lost their lives at the hands of the Turkish military forces. Adorned with numerous Kurdish symbols, the booth was perceived by Turkish nationalists as a platform for the Kurdistan Workers’ Party (PKK), the Kurdish guerrilla organization engaged in conflict with the Turkish state.

As the organizers sought refuge within the premises of a left-wing association in the previously occupied Ernst Kirchweyer House (EKH), a swarm of attackers swiftly converged on the EKH, where windows were shattered, and attempts were made to set the building ablaze. The following day witnessed a demonstration against the assaults on both the information booth and the EKH, organized by anti-fascists and Kurdish activists. Regrettably, this demonstration also became a target for aggression by Turkish nationalists, resulting in several arrests, vehicular destruction, and widespread criticism directed at the police during three days of tumultuous demonstrations, counter-demonstrations, and law enforcement operations (“Erneut Angriff Grauer Wölfe,” 2020). The majority of the assailants were male adolescents and young adults who were either not born in Austria or had parents born outside the country. However, their ethnic backgrounds were not exclusively Turkish; among them were individuals identifying as Afghan, Arab, Chechen, Albanian, or even Kurdish.

These incidents spurred a media and political discourse in Austria on the integration of “migrants” into Austrian society. The Turkish Federation in Austria, supported by the Nationalist Movement Party (MHP) – the prominent fascist party in Turkey – distanced itself from the attack on its Facebook page, urging its members to adhere to Austrian laws. Nevertheless, Austrian media and politicians attributed the assault to the Grey Wolves, the militant wing of the MHP, which was notorious for targeting leftist activists and intellectuals during the 1970s and, in recent decades, for participating in attacks against Kurdish activists. Notably, some participants in the attacks were unequivocally aligned with the Grey Wolves or their symbols, as evidenced by the display of Turkish flags, the “wolf salute,” which has been banned in Austria since the right-wing ÖVP-FPÖ coalition, and the chanting of “Allahu akbar.”

Central to the discussion was the speculation about potential direct influence from Turkey (Scherndl, 2020), where the MHP holds a key position in the government while the primary partner, Erdogan’s Justice and Development Party (AKP), progressively integrates Turkish nationalism into its political agenda. It is a well-established fact that some members of Turkish ruling parties or high-ranking Turkish bureaucrats maintain ties with far-right and criminal organizations in Europe, such as *Osmanen Germania* (Fischhaber & Klasen, 2018). These groups are utilized to intimidate dissenting intellectuals or journalists (“Türkischer Journalist Erk Acarer,” 2021) and function as agents of the Turkish “deep state” within the Turkish and Kurdish diaspora in Europe.

However, these connections do not fully elucidate why nationalist ideology exerts such a profound influence in the diaspora or how hundreds of young people aged 13-21 can mobilize rapidly through social networks in a European capital. Presenting these young individuals as part of a tightly organized fascist organization under Turkey’s control oversimplifies the issue, obscuring the fact that we are grappling not only with a political matter, but also a social one.

Nationalism and nationalist ideologies are prevalent themes in youth work within German-speaking countries. Right-wing parties find substantial support among young people who do not identify as “migrants,” while many young individuals with “migration background” place significant emphasis on their

national identity, often describing themselves as “proud Turks,” “proud Albanians,” “proud Serbs,” and so forth on Instagram.

In this article, my focus will be on young people with a “migration background” who strongly emphasize their national identity. To commence, I will delve into the link between racism in the neoliberal age and tangible power dynamics in society. This connection between racism and actual social relations leads me to posit a crucial distinction between nationalist and racist ideologies among members of privileged and diasporic groups. These phenomena are not synonymous, and likewise, nationalist and racist political attitudes exhibit distinct dynamics and functions within the diaspora and in positions of privilege within power relations. Therefore, I contend that nationalist and racist political attitudes in the diaspora merit separate consideration, to be understood solely in the context of the prevailing social conditions in each country. It is therefore misleading and reductionist to equate nationalism in privileged groups with nationalism in the diasporic group, and similarly, nationalism in the diasporic group with nationalism in the so-called “homeland.” To elucidate this phenomenon, I will draw upon Benedict Anderson’s concept of “long-distance nationalism” (Anderson 1998, pp. 58).

Following this theoretical foundation, the second part of this article will showcase the video project “Let brothers not fight!” from Vienna. This project involved collaboration with young individuals exhibiting Turkish nationalist tendencies, some of whom actively participated in the 2020 riots in Vienna’s 10th district, while others were keenly interested, but refrained from direct involvement for various reasons. This project served as a unique opportunity for these young individuals to articulate and elucidate their motivations, especially at a time when politicians and the media were extensively discussing the youth demonstrators. Based on this project, I identify three functions of nationalist ideologies within diasporic youth groups and discuss fundamental pedagogical stances in critical psychology-oriented work with nationalist youth in the diaspora. In the final section of the article, I will offer reflections on the intersection of social work with racist or nationalist ideologies, particularly within the context of a racist social system.

A terminological explanation

In delving into the term “diaspora” throughout this article, I am cognizant of its religious undertones, particularly its historical association with the Jewish diaspora. Within the realm of migration studies, however, the term has evolved to encompass a broader significance. William Safran (1991, pp. 5) outlines six shared characteristics among diasporic groups:

- 1) they, or their ancestors, have been dispersed from a specific original ‘center’ to two or more ‘peripheral,’ or foreign, regions; 2) they retain a collective memory, vision, or myth about their original homeland—its physical location, history, and achievements; 3) they believe that they are not—and perhaps cannot be—fully accepted by their host society and therefore feel partly alienated and insulated from it; 4) they regard their ancestral homeland as their true, ideal home and as

the place to which they or their descendants would (or should) eventually return—when conditions are appropriate; 5) they believe that they should, collectively, be committed to the maintenance or restoration of their original homeland and to its safety and prosperity; and 6) they continue to relate, personally or vicariously, to that homeland in one way or another, and their ethnocommunal consciousness and solidarity are importantly defined by the existence of such a relationship.

Using this definition, Safran speaks of the Armenian, Maghrebian, Turkish, Palestinian, Cuban, Greek, and Chinese diasporas of the present, and the Polish diaspora of the past, although none of them quite fit the “ideal type” of Jewish diaspora (Safran, 1991, p. 6). Robin Cohen (2008, p. 6) also embraces this list with slight adjustments.

Given that my article centers on young people originating from Turkey and other predominantly Muslim-populated countries, Safran’s identified commonalities prove particularly useful, because, as Safran also emphasizes, these shared characteristics can be easily recognized among a large part of guest workers from Turkey and their children. However, it is crucial to acknowledge the potential criticism of differentiating between young individuals labeled as “migrants” and those deemed “non-migrants,” as this may inadvertently reinforce a racist dichotomy. Many of these young people were born in Austria (or Germany) or have grown up there, with a significant number holding Austrian citizenship. Labeling them as “foreigners” or part of a diaspora group may be deemed racist, implying that their true home lies elsewhere.

As I will elaborate further, this distinction is rooted in the legal and racist interventions of the nation-state in society. Yet, we must recognize the colonialist conditions within European metropolises as an undeniable reality. While certain groups are subjected to being “migrantified” by the nation-state, their relationship with privileged groups becomes a dual and inherently contradictory post-racist exclusion. On one hand, there is a fervent desire for equal rights with Austrians/Germans/Europeans. On the other hand, being identified with these privileged groups is perceived as an affront. The bolstering of identification with an imaginary and many times idealized “homeland” and groups originating from this “homeland” or similar places stems from the aspiration to differentiate from the “selfish,” “racist,” and “snooty” colonialists. Identifying as Austrian or German is only considered in terms of equality and directed towards the privileged groups. Conversely, aligning with the group of colonialist Europeans or resembling “them” is regarded as shameful. This is precisely why the term “diaspora group” aptly characterizes these groups. This distinction is not merely externally imposed by privileged groups or the nation-state; it is also internalized by groups excluded from social resources due to the prevailing racist and colonialist circumstances, serving the purposes of cohesion and resistance.

Institutionalization of racism by the nation-state

As highlighted earlier, the efficacy of racist discourse is contingent upon the intervention of the modern nation-state, which furnishes it with a tangible

political and legal foundation. Étienne Balibar contends that, without this state intervention that links specific rights to citizenship, all national or pseudo-national minorities would remain virtual and lack legal substance (Balibar 1992, pp. 18).

The political strategy inherent in racist discourse typically seeks to regulate, on one hand, those engaged in the most unwanted jobs for meager wages (Wallerstein 1990, pp. 45) and, on the other hand, those entitled to social benefits, welfare institutions, housing, or political participation (Miles 1990, pp. 172). In the context of the neoliberal order's persistent demand for cheap labor, the objective of racist discourse is not the outright termination of ties with individuals labeled as "foreign," but rather their subordination to the interests of the so-called "majority society" (Osterkamp 1991). This hierarchization of interests masks class differences and oppression mechanisms between the exploiters and the segment of the exploited that gains privileges by racist policies. It constructs an ideological unity between the two and simultaneously minimizes production costs, since workers lacking solidarity are less likely to develop a common strategy (Wallerstein 1990, p. 44; Holzkamp 1995, p. 24f).

The state, in principle, delineates a "we group" enjoying full civil rights and an "outside group" granted some of these rights only under specific conditions. Those who acquiesce to this arrangement, requiring at least compliant behavior, implicitly endorse a general deprivation of rights, deeming it legitimate for society as a whole that certain rights must be earned initially; and that all those who do not (cannot) fulfill the requirements of neo-liberal capitalism will also eventually lose these rights –regardless of their civic status (cf. Osterkamp 1987, pp. 140). The latent threat of privilege loss faced by the holders reinforces identification with the "we" group and fosters approval of measures against subordinate groups, inspiring ideologies that adopt an essentialist view of the "otherness" of constructed social groups.

This institutionalization of racism by the state stands in stark contrast to the foundational principle of the modern democratic state, which, at least in theory, guarantees the equality of all. According to Robert Miles (2000), institutionalized racism either evolves from a racist discourse but is no longer justified by it, or it represents a modified racist discourse that retains its original intention but has changed its form (p. 27). Even if no law or regulation explicitly justifies racism, they remain within the framework of racist discourse, not only reinforcing the inequality of legally defined groups, but virtually rendering it self-evident. Laws, regulations, and clauses across various legal domains ensure that the "foreign" group remains largely excluded from democratic processes, citizenship is subject to intricate and inequality-generating conditions, housing allocation and receipt of social benefits are tied to challenging conditions, professional competencies are not recognized, and regulations restricting personal rights (such as the ban on headscarves in public institutions) are implemented, among other examples (Bühl 2016, pp. 213).

Institutional racism is rooted in the structural consolidation of inequality. Irrespective of the intentions of individuals within state or societal institutions, these entities (re)produce racist discourses and discrimination through

bureaucratic processes and institutional logic. Access restrictions in the education sector, labor and housing market disparities, discrimination in the healthcare system, and instances of prejudiced and racist profiling by the judiciary and police are grounded in these structural realities (Bühl 2016, pp. 227). The media play a pivotal role in disseminating racist discourses, wielding substantial influence on public sentiment through racist language and reporting. This influence extends to other social and state institutions, perpetuating racist discourses within everyday communication.

New configuration of racism in the neoliberal era

To comprehend the nationalist inclinations within diaspora groups, it is imperative to scrutinize racism and discriminatory social relations within the contemporary European framework, elucidating the role played by (proto-)fascist European parties. Racism, historically fashioned as both an ideology and a tool for legitimizing prevailing power structures, is intricately linked to historical conditions. The choice of which group becomes the target of racist exclusion, the underlying purpose, and the defining characteristics of a “race” or “ethnicity” are outcomes of historical determinants (Miles 2000, p. 27). Despite historical continuities, understanding racist relations necessitates an examination within specific historical and social contexts. Analyzing economic conditions, political strategies, and ideological elements that underpin the racism in question is crucial (Müller 2017, p. 106). The term racism gains its concrete meaning in its plural form, comprehensible only within its historical context (cf. Hall 2000, p. 11). Contemporary racism does not replicate what was produced by eighteenth and nineteenth-century “race” theorists; instead, it (re)constructs itself according to the needs of *today’s* neoliberal capitalism, occasionally revisiting and reproducing racist schemata from past centuries.

While acknowledging the historical continuities within racist ideologies, it is essential to recognize that any specific instance of racism is an outcome shaped by the reworking of certain elements from the past and the introduction of novel components (Miles 2000, p. 27). The composition of this configuration, the amalgamation of both historical and contemporary elements into a unified entity, is contingent upon prevailing concerns within specific historical social relations. Étienne Balibar (1992) posits that a new configuration of racism relies on pre-existing schemas of collective memory intertwined with a society’s institutional and cultural history. Balibar identifies colonialism and anti-Semitism as the primary schemas of racism in the European context, serving as the foundation for newer forms like anti-Muslim racism. Activation of these schemas hinges upon a social structure of discrimination economically functional and embedded in the state’s organization. In twentieth-century Europe, this structure was given by the hierarchy of qualifications between “native” and “foreign” workers who were brought from the periphery to the centers. The essential moment for this new configuration of racism, according to Balibar, arises during an institutional constellation of crisis, disrupting the relationship *of* the state to its ideological

foundations and individuals' identity-forming relationship *to* the state (Balibar 1992, pp. 18).

In contemporary Western Europe's post-Fordist, neoliberal transformation, a crisis-induced institutional constellation plays a pivotal role. Globalization and advanced production technology lead to downsizing in the industrial sector, diminishing the demand for traditional labor and intensifying competition within the working class in the capitalist metropolises of Europe. The political-ideological transformation of society according to the interests of capital cannot take place without the involvement of the classes remote from capital. Neither can the change in the technical basis of exploitation strategies, which, in turn, prepares the ground for neoliberal policies by securing the technical and organizational basis of global capitalism (Kaindl 2013, p. 22). Mobilization via (proto-)fascist parties becomes therefore a mechanism for involving classes remote from capital in social transformation. These parties, flexible and creative enough to reconcile diverse interests and reconfigure old racist schemes on the basis of the already existing, economically functional structure of discrimination, find success in mobilizing dissatisfaction with societal restructuring (Marvakis 2013).

The post-war era has given rise to significant societal constructs, namely the welfare state (with its social benefits including publicly funded social work) and solidarity-based workers' organizations, which serve as pillars of social unity. Paradoxically, these entities find themselves in direct opposition to neoliberal ideology, which advocates for minimal state intervention in social wealth distribution. Instead, the neoliberal agenda emphasizes state involvement in societal reform for market-driven purposes through stringent control and authoritative security measures (Schreiner 2015, p. 20). To legitimize this authoritarian security policy, neoliberal parties often resort to nationalist and racist rhetoric. The racist discourse plays a crucial role in justifying the calls to dismantle the welfare state in the name of liberation from "state paternalism" and to weaken solidarity organizations and democratic institutions. This strategy, framed as a battle against bureaucracy and elites, proves successful in mobilizing classes distanced from capital (cf. Schui et al. 1997, pp. 152.; Reimer 2013, pp. 33.). The crisis repercussions and dissatisfaction with societal restructuring fuel demands from below for the "restoration of order" in various aspects of social life. Neoliberal parties exploit alleged increases in crime rates, corruption, or misuse of social benefits, framing them as signs of moral decay or a crisis of authority. This narrative reflects "popular sentiment," providing a pretext for advocating for the extraordinary use of state force and control. Discussions about the 'wasteful' welfare state and the portrayal of welfare recipients as exploiting social benefits and living at the expense of society often incorporate elements of racist schemata (cf. Hall 2014, pp. 117).

Racist discourses in the neoliberal order serve the ideological function of shifting seemingly intractable social problems – including not only the consequences of economic dislocation (unemployment, homelessness, etc.), but also the antagonisms resulting from society's preparation for the free market (contradictory definitions of gender roles, moral contradictions, the crisis of

social institutions, etc.) – to a level where they can be framed as a manageable opposition between “us” and “them.” This translation presents a way to address these problems, seemingly offering a coping mechanism while alleviating the pressure created by social contradictions (Elfferding 2000, p. 43). This racist constitution of meaning provides an explanation for the directly experienced world, prescribing or implying a specific political strategy (Miles 2000, p. 26). The shift or displacement of social contradictions to another level is not an individual endeavor, but is orchestrated by social institutions such as the media, political parties, churches, and others (Elfferding, 2000, p. 43). This discourse, grounded in a vaguely defined, nation-state-bound “Leitkultur” (*dominant culture*), is reproduced by various actors (Völkel 2017, p. 92).

Thus, in social work practice, recognizing that racist tendencies are rooted in real fears is crucial. These fears emanate from a genuine concern about being bypassed by social change and losing agency. However, the solutions sought in racist tendencies are unrealistic, aiming for resolutions where the least resistance is to be expected, such as depriving migrants of their basic rights (Osterkamp 1991, p. 53). Racist discourses grapple with the experience of helplessness in the face of inscrutable social conditions, conveying the illusion of action at the expense of others. This illusory sense of agency is contingent on existing social conditions and implies an agreement with them.

The construction of one’s own group against a “foreign” one, aligning with the existing legal and social order, creates a “dominance culture.” This culture influences the attitudes, feelings, and interpretations of all members of society, viewing “foreigners” as deviations from societal norms due to their “cultural” peculiarities (Rommelspacher 1998, p.22). Racist parties and movements position themselves as guardians of the existing order and values. In essence, one’s “own national identity,” defined abstractly in terms of conformity with certain values and legal instances, translates to identification with existing power relations and a willingness to submit to them. The racist discourse ensures not only the subordination of the interests of the “others” to those of the “own” group, but also the obedience of members of the so-called “majority society” to the state and legal system (Kalpaka & Räthzel 2000, p. 182). On the political level, this discourse echoes in the neoliberal critique of the “incompetent” welfare state and the authoritarian demand for the restoration of order – preferably through a rebellion of lower classes against the existing order, which is, in reality, a demonstration of special loyalty to existing power relations and an attempt to gain agency through submission (Kalpaka & Räthzel 2017, pp. 182; Osterkamp 1996, p. 136).

We must perceive contemporary racism as a systemic construct. Within this system, two groups are delineated and juxtaposed based on the interests of capital and state interventions. One group is mandated to subordinate its interests to the other, while the privileged group enjoys specific rights and opportunities. To maintain these privileges, the privileged group is expected, in turn, to actively endorse this dichotomy by aligning with prevailing power structures. Racist and nationalist ideologies serve as tools to legitimize this conformity. Discriminated groups must forge their own coping mechanisms, strategies for action, and

avenues for resistance, which fundamentally differ from those of the privileged group.

Navigating the impact of racism on individuals

The persistent propagation of a racist discourse often coincides with a systematic denial of structural racism, narrowing the focus to extreme and violent manifestations typically associated with marginalized groups. This dual strategy serves to morally justify behavior aligned with social norms and, concurrently, undermines the foundation for collective resistance among those affected, relegating them to a minoritarian status in their protests (Van Dijk 1992, p. 105; Osterkamp 1996, pp. 158).

Recent events, such as “Black Lives Matter” demonstrations, the assertive stance of young people against racism on social media, and the establishment of organizations, have contributed to a heightened awareness of structural racism, especially among younger generations. However, in Austria, this awareness appears confined primarily to the educated middle class. Among those affected, coping with their situation—being subjected to structural discrimination and facing limited legitimate avenues to combat it due to systematic denial—manifests in various ways. For instance, there is a prevalent sense of general mistrust towards the so-called “majority society” and its institutions. This skepticism extends to the social work in its control function. Individuals encountering racism often perceive the “majority society” as complicit, as racist practices can persist only with the tacit approval of the majority, making the majority’s complicity more critical than overt acts of racism or individual racist statements. Moreover, discriminated individuals frequently find it unclear where social workers stand, questioning whether engaging with this professional group might expose them to further racist experiences. This distrust deepens—rightly so—when social workers inadvertently perpetuate racist or culturalist stereotypes and downplay experiences of racism. Given that this skepticism also extends to other institutions such as the police, the judiciary, schools, and the health system, individuals commonly opt to minimize interactions with social institutions and resolve issues within their own communities whenever possible, to avoid new racist encounters. This withdrawal into “safe spaces” is also observable in private spheres. Such a response to racist conditions is often criticized as the creation of “parallel societies” (*Parallelgesellschaft*), further limiting opportunities for those facing racism to disengage.

Some individuals, faced with relentless racist demands, capitulate in an attempt to achieve “full integration” or assimilation, often in vain. This surrender can result in the normalization of discrimination, either socially (“we are only guests here,” “it is like this everywhere”) or on an individual level (“because I wear different clothes,” “because I do not speak German well enough yet,” etc.). A prevalent form of normalization involves aligning with racist demands and adopting a hostile stance towards other targets of racism. The pressure for complete submission may lead to the hardening of positions, manifesting as

“counter-racism” or the cultivation of a nationalist or religious ideology, attempting to reverse the established hierarchy of power, albeit often idealistically.

Let brothers not fight!

The prevalent nationalist tendencies among migrants, culminating in the 2020 riots in Vienna, should be assessed in the context of the explanations offered thus far and in connection with the actual experiences of young people. Exploring the complex realm of ideologies within diaspora groups, particularly their potential for violence, serves as a focal point for practical pedagogical efforts with young people. While various coping strategies are employed, the retreat into nationalist and racist ideologies poses special challenges, rendering young individuals susceptible to manipulation. A poignant illustration of this phenomenon emerges from the 2020 riots in Vienna, which offer valuable insights into the functions of such ideologies within diaspora groups.

During the upheavals, as youth workers at the JUVIVO.21 youth center in Vienna’s 21st district, we were actively engaged with the events. Monitoring social media posts of the center’s visitors, contacting young demonstrators, and later incorporating the discussions into the center’s activities became integral aspects of our involvement. Subsequently, in 2021, we collaborated with young people from the center on a video project¹, drawing from a co-worker’s B.A. thesis, which explored the experiences of three young individuals connected to the riots (Gutschelhofer 2021). In this thesis, interviews were conducted with three young individuals, who were either actively involved in the riots or expressed a desire to participate, but were prevented by various reasons. Two of them identified as Turkish nationalists, while one considered himself aligned with Kurdish activists. One of these Turkish nationalist youths also participated in the video project. Furthermore, the project involved two other young men who, at the time, identified themselves as being affiliated with the Grey Wolves.

Based on the interviews and the young people’s experiences, a script was collectively developed. Throughout the process, the participants engaged in profound reflections on their motivations. A four-minute film was subsequently produced in collaboration with a skilled filmmaker, in which the young individuals actively participated, assuming leading roles. The video was shared on various platforms including TikTok, Instagram, and YouTube, and it was presented publicly. Besides participating in the public presentation, the young contributors also granted interviews to major newspapers. To make the film appealing to a wider audience of young people, elements of youth culture, including youth-friendly language and emotional scenes, were highlighted.

The video project is divided into four segments, with the initial part serving as a trailer. In the second segment, Atilla, a Turkish teenager, spends time in a

¹ The video project is a cooperation of the youth center JUVIVO.21 and bOJA (Bundesweites Netzwerk Offene Jugendarbeit); it can be accessed with English subtitles on the YouTube channel “Bro&Kontra” at https://www.youtube.com/watch?v=tkmt-dwXpWY&ab_channel=Bro%26Kontra

park with his two friends. The news, circulating through social media, reveals that a Kurd has allegedly removed the headscarf of a Turkish woman during a demonstration, prompting a call for a gathering in Vienna's 10th district to protest. The young men decide to join. Witnessing the massive demonstration, Atilla feels an empowering sensation, akin to being the "boss of every Turk." However, conflicting thoughts arise as he remembers his mother's words: "Let brothers not fight against each other!"

In the third part, Atilla acknowledges the empowering feeling, but admits he fears potential violence. Despite the urge to leave, his pride prevails, and he decides to stay, worried that avoiding participation might result in exclusion. As they reach the top of a hill, tensions escalate, but older Turkish men intervene, advising them to return home, emphasizing that "enough is enough." Out of respect for the elders, the young men comply and exit the demonstration. Up to this point, the script draws from the actual experiences of the young men. The last part of the movie is a creative addition by the young men for dramatic effect.

In this concluding segment, the trio encounters a Kurdish boy on the street wearing a balaclava like the others, and assume he is the one responsible for the headscarf incident. Although Atilla is no longer inclined to engage in violence, his friends continue to egg him on, and eventually they succeed. After Atilla confronts and assaults the Kurdish youth, the young man removes his balaclava, revealing himself as a close friend of Atilla's; the two grew up together "like brothers." Atilla questions the sense in their conflict, pondering, "why are we actually fighting?" In an additional part, Atilla emphasizes that within his circle of friends, there is no distinction between Turks and Kurds – they consider themselves brothers and vow to resist getting turned against each other "no matter by which side."

The entire video project took approximately six months to finalize. Throughout the process, all three young participants distinctly distanced themselves from the Grey Wolves. Subsequently, in 2022, they collaborated with other young girls and boys from the youth center on another film that addresses violence against women.

Now, let's delve into some of the outcomes and results yielded by this project.

The notion of imaginary power: Understanding long-distance nationalism among diaspora youth

It's important to recognize that nationalist sentiments are not exclusive to Turkish youth in the diaspora. A perusal of Instagram accounts belonging to various young individuals with migration backgrounds reveals a plethora of self-descriptions such as "proud Turk," "proud Arab," "proud Muslim," "proud Albanian," "proud Kurdish," and more in their bios. While conducting a detailed sociological analysis of the reasons behind the success of right-wing ideologies among young people is beyond the scope of this article, a brief exploration of

Turkish nationalist tendencies among the youth can contribute to understanding the social context of Turkish nationalism in the diaspora.

Children of migrant families face a higher likelihood of being impacted by unemployment and poverty compared to their peers who do not experience racist discrimination (e.g., Algan et al., 2010). They directly contend with institutionalized and structural racism, along with segregation within school systems (Moris-Lange, Wendt, & Wohlfarth, 2013). Originating from traditional working-class backgrounds, they often struggle to acquire the necessary social skills demanded by the neoliberal economic order, facing disadvantages both at home and in schools characterized by segregation. Classical gender stereotypes exert a significant influence, contributing to their marginalization in the neoliberal labor market. These young individuals also keenly perceive everyday racism in political discussions and mass media.

Their apparent disinterest in the politics of the country in which they live often reflects a lack of opportunities for participation and their exclusion from politics. It is precisely in this context that young people encounter a dearth of opportunities for meaningful action, feeling powerless and overshadowed by the privileged. The nationalist ideologies of their families' countries of origin provide them with imagined avenues for action and spheres of influence. Benedict Anderson aptly characterizes these opportunities for action that *long-distance nationalism* unfolds:

The more a diaspora group feels excluded, disregarded, ignored and discriminated against, the more it tends to turn to the politics of its home country – especially when the country is in trouble. Then people start sending Internet messages, making propaganda, sending money, maybe even buying weapons. In rich Western countries, people can do many things that allow them to have a real influence on events at home. There are many diaspora communities whose homeland is in great trouble, torn apart domestically. But the condition for influence is that these people can imagine themselves as heroes, sometimes even heroines. They are fighting on the Internet, not on the battlefield, for their country, for liberation. And that's an entirely different experience (Anderson, 2012, pp. 41).

In this context, it is crucial to differentiate between nationalism and racism against “migrants” and the phenomenon of “long-distance nationalism” prevalent in diaspora communities. As previously underscored, in contemporary Western and Northern Europe's current manifestations of racism, the primary challenge lies in the abstract and conformist nature of one's “own” national identity, characterized by adherence to existing values and power structures. These power dynamics result from state interventions and are not mere constructs; they represent legal realities.

In contrast, long-distance nationalism does not necessitate conformity to the prevailing conditions of the nation-state where the diaspora resides. Instead, it offers an “imaginary” empowerment in an ancestral “imagined homeland” of parents or grandparents, even though individuals in the diaspora frequently experience discrimination in that “home country” as well. Nationalist ideology

asserts a willingness to embrace them as heroes or heroines, as they diverge from neoliberal society's expectations to acquire new social skills and develop "acceptable" coping mechanisms for their experiences of discrimination -given the reduced demand for cheap labor- in order to find a legitimate place in society.

Nationalism, in turn, idealizes their traditional way of life, gender norms, and responses to ethnic and social discrimination. Consequently, nationalism proposes that the marginalized group attains a position of power not only over other ethnic groups in their so-called "homeland," but also over the discriminatory segment of the society in the country of residence. Nationalist ideologies often associate the oppressed groups in the "homeland" with oppressors in Europe, creating the illusion of resistance against colonialism, imperialism, or even racism. For instance, it is common to encounter narratives in pro-government Turkish newspapers suggesting that European politicians instigate the Kurdish issue and insinuating that Kurdish organizations may enjoy the support and protection of European or North American governments.

The concept of being "actually" morally superior and the imagined prospect of returning to a "golden age" when one's "own" group held sway over others take precedence over the possibilities of action in the struggle against oppression in the country in which the diaspora group lives – a prospect that may seem impractical or perilous. Therefore, discussions on nationalist ideologies among so-called "migrants" cannot be isolated from the oppression they encounter and the existing power relations. Racism in the privileged sectors of society and the long-distance nationalism of diaspora groups represent two interrelated facets of the same issue.

Similarly, nationalism within the diaspora group is not necessarily synonymous with the nationalism advocated by nationalist parties and groups in the "homeland" for comparable reasons. Long-distance nationalism does not confer real power upon young people in the diaspora over marginalized groups in the "homeland," especially when they lack familiarity with the intricacies of that environment. In many instances, they may lack the social or linguistic leverage necessary to thrive in the "homeland." Genuine power might only be attainable in exceptional cases for individuals who have established robust connections with the "deep state" and are willing to engage in illicit activities on its behalf. In other cases, this power remains illusory and serves solely as a form of strong identification with oppressive groups. This imaginary power proves highly advantageous for the governments of the "homelands," and they consistently uphold it. While the European media may make minimal efforts to connect with migrants, pro-government media in the "home countries" strive to engage diaspora groups through special broadcasts and content. Governments view this as an opportunity to exert political influence and mobilize the diaspora, primarily as a significant source of funding.

Shaping Identity: The Interplay of Nationalism and Identity Formation in the Diaspora

Another crucial aspect is the role of nationalist ideologies in shaping identity. In this context, it is essential to consider not only the social aspects, but also the developmental psychological aspects. Within such a framework, the interplay of experienced ethnic discrimination and nationalist ideology is significant, exerting a profound influence on the identity formation of young people in the diaspora. The following statement of a young person explains his desire not to be considered a member of a discriminated group:

Well, it... with us, so we have, many Turks have complexes with such things. When you say. ‘Yes, you’re just a shitty Turk’ for example, the one who ... I’m one of those who gets upset when you say that, not from the point of view that I’m really a shitty Turk, but I don’t see myself as a Turk, but I see myself more as an Ottoman (Gutschelhofer, 2011, p. 23).

The inclination to identify as Ottoman may stem from a desire to escape the subordinate role associated with being a discriminated “guest worker” and instead assume a dominant position.

These notions of identity serve a practical purpose in daily life. Faced with constant discrimination, young individuals seek refuge by carving out niches in society where they are free from racist prejudice. Nationalist ideology plays a crucial role in binding these communities together. When a group shares the same nationalist beliefs, it ensures a sense of solidarity and understanding among its members, eliminating the need for constant explanations or justifications. In an interview as part of the video project, individuals who have distanced themselves from the Grey Wolves elaborate on the role of nationalist ideology in the formation of such groups:

“At the age of 13, everyone was a Bozkurt” [Grey Wolf, S.B.], Cengiz says. “But then you have no idea what that means either,” he says. For him, it simply meant being Turkish. “If I met someone, and he was also a Bozkurt, then it was easy: It’s ok. One word and you were friends,” Cengiz says. The two other boys nod as he says this. In the meantime, they know how wrong that is. “We all had abis [elder brothers, S.B.] who enlightened us at some point,” Atilla says. “Only children support the Bozkurt. And too much national pride is not good either.” (Küçüktekin 2021).

In the context of everyday conversations in youth work, it is frequently observed that young individuals identifying with the Grey Wolves and displaying far-right symbols possess limited knowledge about the Grey Wolves or the MHP. For them, the term “Grey Wolf” is used interchangeably with “proud Turk.” In these instances, the name and symbolism serve a distinct function in shaping identity and fostering a sense of group belonging within the diaspora.

Youth Cultural Dynamics: A Closer Look at Right-Wing Ideology's Allure

Youth cultural elements constitute a significant aspect, with the action-oriented nature of right-wing ideology proving particularly appealing to the younger demographic. This allure is evident in various cultural expressions such as popular TV series, Hip-Hop music, and numerous contemporary video games. These cultural media often glamorize a perilous lifestyle characterized by intense action, confrontations, and skirmishes, fostering an environment that resonates with the adventurous spirit of young individuals.

A young person in Favoriten explains in the following way why he participated:

“I was bored,” Cengiz recalls of June 25, when he got a message on his cell phone. “A Kurd pulled down a sister’s headscarf. Come all Reumann” [Reumann Square in Favoriten, S.B.]. “I thought: it’s ok. Action. I’m in!” says Cengiz. For the 17-year-old, it sounded like fun (Kücüktekin 2021).

A considerable number of participants remain unaware of the genuine motivations behind the riots in Favoriten. Young individuals, influenced by various rumors circulating through social networks, spontaneously chose to join the events. Beyond the element of enjoyment, the sense of belonging to a group holds significant sway in their participation. Reasons frequently cited by the youth include the reluctance to let down their friends (Gutschelhofer 2021, p. 24) and the desire to maintain a positive image within their peer group (Kücüktekin, 2021). The involvement of individuals from diverse ethnic backgrounds, such as Turks, Afghans, Chechens, Bulgarians, Pakistanis, etc., in the Favoriten riots can be attributed to youth cultural factors like loyalty to the peer group, a thirst for action, and an attraction to a perilous lifestyle. This confluence underscores that the attackers represented a mixture of young people from various ethnic origins, united by shared cultural inclinations.

Preventive Measures Against Nationalist Ideologies

The three dimensions of nationalist ideologies—imaginary power against oppression, identity-forming function, and youth cultural aspects—hold significant relevance in the context of preventive youth work. As previously outlined, young individuals can align themselves with the Grey Wolves and adopt their symbols without engaging in a formalized structure or possessing in-depth knowledge about the ideological background of the Grey Wolves. Both right-wing groups and entities associated with the Turkish “deep state” often target such youth for recruitment, as these individuals, perceived as heroic figures, bring with them a predisposition to manipulation and a willingness to employ violence. However, it is crucial to note that not every young person identifying with the Grey Wolves or their symbols is necessarily an organized and ideologically driven fascist.

In the context of preventive youth work, it is imperative to engage in reflective discussions with young people regarding the illusory avenues for action presented by nationalist ideologies. The ideal approach involves replacing these imaginary prospects with tangible opportunities to combat discrimination and oppression within the local context. A fundamental stance in this work is to genuinely acknowledge the experiences of discrimination faced by young individuals and to establish inclusive spaces for open discussions on these experiences, fostering the exploration of potential collective strategies for action. Preventive efforts should extend beyond addressing everyday racism to encompass a critical examination of structural and institutionalized racism as inherent social realities. It is essential to challenge not only the behaviors of those experiencing discrimination, but also to scrutinize the role of the nation-state and its legal interventions. Taking a stand for the oppressed serves a dual purpose—it strengthens one's capacity for action and serves as a positive role model for others within the community.

Nevertheless, in the realm of preventive work, meticulous attention must be dedicated to preventing the reproduction of prevailing power imbalances, especially between adult "European" youth workers and young individuals from migrant backgrounds. The approach should be characterized by equality, occurring at eye level and rooted in the specific interests and needs of the young people involved. Youth work in this context assumes a role of solidarity and support, diverging from a traditional "educational" stance that may inadvertently perpetuate power dynamics. Instead, the emphasis lies on fostering a collaborative environment where an exchange of experiences can occur both among the young participants themselves and with those engaged in youth work. This approach aims to facilitate mutual understanding and create a space for shared learning and growth.

Engaging in collective discussions on the intricacies of identity formation and actively reframing nationalist narratives are other crucial components of preventive work. The challenge does not lie in the fact that a group of young individuals identifies themselves as Turks, as this identification is predominantly externally defined. The true concern emerges from the construction of their Turkish identity through the marginalization of other groups.

The process of reframing presents an opportunity to preserve group identity without succumbing to nationalist narratives. For instance, one can take pride in being a Turk without aligning with the Young Turks responsible for the Armenian Genocide of 1915. There exists the possibility of embracing Turkish heritage by identifying with individuals who opposed the Young Turk policies and demonstrated solidarity with Armenian civilians. This approach encourages a nuanced and inclusive perspective on identity, fostering a sense of pride rooted in shared values rather than divisive historical events.

Preventive work extends to addressing the cultural aspects of youth. This involves recognizing the significance of the enjoyment factor, approaching the topic with humor, and providing alternative enjoyable activities for young individuals. Continuous dialogue with young people, staying informed about youth culture, and actively engaging with the latest trends in music, media, and

social networking are vital components of prevention work. Open conversations about friendship styles, relationships, and life concepts contribute to creating a supportive environment. In this context, it remains crucial to critically examine and challenge nationalist and patriarchal narratives, assisting young people in developing their own life concepts and friendship styles that align with their current interests. The fundamental pillar of preventive work lies in adopting an interested, stance-taking, open, needs-oriented, relationship-building, and solidarity-based approach. However, it would be counterproductive for prevention efforts to hastily draw conclusions without first comprehending the genuine reasons behind young people's actions.

Critical Reflections on Social Work in the Context of Racist and Nationalist Ideologies

In conclusion, I would like to share some reflections on anti-racist social work. These considerations hold significance not only due to their practical implications, but are also imperative for the very survival of the social work profession. The connection between social work and racism extends beyond providing support to those impacted by racism or working with individuals susceptible to racist ideologies.

The neoliberal narrative, infused with racist and nationalist ideologies, establishes a paradigm where a group's right to existence is contingent upon its performance. This perspective grants social work legitimacy only in its role as serving the activating state. In this framework, the state views social benefits purely as a transactional arrangement, compelling social work to focus on disciplining individuals to proactively seek employment. Consequently, the sense of solidarity within society diminishes, transforming social work into a tool for enforcing discipline and control dictated by the capitalist market. The emphasis on individual subjectivity and advocacy progressively takes a backseat, yielding ground to administrative logic and the burgeoning demands of the market (Seithe 2010, p. 200; Thoma 2016, p. 61).

As political subjects, both in their theoretical frameworks and through their practical applications, social workers not only (re)produce social relations, but are also active participants within these very relationships and inevitably shaped by them. Consequently, their concern should extend beyond expanding clients' possibilities for action to encompass their own constrained possibilities within the neoliberal system. The foundational choice of social work practitioners to engage in social work institutions is intricately linked to whether they acknowledge their own limitations and are content to function as agents of activation, discipline, and control for the market, thereby (whether consciously or unconsciously) perpetuating discriminatory conditions. Overcoming this restrictive mindset aligned with existing social relations requires recognizing one's position as a political subject. This recognition transcends social workers merely advocating for their clients due to a presumed high level of professional ethics or inherent "goodness." Instead, it involves acknowledging that the

neoliberal system is actively undermining social solidarity. This system is steering social workers, in their professional practice, towards a controlling function at the expense of their aiding role, while also subjecting them to precarious conditions as wage workers. However, social workers can emancipate themselves from this system by realizing that their interests fundamentally align with those of their clients. Both social workers and their clients must collectively develop possibilities for action within and against the neoliberal system. Social work cannot evade scrutinizing the internal connections between prevailing racist ideologies, which seek to fragment and desolidarize society, and the transformation of its own professional image according to market demands. It is crucial to bear in mind that, while the neoliberal system restricts possibilities of action, it also undeniably opens up new fields and opportunities for action. This transformation affects not only the structures and forms of social work, but also its content, problems, target groups, and themes (cf. Marvakis 2016).

A crucial aspect of this analysis involves dedicated reflection on the theories that underpin social work practice, even if practitioners are not always consciously aware of them (Holzkamp 2012). Central to such reflection would be the transformation of the conception of humanity and society within the realm of social work. This is particularly significant because the neoliberal, activating welfare state, with its portrayal of individuals emphasizing self-responsibility, necessitates the individualization of social issues and advocates for a form of social work that is both individualized and depoliticized.

To comprehend and address racism effectively, social work must initially scrutinize the functionality and significance of racist schemas, taking into account the structures within which individuals operate (Kalpaka & Rätzkel 2017, pp. 23.). Emphasizing social relations and the social mediation of individual issues, as noted by Osterkamp (1991, p. 58), does not imply absolving individuals (including social workers) of the responsibility for their racist behaviors. Instead, it suggests that these behaviors can be dialectically transcended as potential courses of action within the framework of evolving social conditions and the circumstances of perceived helplessness.

This intricate interplay between social structures and individual actions demands a particular focus from social work. It necessitates a thorough examination and reflection on social work's own participation in existing social relations, as well as its alignments with the prevailing mode of production and configurations of power. A precise analysis of social work's dual role - as both help and control - aids in differentiating instances of resistance from those affected by racism, even when such resistance might not be immediately apparent – consider, for instance, the public wearing of religious symbols like a headscarf. In such a scenario, imposing one's own models of emancipation onto others as a universal standard and, for example, problematizing submission to religious or patriarchal authorities, entails a certain alignment with the existing power structure. The power structure does not demand that subjects emancipate themselves or submit to non-patriarchal authorities; rather, it dictates submission to the instances within the existing constellation. Consequently, the issue at hand is not submission in itself, but submission to the 'wrong' authorities. Hence, it is

crucial for social work to dissect power constellations in relation to its own actions to genuinely grasp the emancipatory moments within the target group (cf. Kalpaka & Räthzel 2000, p. 188). A headscarf, for instance, can symbolize submission to patriarchy and *simultaneously* serve as a form of protest, a resistance against racist discrimination, highlighting one's divergence from the colonialist through personal appearance.

Effectively addressing racism within the realm of social work requires a comprehensive approach that incorporates racist discrimination as a foundational social structure in the analysis of individual and societal issues, as well as within the framework of its own activities. This entails honing a discerning perspective that identifies instances of both arrangement and resistance among those involved, including social workers. Just as the young people's embrace of long-distance nationalism can be viewed as an alignment with power relations in their envisioned "homeland" and simultaneously as a resistance to power relations in their current locale, the rejection of any nationalist ideology per se by youth workers may also serve as an alignment with existing power structures. Confronting this complexity necessitates a commitment to learning from young people, adopting a stance of solidarity that avoids premature conclusions, and instead collaboratively exploring the motivations behind the actions of young people. This approach involves a critical analysis of both their motives and one's own reasons for action.

Society – racism – psychology(critique)

Athanasios Marvakis

Abstract

In approaching social phenomena like racism, psychology shows great interest in the individual, but also lures the individual into a trap: although social phenomena like racism are first and foremost moments in our societies' dis/order, the social possibilities and impositions on individuals are left out and the subjective functionality of racism for individuals' action also remains unnamable. The action-theoretical approach proposed here opposes psychology's prevailing *modus operandi* towards social phenomena, which works with dichotomies (e.g., normal vs. deviant). It also goes beyond the tunnel-vision on individuals that assumes that the expert is an uninvolved codifier of normality, evaluator and judge of subjects. In this context, a first task of a (critical) psychology is the critical reconstruction of prevailing concepts and terminologies – explicitly also those created and used by psychologists themselves – with all their connotations about and orientations toward society, the individual and their mutual relationship. A second task necessitates the clarification of different subject positions, interests within the concrete social fabric, aiming at making them intersubjectively, politically communicable and negotiable; not as (allegedly neutral) assessor vs. client, but as political subjects in a struggle about the nature and future of the societal order and the allocation of social resources herein.

Keywords

action-theory, political orientations, racism as orientation, critical psychology, political grammar

Our programme must be: the reform of consciousness not through dogmas, but by analysing mystical consciousness obscure to itself, whether it appears in religious or political form.¹ (Karl Marx 1844, Letter to Arnold Ruge, MEW 1, p. 346)

I. The discomfort with psychological culture

Not so long ago, the term 'racism' was used rather reluctantly in the German academic landscape. Something so grimy was confined to the brief period of Nazi Germany ... or maybe to circumstances in other countries; at the time, often South Africa. If at all, in Germany, racism existed only among a small minority of die-hards; it was a phenomenon at the 'margins of society'- and thus not particularly relevant. In recent decades, one can observe a veritable multiplication in the usage of the term, usually employed with the help of a hyphen to refer to different affected groups: anti-black racism, anti-Muslim racism, etc. However, the multiplication in usage has not been accompanied by the necessary theoretical clarification by the social sciences. Thus, the use has remained rather random and arbitrary - and it merely follows certain (disciplinary) 'conventions'.

In and around psychology, it is customary to start from the apparent 'near space' when reconstructing social phenomena like 'racism' (or other unpleasant -isms, such as nationalism, right-wing extremism, etc.), i.e. to start from the individual and their 'inner life.' Terms such as 'prejudice', 'bias', 'stereotype', etc. demarcate this 'near space.' However, this common practice in psychology does not only express its explicit interest in the individual. On the contrary. This 'near space' is usually never again exited or surpassed, neither in theory nor in other psychological practices. And thus the 'near space' turns from an initial interest in the individual, to a final stage, a trap for the individual. In the glare of the psychological spotlight, social possibilities *and* impositions on the individuals disappear.

In the following, I would like to clarify my discomfort with this prevailing psychological culture in four steps. In doing so, I want to explore the possible functions and functionalities of racism – as our example of a social phenomenon - from three different perspectives:

1. Racism from the perspective of society

In our societies, 'racism' is first and foremost an expression of social/societal dis/order. Several structural contradictions organize the fabric of our societies along lines of belonging to class, gender, 'race' (colonialism), etc. Racism is hereby first and foremost a (pre)condition for individual action.

2. Racism from the perspective of concrete subjects

¹ „Unser Wahlspruch muss also sein: Reform des Bewusstseins nicht durch Dogmen, sondern durch Analyse des mystischen, sich selbst unklaren Bewusstseins, trete es nun religiös oder politisch auf.“ (https://www.marxists.org/archive/marx/works/1843/letters/43_09-alt.htm)

However, racism also has a subjective function or functionality for individuals, since it contributes to the anticipation and orientation of individual action within the conflictual societal dis/order.

3. Racism from the perspective of psychology

In this societal nexus, psychology has also been involved - now for over 100 years - as an assessor of normality. This specific disciplinary conceit is no accident; quite the contrary. Since the beginning of the 20th century, the dominant, dichotomizing view on social phenomena such as racism, has served, uncritically, psychology's position in the 'historical deal' between (societal) power and the social sciences: servitude, servility for the promise of (or only the hope for) compensation and prestige.

From here we can deduce some tasks for a critical psychology: a) Identification of positions and interests of individual subjects in the nexus of the historical structural conflicts in our society and the distinct possibilities *and* restrictions for individual subjects within these positions. b) (Disciplinary) Self-reflection also about the entanglement of psychology in this nexus by means of the (theoretical or practical) tools used, i.e., the concepts and technologies/practices applied. Only this self-reflection will enable us to identify the respective 'political orientations' within these structural conflicts and social positions and make them negotiable for the subjects involved, not from the position of an '*assessor vs. client*', but with mutual respect as political subjects.

II. The perspective of society: racism as a (pre)condition for individual action

In societies as we have come to know them historically so far, *racism* is - first and foremost - an aspect, an expression of social order, or rather: of societal disorder. The dynamic fabric of our societies is riddled with structural contradictions. Through 'belonging,' 'affiliation' with, or better: through allocation to, class, gender, 'race' (colonialism), etc., our societies are organized in a hierarchical and contradictory grid, an 'order,' in which individuals must develop and realize their actions. And it would be most surprising if such contradictions in social reality did not encounter inconsistencies and contradictions in the individual consciousness (Thomas Barfuss, 2002, talks about 'bizarre consciousness').

Racism - as a historically concrete social phenomenon - owes its existence and functions to the development, the dynamics, and the struggles in our societies.

However, the capitalist 'penetration' of society, of the world, does not affect everyone and everywhere, nor in the same way. There was never and nowhere (only) one, possibly dominant, way of working, living, and desiring that would have applied to everyone - neither within a 'single' society, nor 'internationally.' Not all (social groups of) people live in the same historical Now - with the same opportunities and impediments for individual subjects!

International dynamics shape capitalism and individual societies as neither static, nor 'national,' or homogeneous. Capitalism is an international system. This can only mean that 'society' cannot simply refer to a single state or a single 'nation.' Rather, societies are geo-political spaces that enter unequal international relations with respective centers and peripheries (a "pecking order" - I. Wallerstein). Thus, even neoliberalism - as the latest form of capitalist organization of our societies - is different in capitalist 'core' countries compared to the 'peripheries.' In its dynamics, capitalism integrates geo-political, social spaces, people, resources, and forms of living into the capitalist nexus of utilization, into capitalist reproduction. For this purpose, at the latest since the beginning of the 20th century, 'useful' knowledge from social sciences has also been in demand for 'governmentality,' i.e., for the support *and*, at the same time, the control of the population.

The *structural contradictions* - such as racism, sexism, classism - constitute, but also create multi-layered relations of domination and produce different political subjects, who struggle about the social dis/order and for access to social resources. The relationships of such political subjects to each other shape societies historically and geo-politically. Any geo-politically particular psychology also depends on these encounters and confrontations with structural contradictions - in at least three fields: as scientific subject matter, as academic discipline, and as professional work.

In the context of this chapter, these brief references to social dis/order mean simply that racism is first and foremost a *pre-condition* for the actions of individual subjects. By necessity, the individual subjects always act *in* or *from* their particular position and situation within the hierarchical and contradictory social fabric. Without a conception of society, including a prospect to change or overcome it, there can be no reasonable discussion about racism. Only with the perspective of a society with equal access to social resources, goods, and opportunities for all individuals does it even make sense to address racism (in theory or/and in practice).

As I see it, moralistic rants by social scientists as experts about or against racism, even if critically motivated, are not *scientifically* wrong in a specific way - which would mean they could be revised and corrected. Rather, this kind of critique is helpless; ultimately, it demonstrates precisely the helplessness of any *abstract* criticism. It might even contribute to the justification of existing racism through the psychologization of social phenomena - whether intended or not by the individual social scientist, the 'expert'!

III. The perspective of the subjects: Racism as an orientation for/in individual action

For the *second* step, let us change our angle and adopt the perspective of the subjects. Here, an action-theoretical viewpoint offers us the possibility of tracing subjects' 'benefit,' the subjective functionality of racism for individual action, without limiting it to some kind of 'deviation.' To summarize it in one sentence:

Racism (or anti-racism) is *one possible* orientation for the (theoretical and practical) actions of subjects. Racism gives individual action a *specific* direction and alignment.

The basic model of action

To make this comprehensible, we need some space to elaborate² - starting with the psychological components of 'action', which Gerhard Kaminski describes as follows (1981, p. 95f.):

... An activity designated as 'action' leads over a period of time towards a state which can be regarded as a 'targeted state.' If the activity is to be *oriented* towards this final state, this state must, before it is realized, already be somehow available as a *representation*, as an anticipation with which the activity must be *comparable* in its *intermediate results*.³

Kaminski distinguishes two logical stages in an action:

The functional whole of an action is, roughly speaking, divided initially into two sections, a *realization section* and an *orientation section* serving the preparation for realization. Both sections are conceived as 'laps,' functioning as a feedback loop (1981, p. 107).⁴

These two "functional sections" are not disconnected from each other; rather, they are interconnected by agents of decision-making that decide whether the 'loop,' in which the action is presently located, can be continued or whether it is necessary to switch to the respective other functional circle or aspect (ibid.). The anticipatory and aligning moments, as discrete 'functional sections' of action are delineated with the term *orientation*. All dimensions referring to the content (such as needs) and all functional aspects (such as cognition, emotion, motivation) of the psychical activity can be valuable for anticipation and alignment - the 'orientational fundament' of action - and can be used for it.

Let us start with a simple example to reconstruct the orientational activity:⁵

A scientist has arrived at the main railway station of city X and initially follows the signs 'To the exit.' In the concourse, she finds herself confronted with an abundance of advertising slogans, interspersed with 'pictograms' and various informational signs, among which she first searches for indications for public transport, taxis, etc. She ignores all unimportant script, pictures, etc. and tries to

² For a systematic and contextualized presentation see Marvakis 1996.

³ "... Eine als ‚Handlung‘ bezeichnete Tätigkeit führt über eine Zeitstrecke hin zu einem Zustand, den man als ‚Zielzustand‘ ansehen kann. Wenn die Tätigkeit sich an diesem Endzustand orientieren soll, muss er, bevor er verwirklicht ist, schon irgendwie als Repräsentation verfügbar sein, als Antizipation, mit der das Tätigsein in seinen Zwischenergebnissen zu vergleichen sein muss."

⁴ "Das Funktionsgesamt einer Handlung wird, grob gesehen, zunächst in zwei Abschnitte aufgeteilt, einen Realisierungsteil und einen der Realisierungsvorbereitung dienenden Orientierungsteil. Beide Abschnitte sind als ‚Schleifen‘ konzipiert, funktionieren regelkreisartig." (1981, p. 107)

⁵ The example is taken from a textbook on perceptual psychology; Stadler et al. 1975, p. 207.

take in only the information that is relevant to her at that moment. Once she has arrived at her hotel room, she will study various brochures from the local tourist office, the city map, and other writings in order to familiarize herself theoretically with the city. Here she builds a first, very abstract and provisional, 'operative system of representation' that will later serve her as tentative orientation during a first walking tour of the city, and which will be simultaneously concretized, verified, and filled with sensual data and knowledge.⁶

In this example, we are dealing with an individual and a finite 'problem' for action. 'Orientation' here means the immediate alignment (of action) with a given, known and unmistakable 'outcome' (in our example also literally). In the railway station, the meanings relevant for orientation, being societally produced offers for orientation, are universally 'plausible,' and so there is no need for further problematization. Any potential problematization here would have the aim of increasing the efficiency of the orienting signals and meanings; for instance, if the signs were found to lead too many people astray instead of to the exit.

If, however, human actions were limited to such individual (eventually also inter-active) and unproblematic action performances (*Handlungsvollzüge*), the scope of the 'orientation section' in the "functional whole of action" (Kaminski) would remain curtailed. Lest we miss our topic - racism -, we must extend the 'basic model of action' as described by Kaminski. In societal conditions, orientation is not characterized by a quantitative increase in formal complexity, but by a series of qualitative changes that assign new character to action and its orientation.

Orientation in the nexus of activity and the division of labor

In its elementary form, *orientation* signifies the anticipatory and aligning moments in the "functional whole of action" (Kaminski). However, within societal life, the (re)production of the "functional whole" attains a different quality. Here, it is part of a cooperative context of activity based on the division of labor, which neither begins nor ends with the beginning or end of an individual action. The individual subject can neither sensorily 'grasp' nor 'perceive' this collective, societal context with its reliance on the division of labor; rather it must be 'thought.' This 'invisibility', 'inconceivability' of the

⁶ "Eine Wissenschaftlerin ist am Hauptbahnhof der Stadt X angekommen und folgt mit ihrem Gepäck zunächst einmal den Schildern ‚Zum Ausgang‘. In der Bahnhofshalle findet sie sich einer Fülle von Reklamesprüchen, eingestreuten "Piktogrammen" und verschiedenen Hinweisschildern gegenüber, in denen sie als erstes nach Hinweisen auf öffentliche Verkehrsmittel, Taxis usw. durchmustert. Hierbei übersieht sie alle unwichtigen Schriften, Bilder usw. und versucht nur die für sie jetzt gerade relevanten Informationen aufzunehmen. Hat sie einmal ihr Hotelzimmer erreicht, wird sie verschiedene Prospekte des örtlichen Verkehrsbüros, den Stadtplan und andere Schriften studieren um sich so mit der Stadt zunächst einmal theoretisch bekannt zu machen. Hier baut sie ein erstes, sehr abstraktes und vorläufiges operatives Abbildsystem auf, das ihr später bei einem ersten Rundgang zur versuchsweisen Orientierung dient und das dabei gleichzeitig konkretisiert, überprüft und mit sinnlichen Daten und Wissen gefüllt wird."

societal context of activity has as a first consequence the fact that orientation *within* it can only be 'thought' through *concepts* of this abstract societal context.

The distinction between orientation of action in a 'narrower' (our basic model) and a 'broader' sense (within the societal context) necessitates a qualitative extension: Orientation in the 'broader sense' no longer refers only to an individually accumulated 'stock of orientation'; rather, in the superordinate nexus of activity within society, the 'stock of orientation' means something completely new and qualitatively different. Any discussion about the orientation of individuals' actions thus must be a discussion of the *concepts* used for/in their orientation. More precisely, it must be a discussion of the implicit and explicit *premises* and *consequences* inherent in the concepts used for the 'thinking' of the societal nexus of action - including all possibilities *and* restrictions of these orientational concepts. In these discussions, 'my' concepts, which may lead me to criticize 'your' concepts, are just as much under scrutiny as yours, i.e., they must be substantiated and grounded in the same way. In such discourses, there is no - supposedly scientific - 'standpoint above' the concepts being used, criticized, or justified. Rather, there is a constant obligation to convince each other and a demand for inter-subjective - political - dispute about the respective premises and consequences behind those concepts, with all their possibilities *and* restrictions, together with their implicit constructs of humanity and society.

Because of the existing division of labor within the societal nexus of activity, individual orientation is no longer simply an individual, psychic activity. Individual actions can serve the collective need for orientation or vice versa, collective actions can serve individual orientational needs. Within the societal nexus, action is no longer limited to individual actions, therefore orientations can also no longer be limited to individual orientations. Out of the necessity for individual orientation within collective activity arises the question about the relationship between *individual* goals/interests and *collective* goals/interests. A clarification of this question is important lest the *motivation* of (individual) action be conceptually confined to *internalized coercion*, and (individual) orientation be restricted to an *adaptation* to given social orientational meanings. This 'problematic' relationship between individual and collective goals/interests obliges us to see the new way of relating between *individual* subjects and *societal* orientational meanings, which necessitates and relies on a subjective, agentive reference by the individual subject to the meanings of societal orientations.

The new societal activity nexus, based on the division of labor, also leads to the explicit *production* of orientation, more precisely, the production of orientational meanings. The superordinate activity context produces '*orientation guidelines*' or '*tools*' that are available to the individuals. Now, I, as an individual, can draw on relevant guides - even if it is only for my individual orientation. In the process of societal development, historically concrete *orientational institutions* are created, as institutionalized guides for orientation. These can take various forms - including *artifacts* such as dictionaries - as well as *institutions* in the more common sense, such as career counseling, universities, etc., which also function as orientational guides. Nowadays one should not forget to point to the importance of *mass* and *social media* as a societally produced

'orientational guide.' Certain *social arrangements*, too, can work as societal orientational guides, for example the structuring of one's course of life according to generational patterns.

Contradictory orientational meanings and subjective orientations

The societal process of life production is by no means characterized by 'uniformity' and 'harmony' regarding the meanings, intentions, goals etc. that are created in it. Domination and the unequal distribution of power characterize social relations and have consequences for the types and the quality of orientational meanings. It is therefore not surprising that societally produced meanings for orientation are contested and contradictory and convey mystifications about these relations of domination and power. The anticipation and orientation of (human) action must therefore be understood as an *orientation in contradictions*. And such an *orientation in contradictions* is impossible without a reflexive and critical relationship of the individual subjects towards the societally offered meanings for orientation!

Orientations, as societally produced meanings and as subjective orientation, are dually determined or overdetermined. It is important to take this dual determination into account if action is to mean not only *adaptation* to given requirements, but also active *intervention* and change. Actual, subjective orientations do not merely mirror fundamental societal conditions - more or less accurately. Rather, the acts of orientation are also acts of intervention in these conditions. The intervention can be differentiated as either '*legitimizing*'/'*reproductive*' with regard to the given social conditions, or as '*resistant*' and/or '*transcendent*' towards these conditions. Orientation within contradictory societal conditions thus oscillates between two poles: (1) orientation along given social presets and principles and thus reproduction of existing conditions and social order; and (2) orientation in transcending the given, prevailing guides. Klaus Holzkamp is quite clear on this:

In every situation in which the securing or the expansion of life possibilities becomes subjectively urgent for the individual, there is always the alternative: either using the existing possibilities for action within the structured meanings of the immediate life world; or transcendence of immediacy by expanding the availability, the disposition on the objective societal conditions of life; thereby also changing the possibilities for action given in the immediate references of meaning (Holzkamp 1983, p. 398f.).⁷

⁷ "Es besteht in jeder Situation, innerhalb welcher die Sicherung oder Erweiterung von Lebensmöglichkeiten für das Individuum subjektiv dringlich wird, stets die Alternative: entweder Nutzung der bestehen-den Handlungsmöglichkeiten innerhalb der Bedeutungsstrukturen der unmittelbaren Lebenswelt, oder Überschreitung der Unmittelbarkeit durch Erweiterung der Verfügung über die objektiven gesellschaftlichen Lebensbedingungen und darüber Veränderung der in den unmittelbaren Bedeutungsbezügen gegebenen Handlungsmöglichkeiten." (Holzkamp 1983, p. 398f.)

The contradictory nature of societal meanings for orientation also points us to the necessarily emotional evaluation within the orientation of individual action. Such an emotional evaluation is articulated, for example, in reflexive questioning of the relevance of a certain orientation meaning - relevance, though, not in an instrumental rationality, merely for the optimization of the subsequent segment of action. What is essential for the subjective orientation is the (emotional-evaluative) reflection and questioning of the personal 'sense' of the action problem. Our human orientation/action is thus characterized by thinking as problem-*posing* (problem-stellendes Denken), rather than merely thinking as problem-*solving* (problem-lösendes Denken). Human beings do not only 'think on commission' (Auftragsdenken) in the context of 'acting on demand' (Auftragshandeln). Rather, instead of only thinking and acting to *follow* goals, human beings also pursue thinking that *sets* goals (ziel-setzend).

In psychological theories, however, the *emergence* and the *posing* of problems are not problematized or are not theoretically negotiable at all. Due to this conceptual gap, the anticipatory moments in orientation can – according to psychological theorizing - only serve in adapting and optimizing individual orientation *vis-à-vis* (*pre-*)*given* (action) problems. Orientation is conceived as mere *reproduction*. This kind of conceptualizations do not contain constructive, 'transcending', projective, designing aspects – not even as a possibility. The theoretical design is thus formulated *from* and confined *to* the standpoint of societal demands *on* subjects; however, a social/societal 'necessity' cannot and does not automatically result in an individual/subjective 'necessity.'

The differentiation between conventional/reproductive and resistant/transcendent (in social meanings for orientation and concrete subjective orientations) is in no way meant to assess and sort - much less to defame - individual subjects. Rather, it is intended as an enlightening, revealing question to the subjects themselves, to 'me', with the aim of helping 'me' to better decode and comprehend the references to society in 'my' orientations. However, this function is not realized by a theoretical distinction alone. Rather, what is needed is an integrative research-practice-arrangement, in which the researched subjects are not barred from formulating research questions and accessing results. What is necessary are conceptualizations that do not stand in the way of such processes. To be able to gauge the 'usefulness' of the individual methodological steps/components, an overall concept is needed that integrates the relationship between theory, empirical research, and practice. Only the integration of these components into an open '*spiral of theory, empirical research and practice*' can eventually decide their respective 'quality.'

The potential assertion that orientation contains only reproduction *of* or adaptation *to* social given meanings must be an empirically concrete statement. If it is that, the argument itself must be addressed critically towards the very social conditions that demand such adaptation: the situation appears to 'me' to be so immovable or so overpowering that adaptation remains my only 'reasonable' choice for my orientation and action.

Political Orientation

The natural-historical new, human quality of life in a society presupposes *and* creates a new relationship between the individuals and the "self-sustaining societal system" (Holzkamp 1983, p. 485). In this historically novel *societal* space, new forms and qualities of possibilities and necessities for orientation of individuals' action emerge, which we can call *political orientations*. Political orientations, too, must encompass the fundamental characteristics of orientation *sui generis*: they must facilitate anticipation and alignment of action - meaning that political orientations cannot be conceived as more or less faithful or true images of societal conditions. Rather, political orientations retain and express the real relationship between the individual subjects in their concrete societal positions/situation and the superordinate societal conditions - as reflected by the subjects themselves and as mediated through their individual position and subjective experience. *Political* orientations also incorporate the creative, productive aspects of action; in other words, the subjective evaluations are part of concrete political orientations. 'My' political orientations are therefore subjective references to societal conditions; 'my' political orientations articulate 'my' subjective relationship to these societal conditions. From the standpoint of the individual subject, political orientations are perspectival references towards societal conditions, towards society as a 'whole,' be it in the form of 'attitudes', 'value decisions,' or other *premises for action*. The political orientation of 'my' action is based not only on images of the status quo, not only on 'representations of the present,' but also on imaginings for the future. The anticipatory moments of orientation include a stance on where-to society should *develop*.

Concrete subjects have dual options in their references to societal orientational meanings, which must also apply to political orientations. Subjects can either 'accept' given political orientational meanings and 'reproduce' them in their subjective orientations or they can attempt to 'transcend' given social orientational meanings. Concrete reference of individual subjects to political meanings can therefore be 'conventional,' not questioning the socially given, dominant meanings, and thus directing action in accordance and alignment with these meanings. Alternatively, individual subjects can also resist and transcend the dominant societal orientational meanings.

As mentioned earlier, the distinction here between 'conventional' and 'transcending' orientations serves only analytical purposes; it does not describe or judge concrete empirical phenomena. It is important to remember the contradictory nature of (societal) orientational meanings. Individual subjects do not face simple binaries – such as having to choose between 'conventional' and 'transcending' orientations. Rather, political orientations are ultimately orientations within contradictions.

This dual determination of political orientations points us to the problem of the underlying image of society and humanity (Gesellschafts- und Menschenbild): Are political orientations conceived as an expression (as a moment) of a 'fixed', determined development, where they can only be an articulation of 'normality' or 'deviation'? Or are political orientations also seen

as subjectively evaluative and constructive moments towards existing social conditions? Do political orientations merely echo existing societal conditions (as seen from the concrete situation and position of the individual subject), or are societal conditions also ‘constructed’ in/through subjective orientations? Such ‘constructive’ moments point to the *‘future reference’* of political orientations. Political orientations provide answers to questions such as: what should societal conditions be like? In which direction should society develop?

Political orientations also contain subjective ‘settings,’ determinations (Setzungen) in relation to societal conditions. These ‘settings,’ ‘value decisions,’ or ‘transcendences’ do not just appear out of thin air; rather, they are socially mediated in numerous ways. In an empirical investigation of political orientations, these orientations cannot be reduced only to their ‘reproductive’ moments regarding the given societal (orientational) meanings; their ‘productive’ (creative, critical, etc.) aspects must be conceptualized as well. Political orientations of individual subjects emerge always from a relationship between reproductive and productive components. Political orientations – e.g., of young people – can only be reasonably understood if one considers the holders’ concrete positions within the societal structure of social inequality.

If political orientations are *generally* conceived as subjective references to societal conditions, they are simultaneously *specific* references from individual subjects’ concrete social situations and positions, i.e., from their particular positioning in the societal structure of social inequality. These individual, subjective references include both ‘reconstructive’ moments, in which the relevant aspects of society are captured, and ‘perspectival’ moments, in which the captured societal reality is either legitimized or ‘transcended’ towards a certain direction. The aim of pedagogical and political work would be to uncover the dual aspects – eg. in young people’s orientations – so that the ‘subjective movement’ in their political orientations can be more clearly articulated. To take young people’s political orientations seriously cannot mean to merely criticize them about how ‘racist,’ or ‘right-wing’ they are.

In the concrete political orientations of individual subjects, certain aspects of the social conditions are emphasized, while others do not play a significant role. Subjective orientations therefore also signify the selection of aspects of social conditions that are essential for the subjective orientation of action. The fact that a foreign youngster is a foreigner may be important to them at that concrete biographical moment, and they may have a more reflective and critical orientation about this ‘being foreigner’ than another foreign youth for whom gender identity or their status as a student currently appears more relevant. Such subjective selection processes are important especially in empirical research since the respective subjective importance or urgency of certain aspects of an individual’s social conditions cannot be *derived* according to some social theory. In other words, conceptualizations of society are one thing, while empirical enquiries are another, entirely different thing.

Political orientations are not ‘characteristics of a person’ (Personen-Eigenschaften), since they already embody mediations between the societal conditions and the individual subjects through their concrete social position and

experience. Political orientations, therefore, never articulate the *immediate* effects or influences of societal conditions *on* subjects. Rather, orientations are products of a subject's psychological activity in certain societal conditions. Thus, political orientations are already *ways of dealing with reality* as this reality is perceived by the subjects. In individual political orientations, we observe *subjective ways of dealing with* societal meanings and relations. This points us to an individual subject's life story (Lebensgeschichte) and thus to their learning processes as an important background for their current political orientations.

From a different angle, political orientations also represent a subject's 'stance' towards the societal whole, the overall societal structure of social inequality. Importantly, the term 'stance' here should not be understood in a simplified cognitivist way. Rather, in their subjective statements, individuals 'reflect' (and evaluate in their emotions) on their own standpoint within the structure of social inequality; in other words, an individual's political stance is a subjective self-positioning vis-à-vis this structure. Such subjective positioning encompasses the subjects' *perspectivity* as it appears to them and as they design it as a project of their actions. A subject's (political) orientations therefore comprise:

- their own social situation and position in the societal conditions;
- their perceptions of this situation and position;
- their conceptual comprehension of their subjective situation and conditions at large;
- their projection of the societal whole and its development;
- their subjective evaluations of their own conceptualizations;
- the current 'zeitgeist', i.e. hegemonic societal discourses, projects, or 'moods.'

From the subject's perspective, political orientations are not only *re*-constructive, in the sense of merely reconstructing and evaluating their distinct section of reality and the subjective, political conclusions they draw from it. Rather, political orientations also contain *con*-structive moments that create alternative sketches or models of societal contexts. Lest a determinism of societal conditions creep in through the back door, such models must be respected as the subject's active contributions, even though they may not be 'original' in a historical sense. Even young racists or right-wing extremists who might be in the headlines are not acting only *in* or *for* the Now. Racist or right-wing policies and practices also encompass societal models and proposals for solutions on social issues; it just so happens that, from our humanist perspective, their consequences are not acceptable. However, to be able to uncover in the empirical data relevant evidence of these models and proposals, we must first acknowledge in theory and investigate in praxis the potential references to society and the future.

It is barely worth mentioning that individual subjects refer to existing societal ideas, as examples, insights, and context for their own orientations and political designs. One can label the present, dominant discourses as racist, but such labeling does not represent a particularly insightful scientific finding. Rather, it represents a politically normative designation, a political position towards such discourses. It may also constitute a political campaign slogan

(Kampfbegriff) against such discourses - articulated from a position that rejects them because they imply the categorization of people and particular perspectives for the societal future.

Finally, it must be examined whether political orientations – such as racist ones - might not just mirror *real* relations and conditions in the world (and not ‘merely’ discourses *about* such conditions) - however distorted or broken such a ‘mirroring’ may appear in a specific empirical case. Specifically, we must investigate whether such racist, nationalist, ethnocentric positions may just describe observations of existing social relationships between real groups. If, for example, Germans perceive migrants as inferior, this stance corresponds to the reality of the social arrangement between Germans and migrants. It is not a mental construct or evidence of bad intentions by concrete Germans who see migrants as inferior: Not because migrants *are* ‘per se’ inferior, but because, in the very specific societal circumstances, migrants are indeed not equal to Germans. In the framework of *our* societies, racist or nationalist orientations are a perfectly ‘normal’ and ‘successful’, i.e., empirically correct, mirroring of *real* conditions. As Holzkamp observes, certain (political) ‘premises’ between historical groups “are accepted as self-evident prerequisites for action” (1994, p. 49). The ‘individual racist’ in Germany is well aware of the position they occupy in the historical division of the world. Still, they may not have much to say about it, partially because we do not live in social structures where ‘everyone’ (‘every Tom, Dick, and Harry’) is asked about social issues; partially because ‘I’ may simply not have something to say about everything in the world, even if the topic might be relevant for - and powerful over - my life.

Before we switch our perspective and move to our next step, let us summarize the effects of the new, the societal conditions on orientation:

- (Individual) orientation is no longer a purely individual task within the societal nexus of action.
- Societally produced meanings for orientation refer to a societally produced context of action.
- The intangible target called ‘societal conditions’ necessitates that orientation is mediated by (abstract) concepts.
- A reflexive baseline relationship between subject and the societal meanings for orientation is important. When analyzing orientations of individual subjects, the relevant levels of mediation and critique must be reconstructed each time to be able to investigate the respective social reference systems to which concrete orientations are aligned to.
- Within the new societal nexus, contradictoriness is a characteristic of societally produced meanings for orientation.
- For our analysis, we can distinguish between two qualitatively distinct modes of orientation: conventional/reproductive and resistant, constructive and transcendent.
- In our multifaceted action-theoretical understanding, we encounter *racism* on three different levels:
- First and foremost, it is a structuring moment of contested societal conditions/relations.

- Furthermore, we encounter racism in socially produced orientational meanings that are infused into, and negotiated within various discourses or theories about societal relations.
- Finally, we encounter racist arguments and justifications as components of individual subjects' action orientations. However, it is very difficult to imagine the political orientation of subjects' actions as 'easy', 'linear,' or somehow unambiguous. Subjective orientation in contradictory societal conditions is certainly not an easy or smooth affair! Racism is a moment of individual subjects' political orientation of action within their particular social position and situation and in their particular relationship to their world. With the help of racist meanings, subjects take a stance towards societal relations and plan and orient their actions within them.

IV. The perspective of psychology: Racism as deviance?

If we change the perspective on racism once more, we see that psychology, as a kind of collective subject, plays a part in this social nexus in a characteristic way. It becomes evident quite quickly that *social* phenomena such as racism, nationalism, etc., are met with disapproval; often, they are interpreted as *individual* dis-orientations or as individual lack of orientations. Social phenomena, such as racism, are too easily conceived as inadequate reactions, as individual deviations from developmental, cognitive, or social norms and standards. Terms like 'prejudice', 'bias', or 'stereotype' reflect this prevailing logic very well.

We see easily that, in its dominant way of dealing with social phenomena, psychology does not reflect the levels and levers of *mediation* between the overall societal nexus of life and individual action/orientation we have established thus far. Instead, psychology dominantly operates with *dichotomies*, usually 'normal' vs. 'deviant'; however, these are the very dichotomies psychology often creates itself! Additionally, (the discipline of) psychology likes to think of itself as a neutral, above-it-all evaluator of subjects. It apparently considers its special task and competence, its social mandate in demarcating or fabricating standards of normality. These constructed standards are then used to judge individual subjects.

Psychology, then...

- a) assigns individual subjects to discrete positions on a spectrum of 'normality' and 'deviance';
- b) decides on the necessary 'treatment' for diagnosed subjects;
- c) attempts to 'correct' or 'cure' diagnosed subjects;
- d) or goes as far as to propose their total exclusion.

It is, however, necessary to ask to what extent racisms - or nationalisms, sexism, and other social phenomena - can be understood as *deviations* from an ostensibly neutral political-scientific *norm*. Are they not rather *potential* political (*counter-*)*projects* that 'I' – psychologist, researcher - may not like or cannot accept because of *my own* political considerations, value decisions or my

customers' orders? To put it bluntly: Racism is not *false* consciousness, but a *specific* consciousness about the world (it is a certain form of 'world consciousness'). Just as anti-racism is not a scientifically *correct* consciousness, but a *specific* consciousness about the world (a certain form of 'world consciousness'). Both perspectives are based on differing values and competing ideas of how the world *ought to be*!

The disciplinary self-misunderstanding of being a supposedly neutral normality-judge solidifies in praxis the psychologization of social phenomena.⁸ However, this conceit is neither a coincidence nor a mistake of any one psychologist that could be remedied by scientific 'progress' and patient coaxing. Quite the opposite! In the context of psychology's contradictory societal functionality, the dichotomizing perspective on racism represents a very successful 'transfer service' for its application, its practice in society. Definitely, psychologization represents the translation of the disciplinary function of psychology into individual psychologists' praxis.

Since the beginning of the 20th century, the historical arrangement in our societies between societal power and social sciences (like psychology) consists in *not negotiating* the dominant social dis/order, but instead in treating 'it' through individual adaptation and repair, as well as through improvement, transformation, or exclusion of *individuals* (eventually also small groups). The historical 'deal' has since then consisted in the servility, the servitude of the social sciences in serving population politics – in serving "governmentality" to use M. Foucault's term. The services are provided in exchange for, or the promise of, wage labor or social prestige for the individual psychologist (social scientist). The dual societal function of the social sciences in this arrangement with power is best summarized with the catchphrase 'helping *and* controlling'.

V. Psychology's double function: entanglements, subject-positions, and (critical) psychology's interests and tasks

From a theoretical perspective that assigns also to '*non-academic*' individuals (racists or not) the equal ability to hold and articulate ideas about society and individuals, about the world and the future, psychology's scientific problem is not to decide whether it wants to play the salaried referee for the evaluation and judgment of behaviors and opinions of different individuals or groups. There is no special social-scientific task to define a line of demarcation between 'national identity' that is still acceptable and a level of 'nationalism' that must be condemned - even though social scientists usually like to understand their task as just that.

Rather, from our action-theoretical perspective on social phenomena, like racism, nationalism, etc., I see the scientific task for psychology in the reconstruction of the different standpoints, entanglements, interests, positions, and actions towards society, the individual, and the relationship between

⁸ For different levers of psychologization see Marvakis 2022.

individual and society (within the context of international structures of social inequality), and thus in rendering them comprehensible (as far as that is possible). Only such a reconstruction can clarify and justify these (ultimately political) positions - also vis-à-vis one's own clients or customers.

The identification and negotiation of one's own political orientations within the nexus of historical structural conflicts of our society enables us to identify the respective standpoints and interests of the involved subjects, as well as to reflect our own entanglement in this nexus – including, of course, the entanglement of psychology itself - in order to properly conceptualize these discrete entanglements.

The tension between politics and science, between political standpoint and scientific standpoint, cannot be eased by floating the researcher's or (the paying) client's own political stances and decisions above society like trans-historical balloons. Researchers or paying clients – like national bureaucracies or wealthy enough elites - cannot infuse their own assumptions and prospects of society, its structure and its future into theory as some anthropological measuring bars or yardsticks above social reality. Rather, these assumptions are themselves (politically and subjectively) grounded and interest-driven proposals of how the world is and in which direction it should develop. Empirically documented articulations of researched human 'objects' may contain political (counter-)proposals of which the researcher-subject might not approve due to their own (probably) well-grounded political considerations and value decisions. Nevertheless, such (counter-)proposals cannot simply be conceptualized as deviations from the scientist's own assumptions about what constitutes normality – with all the consequences for the 'holders' of the 'deviant' stances.

Even in the case of racism, nationalism, sexism, etc., it is necessary to ask whence 'our' (psychologists') ostensibly scientific-anthropological certainty arises that leads us to consider *disliked* political orientations as *scientifically* wrong. This is even more surprising when we consider that social equality and inequality, the overall societal reference of such -isms, represent only potential, *possible* human societal conditions. Social equality is still much more a future *project* in and for our societies than social reality. Whether orientations of inequality or equality prevail in society is not a matter of the scientific justification of the untenability of one (social) design by representatives of the other; rather, it is a consequence of the political struggle of (societal) opposites and political actors. Thus, the fact that people are nationalistic, racist or sexist in their thinking or actions does not constitute a deviation from some scientific norm simply because the researchers of these empirical phenomena come from a completely different political position. Both racist and anti-racist orientations are designs and concepts for people's social coexistence, and in the course of history, must prevail through collective learning processes (Klaus Eder 1985) or/and through class struggle.

Racism, nationalism, sexism, etc. are structural pillars in our societies, articulating existing power relations. These power relations emerge in political struggles; however, in those struggles, not all participants have to advocate for, nor 'believe' in, racism, nationalism, sexism, etc. Participation in society and its

structures always includes individual, subjective contributions to 'things' - conditions and developments -, but it does not always presuppose that one has a 'personal opinion' about or be an advocate of such 'things.'

The differentiation of racism (nationalism, sexism, etc.), a) as a structural moment in the organization of our societies, b) as a socially produced orientational meaning for us, and c) as an individual, subjective orientation signifies also a new quality for the responsibility held by subjects. If 'I' am responsible for my own (racist, etc.) intentions, motives, and orientations, 'I' am now also responsible for the consequences and effects of my (non-racist) (non-)actions in the superordinate societal nexus of activity.⁹ Consequently, in the societal nexus of life, we are encountering an expansion, a 'de-moralization' (or de-ethicalization) and 'de-psychologization' of subjects' responsibility for action.

Our description of the mediation between the societal nexus of life and individual orientations intends to clarify that racist, antisemitic, or other political orientation is possible - and powerful in society - in individual action, even without sharing any racist, antisemitic or other subjectively grounded orientation. In this action-theoretical approach, 'we' are participating in antisemitism, racism etc. (as structural moments of our societies) without – necessarily – 'advocating' racism, antisemitism, etc. And it is this 'de-psychologization' of subjects' action that is opening up new tasks for social-scientific analysis of political orientations.

Social-scientific analysis is not promoted (solely) by the detection of racist (or antisemitic, etc.) orientations in the subjects and the diagnosis of it as a distorted, stereotypical perception, a 'misperception of interests,' or other individual shortcomings. Rather, the scientific task consists now in surfacing the multi-layered mediations and levers, the '*political grammar*' of our actions and its multifaceted orientational background, so that these orientations can become transparent, conscious and communicable. From the perspective of the individual subjects, the *responsibilities* for their actions are located precisely in these mediations and their respective social *contexts*. What we need is knowledge production that does not bisect individual subjects into objects. Rather, we need to see the researched individuals as subjects who anticipate, plan, dream, and consider - in other words: as acting individuals. As subjects we are neither limited to being deviants from some conventional and powerful norms of functionality nor forced to align with the political positions held by the researcher or their bureaucratic clients.

In summary, the task of (a critical) psychology is to contribute to the reconstruction and critique of the prevalent terminology and concepts with all their powerful implications – *particularly* those employed by psychologists themselves. This reconstruction and critique is interested not so much in the individual subjects and their 'inner life' as in the available and used ideas and orientational meanings about society, the individual, and the relationship between individual and society that are *implied* in such concepts. The relationship between individual and society is not an a-historical, static 'essence' that only needs to be excavated. Rather, the relationship between individual and society,

⁹ This is distinct from the differences between 'institutional racism' and so-called 'individual racism,' which encompasses immediate, brutal forms of social interaction.

itself, is a developing moment of the socio-historical process, in which society, the individuals, and their mutual relationship undergo substantial development and change. It is only through such a process of discernment that we can clarify the various *standpoints* and subjects' *positionings* in the concrete societal fabric and render them communicable and negotiable - not by reproducing blindly the assigned positions of *assessor vs. client*, with all its unequal power differentials, but as political subjects who are engaged in struggles for the allocation of social resources within the soci(et)al order.

Athanasios Marvakis, German educated psychologist (Dipl.-Psych., Dr. rer. soc., both University of Tübingen/Germany), is Professor in Clinical Social Psychology at the School of Primary Education at Aristotle University of Thessaloniki/Greece.

Since 1990, he has teaching and/or research experience in Germany, Latvia, Netherlands, Austria, Croatia, Greece, United Kingdom, Turkey, South Africa, Luxemburg, China, Canada, Denmark, Mexico, Brazil, Chile and North Macedonia.

His interests revolve around the relations of psychology with the various forms of social inequalities and social exclusion (like racism, nationalism, ethnicism, multiculturalism); youth as a social group; refugees and migrants in Greece; solidarity as theoretical and practical issue and tool in the social sciences. In the

last 15 years he is engaged particularly in the critical psychology of learning, the ‘schooling-complex’, and the neoliberalization of the psychological regime.

Gender, Women and Critical Feminisms

Community care, practices of resilience and resistance among women in the *La Araucanía* Region

Alba Zambrano Constanzo & Maria Antonieta Campos Melo

Abstract

Chile is a country with significant social inequalities, largely attributed to an extremely liberal economic model (García y Pérez, 2017). These inequalities are expressed with particular harshness in the La Araucanía region, where human development indicators reveal substantial gaps compared to other Chilean regions. High poverty rates and various challenges related to access to basic rights are prevalent in the region. Women are the main group affected by this situation, especially indigenous women living in rural areas. This happens due to the social structure that places them in conditions of greater social and economic vulnerability, while also leaving them responsible for the care of children, adolescents, and elderly people, thus imposing a high burden on them.

This article analyzes the trajectories of organized women and female leaders of neighborhoods with social vulnerability, and of indigenous communities in the La Araucanía region of Chile. The study identifies the forms that their organization and leadership strategies take in contexts marked by patriarchal and colonial relations, social adversity and violence. The stories of women from urban and rural areas were collected through individual and group interviews, as well as participant observation. From this, life trajectories, social organization, community leadership and empowerment processes were analyzed from the perspective of community psychology and Latin American feminism. From a political approach, power relations in everyday life are analyzed, as well as the relationships established with public policy programs and the local government to claim rights and influence decision-making.

Common mechanisms are identified among women who move from life experiences marked by a lack of opportunities and patriarchal and structural violence, to forms of solidarity organization, mutual support, community care and struggle for their rights. It is concluded that there are forms of community leadership and organization that reflect the legacy of relationships among women, adopting counter-cultural profiles that allow sustaining life and bonds in realities strained by patriarchal and state violence.

Keywords

community leadership, community care, resilience, resistance, resilience

Introduction

Human beings are the most vulnerable and fragile species, requiring interaction and care from others throughout our existence in order to stay alive and develop, especially in the earliest stages. Care is organized socially, involving the family, community and a diversity of institutions, including the State. Nevertheless, the socio-cultural construction has eliminated care as an articulating axis of social and economic life. It is understood as part of the so-called reproductive economy, a dimension subordinated to the productive economy, and therefore made invisible. It implies work that is not recognized, valued, or paid. It is fundamentally carried out by women, especially in the private sphere of the family (Cantilo, Lleopart y Ezquerro, 2018).

Gender studies have shown how the tasks that take place in the domestic sphere are essential for the functioning of the economic system and for the social well-being of people. Women, in various social and cultural spaces, have oriented themselves from and towards the care of others, playing a preponderant role even in situations that do not meet the conditions for the respect of human rights. They do this by assigning a central role to bonds, helping to sustain the lives of others through daily care. A set of social and economic transformations, as well as the succession of various crises, have led to the questioning of care as a mission that is solely and exclusively for women. We currently face different, interconnected and overlapping crises that threaten not only individual and social well-being, but also the very sustainability of the planet and our lives on it (Kagan, Akhurst, Alfaro, Lawthom, Richards y Zambrano, 2022). These multiple crises (economic, political, sociocultural and ecological) result in the resurgence of authoritarian, nationalist, and xenophobic populist politics worldwide. Additionally, we face a clear decrease in social equity and a concentration of power and resources in the hands of a minority.

The expansion of neoliberal policies, together with the reduction of public investment in social services, has dramatically decreased the presence of the public sector, affecting the availability of common goods for citizens, especially for those disadvantaged or excluded. Other processes, such as increased life expectancy and demographic ageing, the massive incorporation of women into the labor market (Galv  z y Rodr  guez-Modro  o, 2016) and the erosion of community as an active agent in the exchange of care, and therefore the individualisation of risk, have led to a strong crisis of care.

In different contexts and realities, it becomes evident that care for people and their environments is not enough to guarantee human development, so we must rethink the foundations on which sustaining is organised in a broader sense (Vega, Mart  nez y Paredes, 2018). Consequently, care is not currently a central aspect of public policies, socioeconomic debates, or collective reflection. Furthermore, recent crises have once again highlighted the lack of democratisation of care, not only within families, but also in the broader community.

Feminism has emphasised the need to revalue and redistribute care work, which entails assuming care as a collective responsibility that must underpin the

construction of a fairer and more democratic society. Reality shows us that women continue to have a predominant role at different stages of the life cycle, as well as in situations of illness and adversity affecting family members. This aspect of care, which is typically private, made invisible, and of lower social value, is strongly linked to an impact on the paid labor market, where women continue to be in a more precarious situation than men due to their responsibilities in the reproductive sphere, among other reasons. The data is compelling in showing how the burden of care is associated with lower pay and a more fragile contractual situation, which leads to the feminization of poverty (Cantilo, Lleopart y Ezquerria; 2018).

Providing care involves attending to individuals and the contexts in which they develop. Since these care activities are made possible through various arrangements involving different social actors and entities, it is relevant in contemporary societies to problematise the relationship between the State, the market, communities and families, and their articulated capacity to constitute effective systems for the provision of care (Vega, Martínez y Paredes, 2018).

Given the relevance of care for the sustenance and development of individuals, and in order to eradicate social inequalities with regard to both those who receive care and those who bear the responsibility of providing it, it is necessary that care be taken as a collective responsibility. To achieve this, societies must establish a social organization for political action on this matter (Cantilo, Lleopart y Ezquerria; 2018). In this sense, the politicisation of care is proposed by feminisms as a key aspect to move forward. This means that care should become an object of public policy, to address the social inequalities that cause the reproduction of life to be a subordinate dimension to the productive dimension, a substantive issue of a capitalist and patriarchal society. Care is a right and it must be guaranteed and therefore managed collectively.

Community Care in Times of Crisis

In different contexts of precariousness and in various crises, especially in Latin America, diverse responses arise to confront basic needs. Communities create survival and resistance strategies that take on different forms depending on the characteristics of these, the nature of the crises, how weakened the care systems are, and how much actual presence the state and local systems have in them. According to Vega-Solis (2019), care provided by networks of neighborhoods and solidarity, which are often made invisible, take on heterogeneous expressions and are commonly the result of hybrid processes between family, community, the State and the market. Some of the collective actions that can be observed are the following: communal pots, health brigades, provision of food baskets, among many others (Zambrano, Chacón, Sanhueza y Campos, 2022).

Although these forms of care are made visible in periods of greater crises or natural disasters (Rivera, Velázquez y Morete, 2014), they are based on more stable mechanisms of articulation that allow sustaining daily life in contexts of limited access to resources. These psychosocial processes are woven through the

trajectories of these communities in everyday life, in relationships of support, mutual aid, and solidarity. They are built from a shared history, a common space, and a social identity that is configured over time. Therefore, although care may become more visible in periods of acute crisis, the shared experience in a matrix of adverse life and limited opportunities shows us creative mechanisms of resistance and resilience, where care among members plays a relevant role.

In these spaces, women play a fundamental role in sustaining life despite the precariousness they themselves face, providing community care and making it possible. The community networks they create are evident both in everyday life and in those events that are a turning point, but which undoubtedly also contain the most stable conditions of exclusion, lack of opportunities and limitations for development. In this way, critical events such as disasters or pandemics are only a more acute expression of the permanent crisis situation faced by communities and can be taken as a kind of “analyser” (Rodríguez-Villasante, 2007) of the structure of exclusion and oppression that they face. Likewise, it can help to make visible the roles that women play on a daily basis, when they do not have the prominence and appreciation they may adopt in crises.

Various experiences arise as resistance, not only reactive to the current crisis, but as an established response to the historical relationship of coloniality (Lugones, 2003) that marginalized communities on our continent have organized for generations. These experiences invite us to legitimize everyday collective knowledge, the management capacity of community leaderships, and to make it part of the practical knowledge about public issues, or about how to face them.

The Crisis of Care Systems in Chile

In Chile, the current institutional and economic model has been at the service of maintaining privileges for an elite. The concentration of wealth in a small group has always been present in the history of the country and during the 17 years of dictatorship (1973-1990), conditions were generated to increase the distance between social groups. During this period, a set of economic measures were implemented that laid the foundations for the establishment of the neoliberal model. Privatisation, economic liberalisation, deregulation, state subsidiarity, opening to international competition, and labor flexibility became part of the mechanisms that radically transformed the country. The implementation of the model resulted in a redesign of the boundaries between the market and the State, generating profound transformations among social groups (Araujo, Marinho y Campêlo, 2017). This model favored the accumulation of power and wealth within small groups, generating a subordination of politics to this economic elite that has consolidated in Chile (Contardo, 2020).

In terms of social and economic policies, a liberal model prevails, characterized by an accelerated shift from the State to private provision of services, particularly in health, education and pensions. It is also informal due to the strong presence of unofficial protection mechanisms, where families and social networks play a fundamental role (Arriagada, 2010). As in the rest of Latin

America, the organization of care in Chile is of a mixed nature. This means that it can be carried out by public and private organizations, and it takes place both inside and outside of households and families (Arraigada, 2010).

The weakening of co-responsibility, the privatisation of care, and a less prominent role of the state, along with the tensions generated by various crises, have led the country to face a profound care crisis. The most affected are women, in different aspects of life. This situation was aggravated by the COVID-19 pandemic. Some evidence of these impacts has been provided by studies conducted in the country during the first period of the health crisis.

For example, the MOVID 19 report (National Monitoring of COVID-19 Symptoms and practices in Chile, 2020) points out that 42% of women are caregivers of others, a task they must simultaneously reconcile with other duties (a situation known as the triple workday). In comparison, while 22% of women have increased their daily care workload by more than eight hours, only 13% of men have done so. The gender gap for the rest of household tasks (such as cooking, cleaning, shopping, among others) is similar, intensifying women's workload. On the other hand, the study "Radiography of the Zero Man," carried out by the UC Centre for Surveys and Longitudinal Studies, in conjunction with UN Women and the Ministry of Women and Gender Equity of Chile, revealed that, during the first months of the pandemic, 71% of men had dedicated zero weekly hours to help their children in school homework (Bravo, Castillo y Hughes, 2020).

Before the pandemic, figures had been equally concerning. According to the CASEN survey conducted in 2017, 19.4% of Chilean women over 15 years old were out of the workforce due to caregiving or household tasks, while only 0.6% of men were inactive for these reasons.

In productive labor, inequalities are similar, given that women face limitations to access the paid labor market. 33.9% of women declare having to perform family duties, such as unpaid domestic and care work in their homes, as the main reason for not entering the labour market (INE, 2018).

All areas linked to care, activities that had been devalued and made invisible, became vital during this period of crisis. Most of these activities have been under the responsibility of women, particularly those who share less advantaged living situations.

Resistance and Resilience: Facing Adversity on a Daily Basis

Social sciences incorporated the term 'resilience' starting in the 1980s to describe individuals who are capable of having a healthy psychological development despite living in high-risk contexts, such as environments of poverty, multi-problematic families, prolonged stressful situations, among other circumstances (Uriarte, 2010). Resilience is the capability that individuals have of confronting extreme situations and overcoming them. Thanks to resilience, individuals are not only capable of facing challenging moments in life, but also of emerging

stronger and with new insights. It is a process that demands flexibility to confront difficult experiences in order to successfully navigate adversity.

Although the concept originally emerged to describe an individual capacity, it has later been extended to also refer to family groups or collectives that are capable of minimizing and overcoming the detrimental effects of adversity and of disadvantaged and socio-culturally deprived contexts. These groups are able to recover after suffering traumatic experiences, such as natural disasters, epidemics, deportation, civil wars, concentration camps, among others (Rutter, 1993). Individuals undergo positive transformations after the experience of crisis. This includes processes of regeneration, reorientation, personal reorganisation and openness to new opportunities that arise as a result of the crisis (Olabegoya, 2006).

The concept of resistance can be understood as the personal or collective strength to stand firm in the face of adversity, the capacity to remain intact when facing a setback, or to endure a difficult situation. That is, to be able to live and develop normally in a high-risk environment that generates material damage and stress (Uriarte, 2010). Moreover, especially in those spaces of the world that have faced profound and ongoing processes of colonization and coloniality, the concept takes on a particular meaning. For subordinate or marginalized peoples or groups, this strength represents not only a way to confront crises with determination, but also involves the capacity to resist, tolerate or oppose. From a cultural perspective, it refers to the process of systematic opposition to a homogenizing assimilation and to claim the right to make decisions about their own resources (Morales, 1993).

Community Female Leaders: Amid Adversity, Resilience and Resistance

In what follows, we will present some partial results from studies conducted by the authors of this article in the La Araucanía region in Chile. These findings enable us to analyze the role of female leaders in community care, both in urban and rural areas. In analyzing these results, we hope to find clues to understanding the mechanisms of such care and how women develop practices of resilience and resistance. These practices allow them to become caregivers for others, despite their harrowing experiences. Furthermore, we aim to highlight the limitations of a care system that is exclusively sustained by women within the spaces of family and community, in a context where social injustice and patriarchal violence reproduce and justify inequalities, without any systematic action taken by the state to advance in matters of social and gender justice.

The first study is part of a broader research aimed at characterizing the psychosocial community dynamics associated with community strengthening in different neighborhoods of Chile and Brazil. Specifically, we focus on the leadership exercise of women living in neighborhoods that face conditions of vulnerability. We hope to reveal how female leaders deploy leadership within the community framework, with a strong emphasis on caring for the members of the communities, particularly those who live in a more disadvantaged social, cultural

and economic situation. We seek to analyze the characteristics and conditions under which social leadership is exercised by women in urban communities facing social and economic vulnerability. This study has been conducted in three neighborhoods in Temuco, using a Participatory Action Research approach. Mixed methods have been used, including participant observation, interviews, participatory workshops, surveys, ongoing feedback, among others.

The neighbourhoods were established in the 1980s under conditions of significant precarity, initially lacking basic services. People had to organize themselves in order to improve their living conditions. During this period, community bonds of mutual aid were strengthened, and some community grassroots organizations emerged. Once these improvements were achieved, it was particularly the adults and elderly individuals who maintained a strong sense of community and continued to engage in varying levels of participation and neighbourhood organization.

In the three neighborhoods under study, the pandemic had a significant impact on neighborhood bonds, blurring community organizations to a different extent. Territorial organizations (such as neighborhood associations) directed their efforts towards addressing basic needs of support and care, through their leaders' actions. Female leaders are mainly between 40 and 70 years old, with a strong commitment to their organizations. They strive to achieve aims that primarily focus on securing resources for collective spaces, organizing activities and providing support to those facing greater challenges.

Their life narratives are marked by experiences of abuse, discrimination, mistreatment, and a lack of access to resources to meet their basic needs, that is, adverse life trajectories characterised by limited opportunities for development. As they point out, they have endured various forms of violence, related to social class, discrimination, stigma, gender, and domestic violence. Their trajectories are marked by traumatic experiences, stories of effort, and assuming responsibilities -often at a young age- in caring for younger siblings and sick family members.

I tell all my children that I love them... because I was never told that myself. (TSMVSE_V4).

They currently face a significant caregiving burden, both objectively and subjectively, as they are responsible for the care of their children, partners, parents, mothers-in-law, grandchildren, sick people, among others. Domestic labor has been the main activity for most of them, though they have pursued other parallel occupations to support or fully meet their household's financial needs. These additional activities include sewing, knitting, working as domestic employees, engaging in recycling activities, and preparing and selling jam and other food.

You become everything: a mum, a psychologist, a nurse, a shoulder to cry on. We do it all (TSMVSE_V3).

Everyone expects so much from us: as housewives, as mums, as wives... In the end, you are there for everyone, except for yourself (TSMVSE_V6).

Having been raised in a patriarchal culture and with a strong Christian influence, they predominantly exhibit a traditional view of women's role. Only some of them analyze their experiences from a more critical perspective, identifying the effects of patriarchy and seeking to change their roles and even their own gender identity.

Most of the female leaders stand out for their ability to serve as intermediaries between the "community world," where horizontal bonds and collectivity prevail, and the State. Particularly during times of crisis, they are the ones who concentrate efforts to assist those in greater need, demanding support from different state entities for the community members who need it the most. During the pandemic, female leaders had a predominant role in maintaining bonds of mutual support, and in re-articulating community relationships when the emergency situation subsided.

Neighborhood female leaders have significant skills and expertise in engaging with local political actors, through which they were able to manage and obtain support during the pandemic (such as food baskets, medical supplies, etc.) for community members facing economic woes. However, the presence of the State during this period was low, limited to providing some basic resources. Women leaders have learned to build networks with various agents of local public policy, as well as politicians from different political and partisan positions. Their priority is to secure the necessary resources for their communities.

They take on a mediating role with the State, strategically advocating for resources for their respective organizations and neighborhoods. This mirrors their experience in household management, where they have learnt to deal with scarce resources and to mobilize opportunities in a creative way.

The levels of prominence of women in community leadership vary across different territories, but there is a common thread regarding care ethics. Although they did not experience sufficient care during their childhood and adolescence, most of them facing gender violence, they develop a narrative and take actions of care for others. They explicitly state that they "don't want others to live through what they had to," hence, their efforts are focused on expanding opportunities for others.

In addition to the burden they experience within their households, they also face various duties from their organizations. They have to invest a considerable amount of time in dealing with different authorities or professionals in public policy, as well as in organizing and implementing activities. They lack support from other community members in carrying out these tasks, making it challenging to fulfil their commitments, assignments and initiatives.

We could point out that leadership, in addition to projecting the role of caring for others (as a traditional gender role), constitutes a practice that enables them to integrate their difficult life experiences, their lessons, and to leverage them for the common welfare. In this case, only some women hold a more critical perspective of reality, identifying structural conditions that affect their life situations and those of their communities. We could argue that there are clear

trajectories of resilience, but culturally, there is scarce resistance to economic and socio-cultural conditions.

The second study is focused on political trajectories through a biographical approach of *Mapuche Lafkenche* women from the communes of Tirúa, Saavedra and Toltén. Twelve female leaders of different ages (between 27 and 70), who belong to community organizations participate in this study. One of the participants holds a position of political representation in the municipal council of her commune. In the La Araucanía region, the *Lafkenche* territory is a predominantly rural area. As all the territories ancestrally inhabited by the *Mapuche* People, it has a long trajectory of dispossession and colonization that has shaped the lives of its inhabitants. It has configured a particular local history of resistance and negotiation with the State and Chilean Society.

Lafkenche territory between the communes of Tirúa and Toltén.
Source: Own elaboration

According to the National Institute of Statistics (INE, 2017), the current population in the communes of Saavedra, Tirúa and Toltén who identify as belonging to the *Mapuche* people is 80.6%, 70.6% and 43.1%, respectively. With

regard to communal poverty rates, the 2017 CASEN survey indicates percentages of 35.8% in Saavedra, 35.1% in Toltén and 26.8% in Tirúa. It is important to highlight that in Saavedra there has been a significant increase in the leadership of women in community organizations. Currently, 57% of these organizations are led by women, and 20% of them are exclusively composed of women (own data).

From analyzing the narratives, it can be concluded that in the trajectories of the interviewed *Mapuche Lafkenche* women there is an intersection of oppressions at play. Stories of abuse and discrimination emerge strongly. These forms of violence are present in the various spheres of their lives, including their own family, community, school and workplace. Their life stories reveal a chain of consistently violent events and conditions such as extreme poverty, mistreatment, sexual abuse, forced migration, discrimination, gender-based violence, among others. This has the background of the historical trauma of the indigenous people to which they belong, characterized by a long process of colonisation and coloniality that subjects them to a set of the experiences in which their culture is made invisible, marginalized and excluded.

The study evidences different forms of violence, such as direct violence (psychological, economic and sexual abuse), symbolic violence (derogatory treatment based on cultural, economic and gender reasons) and structural violence (multiple deprivations, lack of access to basic services, limited opportunities for development, among others). Additionally, their socialization conveys a model of womanhood based on domestic labor and family care. As *Mapuche* female leaders, part of their management involves not transgressing cultural norms, because they represent their people. Therefore, a different women's role is evidently not allowed.

It is noteworthy that early on in their life trajectories, they have to assume the role of family caregivers. On the one hand, this becomes an obstacle to their own development as women, but, on the other hand, it serves as a catalyst for leadership, as they consider caregiving as a personal commitment to collective reparation. This is reflected in the following quote:

I ended up playing the role of being the mum, taking care of my little sisters, my brother, and working for them, because we had no food. (BLB1)

This set of adverse experiences compels them to develop resilience from a young age. They acquire resources to confront these situations, as well as a functioning style that enables them to detach themselves from violent and adverse events, and to project themselves towards the future. Among the various resilience strategies they exhibit, we would like to highlight the following: engaging in uncomfortable conversations to directly confront conflicts; migrating to leave behind abuse and mistreatment and to seek new sources of income and learning; acquiring new trades and skills; becoming mothers, teaching and transmitting their own experiences to their children; establishing meaningful connections with those in positions of authority in their workplaces; learning *mapudungün* (the *Mapuche* People language); strengthening a legacy conveyed as a destiny-mission; sacralising examples of parents and/or significant people;

acknowledging their own capacities and potentialities; exercising leadership as a means of healing and redefining their past, among others.

Leadership emerges within this framework precisely as an expression of the resilience process. The exercise of community leadership serves as a way to keep with the dedication to caring for others, as well as a practice of resilience that strategically enables them to access resources that allow them to contribute to the well-being of others.

I came back again and it was good; by then I had personality, because before... with all the shouting I got at home, I was about to go under the table. And then I had personality, and it was good for me, very good. Now I can stand up for myself, I can talk, I won't stay silent, and that was very good for me (BE1S).
I love being a leader. To be there helping people and especially women, because for Mapuche women... Life hasn't been easy for Mapuche women. Like my calling that makes me be a leader (TE1A).

Service to others has allowed them to legitimize themselves, engaging in tasks that align with cultural mandates of womanhood in *Mapuche* society and culture. At the same time, the exercise of leadership means a liberation from the socio-cultural and structural determinants coming from both the national society and the *Mapuche* world. Leadership provides a platform from which they can redefine their traumatic and painful experiences. In this sense, leadership emerges as a life organizer for female leaders. Finally, there is a third dimension that mobilizes leadership, which is accepting a legacy, a learning process coming from their lineage (*kupalme*). This implies assuming a commitment to *Mapuche* culture and identity, this time from a renewed standpoint.

The motivational factors vary from one leader to another, but the community perspective is present in all of them. Their commitment to improving the lives of others drives them to engage in the task of mediating and managing opportunities that enable them to access resources they do not possess.

When analyzing the processes of empowerment, we can conclude that the interviewees' processes transcend the individual level, as their leadership is based on solidarity, social organization and cooperation. They contribute to the empowerment of their organizations and communities, promoting unity around collective goals rather than individual differences.

In an integrative view of both studies, we can conclude that the empowerment of female leaders in both cases occurs through the interaction of personal conditions and the social, cultural and political context where their leadership has developed. From that interaction, and from their personal characteristics, among which their socio-emotional resources stand out, the female leaders develop an ability to understand and manage the environment, threats, and also opportunities. This capacity emerges fundamentally from their own life stories, marked by ongoing adversity and the development of resilience as a strategy to deal with multiple challenges.

In the case of most *Mapuche* female leaders, there is also an evident capacity for socio-political analysis, strongly connected to their cultural identity and the ability to value or revalue their cultural roots and perceive reality from a

broader perspective. This is made possible through the cultural vitalization experienced by themselves and part of their communities, as well as the opportunity to have lived for some period of their lives in different cultural spaces. This life between worlds, whether educational, professional, and/or rural-urban migration experiences, enables them to acknowledge the value of their own culture, while also incorporating resources and strategies to negotiate culturally with the dominant society. We observe in this case a combination of resilience and resistance, which enables them to represent the aspirations of their communities and people, and navigate the institutional system of the State, in order to gain access to resources and opportunities to contribute to improving the living conditions of their communities.

The strategic reading of opportunities, for both groups of female leaders, primarily occurs within the context of public policies oriented towards women in conditions of vulnerability (particularly impoverished and indigenous women). In the case of *Mapuche* female leaders, their position of defending and promoting their culture emerges within a context of increasing recognition and revitalization of cultural heritage in recent decades. In both cases, participation is initially functional, though it enables them to develop a critical perspective as they gain experience in social organization and leadership. Above all, they develop a strategic understanding of their environment, advancing in access to power. However, a significant portion of their leadership actions is still directed towards managing resources rather than directly claiming rights.

As an empowerment exercise, female leaders, especially *Mapuche* women, manage to critically analyze their context; they establish connections between different dimensions and they acknowledge structural injustice. However, their everyday leadership actions do not directly aim to subvert these structural conditions; their proposal is to strategically manage the resources of the environment to improve living conditions. On the other hand, they maintain a traditional view of the role of women and of *Mapuche* women, without critically questioning this role.

Conclusions

Women's leadership in the community sphere is oriented towards sustaining life in the most adverse conditions. From their own life trajectories, marked by experiences of surviving multiple violence and intersecting oppressions, female leaders develop the capacity of resilience that enables them to grow in their own lives and also to exercise leadership oriented towards others. They are sensitive to the needs and potentialities of their communities.

Their living conditions as women that have been marginalized from opportunities for development (because of being poor, indigenous or rural women) enable them to guide the well-being of their communities in a more relevant and heart-felt manner. Paradoxically, the socialization they have received from a patriarchal culture enables them (better than men) to understand the needs and pains of others. They maintain a relational approach that

interconnects them deeply with the experiences and needs of the members of their communities.

Their leadership is, at least partially, countercultural because they participate despite being denied the right to do so, mainly due to discrimination based on gender, class and race. They gain spaces to access resources and decision-making, in a format that is different from the leadership styles prominent among men. They are oriented towards the common good, they place an emphasis on the relationships of solidarity and mutual aid, and they prioritize those who live in more disadvantaged conditions.

Female leaders overflow the State, as they use public policies directed towards marginalized women to engage in public affairs that were previously denied to women. They exercise a mediating role in those places and spaces where the State fails to reach due to its detachment and verticality, especially during periods of heightened crises.

It is important to acknowledge that in the Chilean context, especially in rural areas, female leaders interconnect communities with the State and other entities. Without their involvement, many resources and support would not reach the groups that have been more excluded from the protection systems. They act as a bridge that enables the precarious care systems to operate on a logic of territorial and affective proximity. Moreover, they boost these care systems by interconnecting community life with other spaces that are difficult to access for the community members.

We would like to highlight that female leaders are true models in intercultural dialogue. *Mapuche* female leaders, in particular, demonstrate their ability to establish connections between different cultures.

It is important to consider that although community plays a crucial role in fostering self-organization, socialization and providing close care, in reality, we observe that women play a central role in boosting these processes. However, we understand that the State is still essential to promote, support and complement community experiences, but this has to occur respecting their logics, resources and particularities. Its public function consists in providing public goods that guarantee the universality of control over the material and affective-relational conditions of our existence.

The care crisis must be addressed with public policies and community management, using strategies that dismantle patriarchal, capitalist and colonialist logics. There needs to be complementarity between public policies that guarantee access to basic rights, and public policies that aim at collective rights within the context of a democratic state. Such a State should promote and ensure effective participation, social organization and the strengthening of community networks for social and territorial justice. Female leaders are strategic allies in these purposes, as they hold a comprehensive understanding of the collective responsibility that caregiving entails. They take on community care with a profound sense of the common good.

Mothers and warriors: Constructing feminine militancy and normalizing violence in Greek neo-Nazi media

Marianthi Anastasiadou

Abstract

Although women's militancy and the image of the woman-warrior are often idealized in the far-right and while the stereotype of men's monopoly in far-right violence has been strongly criticized during the last decades, little attention has been paid on the role violence plays as an ideological element in the construction of feminine far-right identities. However, the question of ideology is crucial for understanding the context of not only broader politicization of violence in far-right movements but also women's particular politicization to violence. Representations of violence in relation to femininity in the far-right can shed light on neglected ideological aspects of the - indeed contradictory regarding gender dynamics - political context in which women (are called upon to) mobilize and take action. The case of Greek neo-Nazi party of Golden Dawn and the discourses through which the party and its women have articulated a collective feminine identity is a characteristic example of how far-right femininity can be infused with references to violence. This aspect of Golden Dawn femininity has remained mostly invisible, although women members have not only often invoked hate and violence, but some have been even convicted for participation in or facilitation of violent crimes. Here I ask: how has violence been represented in Golden Dawn discourse and what has its role been in the articulation of gendered and in particular feminine collective political identities? How has potential feminine militancy been constructed in media discourse of the party and its' women?

Analysis of digital media content of Golden Dawn party and mostly its' women's organization, Women's Front, shows that by drawing on national and international, historical and contemporary, racist and nationalist discourses, violence occupies a central position in women's discourse, bearing strong gendered connotations. In specific, femininity is articulated in relation to a narrative of racial wars, illustrated through gendered images of internal and external dangers, while white feminine militancy is constructed as a twofold solution: both reproductive and soldierly. Thus, not only motherhood, but also martial readiness and war competence are praised as *sine qua non* aspects of an 'original' Greek, white womanhood – a dimension of women's politicization and participation in far-right movements and violence often ignored.

Keywords

far-right violence, far-right ideology, far-right women, femininity, nationalism, motherhood, female warriors

Introduction: far-right violence, women and the question of ideology

The relation between violence and women/femininity in the far-right¹ is still a thorny topic, although during the last decades there has been a vivid discussion on the role of women both in historical fascism and in contemporary far-right groups, parties and movements (e.g. Bacchetta & Power, 2002; Passmore 2003; Köttig et al., 2017; Dubslaff, 2022). Focusing on women's overlooked agency, feminist research has strongly criticized the long dominant interpretation of violence as a men's monopole and women's role as victims or only passive bystanders (Bitzan et al., 2003). The trial of Beate Zschäpe, accused for participation in neo-Nazi terrorist group NSU (National Socialist Underground), which committed the murders of nine people of immigrant origin and one policewoman as well as several bomb attacks and bank robberies in Germany from the late 1990s up to 2011, is a good example of how this discussion revived during the last years – the trial lasted from 2013 to 2018. Beate Zschäpe, founding member and held responsible for organization and logistics of the group, denied her central role, representing herself as an innocent, dependent and unhappy woman, basically as a victim of her two basic accomplices, Uwe Mundlos and Uwe Böhnhardt². In the meanwhile, and as it became clear that NSU functioned with the support of a broader network, other far-right women who testified in the same trial, represented themselves as ignorant, unpolitical subjects or even caring mothers, as if that was a proof of good citizenship (Dauber, 2014; Köttig, 2017). More recently, several women were among the prosecuted for the violent siege of USA Capitol in Washington D.C., which took place on the 6th of January 2021, following Trump's defeat in the presential election of 2020 (Matfess & Margolin, 2022). The attack, which resulted in several people injured and some dead, was organized and conducted by far-right

¹ I use the term 'far-right' in a loose way to refer to movements, groups and parties inspired by fascist, nationalist and authoritarian forces and ideas of the past, which can however depict different forms of representation and organization today. 'Far-right' can be seen as an umbrella term for 'radical-right', 'extreme-right', 'neo-fascism' and 'right-wing populism' (Mudde, 2019). Especially in relation to fascism, it is strongly debated today to what extent and which contemporary far-right parties and movements could be categorized as 'neo-fascist' (Griffin, 2018). On the one hand, there are political movements and groups that refer to historical fascism in an explicit way and copy narratives and methods from the historical tradition of fascism, like for example Golden Dawn does with Nazis. On the other hand, many far-right parties and groups distance themselves from historical 'fascism' today, although fascist ideas and practices from the past may inspire or influence their ideology and practices.

² In May 2023, Zschäpe admitted some responsibility for NSU crimes, although in a controversial way. During a new hearing in court, she argued that she could have stopped her accomplices but she did not, now regretting about it - without, however, taking the responsibility for her active role in supporting and co-organizing the crimes of the group. See: Vor bayerischem Untersuchungsausschuss: Zschäpe räumt Mitschuld an NSU-Mordserie deutlich ein. 23.05.2023. *Tagespiegel*. <https://www.tagesspiegel.de/politik/vor-bayerischem-untersuchungsausschuss-zschape-raumt-mitschuld-an-nsu-mordserie-deutlich-ein-9859592.html>

supporters of Trump during the process of vote-counting by the Congress and formalization of the election result which gave victory to Trump's opponent, Joe Biden. Women, who constituted 13% of the individuals charged with involvement in the siege, participated in the attack in several ways: from violent action on the spot to inciting violence through social media. Although the number of women participants is definitely smaller than that of men, some women took even leading roles in organizing the siege and in breaking into the Capitol, which represents a change of paradigm on women's participation in far-right violence, according to Matfess & Margolin (2022). Still, they denied responsibility in court using their gender as proof of innocence, so as to avoid legal consequences. Considering the legendary trial of neo-Nazi party Golden Dawn in Greece, which took place between 2015 and 2020 in Athens and brought sixty-eight members before court - among which all the parliamentary members of the party back then -, five women were prosecuted for partaking in violent or other illegal activities as well as in the constitution of a criminal organization – which was one of the basic accusation the party leadership and members faced, apart from individual prosecutions for involvement in criminal actions, like murders and attacks against immigrants and political opponents (Psarras, 2015). All five of them denied accusations, while two, Eleni Zaroulia and Nicole Mpeneki, partner of the leader Nikos Michaloliakos and ex-partner of the ex-first-henchman Panagiotis Lagos respectively, stated that they were involved in the party only professionally or through their relationship to their partners³. This is a typical example of how far-right women, when in court, resort to gender stereotypes in order to avoid responsibility for their political activity (Köttig, 2017). In 2020, three women were convicted, including the former MP and wife of the leader, Eleni Zaroulia.

Whereas Golden Dawn women's activity and rhetoric has been analyzed in a series of studies (Psarra, 2014; Félix, 2015; Alvanou, 2017; Koronaiou & Sakellariou, 2017; Anastasiadou & Samara, 2022; Kamenou, 2023), the question of violence – in practice or in ideology - has been ignored, although political violence has been a significant practice in Greek political culture (Xenakis, 2012) and despite the fact that far-right violence in specific scores tremendously high in Greece in comparison to other European countries, as Jupskås & Fielitz (2022) explain. This indifference should be no surprise, as there is often a gender-biased (mis)interpretation of far-right women's violence, which results in its invisibility or underestimation (Bitzan et al. 2003,, Köttig, 2017). However, even when investigated, the focus has been mainly on if and how women have been involved in far-right violent activity, and not so much on if and how this relates to their ideological background and motivation (Manthe, 2019).

But, to understand far-right violence in general, we should not only examine acts of brutality alone, as they then often end up being interpreted as isolated cases of aggressive behavior or attacks of mentally unstable perpetrators. To comprehend far-right violence and the context of its manifestation, it is also necessary to take into account far-right ideology as well as the politicization of violence in far-right movements (Ravndal & Enstad, 2021). According to Coester et al. (2023), ideological elements like antisemitism, racism and antifeminism should be seriously considered as political motives when it comes to right-wing terrorism, while recent E.U. working definition for violent right-wing extremism emphasizes the political and ideological motivation behind it, underlining that what qualifies far-right violence as such is ‘a set of particular goals beyond the act itself as opposed to other forms of violence’ (Project Based Collaboration on Violent Right-Wing Extremism 2021, p. 2), with these goals to be ‘classified as political (for example seeking to destroy democracy, overthrow the government, create a state based on authoritarian rule, intense nationalism, and racial purity, or to stop immigration) [...or...] ideological (belief in white supremacy, antisemitism, anti-Muslim hatred, belief in the “great replacement” or upcoming genocide of the white race)’ (Project Based Collaboration on Violent Right-Wing Extremism 2021, p. 2-3).

Here it should be noted that far-right violence covers a broad range of acts and does not refer only to murderous attacks or terrorist actions – although there is an increased legal interest in these aspects and much data collection and research revolves around them. According to Bjørge & Ravndal (2019, p.5), “all violent attacks whose target selection is based on extreme-right beliefs and corresponding enemy categories—immigrants, minorities, political opponents, or governments [...including...] ‘vandalism and spontaneous violence’ should be considered as far-right violence, or as EU working definition for violent right-wing extremism (Project Based Collaboration on Violent Right-Wing Extremism 2021, p.3) notes, “right-wing extremist violence may be defined as any physical or psychological attack, or act of public disorder, whose target selection is based on extreme right-wing beliefs”. Still, such definitions presuppose a common ground of what is understood as violence, that is criminalized violence. Thus, they leave outside authoritarian or racist state violence, often praised or even officially legalized by the far-right when in power. In any case, a definition of violence is per se a tricky issue (Miller, 2021). It should not be doubted that violence is connected to power, force and control and it often refers to causing physical or emotional pain, destruction, deprivation. It may refer to physical action but also to verbal attacks and threats, like hate speech. It can take place off or nowadays even online. Moreover, violence may be recognized and discussed as such or it may be silenced or denied. It may be normalized or even welcomed as necessary and inevitable or as heroic and beautiful, as is the case of altruistic self-harm. As Miller (2021, p.5) notes, although “we probably all agree that its material referents matter”, culturally violence is much of a discursive construction as well, since what is understood and recognized as violence is the product of historically and geographically specific socio-political dynamics and cannot be taken for granted.

This is not at all to doubt the broader political dangers or the harmful consequences of far-right violence from which people suffer – often in invisibility and silence (Köbberling, 2022) –, but thinking of violence in discursive and cultural terms is very much connected to the question of how the far-right represents violence and how this contributes to its’ legitimization and normalization – first for those who exercise it and then for those who accept or support it. Marcks & Pawelz (2022) note that political narratives of threat, more and more mainstreamed today, are only a step away from the exercise of violence and should not be underestimated, since they constitute emotionalized discourses that construct a state of emergency against dangerous enemies, and they can activate palingenetic fantasies and legitimize violence. Such fantasies of collective rebirth, connected to millenarian idealizing of self-sacrifice, can also explain how perpetrators of violence overcome fear of (even their own) death (Griffin, 2003). The question of how such far-right fantasies address women, if at all, remains crucial here, since the dominant narrative represents violence as a men’s issue, while women are supposed to be appalled at violence, naturally not inclined to it.

Here, focusing on the case of Golden Dawn, I am asking what role the discourse of violence has played in Greek neo-Nazi women’s political imaginary and construction of femininity. My intention is not at all to state that ideology is translated one in one in acts of violence; this would be just simplistic and research has shown that the personal stories of members of the far-right scene are often more complicated than we believe (Köttig, 2004; Blee, 2018). However, examination of discourse on violence can shed light in the worldview(s) and identity(ies) articulated for and among women in the far-right, in the space it may open for practicing or accepting violence and can thus contribute to the contextualization of women’s activity, of their potential participation in violent acts, or their support towards violence. Last, examining the relations between femininity and far-right discourses of violence can also contribute to the understanding of what kind of gendered identities and values are propagated towards the broader public at a specific socio-historical moment of neo-liberal transformation and deepening of social inequalities, like the current one, when political forces more or less inspired or influenced by fascist and authoritarian tradition, gain more and more political space, as well as to the understanding of the potential socio-political impact this may have on normalizing and mobilizing exclusionary and harmful attitudes, affect and practices (Krzyżanowski, 2020).

Below, I will first present a short summary of Golden Dawn activity in Greece and the participation of women in it as well as the theoretical and methodological tools that were used in the analysis of party media addressing women, which has highlighted the discursive significance of violence. I will then analyze the gendered dimensions of violence discourse and how they contributed to the construction of a militant feminine identity in the context of Golden Dawn politics, closing with some critical remarks on the discursive politicization and normalization of violence in contemporary far-right politics, problematizing the dominant binary image of the woman-mother and the man-soldier.

The case of Golden Dawn women

Golden Dawn, an offspring of the afterwar Greek far-right, has clearly been a neo-Nazi party. Although it persistently denied its relation to historical national socialism in public after its electoral rise in 2012, its ideological references and practices point directly to historical Nazi movement, whose history and legacy have been of most significant influence on the party organization and ideology – a characteristic that differentiates Golden Dawn from other far-right organizations in Greece. The heritage of national socialism is obvious not only on its open antisemitism, racism, devotion to the supposed racial community and militarism, nonnegotiable discipline to the leader, but also on the direct references to Hitler and Nazis (Psarras, 2012). Golden Dawn exists since 1980, when it started as an ideological, intellectual circle devoted to national socialist theory, and it became a party in the early 1990s, after it mobilized on the streets for the Macedonian name issue. It entered the Greek parliament for the first time in 2012, finding fertile ground in the political unrest and polarization ignited by the debt ‘crisis’ and the consequent austerity politics (Ellinas, 2013), while it intensified its threats and attacks on immigrants and political opponents, until it was brought to court in 2015 with the accusation of constituting a criminal organization (Psarras, 2015). In the national election of July 7th 2019, the party was outseated from parliament, which together with the legal prosecutions against it and later convictions resulted in many high-ranking members abandoning the party and forming new political schemes. In the trial of Golden Dawn, five women – all closely related to the organization – had been charged with accusations. One among them, Themis Skordeli was in charge of the notorious storm-troop of Agios Panteleimon in Athens and she has been convicted as instigator, giving orders in cases of life-threatening attacks to immigrants and political opponents. Nicol Mpeneki, another member who was active in Women’s Front and very close to the leadership, also ex fiancée of Giannis Lagos – one of the leading figures and MP of Golden Dawn, who founded and led the splinter party E.LA.SYN. from 2019 to 2013, and who was convicted in Golden Dawn trial in 2020 while elected in European Parliament –, was questioned in court for photographs showing her illegally holding and pointing with guns. Last, (ex) policewoman Venetia Popori, close informant of Golden Dawn, was accused of – and convicted – for possessing dozens of illegal guns and bullets⁴.

But what has been the role of women in Golden Dawn? Golden Dawn started as a men’s organization back in the 1980s, but it soon included women as members. In late 1990s, when Golden Dawn started to participate in elections, it tried to include more and more women, not only to attract women voters but also because of mandatory gender quotas it had to fulfil regarding election

⁴ Information regarding the trial of Golden Dawn has been drawn from domestic press covering the trial (e.g. Efimerida ton Syntakton, <https://www.efsyn.gr>) as well as the monitoring initiative Golden Dawn Watch - <https://goldendawnwatch.org/>.

candidacies⁵ (Psarra, 2014). In 2007 it initiated a women's organization, named Women's Front, which started its activity with online blogging. Until its withdrawal in 2013 more than one thousand entries were published in the three blogs administrated by Women's Front, that is the blogs 'Women's Front for the People and the Fatherland', 'Ideological Library', and 'Kitchen'. Later, Women's Front participated in rallies and in food distributions, it organized local women's cells and ideological lessons for women. It is important here that Women's Front paid strong attention on ideology – group gatherings organized and managed by high-ranking women were closed to members and ideology was a crucial element in the initiation process (Félix, 2015). Antifeminism combined with nationalism and a Nazi-inspired as well as Nazi-praising racist and anti-liberal perspective have been in the core of this ideology (Psarra, 2014; Koronaiou & Sakellariou, 2017; Anastasiadou & Samara, 2022). Women's Front was rather active in period 2007-2013, closely linked to its leader Evgenia Christou's activity, and then disappeared as a collective women's space from public, although women - and Evgenia Christou herself - continued to participate in Golden Dawn politics. In 2012 and then again in 2015 two women were elected each time as MPs among eighteen MPs with Golden Dawn, while among the four party representatives who were elected in Athens City Council in May 2019, two were women. Although evidently fewer than the men in the party -unfortunately, however, there are no official or other data on the exact numbers of membership -, women's role has not been restricted to presenting a friendly face to the public or taking care of background organizational work, but as Kamenou (2023) points out, they have also claimed a place as 'political soldiers' in the nationalist movement, negotiating the strict patriarchal and masculine norms which dominate the Greek far-right.

Exploring the articulation of a feminine Greek neo-Nazi identity: the emerging element of violence

A first-step exploratory analysis of Women's Front blogs, accompanied by and compared to other party media material, showed that violence is a central element in discourse addressed by and addressing women. It should be noted that Women's Front discourse has been partly produced and signed by women of the organization and much reproduced from other Golden Dawn or broader far-right media. Moreover, although men had the dominant role in leadership and intellectual production in the party - at least in public -, women's active role in supporting and promoting Golden Dawn agenda should not be underestimated, even if it is not clear to what extent women co-determined it (Anastasiadou & Samara, 2022). In any case, the emergence of violence during the analysis of women's discourse - as expressed and defended by women and their 'Front' -, raised a series of further questions: what meaning is given to violence in neo-Nazi discourse? What is its' role in the articulation of gendered political

⁵ According to the law in Greece, the gender quota for election lists was a minimum of 30% for men and for women candidates – a quota which has risen to 40% since 2019.

identities, and in particular feminine identities? How (if) is feminine militancy constructed in Greek neo-Nazi ideology? And moreover: how are historical national socialist interpretations of violence interwoven with current local or transnational nationalist narratives in women's discourse?

A qualitative in-depth analysis followed on fifty selected texts of Women's Front blogs, chosen for their relevance to the topic of violence and gender. The analysis, based on discourse theory (Laclau & Mouffe, 1985) and critical discourse analysis (Wodak, 2001, Reisigl, 2017) from a feminist (Lazar, 2007) and intersectional perspective (Riegel, 2016), showed that in order to articulate a collective political identity, Golden Dawn women draw on three distinct - distinguished here one from another mostly for analytical reasons - discourses: historical Nazi discourse, contemporary international white supremacist discourse as well as old and contemporary Greek nationalist discourse (the latter to a certain extent widespread in the Greek context and mostly among conservative spaces and actors). These threads of discourse are combined in a women's perspective, producing a feminine radical right identity in the context of contemporary Greek politics, and in specific producing what can be named as a *feminine Greek neo-Nazi identity*. The resultant narrative, represented as the one and only legitimate 'truth', appears as strongly antagonistic to concurrent alternative political discourses, which include feminist, antiracist, left and liberal discourses. 'Violence' is indeed one of the main elements in this narrative, related to a series of significant signifiers, such as 'war', 'threat', 'resistance', '(counter)attack', 'genocide', 'death', 'heroes/heroines', which are here given meaning from a gendered, feminine perspective. It is this feminine (or feminized) narrative perspective on violence and its basic components which emerged in the analysis, that I will present below.

Racial war, enemies and the gendered national body

The journalist and expert on Golden Dawn history and politics Dimitris Psarras (2015) has noted that the concept of 'war' belongs to the core of Golden Dawn leadership's worldview, who copy the historical national socialist rhetoric by depicting themselves as "wolves among the sheep", fighting a 'waging war for countless centuries' and seeking to make true Hitler's vision for an *Endsieg* - in their words fighting 'a total and merciless war and we will not cease until we emerge triumphant' (Psarras 2015, p. 65). Thus, Golden Dawn represents itself as the savior of the imagined community, ready to fight against all its alleged enemies - internal and external -, who supposedly lead a war against the nation and the race. Women's Front adopted the same rhetoric. In May 2012, when the party entered the Greek Parliament, Women's Front republished in its blog 'Ideological Library'⁶ a post from the Youth's organization, which copied its title

⁶ Sources originating from media of Golden Dawn or Women's Front are cited here partially, with reference only to the titles of posts/articles and the names of the websites/blogs/newspapers as well as the date of publication. This choice attunes to recent concerns on how to avoid reproducing direct web-links to far-right media through scientific work.

from Joseph Goebbels speech in Sportpalast in 1943 – ‘Stand up Greek People’⁷ and let the storm burst!’ - and which reproduced national socialist language amalgamated with contemporary racist discourses. The text reads that

Golden Dawn has signaled the Call of War [...and ...] undertakes the protection of our persecuted People. Its protection from both the regime of Zionist loan sharks and the barbarian hordes of Asia and Africa. It is time we remove the redundant fat of this people; it is time we punish the ones guilty of this Treason⁸.

Golden Dawn, like other neo-Nazi organizations, has insisted on open antisemitic and antizionist statements in contrast to other contemporary far-right parties, which avoid explicit antisemitic language in favor of a pro-Israel stance – although they may include antisemitic adherents (Kahmann, 2017; Grimm, 2019). Antisemitic images of Jewish bankers and ‘loan sharks’ have suited well the anti-systemic rhetoric of the party during the recent financial crisis in Greece, when international financial institutions and organizations, such as private banks, the European Central Bank and IMF, played a crucial role in the management of public debt crisis. But Golden Dawn did not just reproduce an old antisemitic rhetoric – its antisemitism was combined with latest racist anti-immigration and anti-Islam discourses, which depict the nation as a biological and cultural unity in danger of degradation due to alien invading elements – those mentioned above as ‘barbarian hordes of Asia and Africa’. Next to outer enemies, Golden Dawn also refers to inner ‘betrayers’. These are its political opponents who need to be combated and exterminated as ‘redundant fat’, i.e. as an unnecessary burden to the national body, who deserve punishment for failing or refusing to protect the nation from outer enemies, be that immigrants, Muslims or Jews.

In Women’s Front discourse the nation and the race suffer also from a domestic ‘decadence’ caused by a moral crisis, attributed to a conspiracy plan. Moral decadence is explained as part of a war plan organized by outer forces and backed up by inner collaborators, aiming at disorientating the people from their devotion to the wellbeing and advancement of the racial/national community, which is depicted as nothing less than people’s natural purpose and duty.

Interestingly, sexual and reproductive practices stand in the middle of this war. ‘Low birth rates’, ‘abortion’, ‘homosexuality’, and ‘miscegenation’ are pictured as practices of the plan that aims at the degradation, if not extinction, of the community. Women’s Front condemnation of such practices does not lie on conservative fears; following the legacy of Aryanism, it results from the belief that such practices do not promote but on the contrary, they sabotage the reproductive survival and advancement of the race and nation, which are envisaged as the greatest cause. In women’s blogs it becomes clear that women are attributed and called upon to play a special role in this mission: it is women who are reminded again and again that they bear the responsibility to reproduce

⁷ Words in translated passages written in whole or often with their first letter in capitals follows the choice of writers in Golden Dawn and Women’s Front media. The choice of the writers signals an attempt to underline the significance or even to ascribe superiority to content of capitalized words.

⁸ *Stand up Greek People and let the storm burst!* [Ξεσηκώσου τώρα Ελληνικέ Λαέ και άσε την καταιγίδα να ξεσπάσει!]. May 2012. Blog Ideological Library.

the nation and race and to reproduce it right. Drawing on historical fascist ecological thought, which survives until today but often revives in different forms from the past (Forchtner, 2020), ‘Greeks’, the Greek nation, are represented as part of a broader ‘endangered’ white European family, to which other European nations belong too as brother-nations and whose reproduction is women’s urgent duty. In pictures (re)produced by Women’s Front, Europe is portrayed as a female figure: for example, a post titled ‘Racial ecology’, apart from written text explaining racial theory, also includes a picture of a figure resembling a frowning, young white woman on the back of a white Siberian tiger (Pict.1⁹), accompanied by the caption ‘Endangered species. Save the tiger of Siberia and the human of Europe’. Not only does Women’s Front appeal here to and appropriates quite mainstream preservation worries of the environmental movement but it also identifies an alleged race with its women – or better women with the community they supposedly belong to. Thus, women lose any individuality, since their existence obtains meaning only through the community and the ways they relate to it. This is no surprise, since Golden Dawn openly positions itself against human rights and rights of the individual, with women representatives and members publicly defending such political positions even against women’s rights (Anastasiadou & Samara, 2022).

The racial war Golden Dawn is devoted to is a *gendered* war between races, conceptualized as a competition of natural, biological terms. In Women’s Front discourse historical national socialist ideology meets contemporary debates on European borders and migration together with debates on gender and sexuality. In the aforementioned text ‘Racial Ecology’, racial theory is used to explain the supposed dangers of antiracism, combined with dangers of homosexuality and abortion. Antiracism is rejected as an ideological distortion of the racial logic by opposing and threatening the ideal of racial purity and homogeneity of the community by allowing racial ‘miscegenation’. Neglection of giving children, termination of pregnancies and homosexual living are also part of the conspiracy against the race, where the race is illustrated as overflowed with ‘alien’ elements and distracted from the responsibility to reproduce itself by giving in in distorted sexual and reproductive practices. The above narrative, diffused in Women’s Front texts, is well summarized in the following passage:

[...] biological foundation - the blood - is the womb of creation. Any preach of antiracism that leads to the cultivation and acceptance of miscegenation is disastrous [...] European races are today more than ever in danger. We are experiencing an intrusion of other-races aiming at the dilution of national coherence and consequently the miscegenation and ultimate and irreversible extinction of races. [...] The social planning entails, not at all by chance, the so-called low birth rate and abortions. But also homosexuality, which is promoted in a sick way towards the European youth as a ‘lifestyle’.¹⁰

⁹ The pictures mentioned are to be found in the picture appendix at the end of the paper.

¹⁰ *Racial Ecology* [Φυλετική Οικολογία]. 06.04.2010. Blog Women’s Front for the People and the Fatherland.

The national and the racial¹¹ community under threat is articulated in Women's Front discourse as a gendered body that consequently faces gendered dangers. Women in particular are represented and addressed as victims of the violence exerted by the enemies of the nation/race - but also as an inextricable part of the solution, of the counterattack of the community, as will be explained further below. The representation of women as vulnerable to violence and in need of protection is not at all an original element of Golden Dawn; it is rather a common patriarchal motif and practice, incorporated into Golden Dawn's scheme of war. In contrast, this victim discourse does not apply to representations of masculinities in Golden Dawn and Women's Front discourse. Men are not addressed as victims the way women are – they are mainly depicted as strong and combative and only indirectly represented as victims, as part of the culturally and morally attacked youth and consequently disorientated from its racial/national potential and duties (supposedly false values of individualism, superficial lifestyle, homosexuality, drugs¹²). Moreover, although the myth of rising criminality by 'third-worlders' is a common topic in Golden Dawn discourse, men are not explicitly depicted as suffering from it directly. It is vaguely the 'fatherland' and in more embodied categories the women (being attacked or raped/harassed¹³), or even the animals (stray dogs, cats, doves or pets being stolen, killed and consumed as food¹⁴) that supposedly suffer from immigrants. Women are also addressed by Golden Dawn as victims of gender violence, but gender violence is here instrumentalized from a racist perspective: it is white women and Greek women suffering attacks by men of 'other-race'. As has been noted (Anastasiadou & Samara, 2022), Golden Dawn and its women have been pioneers in diffusing into the Greek context this pattern, which has been intensively used by far-right parties and far-right women themselves across borders during the last years, in order to mobilize people against the 'racial other' and to gain members and electoral support, and which becomes more and more dominant in mainstream discourse and politics nowadays (Farris, 2017; Hark & Villa, 2017). Although in Women's Front discourse gender violence can also be exercised by Greek men (to show how much in decline, 'decadent' the living conditions have been) or against 'non-Greek' women (and in some cases also young boys – to show how 'uncivilized' immigrants are in comparison to the 'civilized West'), it is mostly violence against 'our' women by men of 'other-

¹¹ Nation and race are often referred together in this paper, as the logic that constitutes them is common in Golden Dawn's discourse: both the 'white race' and the 'nation' as part of the white race family are understood in biological terms and even references to culture and cultural differences imply or signify natural differences among groups.

race' that is ascribed special significance as a widespread threat to white women's safety. Thus, we read in Women's Front blog:

[The woman today] is afraid of moving around alone in hundreds of areas of the country, in fear of robberies, attacks and rapes by illegal intruders who overflow the local communities.¹⁵

and

A shocking report [...] revealed that 92% of gang rapes in London come from non-whites. Fifty percent of the victims are white women.¹⁶

In Women's Front narrative, women are also victims of a cultural attack to the nation/race, which disorients them from fulfilling their natural cause and duty to contribute to the reproduction of the national/racial community by mothering and educating the new generation to the proper values¹⁷ (Koroniou & Sakellariou, 2017). Anti-feminism consists a central element in this construction (Psarra 2014; Anastasiadou & Samara, 2022). Feminism is blamed for alienating women from community-centered orientation, resulting in women following individualist values as well as leading a superficial lifestyle, carried away by fashion, consumption and entertainment and caring more about those activities, rather than for family life. Feminism is also blamed for promoting a destructive 'competition' between women and men, in the name of gender equality, instead of cooperation and partnership in a model of heterosexuality and gender complementarity¹⁸. Gender equality and demands or legislation for broader gender rights, together with LGBTQI movement, are also represented as part of the international plan against the nation and the race: homosexuality is represented as an illness and abnormality as well as an element of the outer plan of cultural and consequently biological degradation of the race/nation¹⁹. 'Politicians', the Greek political status quo, - are depicted as betrayers in this war against the nation, as they have supposedly failed to address the above social problems and to suggest policies that should promote births and motherhood, the avoidance of abortions and increase in young couples getting married and making their own families²⁰. Mainstream media are also depicted as playing a

hideous role in racial degradation by promoting false models to the population²¹, while other inner enemies, such as the left(ists) and anarchists are depicted as collaborators in the above so-called ‘crimes’ against the race, as they refuse to serve the nationalist project²².

Politicization of women: mothers and warriors in the racial war

But what is the role of women in the war Golden Dawn has declared against all its enemies, in its ‘Counter-attack’²³? Golden Dawn does not represent women only as victims of violence by the enemies of the nation, but it also stands for the politicization and mobilization of women, resembling the ways historical Nazi movement envisioned the involvement of women in its political struggle (Wagner, 2010). Thus, women are encouraged to take action and participate in the nationalist movement, they are called upon to be active and to contribute to its’ struggle. Their victimization serves the legitimization of their mobilization, as a political response to the dangers women and their nation face. Women are addressed as political subjects, but at the same time they are called upon to adopt a very specific model of subjectivity which complements – and does not compete with – men’s social and political roles in and which is devoted to the service of the national(ist) project. When it comes to violence, women are called upon to take action and to free themselves from violence as well as to work for others’ freedom. However, violence – a central signifier in women’s movement discourse – is here redefined as violence against the race and the mythical community, in opposition to competitive political approaches and mostly feminist critiques that address violence as an issue of gender relations and patriarchy (Anastasiadou & Samara, 2022).

In Women’s Front narrative, women’s freedom should be accomplished through action as well as through enlightenment and education – an education in alternative, racial values. Women should be educated themselves and they also have a duty as educators, that is as nurturers in the family and as cultural reproducers in society (Koronaïou & Sakelariou, 2017), e.g. as heroic teachers at schools – here a series of contemporary and historical female figures are praised for their nationalist work as teachers, as will be shown below. There is a major contradiction lying in this kind of emancipatory project, which interestingly is not named as ‘emancipation’, obviously because of the term’s strong connotations of historical autonomous feminist movements: women are called upon to become politically visible and active, and to break free from repressive mainstream lifestyles focused, as we read, exclusively on beauty, consumption, flirting and entertainment, but only to follow the norms set by a nationalist movement which

²³ ‘Counter-attack’ [Αντεπίθεση] is a favorable concept in Golden Dawn discourse and it is also the name of the magazine of the party’s youth section.

praises gender segregation and heterosexual family life as ideals. In other words, women are called upon to be politically active, but not independent: women's action should be devoted to mothering and care, and any other activity, in order to be accepted, should be tuned to the racial, nationalist project, denouncing any kind of women's political autonomy. So, rather than being politically ignored, women are mobilized by Golden Dawn to work for emancipation, be that however not an emancipation from men's power, but an emancipation of the nation and the race from its oppressors. In order to do so, they are proposed a combative political attitude, a militant femininity which combines two – at first sight contradictory – elements, one creative and reproductive (woman as mother and nurturer) and one martial and aggressive (woman as warrior and fighter). The consistency of this scheme can only be understood in the context of Golden Dawn's narrative of racial competition²⁴.

Mothers as reproducers of the nation and race under attack

In Golden Dawn women's discourse motherhood is depicted as a creative practice linked to the biological and cultural reproduction of the community (Koronaïou & Sakellariou, 2017). This means that motherhood is not at all understood – and not even accepted or tolerated – as an individual choice of the mother or the parents. On the contrary, it is represented as the ultimate natural mission of women, with nature identified here with an imagined racial ecology – that is a system of human races competing for survival. Motherhood should offer women self-fulfillment, but only as a contribution to the resurrection of the community. In other words, it is this contribution to the race and to the nation that provides women with self-fulfillment, while motherhood is constructed as the principal means which connects women to the community. As has been noted, in Women's Front media a discursive process of women's 'motherization' takes place (Anastasiadou et al., 2015): women are imagined and praised as mothers – any other identity and activity of women is only accepted if it serves the race and the nation, but even then, it is only secondary in value in comparison to motherhood, which is depicted as women's 'utmost role' and 'highest honor', as for example exemplified in a text titled '*Women's Place in People's Community*'²⁵.

Where does this narrative of motherhood stem from? On the one hand, the pattern and the language used are linked to broader far-right discourse as well as to national socialism – as for example the aforementioned reference to '*people's community*' implies. On the other hand, the motif is also found in the tradition of Greek nationalism, which has long praised the 'mothers of the nation'. This observation points to one of the most important aspects of Golden Dawn Women's Front discourse: the marriage between national socialism and Greek nationalism. Evgenia Christou, in charge of Women's Front, when referring to the natural duty of women to reproduce their race and its culture, resembles -if

²⁴ Although Golden Dawn often follows the ethnopluralist discursive paradigm, racial competition logic is not at all abandoned, but nesting on the core of arguments that want the nation or race under attack of 'foreign' populations or falling behind in comparison to 'others' in reproductive terms.

²⁵ See for example: *Women's Place in People's Community* [Η Θέση της Γυναίκας στη Λαϊκή Κοινότητα]. 26.05.2007. Blog Women's Front for the People and the Fatherland.

not imitates - Gertrud Scholtz-Klink, the leader of National Socialist Women's League (NS-Frauenschaft), whose words have been openly reproduced in Women's Front blogs. A passage of a historical speech of Gertrud Scholtz-Klink in New Year's Eve of 1935, translated for the blog of Women's Front, reads

It is thus our duty to arouse again the sense of the Divine, to make the calling for motherhood the way through which the German woman will see her calling to become mother of the Nation. Then she will not live her life in egoism but in the service of her people.²⁶

When asked in an interview for a nationalist website about the aim of Women's Front, Evgenia Christou repeated the above call in almost identical words. Although she did not refer to national socialism openly, the similarity in ideas and language is striking. This is how Evgenia Christou explained the aim of Women's Front in her interview:

We are trying to show an alternative lifestyle to women [...] That they educate their children based on the values and ideals of our race. That they feel proud Greeks and that they love the divine gift of motherhood which Nature gave to them²⁷.

However, it is rather hard and to some extent pointless to distinguish between national socialist and Greek nationalist influences in a passage as the above. It is more insightful to approach such a statement as a point where fascist ideological tradition and local nationalist heritage meet, making it almost impossible to sort the two traditions out, to separate them from one another even for analytical purposes, which shows a striking (at least at first sight) paradox in their intersection: historical fascism with all its brutality in its ideology and practice can remain concealed in contemporary - often mainstream - nationalist discourse and thus become normalized; at the same time, however, it also shows how close these two nationalist traditions are in their narratives and rhetoric – at least where, like in Greece, soil and blood as well as a persistent images of dangers and enemies against the nation constitute the base of national identity. In Evgenia Christou's above statement, the references to race, divinity (in other texts to 'God') and motherhood as a natural gift resemble the ideology of the 3rd Reich, but they also belong to the core of the dominant Greek nationalist narrative, which not only ascribes an important role to women as mothers for the continuation of the 'eternal' - originating from 'ancient Greeks' - nation, but it also attributes characteristics of a collective threat to 'low birth rate' and abortion (Halkias, 2004).

The calling for reproduction is at the same time an urging for participation in race competition. Since the race and nation, constructed in blood terms, are depicted in danger of degradation and even extinction – history is used here to

prove the possibility of extinction of races, as the reference to Sumerians shows below -, threatened by other races and nations, which grow and spread over the white race and the Greek nation²⁸, women's contribution to interception of the decline of the community and the onslaught of 'other-races' – here the 'Muslims', since religion is used in Golden Dawn discourse as a racial category -, becomes a main strategy in winning the war of racial survival and domination. Thus, in Golden Dawn's narrative procreation and nurturing are not only creative practices, but they also function as a defensive or even aggressive practice against the racial enemy, whom they intend to fight by outperforming in reproduction – in numbers and in genetic quality. Such an explicit reference to racial competition is noteworthy, since Golden Dawn often uses ethnopluralist arguments in order to argue against the accusation of racism²⁹. Evgenia Christou has offered a good example of this urging towards women to reproduce the nation against the racial enemy, and this way to protect the race from disappearance.

Muslim women have six children on average, whereas the Greek woman barely one. Greek woman has the duty and honor to continue her race [genos]. [...] It is really unheard that we let the Greek race go extinct like Sumerians and other races went extinct in the depths of centuries.³⁰

Moreover, in this generative strategy against the enemy, women are not alone. Although it is mostly women that are assigned the tasks of mothering and care work, responsibilities of ensuring the well-being of the family and the education of the children are also allocated to men. Some writings underline both the role of the breadwinner and that of the instructive father as measures of self-fulfillment for men. Thus, masculinity consists of more than the role of "soldier" for men - at least in Golden Dawn women's discourse. As we read in a text signed by the nickname Telesilla:

Our Race must realize that it can make true what they fear the most: its numerical advantage, its perpetuation. Men will feel that their existence has a purpose in this world, by making a family and having ahead the challenge of educating their children and struggling for covering their needs. Women will accept their nature, the only real emancipation, to give birth and nurture children.³¹

Combat women (a): the right to self-defense, vigilantism and the re-establishment of state power

Although motherhood has been praised as the highest valued role for women in Women's Front discourse, femininity is not at all articulated as a passive, quiet or suave identity – one that would suit the model of mother and housewife as usually expected. On the contrary, women are called upon to show a strong, combat character, which can even authorize them to direct violent action. Although it is men that are primarily given the role of the fighter and soldier, women are also legitimized to support and to participate in violence, be it impulsive or planned, individual or collective – their potential for violence justified by eternal models of feminine warrior ancestors, and a narrative of a racial and political war emergency.

First of all, a spirit of fighting readiness is key in the representation of female membership in Golden Dawn. Women's Front logo alone proves that well. In the first period of the organization's blogging, it showed some female figures pointing with guns towards the public (Psarra, 2014), while later it resembled a young girl's figure holding a slingshot and pointing again directly towards the reader. The picture, painted in the three typical colors of Nazi and also Golden Dawn flag – black, red and white –, was accompanied by the motto 'always ready' (Pict.2). So, women are not only described as victims of violence, but also as militant political subjects who take action against it. Women's Front called for 'readiness' of women in the war against the enemies of the nation and race, focused mainly on 'other races' and secondarily on political opponents. Women were called upon to be ready to fight against criminal attacks in everyday life, dramatically described as full of dangers, unsafe and provoking insecurity. In 2012, when the party entered the parliament and gained popularity, Women's Front started to organize self-defense classes for women - 'only for Greek women' - against those constructed as criminal intruders, that is 'illegal immigrants', 'Muslims', 'third-worlders', who are accused of threatening women's safety during their daily routines, like for example in their stroll with kids, on the way back home or even inside their houses³². Women were thus encouraged to exercise their physical condition and fighting skills, so as to be able to protect themselves on the streets or at home in case of attack – and not to restrict their movement out of fear or depend on men's protection. Although visibility to the issues of women's free movement and safety in everyday life and the appeal for women's mobilization may at first sight seem as an empowering process, Golden Dawn addressed only a special category of women (those fitting in the category of 'Greek women') and did so in a racist and fanatical discursive context, which constructs racial and political 'others' as enemies who worth punishment, if not annihilation. It is thus a racist, nationalist empowerment, aiming at mobilization in the (limited) lines of Golden Dawn party, away from struggles for women's independence. This is so, because such a 'femonationalist'

³² *From First Self-Defense Seminar* [Απο το Πρώτο Σεμινάριο Αυτοάμυνας] 09.06.12; *Women's Self-Defense Lessons*. [Μαθήματα Αυτοάμυνας Γυναικών]. 09.10.12. Blog Women's Front for the People and the Fatherland.

(Farris, 2017) targeting of the male foreigner disguises and silences universal dimensions of patriarchal power, masculine violence, misogyny and sexism against women and redirects the problem against a vulnerable group, that is (male) immigrants and refugees.

Moreover, the call for women's combat 'readiness' has also an anti-systemic aspect, which delegitimizes (existent) state power and at first sight, calls for people's (controlled) insurgency. Based on images of failed, corrupted Greek state and police, who are blamed as incapable of protecting citizens, here women, from criminals (often meant as immigrants), the narrative says that women cannot rely anymore on institutions and therefore need to take action for their own (and their nation's) good. In a post on Women's Front official blog, signed with the female name 'Veta', the police are scorned for an official announcement advising women to be careful on the streets, e.g. by not walking alone late at night or wearing jewelry. The solution relies on Golden Dawn women who are called upon to address Greek women's problems, to take action and to play the role of catalyst in inspiring women's confidence and empowerment.

I will answer to the police by saying: "No, gentlemen, if you cannot do your job, we do not deserve to pay for your incapability – or your restrictions. We will go wherever we like, we will be out whatever time we want and wherever we want inside our Fatherland, and we will take the law in our hands, if necessary, in order to protect ourselves". (I am appealing to Nationalist Women: We have to finally answer to all the conditions. We are able to raise the morale of all women of Greece with our powerful presence where necessary)³³.

Golden Dawn women oscillate here between vigilantism and legality. In other posts, a self-defense advice was given, paying special attention to what counts as legal defense according to the law, so that women become informed and somehow aware of the limitations posed by law³⁴. This makes sense, if we take into account that the activism and rhetoric of Golden Dawn has often been (far) beyond the rule of law by taking or calling upon taking the law into one's hands. The appeal for women's readiness is illustrated with pictures depicting female figures with guns in their hands, for example a young woman waiting at home for potential inventors (Pict. 3)³⁵, while another picture of a woman pointing with a gun accompanies a post that asks for the right to self-defense against the incapable state (Pict. 4)³⁶. In a post reporting on a case of sexual harassment, lynching is indirectly suggested as the proper punishment, with the picture of a human figure hung on a tree (Pict. 5). Justice is here criticized for prioritizing the protection of human rights of criminals, instead of the rights of the local

community³⁷. According to this logic, the state should be stricter in its punishing system, so as to avoid frustration and vigilantism by the people³⁸. Thus, death penalty is suggested as the proper punishment in cases of child molestation³⁹. For example, a post reporting on a case of ‘pedophilia’ and criticizing the punishment of the perpetrator as soft and therefore unfair, the text is accompanied by a picture of a broken mirror and the message ‘Kill them! Boogeymen exist.’ (Pict. 6)⁴⁰. However, although women are depicted as ready to take the law into their hands if necessary, the solution proposed in the long run is not people’s spontaneous or autonomous action of vigilantism, but a state organized and governed by Golden Dawn itself. So, anti-systemic rhetoric is only a means of bringing women (and men) closer to Golden Dawn, so that they trust the power to the party, which can then re-establish the state and its power over people.

Combat women (b): women at war and the legacy of eternal warriors

What does an alternative make-up look like? That is the colors of war on the face of a woman⁴¹ – army women become beauty symbols against what Women’s Front depicts as mainstream, sexist beauty norms. But it is not only an issue of aesthetics, since Golden Dawn women also state their readiness for joining the army next to men. Indeed, women’s military service has been one of the official demands of the party, expressed in parliament for the first time in 2012 by former MP Eleni Zaroulia, during a discussion on Istanbul Convention – military service proposed as an alternative to a convention aiming at preventing and combating violence against women. Eleni Zaroulia, who was the only MP in parliament who objected the ratification of the convention, stated that what constitutes a discrimination against women is their non-enlistment in army and proposed the legislation of obligatory military service for women at the age of 18 – the same as for men⁴². Some days later, in an interview of hers for a nationalist website, Evgenia Christou expressed the same position: she stood for women’s service in the army and explained that Golden Dawn recognizes a manifold potential in women against the stereotype of the soft vulnerable woman, stating that women

are ‘no fragile ornaments’⁴³ – thus claiming an active social role for women, even in fields that have been traditionally masculine in Greece, as the army. However, she added clearly that women’s role in service should be assisting to that of men, who should have the first place as armed soldiers. This reassurance, though, for a secondary role of women in army is not always the case in Women’s Front discourse, at least in the level of the imaginary, as will be explained next.

Women’s Front mythology of women warriors occupy a special place – next to women teachers of the nation. It should be noted that the image of the woman-warrior occasionally appears in Golden Dawn media as well, which indicates its relatively broader acceptance in the movement, but it mostly unfolds in women’s media. Golden Dawn women identify with a series of heroized female figures who are manifested as having fought in warfare bravely and vigorously, sometimes even more than their male comrades. Thus, women’s place is not only in the house nurturing children but also in the battlefield. Although men come clearly first in the role of fighters in Golden Dawn – and this is not doubted in Women’s Front writings – women’s ability and skill in war is not at all undervalued, but rather praised in cases of heroines of the past, even compared to that of men whom women are occasionally depicted as overcoming in combativeness⁴⁴. Such competitive instances, though contradictory to Golden Dawn’s segregated gender model, only little imply gender antagonism by women’s side. References to women’s extra-ordinary strength, described as fighting even better than men, mostly serve the idealization of women warriors – their comparison to men only proving the greatness of women’s courage and power.

But who are these fighting figures praised by Golden Dawn women? Women’s Front heroic warriors come to a good part from the dominant Greek nationalist narrative – reproducing and reconstructing here the myth of the continuation of the nation from Greek antiquity to War of Independence and further to national struggles in 20th century. They also come from the historical fascist movement and the international contemporary ultra-nationalist movement. Other cases of famous women warriors in European history are also praised in Women’s Front – depicted as fighting for a national(ist) cause. As the list of warriors is long, I am going to present here only some outstanding examples.

First, as explained, the Greek nationalist narrative is a privileged field, from which Women’s Front draws in order to construct its national fighting heroines. Starting from the Greek antiquity, Women’s Front introduces women of ancient Sparta as the superior model for women, the ‘eternal models for nationalist women’⁴⁵, to some extent following the idealization of Spartan women by the Nazis. Spartan women are praised for their toughness, independent spirit and at

⁴³ In Greek the French word *bibelot* (ornament) is used to name fragile, small decorative items and metaphorically for small-bodied, elegant women and further for “fragile” femininity, that is one that is inherently vulnerable and needs special care and protection.

the same time devotion to their community. They are depicted as women of strong character, discipline and excellent physical condition, of high sense of responsibility towards their people, being strict and rigid mothers and partners⁴⁶. Among Spartan women's qualities is their fighting spirit, as explained in the post titled 'Eternal models of nationalist women', which refers to a text from an official Greek school book of 1959 – this interestingly shows the relation of Golden Dawn to historical nationalism in Greece, in which Spartan women have also served as a model for women's devotion to fatherland. Spartan women are here praised for not abandoning the homeland, according to an evacuation plan proposed by Spartan men soldiers, but staying and supporting men's preparation and actual fight throughout the battle. In another post⁴⁷, the fight and victory in the battle of Sparta against King Pyrrhus is credited completely to women (and children), as men's army was away from the city.

Moving forward to time, the war of independence, known as the 'Greek revolution', serves as a source for heroines depicted as having fought with guns and fire for the liberation of the nation. Women warriors are here illustrated as models of courage, strength and even excellence in war skills. So, we read the story of Moscho Tzavela, who fought in Souli battle in 1792 against the army of the Ottoman pasha Ali, leading 400 women with guns – women's contribution to the battle is estimated in the text as crucial for the victory of the army of Souli⁴⁸. The story is reproduced from a book of 1914, collection of folk songs, by Nikos Politis, who is considered the founder of ethnology in Greece. The text is supplemented with a reference to a biographical book on Moscho Tzavela written by Lilika Nakou, a female writer of the first wave of feminism in Greece. These references show that Golden Dawn women's mythology of women warriors is not an innovative construction of Golden Dawn and Women's Front. On the contrary Women's Front draws here on older narratives of women's role in the national history, it reproduces and reconstructs the already existent myths of the dominant national historiography, which to a certain extent has also been produced and used by first wave (and later second wave) feminists for promoting women's rights. As Poulos (2009) has explained, the woman – warrior has been a central element in the articulation of a feminine national identity in Greece all the way from 19th to 20th century with feminists, nationalists and even the left participating in the construction of this legacy of feminine combats. Other examples of heroic women warriors of the nation include the story of Domna Visvisi, depicted as 'the beautiful, the strong, the captain'⁴⁹, who fought with the boat of her dead husband against the Ottomans in 1821 - the year established as the beginning of the 'Greek revolution' – and the story of Margarita Basdeki, reproduced from a local Golden Dawn site, who is depicted as a young, 20-year-

old shepherdess, who put on the traditional men's kilt, took a flintlock, fought together with men and even encouraged them during the battle of Makrinitza in 1878⁵⁰.

The list of women warriors includes also figures of the struggles for national expansion in 20th century or of the populations that resided outside the borders of the Greek state and who would – at least at a certain historical point - identify as Greeks, while the regions where they lived, would also be claimed as Greek. Thus, a series of women are praised among the fighters who died during the 'Macedonian struggle', that is the war to incorporate the northern part of today's Greek territory⁵¹. Pontiac Greek women of Santa, in Black Sea, are compared to ancient Amazons and also referred to as an example of heroic warriors, who resisted the conquer and assimilation by 'other races' of the region, described as holding guns and ready to fight at any moment the enemies of their people⁵². What is here noteworthy is that such references are not always original, but reproduced from other websites of the Greek blogosphere, which shows the relation of Women's Front nationalist models to broader nationalist narratives produced and disseminated in the Greek-speaking world the same period when Women's Front operated its blogs.

However, Women's Front mythology of warriors does not consist only of Greek heroic women, while political orientation seems also to play a crucial role in women's mythology. This explains why Greek women who fought as soldiers of ELAS (Greek People's Liberation Army) against Nazi occupation in Greece during the 2nd world war, are omitted from this mythology – ELAS was organized by communists, and communism is articulated as one of the most important political enemies of Golden Dawn, which has been often proved by violent attacks against left activists (Jupskås & Fielitz, 2022). Golden Dawn has not really tried to appropriate the history of resistance against Nazism – neither of the women who took part in it. On the contrary, women's participation (although without frontline fighting) in the nationalist (and anticommunist) organization EOKA in Cyprus, which fought in 1955-56 for independence from the British and for unification with Greece, is glorified⁵³. Moreover, women fighting against communism are idealized in Women's Front. For instance, there is a post referring to the uprising of 1956 in Hungary against Soviet Union – interestingly one of its leaders, Gergely Pongrácz, founded the neo-Nazi party Jobbik in 2003. The post includes a historical photo of the events of the uprising, showing a woman fighter who holds a gun in one of the streets where the battles took place – the picture is captioned 'Better dead than red' (Pict. 7)⁵⁴.

Furthermore, in accordance to Golden Dawn's admiration of Nazism, famous Nazi women are praised for their strength and achievements. Hanna Reitsch, the famous woman pilot of the German air-force during second world war and unapologetic supporter of Nazi regime has a special position in Women's Front discourse. A relevant post in Women's Front blog, which praises Reitsch' extra-ordinary skills in piloting and her bravery during the war – e.g. the fact that she flew over occupied Berlin to meet Hitler - is titled 'Great Hanna Reitsch dies' and it ends with the acclamation 'Immortal!' – 'great' and 'immortal': adjectives that imply nothing but respect and admiration to Hanna Reitsch' s face⁵⁵. Moving to post-war fascist influences, Women's Front finds warrior models in the international contemporary ultra-nationalist movement. Here, there is a detailed report on Asgarda, a nationalist women's group in Ukraine, described as reviving the tradition of mythical Amazons by mastering martial arts and 'training paramilitarily and as a community'⁵⁶.

Last, famous women warriors from European history are also introduced in Women's Front as role models for women nationalists. The focus on European history is no coincidence; it suits Golden Dawn's Eurocentric thought and it also serves the narrative of white, European superiority over 'other races'. Jeanne d' Arc, the famous warrior in the Hundred Years' War, is depicted as an embodiment of the national socialist ideals of 'virtue' and 'honor' for women. Her story is here appropriated from a nationalist perspective, as Jean d' Arc is represented as a proper 'nationalist'. She is depicted as an example of devotion to the nation and a woman fighter: her bravery, we read, was greater even than the knights of her time⁵⁷. In accordance to this representation, in May 2017 Irene Dimopoulou Papa, one of the prominent women of Golden Dawn, participated in a nationalist gathering to pay tribute to Jeanne d' Arc in Paris, where she underlined the need for European nations to fight for their continuation and against multicultural Europe⁵⁸.

Concluding remarks

By examining the discursive patterns of violence in Golden Dawn Women's Front blogs, it becomes clear that despite the strict hierarchical and patriarchal relations suggested in the ideology of the party, white nationalist femininity, as propagated by the women's organization, is articulated in an assertive and rather militant way, combining the ideal of motherhood with a readiness for fighting and for exercise of violence in everyday life and in warfare. Such an aspect of Golden Dawn women's collective identity is usually overlooked, although the

woman-warrior is a common pattern in the history of national identity construction (Poulos, 2009) and it is worth asking here how local context contributes to the shaping of far-right identities at the national level, potentially normalizing far-right violence - exercised by women or at the eyes of women -, by referring to an - already normalized - common national imaginary. However, Golden Dawn references to women's militancy do not stem only from the Greek nationalist tradition. They also draw on historical and contemporary discourses of the international far-right, which also provide space for women's involvement in violence – embracing and even exercising it.

The usual binary scheme of soldier man-woman mother, which is usually used to explain the imaginary of gender relations in far-right and neo-fascist ideology, needs to be further problematized. Such a binary approach obscures the understanding of gendered identities and activities of women (and men) in far-right groups – more or less inspired by fascist ideology - as well as our understanding of how far-right movements attempt to involve women and/or how women claim a place inside these undoubtedly male-dominated, supra-masculine movements. Especially neo-fascist ideology seems to be more complicated than the dominant interpretation of how gender roles work in it, which potentially opens more space and opportunities for women's action, even aggressive behavior, and participation in crimes, than it is usually believed - with all the contradictions produced by existent patriarchal social relations and norms, reproduced and negotiated in far-right movements too.

Although studying ideology and discourse alone, the question of how they relate to concrete action and praxis of gendered individuals and groups cannot be answered, what is, however, worth considering here is what orientations discourse creates for practice, what norms and limits it poses, explicitly and implicitly, in the production of gendered subjectivities and how it can legitimize and incite exercise or at least acceptance of violence by certain subjects constructed as 'we in danger' against the ones constructed as 'the enemy others'. By studying far-right media, it becomes clear that - against dominant interpretations of violence as a deviant behavior of the individual - violence is constructed and addressed as a collective issue in the far-right and especially in neo-fascist groups, against which subjects are called upon to take (gendered) positions and action, to mobilize as part of the community, and are thus legitimized to exercise violence in order to bring the social solutions proposed. This way violence is given political meaning, and it is therefore necessary to ask what the implications of this politicization of violence can be in the production of gendered identities and militant practices in far-right movements.

Showing (off) violence against women

Discursive constructions of violence against women and girls in an Austrian daily newspaper

Vanessa Siebauer

Abstract

One of the many achievements of the second wave of the women's movement has been to politicize and publicize the seemingly intimate forms of violence against women. Critical psychology holds that psychology is also not a private matter, but deeply political. Thus, a core task of critical psychology is to expose the structural conditions of inequality and oppression that permeate human feeling, thought, and action. One place where power operates, especially in private, is in violence against women, and media discourse is one of the means by which these structures are maintained. Austria has one of the highest rates of violence against women in the European Union, not first, but especially since the spread of SARS-CoV-2 in early 2020: in 2021 alone, 30 femicides were committed in Austria. Since 2020, mass media coverage of violence against women has also increased sharply. While the most visible forms of violence have been the subject of much research, an analysis of the discursive reproduction of structural and symbolic violence in the context of mass media coverage of violence against women is still lacking. This paper aims to fill this gap by conducting a critical discourse analysis of media coverage of violence against women and girls in Austria's largest-circulation daily newspaper, the *Kronen Zeitung*, in January 2022. In order to investigate and show how structural and symbolic violence against women is discursively reproduced in a covert and subtle way, exemplary articles are analyzed and discussed against the background of poststructuralist and deconstructivist accounts of the relationship between discourse and power. In this way, the political impact of these seemingly apolitical discursive acts on the realities of women's lives will be shown.

Keywords

violence against women, discourse analysis, power, structural violence, deconstructionism

1. Introduction

"Well-behaved husband commits atrocity" was the headline of an article in the *Kronen Zeitung*, an Austrian daily newspaper, about the femicide of a woman in Austria on January 16th, 2022. Reading the headline, questions and irritations arise: Why is it about the murderer and husband being well-behaved when he committed a femicide? How can someone who is well-behaved commit femicide in the first place? Why is it even mentioned that the murderer was well-behaved? What is happening in this sentence, in this article about a femicide? What do headlines like this suggest? To answer these questions, it is necessary to look at Austria's social structure on the one hand and violence against women* and the discourse about it on the other. One structural condition is patriarchy, that is, the emergence of violence against women is supported and accepted by the social system of patriarchy.

In this paper, the term violence refers not only to the most commonly perceived form of violence, physical violence, but encompasses all forms of violence that occur in the greatest danger zone for women and girls: the social environment of the private sphere. When violence is referred to in this sense, it includes physical, sexual, psychological, and economic violence as well as structural, discursive, and symbolic violence. It is important to note that violence against women is not perpetrated by anyone or anywhere, but most often by men within the context of intimate partnerships and family environments (see AÖF 2022; Russo et al., 2021). The most subtle and covert forms of violence are symbolic, structural, and institutional violence (cf. Russo et al., 2021), which can be perpetuated through discourse, i.e., hegemonically secured justifications that also find their way into media discourse.

There are now various laws to safeguard women from violence, but in everyday life, violence against women is still protected by social structures and is still mainly perpetrated by men. In 2014, a study by the *European Agency for Fundamental Rights* (FRA, 2014) highlighted that at least one in five women in Europe aged 15 and older has experienced sexual or physical violence by men, mainly in the private sphere. The problem is

in the tradition of Western political thought down to our own days, the way in which the distinction between the public and the private spheres has been drawn has served to confine women, and typically female spheres of activity (...) to the 'private' domain, and to keep them off the public agenda in the liberal state. (Benhabib, 1998, p. 85)

For it is precisely there, "at home", in the "private sphere", that most violence against women takes place, in the vast majority of these cases by (ex-)partners (cf. Russo et al., 2021). Therefore, these forms of violence are often framed as "domestic violence," which, however, obscures the gendered nature of the violent relationship.

These hegemonic phenomena are also (re)produced, (re)constructed, disseminated, and finally received again in discourse. Discourse, in this sense, both produces and mirrors social relations: In media discourse, for example,

women are fundamentally underrepresented both as subjects and as objects of speech and are mostly portrayed in a stereotypically female way. Violence against women also takes place in discourse, for example, when violence against women is reported from a male and androcentric perspective that relegates female voices into the discursive background (cf. Geiger, 2008). In discourse, sexual violence, and physical violence up to femicide are most often reported, and most research also focuses on these direct forms of violence. Cases of violence are portrayed very differently by different media genres, e.g., in quality or tabloid journalism (cf. Meltzer, 2021; Pernegger, 2019). Results of previous research on the reproduction and perpetuation of violence through discourse state that femicides, in particular, are exploited as an extreme form of violence, with many images, large lurid headlines, and stereotypical portrayals that frame the events as tragic individual cases and not structurally classified (cf. Meltzer, 2021; Pernegger, 2019).

Sadly, Austria is now one of the leaders in the *European Union* (EU), when it comes to femicides: "In 2021, there have been 30 cases of murders of women* so far. 29 of them were allegedly committed by their (ex-)partners. These murders are to be understood as femicides: They are committed against women* because they are women*" (Russo et al, 2021, p. 6)¹. Before femicide occurs, it is usually preceded by other forms of violence, for example structural and symbolic violence, which are the most invisible. However, this is rarely addressed, creating a distorted picture of the reality of violence against women. Neglected - especially in tabloid journalism - are the structural conditions for women suffering from violence. Femicides, in particular, are presented as tragic individual cases (cf. Meltzer, 2021). "Accordingly, such a form of reporting does not lead to social and political changes in the long run, but preserves violence against women as a private topic" (Meltzer, 2021, p. 6) - instead, it should be politicized and openly discussed. A structural and symbolic contextualization of the topic in the mass media, or in a representative of the high-circulation and high-reach tabloid journalism in Austria, as found in the case of the *Kronen Zeitung*, is therefore essential. I will therefore explore the question of how violence against women is discursively constructed in the *Kronen Zeitung*. Additionally, I will interrogate the constructions of violence against women and ask how structural aspects on the topic of violence against women are reproduced. In doing so, I address how reality and knowledge about violence against women is (re)produced through (institutionalized) ways of speaking and what is thereby made invisible and obscured – not only in the private, but also in the structural and thus in the political sphere. After reviewing existing work and findings on the topic and presenting theoretical and methodological perspective, I summarize the results of my critical discourse analysis of online articles in the *Kronen Zeitung*. After presenting the research findings, I reflect on my own research process and myself, for which I have provided a separate section.

¹ According to the Autonomous Austrian Women's Shelters (AÖF), 31 murders of women were committed in Austria in 2021, 30 of them presumably by their (ex-)partners, acquaintances or family members. The AÖF also includes so-called extended suicides by men, in which the suspect presumably kills the woman first and then himself.

2. Research background

Since the seemingly private sphere of intimate relationships has been politicized by the women's movement, the political dimension of violence committed in private has also been made visible. Not least in the wake of #metoo, both public and scientific discourse on the diverse forms of violence against women and girls has also surged: "Research, as well as practice and policy on reducing gender-based violence, has undergone significant internationalization in the last 10 to 15 years" (Schrötte, 2019, p. 841). In 2014, *the European Union Agency for Fundamental Rights* (FRA, 2014) conducted the largest study to date on gender-based violence with 42,000 women and shows as a result that "one in three women (33%) has experienced physical and/or sexual violence since she was 15 years old" and "out of all women who have a (current or previous) partner, 22% have experienced physical and/or sexual violence by a partner since the age of 15" (FRA, 2014, p. 15). The authors finally state: Problematic in any case is that

the extent of violence in gender relations can only be approximated by dark field studies (violence prevalence studies), since due to taboos, sexualized violence and violence in couple relationships in particular are largely unreported and thus remain institutionally "invisible". Thus, about 95% of all forced sexual acts are not reported to the police, and the vast majority of cases of domestic violence are not disclosed to the support system or to the police and judiciary. (Schrötte, 2019, p. 835)

With the entry into force of the *Council of Europe Convention on Preventing and Combating Violence against Women and Domestic Violence*, better known as the *Istanbul Convention*, which is "currently the most important legal instrument against violence against women" (AÖF, 2022), the issue received further considerable attention.

The fact that we can talk about violence against women and the different forms of violence stems from the strength and political urgency of the women's movement. Their demand that "the private is political" led to an openly public discourse about "demands for social change, new forms of political participation and the creation of free spaces" (Schulz, 2019, p. 914) - specifically, for example, the right to new abortion legislation. Feminist political engagement unfolded in this movement, expressed in university-based women's and gender studies, among others, which addressed rape and spousal violence (cf. Schulz, 2019, p. 915). "Feminist research exposes the following: violence against women* is primarily violence by male* relationship partners* and ex-partners*. It is mostly perpetrated in the domestic sphere, often systematically over a long period of time" (Russo et al., 2021, p. 24). Moreover, research shows that there are different types of violence - visible and less visible. For example, in their contemporary feminist work, Russo et al. (2021) divide violence against women into psychological, physical, sexual, economic/financial, symbolic, and structural/institutional (pp. 25 - 43). By differentiating the concept of violence or the different types of violence, it can now be researched in a more differentiated and precise way, which can also provide a starting point for psychological

research into different types of violence. As a result of the increased attention, there is a great deal of research on violence against women. For example, based on the representative EU study on this topic, Russo et al. (2021) conclude:

The consequences of violence are profound and far-reaching. Studies prove the sickening effect of violence. In addition to physical injuries and even death, the European FRA study mentions psychological injuries such as depression, anxiety, panic attacks, sleep disorders and chronic pain as a consequence of violent acts. To be added are: Concentration and memory disorders, psychosomatic complaints, lack of self-confidence and sense of self-efficacy, social problems, isolation and difficulties at work that threaten the existence of the victim. (p. 23)

Media discourse on violence against women influences and is part of the reality of violence against women, because discourse not only represents, but above all *constructs* reality. Against the background of such a perspective on discourse, different levels of the construction of knowledge about gender and the body can be identified: the level of representation and normalization (I refer to this as the symbolic level), following Foucault the "body as discursive-media object" (Michaelsen, 2019, p. 1368), and then following Judith Butler the "theory of a performative gender body and of the body as a perception- and reality-generating medium itself" (ibid.). The feminist critique of the representation of women invokes a difference between actual living women and 'the woman' as a (seemingly existing) symbolic image or ideal, thus pointing to the differences between media and political representations/representations and what is represented (cf. Michaelsen, 2019, p. 1369). Thus, there is also a difference between the factually existing violence against women and its representation in the media.

Media coverage on violence against women in Austria has been most exhaustively studied by Maria Pernegger (2022), who analyzed direct violence by means of a content-based text and image analysis of quality and tabloid media. By direct violence, Pernegger means physical, physical, sexual and economic violence. Results of Pernegger's study show that, in a comparison of media coverage, violence against women is reported very differently and that the focus of tabloid journalism is on the extreme case of femicide and that hardly any other forms of violence besides physical violence are included in discourse. Further findings were that even extreme acts of violence are downplayed and, at the same time, dramatized, and portrayed as individual cases and not in the context of structural patriarchal mechanisms of power and domination. Structural and symbolic violence was not examined in the study in the first place.

Another comprehensive study by Christine Meltzer (2021) analyzed discourse in Germany in the form of a systematic content-analytic study of print coverage of violence against women. From 2015 to 2019, Meltzer examined media discourse on violence against women, the study "was limited to physical violence, or threats thereof, coercion, and stalking" (p. 20). Meltzer also concluded that acts of violence against women, particularly femicides, are presented as "tragic individual cases" that must have a high violence component to be published at all. The extreme cases then take up most of the reporting and

lead - also through repetition - to a media bias in the portrayal of violent acts by men against women. Metzler concluded that “revealing patterns behind the (apparent) individual events could create greater sensitivity and thus protection, both for women in violent relationships themselves and for the social environment” (cf. Meltzer, 2021, p. 64). Meltzer thus calls to look at the structural patterns behind violence against women - no matter in which department.

As I have argued above, symbolic violence in the form of (media) discourse is itself a stabilizing factor for these structures. However, before diving into the data, it is important to contextualize the background of the *Kronen Zeitung*, as it occupies a specific position in the canon of Austrian newspapers, being one of the most widely read newspapers and at the same time representing a very specific paper line, which repeatedly points to a diversity of opinion representation, while showing quite strong conservative content.

The *Kronen Zeitung*²

Today's *Kronen Zeitung* has a long history dating back to 1900, of which only a small excerpt can be reproduced here. Today, the *Kronen Zeitung*, known as "Krone" for short, belongs to the *Funke Mediengruppe*, which unites 15 daily newspapers, 21 magazines, 11 radio stations, a weekly newspaper and a book publisher under its central editorial office and according to the *Funke Mediengruppe* website, the focus is on regional media, magazines as well as digital media. The company was founded in 1948 and reaches several million people a day. According to its own information, the media group employs 1,500 journalists and 4,000 "media makers". *Funke Mediengruppe* also owns *Mediaprint GmbH & Co KG*, Austria's largest newspaper and magazine publisher, and is active in advertising, printing and distribution. The managing directors of the *Krone* both sit on the supervisory board of the *Mediaprint* publishing house. There is only one woman on the Supervisory Board, otherwise eight men. Although the *Krone's* mission statement is "diversity of opinion of the editors and journalists" (*Kronen Zeitung*, 2022), the masthead lists no one except the aforementioned eight men and one woman from the supervisory board; moreover, two of them also head the publishing house in which it is published. Despite declining print figures, the *Kronen Zeitung* is the Austrian daily newspaper with the highest circulation (*Statista*, 2022b) - it also continues to expand digitally, in addition to a news channel that has existed since 2020. The *Mediaprint* publishing house, founded in 1988 when the *Kronen Zeitung* and *Kurier* - another Austrian daily newspaper - merged, dominates the market with the *Kronen Zeitung* and *Kurier*, especially in Austria (*Statista*, 2022c). *Kronen Zeitung* is owned by Christoph Dichand, son of founder Hans Dichand, and *Funke Mediengruppe*, while *Mediaprint GmbH* is also owned by *Funke Mediengruppe* and Hans Dichand's family, but additionally by *Raiffeisen Bankengruppe*, the largest banking group in Austria. *Mediaprint* represents the

² "Krone" can be translated as "crown".

second largest media group in Austria after *Österreichischer Rundfunk (ORF)*³. At the beginning of 2022, an estimated nine million people lived in Austria (see Statista, 2022a). According to a media analysis in Austria (Media Analyse, 2021), the printed *Kronen Zeitung* alone, at 23.3%, reaches almost a quarter of Austrians, especially people with a low level of schooling from lower social classes and especially older people. It is also published in regional editions for each of the nine federal provinces⁴. The *Kronen Zeitung* is not a member of the *Austrian Press Council*. The newspaper has had repeated conflicts with the Press Council and does not accept it, which is also not mandatory in Austria - but the latter issues guidelines for dealing with violence in reporting. In 2021 alone, the *Kronen Zeitung* violated the guidelines of the Austrian Press Council nine times (out of a total of 31 times in 2021, or 29.03%), and 111 cases (out of a total of 647, or 17.06%) were reported to the Press Council in relation to the *Kronen Zeitung* - the highest number of any newspaper in Austria (Presserat, 2021a). This means that around one-third of all violations of the *Austrian Press Council's* guidelines in 2021 were committed by the *Kronen Zeitung*. The violations in 2021 included coverage of a terrorist attack in Vienna, multiple uncensored publications of pictures of victims of terror and violence, details about the killing of a child, the unnecessary use of the migration background of a nine-year-old child, the publication of various accident videos resulting in death, the unlabeled advertisement for a casino, the designation of the unvaccinated as enemies of the people, violations of the protection of personality, and finally the publication of an uncensored photo of a femicide victim (cf. Press Council, 2021b). Due to its political power, high circulation and reach, and violations of ethical reporting, the *Kronen Zeitung* has a major influence on how reporting on violence against women spreads in Austria, and how violence is portrayed and perceived.

3. Discourse, knowledge, and power

In order to analyze the media reports and provide a theoretical framework for this work, I draw on poststructuralism. There is no single concept of "poststructuralism"; rather, it is a conglomeration of many different perspectives. Nevertheless, there are core characteristics of poststructuralism that I rely on. These can be described as a rejection of objectivity, including the conception of a single reality and truth. Poststructuralism is based on the social constructivist concept of meaning, which means that subjects construct "truth" or "reality" on the basis of larger structures and patterns of thought and (also) through language, which, bound up in discourses, carries knowledge in and with it, knowledge being interlocked with power. This gives rise to these three spheres: Discourse, knowledge and power, which socially construct and also structure our societies; they are construct and constructing element, structure and structuring element in

³ ORF is a "public service program on television, radio and online. More than 90% of Austrians use one of ORF's offerings every day" (ORF, 2022).

⁴ Austria consists of nine federal states: Vorarlberg, Tyrol, Salzburg, Carinthia, Styria, Upper Austria, Lower Austria, Vienna and Burgenland.

one. Thus, subjects (e.g.: people, women) and realities (e.g.: violence against women) are also discursively produced and do not exist *a priori* - which makes poststructuralist theories especially useful for gender studies (cf. Kleiner & Dinsleder, 2017). In the context of this work, this means that violence against women also does not exist *a priori*, "just like that," but that violence against women is "the result of powerful knowledge politics that are subject to performative shifts" (Bublitz, 2019, p. 374). Before I briefly discuss *Critical Discourse Research* (CDR) as an instrument of power critique and as a methodological tool for analysis, I will take a closer look at the notions of discourse, knowledge, and power.

Discourse refers to the totality of all discursive practices (e.g.: performance) and thus can never be captured in its entirety; rather, it can be understood as a "discursive teeming" (Jäger, 2007). The poststructuralist concept of discourse is characterized by its dynamism. It vehemently argues against a reductionist, exclusively descriptive view of discourse; instead, it posits that discourse thrives on constant change and updating by participants and the discursive power that develops through context and speakers. Discourses are not unanimous or congruent: rather, they contradict, misunderstand, complement, disagree. Margarethe and Siegfried Jäger (2015) also refer to this as a "discursive struggle" (Jäger, 2015). According to this, it is a power struggle that is extremely dynamic, although it (seems) static-descriptive. However, discourse is realized through performance, which has implications for the discourse subjects, in this case the women who are or have been affected by violence and who are or have been reported on. Discourse also refers to what is not said - for example, who or what is given less space, who or what has - in other words - less power? Or, what doesn't need to be said at all, what is still understandable? And how are the topics (re)presented? Which structures of power play a role in this? What do the historical-concrete conditions have to do with it? In the sense of poststructuralism, our knowledge is historically produced, at a certain time in a certain place by certain people.

Margarethe and Siegfried Jäger also describe discourse in the tradition of Foucault as the "flow of knowledge through time" (Jäger, 2007, p. 15). Discourse is thus what connects us when we transport knowledge (through language) through our (social) discursive networks - as a simple example, consider a newspaper like the *Kronen Zeitung*. Behind a newspaper, there are historical-structural conditions, a socio-political attitude or way of thinking, also the financiers have influence and those responsible have power. Within this framework, knowledge is constantly negotiated - for example, what is considered true or normal and what is not. On the one hand, the negotiated knowledge itself is drawn from the discursive web; on the other hand, the processing and negotiation of knowledge constantly creates new (knowledge) that circles back into the discursive web. However, knowledge is not de-contextual but follows power structures and knowledge politics that already exist and are discursively reproduced.

In the context of this paper, patriarchal structures are understood as such. Like discourse and knowledge, power does not exist in a decontextualized

manner but requires the exercise of someone or something over someone or something. The maintenance of power in this context can be achieved through disciplining, rules, prohibitions, controls, and punishments, that is, through the exercise of force. However, even when there is no structural or institutional punishment, social values and norms are permeated by the force field of power. According to Foucault, power structures become visible where they generate resistance (Foucault, 1982, p. 243). This resistance, in the poststructuralist sense, also enables the new, enables the change of existing relations. When a discourse is examined, this always allows conclusions to be drawn about social power structures. Discourses are thus specific spaces of the sayable and knowable. "The power effect of discourses is generated from the containment of sayability and knowability, speaker subjectivity, as well as the coupling surfaces to action" (Link, 2008, p. 118). These meta-theoretical considerations are relevant in relation to the problem area of violence against women insofar as

Violence, and especially violence against women*, is embedded in a thoroughly patriarchal social system. Patriarchy represents a form of social organization and a value system that favors men* in the state, family, and other institutions and gives them the more powerful position - over women* and non-normative gender identities (Russo et al., 2021, p. 8).

In the course of the analysis, I will therefore repeatedly refer to the hegemonic and thus gendered distribution of violence against women.

4. Research process

Critical discourse research (CDR) is to be understood as an instrument of power critique that contributes to deconstructing discourses and making the interwoven structures of discourse, power and knowledge comprehensible. Originating with Foucault, CDR was further developed - among many others - by Siegfried and Margarethe Jäger (cf. 2007; 2015), finding its way to an increasingly elaborated form to become more accessible to academic researchers. Central to CDR is that its research questions are situated in social problem areas, that it asks decidedly about disadvantage and discrimination, and that it seeks to pursue a critique of power and domination. Thus, because of the many different streams in CDR, the researcher can assemble a toolbox (cf. Jäger, 2007) to the best of their ability to conduct research according to desired characteristics, as CDR operates in an interdisciplinary field. Thus, CDR does not begin with the initial macro-analysis, but with the preliminary thinking of the entire research. The research process is then divided into different steps.

A total of 114 articles finally found their way into the macro-analysis. In the end, only those articles explicitly dealing with violence against women were considered. After the macro-analysis of the 114 articles, 30 of them were selected for micro-analysis, 23 of which were short news stories that were only a few lines long. Therefore, I selected seven main articles, all of which were about a total of two femicides in Austria, three of the articles about the first femicide, and

four articles about the second femicide. These are also the articles that are seen or read most quickly and create a bias in terms of (stereotypical) portrayal of violence against women. These seven articles were about two femicides, both committed by male relatives in January against a woman and a girl, respectively. The first femicide occurred on January 8th, and was covered in three articles; the second femicide occurred on January 12th, and received 4 articles. The articles range from one page to three pages. In these seven articles, different authors report on the femicides and especially on the background. To better understand the findings, I will briefly introduce the two femicides here. The first femicide of a woman was committed in the shared apartment, in the living room, by the husband. The killer shot his wife in the back of the head with a pistol, while she was sitting at the dining room table and the children were nearby. The second femicide of a girl was committed by the girl's father on railroad tracks. The perpetrator forced her to go with him on the tracks and then murdered her. The killer had already been known to the judiciary, as he had threatened to kill his daughter and had stalked the girl's mother in the past.

5. Results

In the newspaper, a distinction is made between domestic and foreign countries; domestic means Austria, foreign means all other countries. Results of the macroanalysis reveal that there was also reporting on violence in other countries, especially Great Britain and the United States of America, in connection with Jeffrey Epstein, Ghislaine Maxwell and Prince Andrew⁵. The Church and the Pope were also key social actors that were reported on.⁶ Otherwise, articles related to femicides, cases of violence, or new information on old cases that had not yet been solved. The topic of stalking was also covered. Articles about violence against women in Austria appeared most frequently in the form of small articles that are only a few sentences long and usually do not contain pictures. Most dealt with physical violence, often with knives or firearms, or with threats of violence or femicide; they also addressed economic violence and police measures; the large articles then dealt mainly with domestic femicides - in the past as well as in the present. A structural understanding of femicides is sometimes found in separate supplemental articles on the site that feature experts and present statistics. These articles were not, as in the many short and few large ones, about the act or the course of events from the male point of view, but about the social context of the topic and the fact that Austria is such a negative pioneer.

⁵ Jeffrey Epstein was a sex offender and maintained a sexual abuse ring of underage girls with his girlfriend and accomplice, Ghislaine Maxwell. The allegations range from human trafficking, sexual exploitation and coercion into prostitution to rape. Prince Andrew of England is also alleged to have had sex with a minor but, like Epstein before him, was able to settle out of court with the victims and/or the prosecution (Der Standard, 2021a)

⁶ Pope Emeritus Joseph Ratzinger has made a false statement about his knowledge of abuse in the church. An abuse report states that there were at least 500 cases of sexual abuse in the Catholic Archdiocese of Munich/Freising. The expert report concludes that Pope Benedict, then Cardinal Ratzinger, attended a meeting in which it was decided that a pedophile priest could continue to work as a pastor, whereupon he continued to abuse children (Der Standard, 2022).

Topics of the articles that structurally classify and reflexively deal with violence against women were mostly women's protection, the "Million Violence Protection Package"⁷, femicides committed by men last year ("Chronology of Horror")⁸, interviews with experts⁹, political protest, statistics on the topic and research projects. The murders were not usually referred to as femicides; only once (in one of the structurally classifying articles) was the word "femicide" used. Apart from this instance, they were referred to as "acts of blood," "horrific explosions of violence," "marital dramas," "acts of madness," etc. In the cases covered in the *Kronen Zeitung*, the perpetrator usually came from the immediate environment of the woman affected by violence or ultimately murdered. In the articles, the emphasis was often on describing the act as "dramatic," "inconceivable." The "ethnic origin" of the perpetrator was regularly mentioned. In some cases, "origin" was also mentioned for the women involved, but much more frequently for the perpetrators. Almost as important as origin was occupation - again, that of the perpetrator, not that of the murdered person. Separation or divorce were often stylized as the "reason" why women were threatened, stalked or then subjected to physical or economic violence by their (ex-)partner. This was also reflected in the headlines, for example: "Infidelity with nasty consequences", "Love whispering", "Love whispering led to illegal weapons".

Several characteristics emerged during the subsequent microanalysis. The results are divided into commonalities and differences, followed by a brief summary.

For ease of reading, I first list the articles by title and coding, and then at the end of each section I provide selected representative quotations from some of the articles from whose analysis I drew my findings.

Femicide 1

1. Article 1 (Fem1/Art1, 10/01/2022): *Forester shoots woman at kitchen table*
2. Article 2 (Fem1/Art2, 11/01/2022): *Woman shot dead: Family wanted to emigrate to Sweden*
3. Article 3 (Fem1/Art3, 01/16/2022): *The cruelty of a good husband*

Femicide 2

⁷ The government in Austria adopted a violence protection package for women in 2021 which includes mandatory work with and an automatic weapons ban for dangerous persons, an increase in the number of trained prevention officers, and the strengthening of police case conferences for high-risk cases - with 24.6 million euros.

⁸ According to the AÖF, 31 murders of women were committed in 2021, 30 of which were allegedly committed by the ex(partner), an acquaintance or a family member. "In the last ten years, according to Raab (Federal Minister for Women, Family, Integration and Media, note), there were 319 murders and 458 attempted murders of women. The peak was in 2019 with 43 murders" (ORF, 2021).

⁹ For example, with Maria Rösslhumer, the managing director of AÖF and head of the Women's Telephone Against Violence and board member of the Austrian Women's Ring, who was awarded the Austrian Human Rights Award 2020 for her extraordinary commitment to women and children affected by violence.

1. Article 1 (Fem2/Art1, 13.01.2022): *Father threw himself in front of the train with daughter (6)*
2. Article 2 (Fem2/Art2, 14.01.2022): *"We are at the end of our rope".*
3. Article 3 (Fem2/Art3, 01/15/2022): *Put on rails with daughter (6): Perpetrator stalked family for years!*
4. Article 4 (Fem2/Art4, Jan. 25, 2022): *Justitia now has a lot of explaining to do*

Similarities

The murderer

The perpetrator is rarely if ever named as the perpetrator or the murderer or the guilty party, but always as a private person who is a father, likes to play tennis, is a forester and so on. In this way, the perpetrator is normalized via profession and hobby and not via the core of the matter, namely that he committed a woman's murder. Moreover, the act and the perpetrator are often discursively separated: the perpetrators in the text are perpetrators by the attributions of action, but they are not named as such (perpetrator, murderer, guilty), e.g.: "good husband commits atrocity." The murderer, his perspective and narrative are given more space than the woman or girl. He is mostly connoted positively, constructed with "good" qualities. Examples include these or similar descriptions:

1. The former forester - who until recently was employed by the Federal Forests - took his Glock 17 registered to him and shot his wife, who was sitting at the dining table, in the back of the head." (Fem1/Art1, 10.01.2022).
2. Farmer Josef R. (88) was friends with Daniel S.: "He was a pleasant, quiet person. He came from northern Germany, originally learned gunsmithing and then changed professions because he had no future. We often talked about forestry things. She [the murdered woman] learned forest education some time ago and worked in schools" (Fem1/Art1, 10.01.2022).
3. Well-mannered husband commits atrocity (Fem1/Art3, 01/16/2022).
4. [...] as reported, the 38-year-old amateur tennis player had thrown himself and his own daughter in front of an express train on Tuesday evening not far from the southern railway station near Sollenau (Fem2/Art2, 14.01.2022).

The murdered woman or girl

The woman and the girl are very passive in the text and are therefore presented as less relevant than the murderer's narrative. They are often constructed stereotypically, in a way that has negative connotations. While the murderer is often associated with his profession, the woman or girl is constructed as a mother or daughter, that is, only in relation to and dependent on the man. The victim might be described in the following ways:

1. So, she was a single mother when she looked for a partner on an Internet platform in 2006. There she came into contact with Daniel S.. A German, a gunsmith by profession (Fem1/Art3, 01/16/2022).
2. Sometimes the woman's voice could be heard from the estate. When she scolded, "probably with her daughters and sons, but with a mother of five children, sometimes the nerves can be on edge" (Fem1/Art3, 16.01.2022).
3. Apparently, the enthusiastic amateur tennis player and his beautiful ex-partner (33) - she once won a beauty contest and also took part in the competition for the most beautiful woman in Austria - had separated. (Fem2/Art1, 01/13/2022).

The search for meaning or the production of meaning

In addition, the "search for meaning" or "the question of why" was a common feature: a narrative is created through marginal information, certain parts are particularly staged or emphasized. Speculations from close people are often used to create a meaningful narrative. It became apparent that the narrative of femicide - albeit constructed from the perspective of the perpetrator - served as a kind of explanation for the femicide in order to be able to classify the act in such a way that it made "sense." The more "sensible" and "normal" the perpetrator and the course of events appeared, the easier it was made for the readership to understand and thus ultimately (socially) process. The "search for meaning" became implicitly and explicitly visible: Either all means were used to try to establish (speculative) connections of meaning, or the "why" was explicitly asked. Furthermore, it could be observed that the narrative took over the supporting role for normalization processes: Through the narrative, justifications and linkages could be created and legitimized. Depending on the narrative, the act of femicide was justified by different aspects and made comprehensible for the readers or not. In this work, normalization contrasts with dramatization: the more dramatized through word choice and stylistic devices, the more "abnormal" the narrative and the femicide were classified.

The search for meaning could take these or similar forms:

1. In front of the entrance of the neat house in Weißenkirchen im Attergau are candles, next to them are flowers. The testimony that something terrible must have happened [...]. In this family, which - according to the neighbors - had been considered a "model family". Nevertheless, from time to time the voice of the woman could be heard from the estate. When she scolded, "probably with her daughters and sons, but with a mother of five children, sometimes the nerves are on edge." They were considered a "perfect couple." And otherwise? "No, there was nothing noticeable." No one wants to have heard anything about quarrels between the couple. And besides, the two would have been a perfect match in their contrasts: She, the extrovert. He, the quiet one. And then the incomprehensible: HE killed HER at 2:44 p.m. on January 8." (Fem1/Art3, 01/16/2022).
2. "My relationship with Simone was not as happy as everyone thought," the 46-year-old said when asked, "especially in the last few weeks it was conflictual." Why, why, why? (Fem1/Art3, 01/16/2022).

3. When officers arrived on the scene shortly thereafter, he was already standing in front of his house with his hands up. Why? Why this terrible crime? (Fem1/Art3, 01/16/2022).

The psychological

It was also apparent that mental impairments or incidents were presented in a stigmatized way. In two cases, mental illness was brought into play and stigmatized: Either it was directly interpreted as a weakness - this was the case with the murdered woman - or it was seen as abnormal and a possible reason for someone to commit a crime - this was the case with the murderer who killed his daughter:

1. A plan that sent Simone S. into a panic. Like the first trip to her "dream destination" when the family's van got "stuck" in a tunnel due to a traffic jam, she then completely freaked out, jumped out of the car and hysterically screamed for help. (Fem1/Art3, 01/16/2022).
2. Alex V. probably deliberately drove his little girl to her death. Now, piece by piece, what can be called a collective failure is coming together. The psychogram of a stalker that makes you shudder. (Fem2/Art3, 01/15/2022).

Other

Moreover, femicides were not named as such; they were called "acts of blood," "atrocities," and "acts of madness." The articles were often characterized by the tragic individual case portrayal (cf. Meltzer, 2021), which failed to classify femicides structurally or even to place them in a larger than private context. Moreover, facts were often constructed dichotomously, i.e., in two ways: normal vs. abnormal, good vs. bad, right vs. wrong. The balance between these dichotomies then becomes either inadequate or one-sided. This can be seen, for example, in the fact that an act can be abnormal, but the perpetrator normal: this leads to a narrative conflict ("good husband commits atrocity") that becomes irritating: How can a good husband commit an atrocity? Examples include the following:

1. Because the couple has five children aged seven to 18 years, who were present at the bloody deed! Saturday afternoon around 4.45pm ends an apparently for years smoldering relationship dispute of the married couple Daniel (46) and Simone S. (42) in any case in a terrible explosion of violence. (Fem1/Art1, 10.01.2022).
2. They still wanted to emigrate to Sweden together - but instead it came to a bloody marriage drama: the forester Daniel S. (46) is reported to have literally executed his wife Simone S. (42) at the kitchen table in the smart house in Weißenkirchen im Attergau. (Fem1/Art2, 11.01.2022).
3. And besides, the two of them would have been a perfect match in their contrasts: She, the extrovert. He, the quiet one. And then the incomprehensible: HE killed HER at 2:44 p.m. on Jan. 8. In front of her eldest son. The high school student was

sitting at the dinner table. His mother stood next to him and prepared a snack. Suddenly, Daniel S. came into the room and reportedly yelled, "You destroyed my life!" - Before putting a bullet in the back of his wife's head with a handgun. (Fem1/Art3, 01/16/2022).

4. Father throws himself in front of train with daughter (6): drama at the tracks of the southern railroad. (Fem2/Art1, 01/13/2022).

5. HORROR ACT: Put on rails with daughter (6): Perpetrator stalked family for years! (Fem2/Art3, 01/15/2022).

Differences

(Female) experts

The two femicides and the articles about them differ quite clearly in the appearance of experts and thus in the structural classification of the femicide. While in respect to the first femicide, not a single expert appears in the three articles, in the articles about the second femicide, two experts are given space in two articles. The inclusion of (female) experts had the effect of drawing attention to structural conditions, thus moving the femicides away from the "tragic individual case" to a social, systemic problem. The appearance of neighbors, friends, acquaintances, and confidants had the opposite effect: this gave great weight to individual accounts, and the narrative could be further expanded with regard to the significance of the crime from the perpetrator's point of view. Experts thus had great influence and power in the text. Examples of the latter include the already cited quote by farmer Josef R. (88) and the following:

1. But it was obvious that there was a crisis behind the perfect family façade: the couple would have shouted at each other again and again. Daniel S.'s evening ritual: He came home, sat in the trunk of his car, listened to music and drank beer. He had probably been unemployed for about three weeks. Maybe the final trigger... (Fem1/Art1, 10.01.2022).

2. "No, there was nothing to notice." Nobody wants to have noticed anything about quarrels between the couple. (Fem1/Art3, 01/16/2022).

Examples of experts include the following:

1. Now the public prosecutor's office checks not only whether the requirements have been met, but also whether a report has been made to the guardianship court. "With this," knows Sabine Matjeka, chairwoman of the association of judges, "a change in custody is currently only made upon request, usually by one parent." Since the courts are not networked with each other, automatic endangerment notifications do not take place - for "data protection reasons"! However, according to the Federal Child and Youth Welfare Act, employees of courts and public prosecutor's offices are obligated to "immediately report in writing to the locally responsible authorities if there is a reasonable suspicion that children are being abused, tortured, neglected - or otherwise endangered in their well-being" (Fem2/Art4, 25.01.2022).

2. "Many questions remain unanswered; the public prosecutor's office Wiener Neustadt will now take care of the answers. Investigations are underway, but first, says spokesman Habitzl, they want to wait for the final report of the police. There is even a threat of charges against the court staff." (Fem2/Art4, 01/25/2022).

Language

Finally, the narrative was significantly influenced by dramatizing elements that were found in every text without exception. These were not only speculative links, but also incomplete sentences ("Why, why, why?"), work with capital letters ("HE killed HER at 2:44 p.m. on January 8th"), and the frequent use of punctuation:

1. And then the unbelievable: HE killed HER on January 8 at 2:44 pm. In front of the eyes of THEIR oldest boy. The high school student was sitting at the dinner table. His mother stood next to him and prepared a snack. Suddenly, Daniel S. came into the room and reportedly yelled, "You ruined my life!" - Before putting a bullet in the back of his wife's head with a handgun. (Fem1/Art3, 01/16/2022).
2. And when officers arrived on the scene shortly after, he was already standing in front of his house with his hands up. Why? Why this terrible crime? (Fem1/Art3, 01/16/2022).
3. "My relationship with Simone wasn't as happy as everyone thought," the 46-year-old said in the interrogation, "especially in the last weeks it was conflictual." Why, why, why? Co-witnesses of the couple believe they have explanations for the drama. (Fem1/Art3, 01/16/2022).

Space and images

Either very large pictures of the house, the family with children, the murdered woman, the murderer, and the place where the femicide occurred are shown, taking up most of the space allocated for the femicide, usually half the space or more, or small or no or few pictures are combined with a smaller text or space in general. The larger the space and images were, the more dramatic (linguistically) the text was.

6. Discussion

On the one hand, the discourse analysis was able to replicate earlier findings and, on the other, to gain new insights. The demand of the second women's movement is still highly topical, as can be seen from the results. Both femicides were committed in private settings and were also subsequently presented in the *Kronen Zeitung* predominantly as tragic individual cases and not placed in a political context. One article - (Fem2/Art4, 25.01.2022): "Justitia now has a lot of explaining to do" - clearly stands out from the others, though: In it, two (female)

experts have their say, classifying femicide structurally. The feminist critique of the (re)presentation of murdered women and girls also applies here: they are strongly underrepresented and disappear in the discursive background in favor of the male perspective. Moreover, they are stereotypically portrayed, which creates a difference between the media portrayal of violence against women and the violence actually perpetrated by men. If these very mechanisms are not made visible, violence against women cannot be adequately explored and received in the context of power. In the texts, this was almost never the case: instead of illuminating the patterns and structures behind men's acts, the authors opted for idiosyncratic, male perspectives or created narratives based on them that were offered to the readership. However, discourse analysis allows us to understand these articles not as expressions of individual authors' perspectives but as text through which a social order and power structures are manifested and, at the same time, perpetuated.

It is paramount to understand how this (re-)production of existing social relations is achieved discursively. Most significant in this regard, in my view, is the normalization of the perpetrator on the basis of neighbors, friends, acquaintances, etc., to whom it seems unimaginable that a "normal" man would do something so "unimaginable." In this way, what is common in (discursive) reality happens: if something does not fit the socially shared values and norms, it is more difficult to understand and must be made understandable accordingly. This psychological effect is also very clearly evident in the search for meaning in the act or in the perpetrator himself, but not - which would be much more complex - in the structural-institutional reality, which is much more confusing and complicated to understand and present than a subjectively based individual perspective. This tendency of "simplification" can also be observed in dealing with the "psychological". Either psychological characteristics have been declared in a reductionist way as weakness (in the case of women) or as a reason to become and be violent (in the case of men) - which is clearly stigmatizing and also stereotyping.

Very important is the realization in relation to the (female) experts who speak in the articles. Although this idea is so simple, it shows a strong effect: as soon as female experts appeared, the femicides, but also what had happened before, were structurally classified, placed in a decided context that could make comprehensible where and at what point what had to be done. In favor of the expertise, the narrative with its many speculations took a back seat, so that the influence on the overall picture and thus also its inherent political power became clear. The results on the "structural" aspect show that it is difficult to grasp, understand and describe complex structures linguistically and intellectually. Even experts refer to institutions and laws when they speak of structural conditions. Since it is not really possible to grasp what "the structural" actually is, it makes sense to reduce the complex reality and prefer simpler ideas and solutions. However, this effect also leads to an individualization of such cases. At the same time, violence against women is also individualized, leading to less acceptance that women are structurally disadvantaged, and this is one of the reasons why so much violence against women can go unchecked. This also includes the symbolic

violence that is exercised and reproduced here in the *Kronen Zeitung* and the portrayal of femicides, under the protective cloak of the powerful newspaper in the powerful publishing and printing house by predominantly men. The symbolic violence here is reinforced by the underrepresentation of the "structural," by the use of male narratives and stereotyping. The two indirect forms of violence, the structural and the symbolic, are thus constructed, represented, disseminated and received via Austria's daily newspaper with the highest circulation and reach. The study shows that the (very simple) use of female experts already makes a major contribution to improving the representation of violence against women in the media. At the same time, the results show that - despite its unbroken relevance - it is important to shift the focus from the much-cited direct violence to indirect violence, as this is, among other things, the basis for how people perceive violence against women in the media in the first place, which can then result in cognitions, emotions and behavior - which is then either structurally trained or individually shaped. At the same time, the article shows that it is also important in discourse research to find clear ways to study phenomena that are very difficult to grasp cognitively and linguistically; in this case structures, that are also practicable for less experienced researchers.

7. Leveled structural conditions I feel in my own body: from where I speak. An autobiographical self-reflection.

Throughout the project researching violence against women, I was involved in regular meetings where we also had the opportunity to reflect and exchange ideas. In the beginning, I was so excited about the great team and the exciting work that I left my own experiences of violence out of it, as I preferred to process them myself. However, as time went on, I became physically and psychologically worse, which had other causes, such as a move, the death of a loved one, severe pain in my abdomen due to various triggers. After my condition worsened significantly, it became more and more difficult for me to continue working on this stressful issue. For the macroanalysis I had to carefully read, record, categorize and analyze in detail the articles about violence in the *Kronen Zeitung* - which turned out to be very difficult when confronted with this mass of violent cases, especially since I had already experienced sexual and physical violence myself, which was also the topic of most of the articles. At some point I could not and did not want to continue, which made me feel guilty as a researcher because the topic is highly relevant and I wanted to write this paper, which is my first. Moreover, my three colleagues were already further along in their research, so I imposed additional pressure on myself to perform in the neoliberal sense. I was trapped in powerful structures.

The "solution" soon became apparent: at some point I could no longer hold back and hide, and at one of the meetings I blurted out that I felt bad and why. We talked for over an hour and began to think about how the psychological (protective) processes might have prevented us from addressing stressful issues ourselves. We began to discuss how to protect ourselves and how to deal with the

emotions that came up during our research as women about violence against women - including what coping strategies we developed. These were mostly action-oriented: from political activism to shouting out anger, to speaking up and engaging in discourses that were uncomfortable, and even more so, going into research about it. These are just some of them. I, too, as a student, as a scholar, as a human being, as a woman, am implicated in powerful structures that I reproduce and try to reflect through this work. After the macro- and microanalysis, I have additionally written two reflections that also shed light on the work I did during the Corona pandemic - completely isolated, from home, behind the laptop - and what that can mean for research on social problem issues. Especially with the ("self-evident") scientific claim to be neutral and objective, there were inner conflicts, although I reflected on this from a socio-critical perspective. Emotions rose in me, especially anger, but also bewilderment and above all helplessness in the face of these powerful structures that produce so much violence, that often seem so unchangeable and rigid. At the same time, this "outing" as a scientist is difficult because it could diminish my own qualifications. Nevertheless, I decided to include this reflection section and reflect on my point of view or situatedness. Away from the research world, I also noticed other changes in my behavior toward men in my personal life when they approached me or physically touched me, even if only on the arm. I noticed that my emotions became stronger depending on how much and how intensely I had engaged with the many articles due to my research. The more I was "in," the harder it was for me to distance myself and keep my emotions under control. The more I was "out", the more the strong focus on the negative emotions gave way. So in the end, this work took much longer than I thought it would, because it was important to keep distancing myself from the material, reflecting on it, and communicating with someone about it. From the microanalysis on, when I was allowed to immerse myself in the material, it was much easier for me to (continue) working, because I was no longer hit by this sheer mass of violent cases, all reported in a similar way, which had created this powerlessness in me. Especially when you are sitting alone behind a computer, have little social contact and are not supposed to have it due to a global pandemic, the direct exchange with fellow researchers about issues you need to reflect on and communicate as if you were affected yourself suffers. Considering that research results show that at least one in five women older than 15 has already experienced physical or sexual violence, I conclude that many women researching on violence against women have also had to experience violence themselves, which must be reflected on in any case - in the optimal case - also to protect the researcher and offer her a safe framework to research socio-critical topics out of her own affectedness and thus participate in a dynamic process of change. Unfortunately, this can also lead to the fact that (especially) as a woman in a male connoted field (the sciences) the competences (seriousness, objectivity - male connoted attributes) are denied, should one bring one's own subjective experiences into the scientific process, e.g., by reflecting on the circumstances and one's own situatedness. With this I would like to give an example for doing it anyway.

8. Conclusion

As this paper shows, research on socio-critical and politically embedded content is always also research on the self and the social environment, and therefore cannot be artificially separated from the embedding in the environment. This is exactly what natural science demands - thus also a part of psychology, the institutionalized natural scientific psychology. It is required to be neutral and objective, to control the experimental conditions, to experiment in artificially produced settings, and then to generalize the results as well as possible to the environment.

In contrast, it is important to support people in their research who are interactively connected to their socio-critical research object through their own potential discrimination mechanisms, i.e. who conduct research out of their own concern. Based on the self-reflexive reappraisal of one's own resistances, it becomes clear how much work still needs to be done with regard to the perception and awareness of one's own situatedness and the emotions, cognitions, and behaviors associated with it in research on violence against women. It is not only important to learn about one's own situation - that is, psychoeducation with regard to structural conditions - but also to be able to apply this knowledge in practice under guidance or supervision. For this purpose, it would be more than desirable to establish a platform or a network that on the one hand collects the necessary knowledge about (e.g. one's own situation or psychological mechanisms of women affected by violence), but on the other hand also connects younger women with already more experienced affected women in order to generate an interactive, supportive network out of one's own affectedness - an act of empowerment. This could also result in regular meetings or gatherings with specific agendas. This would be desirable not only with regard to the intersectional discrimination category "gender", but also for researchers who are affected multiple times or by other discrimination structures. As in any other social field, it is important in research on violence against women in psychology to have role models, i.e., women who have experienced violence themselves, who can communicate openly about it and thus become visible to other younger and subsequent researchers and encourage them to participate. Another practical step that can be derived from this paper is the targeted use of (female) experts. Here, too, it is important to show that what happened is not subjectively classified as an individual case, but that an attempt is made to place it in a broader and generally structured socio-critical context through female experts. It would also be desirable here to have female experts, since they are underrepresented in the media. Unfortunately, what this work could not do is a broader and deeper analysis in terms of structural and symbolic violence, its construction, reproduction and very importantly: reception. An intriguing question in this context would be, for example: How do women affected by violence respond to the structural and symbolic components of violence when confronted with articles about violence against women? In summary, violence against women is a highly topical political problem that should by no means remain hidden, which is why more research on it should be encouraged or

decidedly guided. In addition, it is necessary to subsequently bring the research to the public in an understandable form, so that it does not remain only in the academic sphere. It would also be important to increase the involvement of the public and private media landscapes, so that there is regular reflection on violence against women in all media, led by experts and those affected. The majority of reporting on violence against women must not be done by people who are untrained (in relation to the topic of gender-based violence), but on the basis of professional, networked, affected women and researchers. This is because public perceptions and discourse about violence against women also contribute to violence against women, as this paper makes clear.

Researching gender relations with youth – Reflections on the attempt to conduct a subject-scientific and participative research project

Marlene Märker

Abstract

Subject-scientific and participative approaches both strive for co-research to involve life-world experts in the research process. The goal is to jointly work toward gaining a deeper understanding of social reality as well as changing it. These approaches are challenging and require constant reflection on the process. This article revisits a study that aimed to follow subject-scientific and participative approaches conducted by a colleague and myself. Using the photovoice method, we asked how the youth co-researchers perceived gender relations. To explore how subject-scientific and participative approaches can be combined, I reflect on specific research experiences and their potentials as well as the research dilemmas that arose from these claims. First, I describe both approaches to elaborate on the potentials and challenges in the context of such research. In particular, I illuminate the school as a restrictive research field and highlight how focusing on the agency of all co-researchers can enable approaches for socio-critical research from the subject's standpoint.

Keywords

Gender relations, Critical Psychology, subject-scientific research, participative research, photovoice

1. Introduction

Children and adolescents acquire their knowledge in societies that are shaped by historical relations of inequality (Stark & Noack, 2017). Here, they learn from an early age to behave in a gender-typical way to avoid negative consequences and sanctions while being simultaneously entangled in the production of differences (ibid.). In everyday life, gender relations and the hierarchies and inequalities attached to them are learned, internalized, and (re)produced. To grasp these normative attributions and the manifold processes of upgrading and downgrading

as well as the inclusion and exclusion of people requires focusing on the social contexts of domination in their historical development as well as their concrete effects. Critical Psychology pursues this claim to help understand how people move within the contradictions of a capitalist society (Markard, 2010). Referring to Marx (1960), Critical Psychology assumes that people (re-)produce their living conditions and thus society itself while also being subjected to them. Domination is a reciprocal relationship of practice that must always be renewed and is in a constant state of becoming (Merkens, 2006). A critical psychological perspective examines how to comprehend subjectivity in this interplay. Holzkamp, who founded Critical Psychology, re-centered subjectivity in psychological theorizing and research,

and developed the idea that we need to analyze psychological processes and contents in the conduct of one's own life. Accordingly, one's life is lived in concrete societies and individuals have locations and positions in this society, from which they act and engage their agency (Teo, 2019, p. 112).

Our formulation of the subject-scientific approach was based on Critical Psychology assumptions that make the *sociality of one's own actions* and their entanglements with prevailing power relations the object of common research processes (Osterkamp, 2008).

These epistemological considerations shaped a joint research project done with my colleague Theresa Zimmermann that investigated how young people perceive gender relations and how they move within them. We researched with youth at an Austrian high school to uncover what role the social category of gender plays in their everyday lives, what constraints they face, and where they reflect on these gender roles. We discussed about what they wanted to change both in school and beyond, and where they questioned or pushed the boundaries of existing gender norms.

We define gender as a social category that is produced discursively and praxeologically and is (re-)produced situationally in every interaction (Riegel, 2010; West & Zimmermann, 1987). Gender is a powerful social category that divides people into the binary, two-gender system every day, but also causes people to classify and subordinate themselves. The social category of sexuality is also defined binarily. For example, Butler (1991) shows how discursive strategies and psychological processes help to discard homosexuality and implement heterosexuality as a norm. Furthermore, gender is understood as interwoven with other social categories, such as race, class, dis/ability, or age (Riegel, 2010; Crenshaw, 1991). Drawing on Riegel (2010), these social categories should be emphasized as being structural categories in which asymmetrical classifications and structurings of society take place. This process results in the (unequal) distribution of life prerequisites and social resources. At the same time, this process leads to social constructions through which hegemonic orders of difference are always discursively and praxeologically produced and unequally evaluated (ibid., p. 68).

However, the emergence of heteronormative gender relations as well as other orders of inequality such as class relations as well as racist and postcolonial

orders in globalized capitalist societies have developed and changed historically, and thus are contingent and relational, which requires analyzing them historically and concretely in each case (Haug, 2018). Subject-scientific research aims to contribute to approaching the mediation between structure and agency, or between objective determinacy and subjective determination, and to involve co-researchers in working out these entanglements (Holzkamp, 1983). Participative research approaches start from the co-researchers' everyday experiences, which become the object of joint research (von Unger, 2014). Why the term "participative"? In her article on (feminist) participatory action research, Prasad (2020) distinguishes between *participative* and *participatory* research. Participative research enables participation in certain research phases, whereas participatory research fundamentally envisions participation as a core element at all stages of the research process (Prasad, 2020, p. 19f.). In the following, I refer to this definition and describe participative research to demonstrate the effort involved when trying to enable participation in certain phases of the research process.

My colleague and I designed our research project with this understanding about participation as well as subject-scientific considerations in mind and tried to adapt these theoretical and methodological ideas for our project. The extent to which we succeeded in doing this – or can succeed at all – is the object of this paper. Thus, instead of concluding with detailed results, we ask if a research project can indeed be successfully conducted when it involves a subject-scientific and participative claim and what contradictions arise in the process. By reconstructing my own experiences in attempting to conduct subject-scientific and participatory research, I use the project to reflect upon the opportunities and challenges of such an approach to research and explore the possibilities of combining these two approaches. Our research (Märker, 2018; Zimmermann, 2017) serves as an empirical reference that I look back at self-reflectively for this article.¹ To better understand these reflections, I will (1) clarify the basic assumptions of Critical Psychology as a subject-scientific approach (2) as well as participative research strategies (3) before describing the research process. (4) Using selected results, I will discuss the opportunities, challenges, and dilemmas of such an attempt. These two approaches, including their premises and claims, function as *lenses* that help view the research results and the research process through a renewed reflection. (5) Further, I will examine the school as a research site with a particular focus on its restrictive conditions, which strongly influenced the project. Research that critically reflects upon power relations requires ongoing self-reflection, which must take place at all phases of the research process and also becomes relevant in the writing process (Rühlmann, 2021). (6) Hence, my paper will critically discuss my own situatedness and actions as a researcher. Doing so also bring considerations of alternative modes of research into focus for discussion. Therefore, this effort follows a subject-scientific approach that understands the research process as an opportunity for education

¹ When I write about research phases or reflections that my colleague Theresa Zimmermann and I conducted together or which were conducted collaboratively with the co-researchers, I write of *we*; reflections that were not part of the joint work are written in the first-person singular.

and reflection and thus intends to stimulate the transformation of previous modes of action (Riegel, 2016b).

2. Subject-scientific approach as critical methodology

Agency is a central category of Critical Psychology, and it forms a bracket between the individual and the social as well as between the personal and the political; immediate experiences are simultaneously individual and social (Brensell, 2014, p. 147). The concept of agency conceptually highlights the relationship between the opportunities and constraints of action under capitalist relations and addresses how these are mediated through relations of power and domination (Held, 2015). Here, the focus is always on the double possibility of adaptation and transgression, as comprehended through the terms *restrictive* and *generalized agency* (Markard, 2010). These terms do not describe individual characteristics or seek to classify actions, but rather function as categories of analysis for contradictory social situations (Kaindl, 2017). A central Critical Psychology question is why it can be subjectively functional for individuals to waive the expansion of agency in a restrictive arrangement and instead accept these restrictive circumstances. Answering this requires breaking down how and why those concerned do not perceive opportunities for action and which risks they shy away from (Markard, 2015, p. 51).

By contrast, the category of *generalized agency* captures the ability to gain disposition over relevant life conditions in association with others (Holzkamp, 1985). This term fulfills the function of a utopian corrective and is essential for critical-psychological thinking to maintain an emancipatory perspective (Kaindl, 2017). The focus, then, is on where an expansion of agency can be achieved and alternatives for action can be discovered, but also where it is renounced, and why (Markard, 2015; Holzkamp, 1983). Likewise, the expansion of agency is not a contradiction-free process, because:

it cannot be realized smoothly and easily, but always contains a situation of conflict, in that on the one hand there is the subjective necessity of expanding the quality of my life by expanding the disposition over the conditions of life, but on the other hand I also run the risk of coming into conflict with the ruling authorities at all levels (Holzkamp, 1985, p. 4; translated by author).

However, we are never confronted with society as a whole, but only mediated through various social levels (Markard, 2009). In Critical Psychology these social levels are named *conditions*, *meanings* and *premises*:

[...] [C]onditions mean the objective-economic circumstances of life, meanings refer to the extent to which these conditions contain possibilities and restrictions to action, while premises finally mean those aspects of meaning that each individual accentuates for himself or herself out of their respective reasons and interests. (Markard, 2015, p. 50; translated by author).

However, this level of distinction is, importantly, an analytical one, because these social levels empirically influence and condition each other (Riegel, 2010). As Riegel (2010, p. 72) states, we are dealing with a dialectical and dynamic relationship between structure, social practices or representations, and subject, while the intersectional interaction of relations of difference and dominance are effective at each of those levels. When discussing subjective *reasons* for or against an action, the person must not necessarily be aware of them; 'reasoned' is understood within Critical Psychology as an opposite term to 'conditioned' (Held, 2015; Markard, 2009). Individuals reason their actions as being in the socially mediated meanings and are not determined by them (Markard, 2009). Thus, individual action can only be understood if social conditions, as experienced by the individual, are taken into account, i.e. how the world is interpreted from the respective social situation and intersectional position of a person (Riegel, 2010; Markard, 2009). Thus, in summary, a social theoretical analysis of life circumstances is necessary as "their concrete psychological meaning has to be proven *from the standpoint of the subject*." (Markard, 2009, p. 151; translated by author). This means that subject-scientific research depends on the co-research of all those involved: The co-researchers are those who can intervene in their life circumstances and thus also reflect and elaborate upon the social possibilities and limitations for action that emerge, as well as their meanings in the co-researchers' everyday lives (Markard, 2015). The co-researcher principle implies that the people involved in the research process are seeking an intersubjective relationship (Markard, 2015). This led us to participative research strategies, which also formulate a co-researcher principle, but—unlike to Critical Psychology—have formulated more concrete research methods.

3. Participative research and the photovoice method

Not research *about* people, nor *for* people, but research *with* people – this is the claim and the fundamental epistemological position of participatory research. (Bergold & Thomas, 2010, p. 333; translated by author).

Participatory research aims to ensure the participation of non-scientists across the different levels of a research project. It is vital to enter into a conversation with the co-researchers about their life practices to make explicit what practice has long known implicitly and practically, to free it from irrational reductions, and to lift it in a systematic conceptualization (Bergold & Thomas, 2010). Thus, it is a matter of approaching everyday experiences reflexively to gain distance and to reach a generalization of the respective everyday experiences through exchange with others (Fine & Torre, 2021). Recognizing that other people feel similarly about an overlap in experiences can be a great starting insight (Mies, 1978). Participative research, like Critical Psychology, also formulates the goal of analyzing and changing life-worlds while focusing on lived experiences. Following post- and decolonial critiques, participative research strives to question hegemonic orders of knowledge production when informed by critical

theories and therefore questions who is doing the research, who is speaking and who is legitimized to speak, and whose perspectives are heard or not (Fine & Torre, 2021; Spivak, 1988). Co-researchers' resources and expertise, as well as their experiences of oppression and discrimination, form the starting point for such research (von Unger, 2022; Brensell & Lutz-Kluge, 2020). By conceptually incorporating *participatory contact zones* (Fine & Torre, 2019; Torre, 2009), this research strategy aims to bring individuals from different positionings together to begin a process of joint knowledge production. Hence, research is understood as a practice that is always conducted from a particular socially and physically situated perspective (von Unger, 2022; Haraway, 1988).

My colleague and I chose Wang and Burris' (1997) photovoice method, which is a participative method that combines photographic visual documentation with narratives in a reflexive group process (von Unger, 2014). The project's co-researchers took photos of their living environments, which the group then analyzed to initiate changes (ibid.).

4. The research process

The research project was implemented in collaboration with a fourth-grade class² of Austrian high school students, where we received permission to work with the students in several school periods. The project, translated as "Research on gender roles and gender diversity" started in March 2017 and ended in mid-July 2017, as limited by the strict school curriculum. Our primary research question was on how youth perceive gender roles, but also if and where they push existing boundaries and question dominant gender norms. Approximately 25 students participated in the study, although the number varied at times because of sick leaves and other absences. The first units of the photovoice project concerned planning the research and training the co-researchers to use the cameras (von Unger, 2014). This included collaboratively working out what research can mean, what our joint project could look like in concrete terms and discussing ethical guidelines for taking photographs. During the second unit, we played a game to initiate a critical reflection on gender relations. This led to the photo assignment where the co-researchers were given disposable cameras. Disposable cameras were chosen for the photovoice project because their photos cannot be edited, shared, or deleted in any way. This would ideally counteract and social pressure among the youth and prevent the assignment from becoming a competition for the most beautiful photo. Many students were unfamiliar with this type of camera, which increased their interest. By taking photos, the youth could capture their own perspectives and engage in an exploration of gender and gender relations in their everyday life. After this longer field phase, we collected the cameras were collected and had the photos developed. The co-researchers were then tasked with selecting one or two photos to speak about in the group discussions that followed. While we emphasized that the task of selecting photos

² This is a typical way of counting school levels in Austria; the students were between 13 and 14 years old.

was voluntary, we were also aware that tasks are usually perceived as mandatory – especially within a school context. We selected dominant topics and questions from the group discussions, further explored in plenary discussion. The final session took place at the university, where we ran a research workshop to plan a photo exhibition with the co-researchers a few days later. During the workshop, the youth gave the photos titles and we worked together to cluster the photos thematically and conceptualize the exhibition path. Furthermore, different working groups were responsible for planning steps like setting up a musical playlist, crafting decoration, and writing an opening speech for the exhibition.

Outside of the participative research phase, my colleague and I conducted two interviews with class teachers and the school principal, and another interview with a gender mainstreaming expert. Through these interviews we wanted to learn more about if and how gender-reflective teaching is handled in everyday school life, while considering teachers' perspectives.

5. Opportunities and challenges in attempting to conduct research with a subject-scientific and participative claim

Research with a subject-scientific and participative claim is demanding; it requires openness and flexibility, which can conflict with institutional restrictions, research logics as well as the researchers' admittedly normative attitudes and perceptions. The following reflects upon the possibilities and challenges that arose in the research process and discusses how concepts and the terms, especially from Critical psychology, helped us navigate and think through difficult project situations.

5.1 Terms and concepts for social (self-)understanding

Gender relations are properly understood through the Critical-Psychological concepts of *restrictive* and *generalized agency*. For example, settling with the existing gender order can be seen as an attempt to maintain one's own agency under restrictive conditions. Thus, personal needs and interests may require suppression while youth are growing up in order to 'fit' into this binary order (Kalkstein, 2016). "Gender, in the sense of the heterosexual matrix, is always a restriction of action and experience, as well as a restrictive attempt to gain agency: It excludes a significant part of sexual practices [...], access to certain feelings, lifestyles" (ibid., p. 132, translated by author), along with ways of relating and loving, and gender identities. Acting towards *generalized agency* could mean collectively working against the existing gender order. However, advocating for spaces where existing norms can be challenged can also mean an expansion of agency. This process is not contradiction-free, since transgressing the existing hegemonic binary order may cause the subject to encounter hetero and cis sexism, exclusion, and even violence (Meissner, 2008). Thus, remaining in a restrictive arrangement, behaving in a gender-conforming manner, and

(re)producing these often seems subjectively functional. This is where our research began in order to explore spaces of possibility with the students. We asked where they perceived societal structures and norms and simultaneously encouraged them to reflect on how they already questioned the existing order. Agency as an analytical category, as well as its intersectional differentiation (see Riegel 2016a/2010), helped us recognize everyday categorizations, boundaries, and constructions of difference more quickly in the respective interactions with the co-researchers. Our intention was to make them the object of research in the form of our own self-reflection, but also to use these observations as the basis for discussions with the co-researching youth. This form of dialogical analysis can help co-researchers as well as academic researchers to gain a deeper understanding of their entanglements, experiences, and limitations in the existing inequalities and to grasp structural problems (Brensell & Lutz-Kluge, 2020; Fine & Torre, 2019). Naming collective experiences enables the beginning of a process of recognition, which is the condition for changes in actions. For us as academic researchers, the concepts of Critical Psychology were central to reflect upon our own thinking and acting in the process itself, as they helped us break down concrete situations in their contradictions and embeddedness in existing power relations.

5.2 Stages of participation and acquiring new possibilities of thinking

The degree of co-researcher participation varied in different stages of the project. When discussing the questions, there were fewer opportunities for co-determination, since ensuring the approval of our research project required us to formulate the questions in advance.³ However, we made sure to formulate them as openly as possible. In the units leading up to the research workshop, the co-researchers' decision-making power mainly concerned content. By contrast, we set the thematic framework within which the youth provided the focal points and could decide how much they wanted to be involved. The research workshop is an example of the realization of participation where the young people could plan the exhibition in a self-determined manner. Opening a space for intersubjective understanding processes of social attributions and the effects of these in everyday practices with the youth sometimes revealed personal entanglements in structures of inequality. Thus, the young people referred to stereotypical images and ideas of how boys and girls 'should be.' At the same time, they also reproduced many binary and biologicistic gender ascriptions. The narratives showed what kind of adjustments go together with assignments and classifications concerning gender markers of difference. Likewise, the narratives demonstrated forms of inclusions and exclusions that result from hegemonically incorrect gender representations in

³ As part of the project's approval, we were required to explain and provide the research questions, the theoretical background as well as the methodological framework. Additionally, we had to submit grant applications to the University of Klagenfurt/ Celovec to receive research funding. These procedures were anything but participative and represented institutional logics and regulations that made us (as academic researchers) determine key research steps before we could even initiate our collaboration with the students.

their everyday lives. These stories also articulated resistance against normative gender ascriptions and described moments of rebellion; for example, when students resisted being told from other peers or adults that boys and girls can't be best friends or that feelings are classified and gendered. These processes of questioning and contradictions were moments we incorporated into the later units. The photos, captions, and co-researchers' self-written speech also allowed for a visual record; in some cases, these revealed how new patterns of thought and interpretation were acquired while dealing with everyday attributions. One co-researcher titled her photo, displaying a pink and a blue sock, "*The pink and the blue sock are supposed to represent which clichés the two sexes often (have to) follow.*" This photo led to narratives of experiences of discrimination that several students encountered when they failed to comply with hegemonic gender norms. Yet, narratives also thematized the co-researchers' own involvement in the reproduction of gender ascriptions as well as the devaluation of others through swear words. Another photo showed bathroom urinals, which led to an examination of gender-segregated spaces and places at school and was thus assigned to the 'typical girl and typical boy' exhibition. Another photo, which depicted two pairs of legs in jeans and sneakers, was titled "*Puzzle picture: Which gender do the respective legs have?*" The image stimulated a discussion about the pressure to dress in a gender-conforming way and the forms of interaction that are practiced daily. The young people also referred to historical developments and changes in gender roles, which points recognizing social conditions and working towards their de-naturalization. It was clear from the majority of the youths' contributions that they perceive a liquefaction of existing gender orders especially through clothing. On the one hand, they also cited limited flexibility since their actions were sometimes met with rejection from parents, teachers or peer groups. On the other hand, the school setting and the groups of friends formed there also seemed to provide spaces of experience where the co-researchers could experiment with their clothing and their gender expression.

Nevertheless, as existing studies have shown, this project revealed the robustness of the heteronormative gender binary and its associated attributions as well as how they function as a deep layer knowledge of everyday life (Gildemeister, 2010; West & Zimmermann, 1987). Projects making a subject-scientific and participative claim can only *try* to open up a space to make one's own embeddedness in existing power relations the object of joint reflections. The photographs and joint group discussions allowed for combining perspectives and bringing them into an exchange to facilitate potential, deeper understandings.

5.3 Photographically tracing contradictions and initiating negotiation processes

Wang and Burris' (1997) photovoice method can empower people to capture and reflect on the problems and strengths within a community. Furthermore, it can

help initiate critical dialogue and a process of gaining knowledge about key community characteristics through discussing the photographs.

As a participative method, to what extent could the photovoice method contribute to analyzing the young people's lifeworld and to addressing contexts and problems more concretely? Using the youth's self-selected photos facilitated an entry into discussions by using this third object to trigger reflections and subsequent questions that arise. Importantly, the discussion was not facilitated by the photo alone, but by a conversation 'about it' with the makers and about 'their' reasons and meanings behind it. Thus, the central issue is therefore the extent to which the young people's life-world can be experienced through the camera lens. The method proved useful to our project with the young people because it represented a low-threshold approach since most young people are familiar with taking photographs. Likewise, it enabled the co-researchers to initially record their very individual perspective without being bound by language. Taking photos enabled them to primarily focus on the social practices that produce gender as a category of social distinction, as well as where these are questioned. The subsequent group and plenary discussions allowed for a more in-depth examination of these everyday interpersonal attributions and experiences. It was precisely the photos depicting people, objects, or behaviors that did not correspond to the hegemonic binary logic that triggered the most group discussions. Given that what is *supposedly self-evident is robbed of its self-evidence* (Degele, 2008, p. 93), this explains why such photos can therefore lead to a different discussion. Freire (2005), who has made important contributions to participative and participatory research literature, suggests that processes of consciousness arise when people meet as dialogue partners. This occurs because they are "simultaneously reflecting on themselves and on the world, increase the scope of their perception, they begin to direct their observations towards previously inconspicuous phenomena" (ibid., p. 82). In that regard, the socio-critical claim of subject-scientific and participative research is also characterized by its goal to acquire new potential ways to think and act through the insights gained from the joint analysis. However, participants' project findings were certainly not uniform. Nonetheless, the participative and subject-scientific approach allows for moments of co-production where everyone can learn something new (Arztmann et al., 2017). Taking young people's issues seriously promoted processes of negotiation that allowed for resistance or dissent. Participative and subject-scientific approaches are precisely characterized by their tendency to support taking up and repeatedly discussing important topics. The project's concluding exhibition at the university further disseminated the results to a wider public, thus providing external visibility. For at least some of the students, the photo exhibition and preparatory research workshop – which some students were proud of – was encouraging. However, we continued later steps of the analysis without the co-researchers due to time, resource and structural limitations. Presenting the results as a photo exhibition concluded our collaboration with the youth, while my colleague and I continued to work with the data and results and added some new questions. However, strict university guidelines had a great influence on the project and limited it.

5.4 Research logics and settings as en/disabling participative processes.

Research is determined by a logic that is presuppositional and imbued with power, requiring constant reflection (Arztmann et al., 2017). Participative and subject-scientific research risks constructing co-researchers as entirely able and willing to research, although they may have different individual interests about their participation. Likewise, their motivations may vary and include an interest in the topic, a sense of duty, or avoiding regular school lessons. Our motivation was mainly determined by our curiosity about working with youth on about gender relations. Despite diverging motives, a space emerged during the project that provided the foundation for joint researching, learning and working.

The observed processes of *doing differences* in youth's everyday life and society demonstrated that young people are clearly aware of these processes (West & Fenstermaker, 1995). Nevertheless, they rarely directly relate their experiences to social structures of power and domination. However, how should they do so, if in school there is little discussion with young people about the various inequalities. Schools are usually unable to address these issues sufficiently because they themselves are anchored in social relations and are as Foucault (1977) says, *institutions of discipline*. Like other disciplinary institutions, the school is a place where mechanisms "of comparing, differentiating hierarchizing, homogenizing, and excluding become effective as so-called disciplinary techniques." (Riegel, 2016a, p. 32, translated by author). The relationship between those who teach and those who must learn illustrates the hierarchical and asymmetrical nature of school relationships, which is where participative and subject-scientific research strategies can question existing boundaries by breaking up the traditional schooling logic:

Working with children and adolescents in school means [...] addressing them as knowers or as knowledge producers in a place where they are otherwise integrated as 'learners' and where - depending on the basic pedagogical stance of the school and the teachers - less(er) knowledge and autonomy is attributed to them. (Wöhrer, 2017, p. 44; translated by author).

The participative and subject-scientific approaches allow for thinking about hierarchies and addressing entanglements, which certainly contributed to discrimination by teachers being raised as a topic in almost all groups. This was further discussed during the plenary session in terms of how 'good teacher' should be and what needs to change within the school. These discussions resulted in a list of points and demands, which my colleague and I passed on to the school principal at the co-researchers' request.

The school system and its accompanied structural limitations enabled and disabled certain research relationships, which were relevant for collaborating in the field. We quickly realized that the school as a *space of norming* (Mecheril & Shure, 2018) also had a structuring influence on this project, which is why I will expand on relevant experiences in this regard.

5.4.1 School as a research field

Researching with young people in school is a challenging process. Schools have their very own constitution, which is not conceived from the students' point of view (Wöhrer et al., 2017). Schools comprise a specific form of organization that is determined by a fixed set of rules with clear courses of action, structures, and conditions. In turn, these rules have an impact on students and teachers, although as different socialization experiences (Feichter, 2015). Although we had to adapt to the school logic as researchers, because we lacked a teacher role, we had other opportunities for action during the project. Since we had different goals than teachers when working with the youth, our role as researchers helped us escape certain school-specific communication patterns and rules. However, we still had a duty of supervision, which gave rise to new contradictions as well described by Arztmann et al. (2016):

Yet, researchers do also have pedagogical as well as ethical demands in the situation. Moreover, they have the legal responsibility to watch over minors. These requirements may conflict with their role as observers and facilitators of open modes of exploration. (p. 89).

Throughout the project, we noticed how both the demands placed on us by the school and role expectations conflicted with our intentions. We had the impression that we were strongly perceived as teachers by some of the youth; for example, some of the co-researchers searched to make eye contact with us during their spoken contributions to confirm their contributions were appropriate. Typical school experiences of being corrected and censored were clearly visible in such situations. Additionally, the collaboration was influenced by the fact that my colleague and I entered the students' environment from an external context and left after the project ended, while they were required to attend school. Thus, the school setting significantly influenced the project's aspect of voluntariness. Although student participation was not necessarily compulsory, it was neither entirely voluntary because students who opted out of the project would have remained with the class teacher. The entire class was also asked prior to the research if they wished to participate in the research project at all⁴. However, we were not given detailed information of the class voting procedure and therefore do not know if it was, e.g., a majority or consensus decision or how the teacher designed the project announcement.

Student participation in school development or change opens up areas of tension (Arztmann et al., 2017). The limitations we faced became quickly apparent because the role of students in the school systems does not involve changing something in the structures (ibid.). The hierarchical structures, rigid school logic, and its behavioral norms contained also influenced the form of knowledge production within the project; for example, we were pre-structured by the school time frame. The co-researchers seem to expect a lot of input from us, especially at the beginning of the research project, which could be linked to the

⁴ Previously, another class was asked, and refused to participate in the project.

clear scheduling and familiar school hours. Additionally, the physical space proved highly relevant for the type of communication and the atmosphere: The first units took place in the classroom, whereas the group and plenary discussions were held in at the school in other rooms,⁵ and the research workshop was outside the physical school building—at the university. The act of physically stepping out of the familiar school premises seemed to make it easier for the young people to engage in the research process.

We subsequently reflected on whether research projects with a participative and subject-scientific claim are even possible within the school framework, or whether seeking out-of-school settings would be more conducive to collaborative research projects with children and adolescents, since they allow for more creative freedom. Again, the analytic category of agency helped us think through our positionings in the research setting and about alternative ways of acting. For future projects, it would also be interesting to focus on interpellation practices that take place in the research process and empirically reconstruct how an academic researcher is referred to and seen by the field and the respective actors and *vice versa*. Our analysis is informative because it allows us to trace the rules and routines in the respective field as well as the power relations inscribed in them more closely from an intersectional perspective (Siouti, 2022; Riegel, 2016a). These reconstructions could then help derive modified modes of action for further research (steps).

5.4.2 Involved research and moments of failure

We are involved in *doing gender* on a daily basis and thus also in the research process (West & Zimmermann, 1987). Therefore, we are always, simultaneously both recognizers and recognized (Schigl, 2012). Constantly reflecting on my own biographical knowledge bases and privileges as a *white* cis woman,⁶ who studied psychology, as well as all other lines of difference, was and is a challenging task. Being embedded in existing power relations and binary patterns of thought and role, it was crucial to exchange ideas with my colleague and other peers. It was precisely because of our research question, with its strong focus on gender relations, that we could quickly neglect other relations of inequality or become entangled in othering processes ourselves. We also saw how we were confronted by reifications as an urgent matter, since we reproduced binary categories ourselves to make power relations speakable while claiming to adopt a deconstructivist stance. This is a contradiction that could not and cannot be resolved, but nevertheless demands constantly trying to work through these

⁵ The other rooms were the library and a music room.

⁶ Cis or cisgender means that I identify with the gender that was assigned to me at birth. This designation does not imply that cis persons are 'normal.' Rather, prior to the term 'cisgender' being introduced, only transgender people were exclusively named, which contributed to othering (Ewert, 2021, p. 21). The designation *white* does not refer to actual skin color but is about a very privileged social position in the hierarchical, racist order (Kurt, 2021). *white* is written in lower case and italics to mark its socially constructed character.

dilemmas⁷. With regard to my own stance, I had to remind myself of our aims and practice constant critical sensitization and vigilance. For example, during some of the co-researchers' narratives of discrimination they experienced, I felt a sense of wanting to protect and shield them from normative violence, but in doing so I homogenized them as victims and adopted a paternalistic perspective. In addition, the question of normativity arose often, because we felt the need to intervene when derogatory and/or discriminatory statements were made by other students. We experienced unease when binary conceptions of gender were reproduced and felt an urge to co-construct emancipatory results. These are problematic conceptions and should be the object of constant reflection processes since they contradict the principle of openness in qualitative research. Addressing these observations with my colleague allowed us to reflect on them together and refocus the project goals of the project, to proceed in a subject-scientific and participative way. I therefore find it very important, especially for participative and subject-scientific projects, to work in a team that consists of more than one academic researcher, thriving on cooperation and solidarity among each other.

Relationships are vital throughout the research process; they are shaped to different degrees and in different ways by both insider and outsider positionings. While intersectional positionalities are relational (Siouti, 2022) and stem from complex situational negotiations, shared experiences or similar imprints through socialization and education can nevertheless have a fundamentally positive influence on research and understanding processes (von Unger, 2022, p. 95), as expressed by von Unger: "Conversely, social distance and unequal power relations in research relationships can foster othering processes" (ibid.; translated by author). Fine (1994) uses a *hyphen* metaphor to reflect on the 'in-between', i.e. the manifold ways of relating in the field, and especially what connects and separates us:

By *working the hyphen*, I mean to suggest that researchers probe how we are in relation with the contexts we study and with our informants, understanding that we are all multiple in those relations. I mean to invite researchers to see how these 'relations between' get us 'better' data, limit what we feel free to say, expand our minds and constrict our mouths, engage us in intimacy and seduce us into complicity, make us quick to interpret and hesitant to write. Working the hyphen means creating occasions for researchers and informants to discuss what is and is not 'happening between' within the negotiated relations of whose story is being told, why, to whom, with what interpretation, and whose story is being shadowed, why, for whom and with what consequence. (ibid., p. 72).

Drawing on Fine's considerations, von Unger (2022) concludes that for research processes, this means reflecting on the posed questions and entanglements in

⁷ Mohseni, Merl & Mai (2018) refer to these difficulties in the following excerpt: "Binary categories such as woman/man or sick/healthy only offer the possibility of naming and making visible relations of domination. Without such naming and making visible in the binary categories, political resistance would not be possible.

At the same time, working with the analytical tool on relations of difference such as 'deprived' and 'privileged' inevitably runs the risk of reproducing binary category thinking and essentializing social constructions and collective identities." (p. 27f.; translated by author).

field notes, memos, in conversations with peers, and in research workshops. It is not only epistemologically relevant to reflect upon situatedness and positionality, but also from a research ethics point of view (von Unger, 2022). This is especially due to the fast-moving nature of moments and the strong involvement of academic researchers, which causes a much stronger compulsion to act in participative settings than in more distanced qualitative research designs. This compulsion quickly leads to the reproduction of discrimination, even if unintended (see chapter by Schneider, 2017). Thus, as Guillemin and Gillam (2004) proposed, I call for an *ethically vigilant stance*, which means taking responsibility for the research process, especially for faulty situations, looking at them self-critically, and writing about them. Keeping a research diary and collegial exchange helped us gain distance from the field and self-critically reflect upon our experiences, descriptions, and mistakes with a time lag. Following Fine, von Unger (2022) aspires for research to importantly include all co-researchers and researchers in these processes of joint reflection. The basic assumption of subject-scientific research is that people do not act against their own interests: Social self-understanding means that we all depend on each other to be able to recognize the limitedness and restrictiveness of our own ways of seeing and acting in the world (Osterkamp, 2008). In participative and subject-scientific research, trying to create spaces for joint reflexive meta-discussions about the research process itself would be desirably rather than only about the object of the research. Our project especially lacked the time and resources to engage in this in-depth work⁸.

Participative and subject-scientific research project is very demanding, and we could meet all such demands. In retrospect, this led feelings of a guilty conscience, disappointment, and shame. I felt that I had failed to meet my own standards as well as the principles of participative and subject-scientific research. However, in Wöhrer et al.'s (2017) *Participatory Action Research with Children and Adolescents* – especially Karin Schneider's commentary – helped me to better classify these emotions and also recognize them as a productive moment for learning about the tensions in such research processes:

This guilty conscience effect happens when I start with a claim and fail to meet it. Namely, the claim of shared and equal knowledge production in a different research paradigm that leads to change processes in which the development of the research question and the presentation of the research results is egalitarian. If we feel an emotion like 'guilty conscience,' this could also refer to a tension between these egalitarian and political claims we make about PAR [Participatory Action Research] and the reality of falling back into classical research stances. (Arztmann et al., 2017, p. 24; translated by author).

It was not realistic to do justice to the claim of participative and subject-scientific

⁸ Participatory and participative research is much more time intensive compared to more 'conventional' projects (Schwenken, 2019). Referring to colleagues at the National Domestic Worker Alliance who conducted a participatory project, Schwenken recommends doubling the estimated time required for all research steps. This is a significant hurdle for participatory and participative projects within the scope of project funding logics and the neoliberalization of the university.

research, especially in a restrictive school setting and given the project's time-restricted framework. Hence, we can instead discuss certain participative moments and phases during the research project. Additionally, it raises the question, what damage can result from this form of participative interference? We were no longer in the class after the project ended and thus cannot say anything about initiated negotiation processes. However, it was and is precisely the research ethics dilemmas that were and still are of increased urgency in this type of research or become visible through the approaches. These questions and challenges continued to preoccupy my thoughts long beyond the project context, raising the further question of how this form of research is possible and what it needs to really meet the claims of these research strategies.

6. Provisional conclusion

Despite the interconnectedness of research in existing inequality relations and previously addressed problems, subject-scientific and participative projects can have critical potential if they are based on the everyday practices of the co-researchers. Together, the co-researchers and researchers attempted to unravel the problems and reasons behind encountered contradictions and experiences and explore new opportunities for action through processes of intersubjective understanding. Opening a space to address gender relations and deal with discriminatory experiences could lead to new experiences, and possibly to the development of new spaces for thinking and acting (Meretz, 2017). Even if the respective social conditions impose certain role patterns and hegemonic norms on every individual in daily practices, there is nevertheless always the possibility to transcend the in- and excluding patterns of thought and shift or change one's modes of action to contribute to changing social conditions (Riegel, 2016a, p. 311). The co-researchers also addressed these opportunities for action in their self-authored speech at the exhibition opening:

It's a shame that not everyone is treated and given equal rights regardless of their gender. With our project, we probably can't completely eradicate this injustice, but we can make others aware of this problem. Each individual can have a say in whether discrimination should play a role in their world. (Märker, 2018, p. 131; translated by author)

Subject-scientific and participative research approaches can be combined well, since these approaches are characterized by a partisan and value-based stance that strives for the equal participation of all those involved in the research process – recognizing that this undertaking is impossible in relations of inequality (von Unger, 2022/2014). However, this raises the question of what understanding of society this stance is based on and what underlining conception of agency exists. These considerations are vital to research understanding itself as an instrument "by means of which subjective experiences can be made visible in their mediating context with social contradictions" (Brensell & Lutz-Kluge, 2020, p. 9; translated by author) and that focuses on opening up new modes of

action under local conditions. To avoid instrumentalizing participative research or even stabilizing prevailing relations of violence, a more concrete understanding of the interaction of structure and agency is necessary, which sets the stage for the critique. Critical psychology, including its categorical determinations and its intersectional reformulations and additions (see Riegel et al., 2018; Riegel, 2016b/2010), offers a central starting point that is fruitful to combine with participative research. These approaches can shift the gaze to take people's practices, experiences, and their willful ways of acting as a catalyst for research without neglecting existing relations of inequality (Ahmed, 2014). Making these different modes of action and the associated desired expansion of agency a research focus can enable socio-critical research from the subject's standpoint while acknowledging that "our work will never 'arrive' but must always struggle 'between'" (Fine, 1994, p. 74) between the multiple relationships and entanglements in existing power relations.

Acknowledgments

I would like to thank the peer reviewers for their helpful comments, Veronika Wöhrer for her valuable feedback as well as Leora Courtney-Wolfman for proofreading. Also, I want to thank the members from the AK Kritische Psychologie Klagenfurt/Celovec as well as Dominik Schmitz for their feedback on former versions of this text. Finally, my great thanks go to the co-researchers and to my colleague Theresa Zimmermann without whom the research would not have been possible.

"Money lets you sleep more peacefully, that's what I've experienced": Negotiations between motherhood and working-life from a class-sensitive perspective

Fiona Kalkstein

Abstract

Since the early 2000s, numerous family policy interventions have aimed at improving the reconciliation of work and family life in Germany. However, low-income women often face particular challenges in this regard, which the new measures hardly seem to take into account. This study therefore explores the question of what subjective and objective possibilities these women see for combining work and motherhood. It is based on biographical, guideline-supported interviews with six women from workers' milieus of different generations. The theoretical and methodological framework of the study is formed by critical psychology in Holzkamp's sense, and the interviews were evaluated with the developmental figure of critical psychology. The results show that the six women interviewed find ways and means to deal with the contradictory demands on them as mothers and class subjects, which can hardly be met in their entirety. The focus is on the negotiations along the following aspects, which proved to be central in the evaluation of the interviews: The relationship to (bourgeois) norms of the "good mother"; the mental relationship to the sociality of one's own problem situation; the awareness of the unstable preconditions of the (modernized) breadwinner model; and the care and maintenance of one's own social relationships (outside the partnership). These aspects are highlighted and discussed in relation to the current research situation.

Keywords

class, family policy, Germany, motherhood, women, work-life

1. Reconciliation or (in)reconciliation - a matter of class?

In the past thirty years, reconciliation of family- and work-life has become a societal goal and a "central policy field" (Auth, 2010, p.7) of German family

policy. This development is discussed in close connection with the increased labor force participation of women¹, which has almost doubled in Germany since 1970. Women have become an important, if not the most important, component of new labor market policies, not only wanting to work but also being expected to do so. Since women have also been considered "achievers" (McRobbie, 2010, p. 114) "who can make it in this society" (ibid.), measures to reconcile family- and work-life have increasingly become the focus of family and equality policies. Thus, since the early 1990s, numerous measures have been introduced to make it easier for mothers to be gainfully employed. The expansion of public childcare for under-threes and all-day care in kindergartens and schools, the right to work part-time while receiving parental benefits, and the introduction of parental allowance as an income-related wage replacement benefit are just a few examples of such measures. All of these are aimed at a modernized, heteronormative model of the family², according to which both parents can and should be gainfully employed (adult-worker model, see Lewis, 2004). Auth et al. (2010, p. 8) argue, with regard to equality policies since the 2000s, "that the family and equality policy reforms in Germany [...] have not meant equal opportunities and more freedom of choice for all women equally. Instead, selective emancipation has taken place, with more equality for socially better-off women." The goal of supporting female academics in particular in having children and taking parental leave through the introduction of parental allowance was also reaffirmed by the German Chancellor³. A turning point in family policy was the introduction of parental allowance in 2007 as an income-related wage replacement benefit, which replaces almost 70 percent of the previous salary. But if this measure was intended to better enable women to remain financially independent during parental leave, this step was also a novelty in that it no longer included any disadvantage compensation for low-earning women. In 2011, parental allowance was finally offset against unemployment benefit II (Arbeitslosengeld II, short: ALG II) to the detriment of mothers who are already on the edge of the subsistence level. While higher-earning women today have more opportunities to combine family and career than in the past (see e.g. Abele, 2003), the influence of changed conditions and a changed discourse on the life reality of proletarian women has not yet been investigated.

¹ In many articles cited in this study, the category "women" is not further defined. I will refer to cis-women in the following when quoting statements about women. The active opening of the labor market to trans women and queer people occurred later and is to be discussed in a different context.

² The ideal of family is to be separated from the definition of family on which this work is based. The societal model of what family is and what almost everyone can agree on is the core family: mother, father and about two children. The more another form of life resembles this composition, the more likely it is to be perceived as a family. The extent to which a constellation can deviate from the ideal nuclear family in order to still be perceived as a family varies socially (Luck/Ruckdeschel, 2015, p. 74f).

³ Until now, support for families has actually always been support for families in need. Now, for the first time, we have taken the initiative to say that no matter how much someone earns, the decision to have a child is, of course, a wonderful private decision, but it is also an important decision for society. That's why we don't want this decision to be associated with too much loss of standard of living. That's why we give a certain percentage of the last salary for one year." (Merkel, 2006)

2. State of research

While for many families⁴ the hegemonic concepts are indeed the model and reality, alternative family practices and designs have always existed. When the norm of the male sole breadwinner was booming in the 1950s and 1960s, many women were simultaneously single parents in the aftermath of World War II (Notz, 2016, p. 102). Women from the working classes were often gainfully employed, as one salary was not enough to live on, and they additionally did the household and child-rearing work (Beer, 2010, p. 60). If today the *adult-worker model* or the ideal of the *working mom* prevails, according to which the mother is supposed to combine gainful employment, family life, financial independence, and self-care without any problems, reconciliation in the sense of having her own salary that is not far below the social average remains the preserve of very few women with children (Barišić/Consiglio, 2020, p. 4f; BMFSFJ, 2016, p. 4). Barišić and Consiglio highlight that mothers continue to earn significantly less income than fathers and then women without children. According to them, the average increase in women's earned income over the past 30 years is almost entirely due to the increased incomes of women *without* children. In particular, the expansion of the low-wage sector and part-time work in the form of mini-jobs is seen as a "risky form of employment" (Klenner/Schmidt, 2012). There is a clear gap between the social ideal and the reality of motherhood. For many women, reconciling family and work life is a problem when it comes to lasting, stable financial independence (OECD, 2017; BMFSFJ, 2016, p. 11). The notion that more and more women are employed as well as (quite relevant!) debates about double burden have displaced those about women's financial dependence. Sick and Schmidt (2015) point out:

While more and more mothers are in the labor force, one might therefore assume that women's household incomes recover over time from the post-divorce trough. But in fact, only marginal employment and part-time work have increased. The volume of work itself has actually declined! (p. 129)

Since 2016, the labor force volume has been back at the 1991 level (Grünheid, 2018, p. 6).

The fact that most mothers are employed part-time is considered the cause of the low income of mothers in Germany. Women state family responsibilities and caring for dependents as the most common reason for part-time work (Wanger, 2015, p. 3). Full-time working women are nevertheless left with the bulk of the reproductive work (Berghammer/Verwiebe, 2015, p. 122). While women of the higher (wage) classes can finance household help and external childcare in this case, those from the working classes are often exposed to the

⁴ The term is based on the family definition of the microcensus: "In the microcensus, the family includes all parent-child relationships, i.e. married couples, non-marital (mixed-sex) and same-sex partnerships, as well as single parents with unmarried children in the household. Included are - in addition to biological children - also stepchildren, foster children and adopted children without age limit. Thus, a family always consists of two generations: Parents/parents and unmarried children living in the household." (Statistisches Bundesamt, Glossary: Family)

double burden of gainful employment and family work. If they opt for a part-time model, their income is barely sufficient to support themselves. Another problem is shift work, which often does not fall within the childcare hours of daycare centers.

Motherhood and the regulating power of norms

In 1921, the socialist women's rights activist Alexandra Kollontai asked, "How can women get rid of the eternal housework that only consumes unnecessary energies? Women could really use these energies more sensibly" (Kollontai, 1977, p. 163). What was meant was not how women could cede housework to other social groups, but how they could free themselves from the situation that they do housework because they are women (and are thus kept from other activities). It is not only social structures that lead to women not being able to get rid of 'the eternal housework', especially when they start a family. Dreßler (2018, p. 11) additionally understands motherhood as a cultural pattern of interpretation that "links female reproductive abilities with caring competencies and an emotionally strong bond between mother and child." Thus, from femininity is derived the natural-biological ability to care for children emotionally and to raise them competently out of an apparently innate maternal instinct. It is by no means to deny that this socially implemented female bonding and caring capacity allows mothers to form strong bonds with children that are sources of positive experiences happiness, joy, and social competence. Nevertheless, gendered norms of parenting undoubtedly have a regulating role. Speck (2016, p. 40) even sees the "primary function" of the ideal of the good mother in the "allocation of familial caring activities [...] to women," thus clearly highlighting its regulative character. In addition, there is the class bias of the symbolic representation of good motherhood, which various authors also point out (e.g., Speck, 2016; Dreßler, 2018). Mothers today are supposed to be financially independent, but *full-time* maternal employment is still considered incompatible with maternal responsibility toward the child (Dreßler, 2018, p. 33; Diabeté, 2015, p. 216). Financial independence on a part-time basis is difficult to achieve for many women, but for mothers from low-wage backgrounds it is sheer impossible. At the same time, women today are suggested that they can work and have careers as mothers, that they can seemingly become politicians and professors with ease – if only they manage their lives in the right way. Following McRobbie (2010), this imposes an interpretive framework with which the "effects of class discrimination, racism, and the sheer persistence of insurmountable obstacles for girls from poor backgrounds" (ibid., p. 110) completely disappear from public consciousness. If mothers fail to meet expectations of society, this can quickly become emblematic of merely individual failures to plan, she argues. Incompatibility is not a new phenomenon, but what role do class privileges and resources play in determining whether a woman manages to combine motherhood satisfactorily with a job and financial independence? If Flöther and Oberkrome (2017, p. 143) are followed, then in Germany "compatibility

problems are discussed especially for university careers, while empirical findings are largely lacking for other professional sectors." Against this background, this paper examines the reconciliation goals and practices of working-class women with a view to their subjective satisfaction with their implementation. Of particular interest is the question of whether desires for financial independence were present and how the possibilities to realize them were perceived. Against the theoretical background of Critical Psychology, the question of the extent to which women actively work to improve the conditions for reconciliation is always relevant.

3. Theoretical framework: Critical Psychology

Research that emerges within the paradigm of Critical Psychology always poses challenges to relatively short writings, such as a journal article. Critical psychology must be understood as a distinct research paradigm that operates with its own theoretical presuppositions, analytic terms, as well as a specifically developed methodological implementation of the paradigm. This sediment of Critical Psychology can only be presented here in a very abbreviated form and reference must be made to more comprehensive writings. In doing so, the study is oriented towards the theoretical-methodological explanations of Critical Psychology by Holzkamp (1985) as well as its further development by Markard (2009) and various feminist further developments (Kalkstein, 2016, Sieben & Kalkstein, 2015, Rommelspacher, 1991). The central lines will be traced.

How a subject behaves in a situation is considered by Critical Psychology as the interplay of individual needs, objective possibilities and constraints, their (normative) representation (e.g., in forms of thinking), and their accentuation and interpretation by the subject itself. In this context, Markard (2009) speaks of the "overall social mediatedness of individual existence" (p. 178). In the present study, the focus is specifically on the tension between the externally imposed conditions under which women must establish compatibility and the exploration of possibilities to overcome obstacles and to shape compatibility according to their own ideas and needs. For proletarian women, a situation exists that is referred to as *structural (in)compatibility* of family and gainful employment, following the explanations in chapter 2. Within the structural framework, the respective chosen forms of action – the *practices of (in)compatibility* – emerge. In critical-psychological terms, they are seen as an interplay of individual *reasons* (desires, needs, biographical experiences), structural possibilities and their subjective accentuation (*premises*). Forms of action can be analyzed as *premise-reason relations*. Actions are grounded in premises and usually aim at expanding the individual's agency. The agency can be expanded *restrictively* (within the structurally given framework) or by struggling to improve the initial situation (generalized agency). *Generalized agency* thereby represents a determination of the direction of practice in order "in the unfolding of the possibilities for cooperative self-determination of our own affairs [to] also arrive at a satisfying, anxiety-free, and fulfilled subjective existence." (Holzkamp,

1984, p. 10) It shows what would be possible and focuses on cooperative self-determination: the disposition of one's own living conditions in interaction with others. Against this background, the analytical notion of double possibility emphasizes that concrete people in principle always have the possibility to intervene in social conditions. As a category of analysis, it systematically incorporates into the inquiry that people have the possibility to engage in the expansion of the disposal of one's own living conditions (*generalized agency*). Analytically, it provides the framework for determining what restrictions on agency people experience in a situation.

In research practice, the focus is on the "subjective way of prereception" (ibid.) these very restrictions. The perceived immutability of existing power and inequality relations is identified as the intellectual premise of restrictive agency (Holzkamp, 1985, p. 370). With regard to the social contradictions between gainful employment and motherhood that the women in question encounter, it is important to understand the functionality of restrictive entanglements through the mental fading out of the *double possibility*. Actions do have reasons, but these reasons (interests, desires, needs) are by no means always conscious (cf. the self-critical discussion by Huck, 2006). Analyzing the conditions and functionality of individually realized forms of thinking thus opens up the possibility of looking at experience in a new way. In the critical-psychological developmental figure (*Entwicklungsfigur*), it is an independent methodological step, which I will discuss in the next chapter.

The relation between subjectively experienced possibilities of action, objectively restricting conditions of life, and double possibility forms the core of a critical-psychological problem-analysis. The typical critical-psychological relation between subjectively experienced and socially given possibilities is brought into analytical focus.

4. Methodical Procedure

Data collection

The study reconstructs the subjective view of women of different generations on their own possibilities of reconciling family and gainful employment. Data basis are seven biographical interviews with six women⁵. These were recruited by means of notices in women's centers, sending mails via distribution lists and inquiries to trade unions. The interviews were transcribed and anonymized. The biographies of the sample were recorded by means of biographical guided interviews, which first asked (chronologically) about the biographical course and touched on certain areas of life (family, friendship, school, work, crises), and then asked about self-constructions, which were specifically intended to stimulate reflection ("Have you changed over time?").

⁵ One woman was interviewed twice, as the first interview was originally a trial interview. When the guide was subsequently adapted and the interview was evaluated after all, some questions had to be asked subsequently.

Sample

The sample (see Table 1) consists of six women between the ages of 28 and 66. Three women were between 29 and 35 years old at the time of the interview, three women between 58 and 66 years old. Accordingly, two generations were interviewed⁶. Four of the women were already mothers, and two were planning motherhood⁷. To determine the class position, the characteristics of educational attainment, professional qualification, and occupation, as well as inheritance and property situation were collected. Five participants have a secondary school diploma, another participant completed A levels, which was not recognized in Germany. As a housekeeping assistant in a large kitchen, she was undoubtedly part of the target group. At the time of the interviews, five women were living in rented accommodation; one participant had bought a small condominium in a working-class neighborhood in *city A* when she was a senior citizen. One of the women had already received an inheritance at the time of the interview, but it was so small that it did not result in a 'class change'. Another will receive an inheritance during her lifetime. These and similar blurbs are not uncommon in attempts to operationalize 'working-class' and must be decided on a case-by-case basis (see Braun et. al, 2008).

Table 1.

Name, Age	Education degree	Professional Qualification	Professional Occupations	Number of children	Family status
Julia, 66 years	secondary school diploma	Forwarding agent	Forwarding agent, unskilled labor	2 adult children	Married 2 times, divorced 1 time, Widowed
Nina 66 years	secondary school diploma	Industrial clerk, educator	Industrial clerk, Stenographer. Büro-tätigkeiten, educator	2 adult children	Married, Divorced, Partnership, Single and Singleparent
Dunja, 58 years	A-levels (Iran)	Housekeeping Help	unskilled labor, Housekeeping Help	1 adult child	Married, Divorced, Partnership, Singleparent

⁶ The question of whether so much has really changed for women from the working classes cannot be pursued further in this article, but can be read at the indicated place (Kalkstein, 2021).

⁷ The starting point of the study (Kalkstein, 2021), of which this article is an abridged version, was not compatibility or motherhood, but the question of central areas of life in which women from working-class backgrounds struggle particularly hard for agency. Motherhood and issues around compatibility only emerged as a central theme in the analysis. Although only four of the six women were already mothers, all of them had a relationship to motherhood: Planning to start a family soon also took up significant space in the interviews.

Maria, 32 years	secondary school diploma	Nurse practitioner	Nurse practitioner	No children yet	Partnership
Vanessa , 31 years	secondary school diploma	Social Assistant	Waitress, Social Assistant Vocational baccalaureate (currently 12th grade)	2 Children of preschool and primary school age	Partnership, Singleparent
Marion 28 years	secondary school diploma	Hotel manageress	Hotel manageress	No children yet	Partnership

Data Analysis

Critical-psychological research practice pursues the goal of "analyzing how people move within the contradictions of capitalist society, how they expand or renounce their subjective possibilities of determination - and with which (psychological) problems this is associated in each case" (Markard, 2010, p. 170). The focus here is on the conceptual pair of *restrictive vs. generalized agency* (see above), and its reflection in thinking and in the form of social relations.

In the first step of the analysis, the interviews were sorted thematically and examined for common central themes. The procedure was based on the open coding of Grounded Theory (Strauss & Corbin, 1998). From this, it was possible to reconstruct the common problematic situation of the participants in the negotiations about gainful employment, family planning, and family work.

In the second step, the analysis of the thematic complex of *(in)compatibility* thus elaborated was oriented towards the first two steps of the critical-psychological development figure (*Entwicklungsfigur*) (see Markard, 2009, p. 279ff; also Geffers, 2008). These are:

- (a) *the identification of the problem* (reconciling motherhood and work) and *reconstruction of the subjective view* of the person concerned.
- (b) the analysis and working through of the problem and *reformulation in critical-psychological analysis categories* (cf. chapter 3, theoretical re-framing).

Depending on the data situation of the interview, either both concrete *reasons and premises* can be reconstructed from the narratives of the individuals, since these are disclosed. Or they have to be "speculated" about, since they remain unclear in the interviews. This means the "attempt [...] to make clear the premise-reasons-relations, subjective theories, life-condition references that come up in the evaluation in such a way that they are not only reproduced or thematized, but

reflected upon and questioned with regard to the respective (i.e., also one's own) location-boundness – and thus become comprehensible for others in a methodologically proven way" (Markard, 2020, p. 39). At the end of each individual case analysis, there is accordingly the practical or intellectual answer to the problem as a premise-reasons-relation against the background of restrictive vs. generalized agency. The individual responses (*practice of (in-)reconciliation*) to the structural framework (*structural (in-)reconciliation*) were cross-compared with each other in order to develop axes along which differences and similarities can be described. Four heuristic dimensions have emerged from the empirics to describe them. These will be presented in the following.

5. Presentation of the central results: Practices of (in) reconciliation⁸

As presented in the theoretical section, women faced a situation of structural (in-) reconciliation that made it practically impossible for them to fulfill the norms of good motherhood while remaining financially independent. For reasons of space, the detailed elaboration of the respective situation of each interviewee must be omitted. This can be found in Kalkstein (2021, p. 107ff). Although the initial situations showed structural parallels, the practical responses to them could be distinguished along the following four dimensions:

- (a) relationship to norms of good motherhood
- (b) presence or absence of structural categories in the thought patterns
- (c) subjective assessment of the risk of financial dependence
- (d) quantity of social involvement outside the partnership.

These form the core of the findings of the study and are presented below as dimensions of practice and filled with content.

a) Relationship to norms of good motherhood

The normative relationship of the interview partners to motherhood, working life, and their compatibility was examined to see which subjective practices emerge from this relationship in response to a social structure that disadvantages women due to societal class relations. The evaluative pattern of the good mother can be reconstructed as particularly relevant, which to this day frames supposedly too much gainful employment of the mother (the extent varies historically) as a potential threat to the well-being of the child (Dreßler, 2018, p. 33).

Questions about the temporality of career exit influenced all women's negotiations at a normative level. Nina (66 y.) exited the workforce when she became pregnant (1972), while her husband, three years younger, continued to work and provide financial security for the family. This form of division of labor was not only socially expected at the time, but was also legally mandated (Notz,

⁸ The comprehensive presentation of the results is beyond the scope of this paper; it can be read in detail in Kalkstein (2021, p. 318ff). At this point, it will be limited to the central results along the four heuristic categories.

2016, p.100). When Marion (28 y.) is asked in the interview about her desire to have children, she answers that her partner now has a new job, which is why the "external circumstances fit" (Ma, 12:10). Both Nina (66 y.) and Marion (28 y.) refer – despite considerable age differences – to socially legitimized forms of gender-specific division of labor as a practice of (in-)reconciliation, which in both cases leads to financial dependence on the partner. But as a family, societal expectations and social norms could be fulfilled (maternal care and paternal financial security of the family). The legitimacy of gender-specific division of labor remains self-referential (it is right because it is customary). It is not named as risky in the sense of giving up financial autonomy. Within the framework of the existing society, however, the breadwinner model also has an enabling character; despite its restrictive characteristics (economic dependence on the partner), as long as the relationship remains stable, a double burden is also spared.

Julia (66 y.) and Maria (35 y.) choose a different path. They put themselves in a problematic relationship to norms and social expectations as to when (how 'early' or 'late') and to what extent it is apparently good or right to re-enter the workforce. In the interview, Maria (35 y.) carefully weighs up the socially expected period of time against her own needs:

Nowadays it's also possible that you give them up somewhere when you're only six months old. I mean, I think that's very early, but when they're a good year old, I think that's fine. (M_II, 5:33ff)

She expresses normative boundaries as well as possibility that her own needs (to return to work at an early age) do not meet social expectations. Maria evaluates it as possible in future to place her child in external care at the age of six months, but very early. But it remains an alternative, even if not the optimal one. Maternal primary responsibility is used as an orientation, even if it contradicts one's own needs. Subsequently, other alternatives are discussed, in which an external institution, rather than the mother herself, becomes responsible for the child's care at an early age. Comparable negotiations about the model of good motherhood with the main maternal responsibility can be found in the interview with Julia (66 y.). She tells about a biographical situation when she was a single parent looking for a daycare place in the mid-1970s and the district office told her there was none:

Then I said, 'Good! Then I'll have to leave him [son] here so I can go to work on Monday!' (J, 14:14ff).

As a mother, the threat to leave her one-and-a-half-year-old son behind at the district office if she was not provided with a kindergarten place violated social norms. Julia thus signaled a willingness to prioritize her gainful employment rather than her maternal duties. In doing so, the interviewee referred to the double burden of being responsible for her children and being employed:

From a health point of view, it would have been nicer to stay at home for three years. But how do you get back to work, that was hard enough as it was. (J, 31:16f)

The claims of good motherhood are experienced ambivalently, when parallel gainful employment had to be managed as a single parent. On the one hand, one had "not brought children into the world in order to have nothing at all from them" (J, 6:15), on the other hand, maternal main care was experienced as an external regulatory instance whose universal validity could be questioned depending on the situation. Maria (32 y.) also adds in the interview her plan to return to work early and to have the child cared for externally: "And I think that's good for a child, too." (M_II, 6:2) Since a supposedly too early entry into working life can be socially sanctioned, the decision to do so required one's own 'inner' or alternative system of norms and values that can be set against the sanctions. Although both interviewees were oriented toward the model of good motherhood, they still considered the possibility of violating it in exceptional cases in order to realize their own needs with regard to compatibility. Working is also weighted here as a factor in fulfilling one's own needs and desires. Agency is achieved here by setting oneself apart from expectations.

When Vanessa (31 y.) became pregnant unplanned at the age of 22, she found herself in precarious living and working conditions. Since her partner was studying and since she herself had neither vocational training nor a fixed employment contract, she received social benefits (ALG II) for several years. Poverty also contradicts the idea of good motherhood:

Sure, there were months when I had no more money a week before the end and the refrigerator was empty and I had to go to my father and he then lectured me on how to manage. And me as a mother and anyway, yes (V, 22:21ff).

From the principle of society, she found it justifiable to receive state transfer payments: "And I also find it completely legitimate." (V, 22:11f) The concern about being measured against standards from the outside was countered by a lack of opportunities and the violation of one's own interests and needs that would result from adhering to appropriate standards. She talks openly about violations of the law in the interview. In addition, having an environment that shared sub- or counter-cultural norms reduced the potential threat of social exclusion from falling short or violating social expectations. Her "really strong social network" (V, 20:23) empowered Vanessa because her social participation was maintained even when she violated norms and rules. Vanessa referred to a system of values and norms that placed different evaluative standards on individual practices and allowed her normative space. This made it possible to question practices of (in-)reconciliation that are socially (tendentially) negatively valued (motherhood and receiving social benefits) and were avoided by other interview participants.

b) Presence or absence of structural categories in the explanatory patterns

Forms of thinking represent not only the mental relationship to norms and proximities, but also that to the material conditions within which attempts are made to reconcile motherhood and working life. They are a correlate of practice. The analytical perspective of critical psychology asks whether one's own situation is related to the social structure or appears as an immediate problem (to be solved privately). Julia (66 y.) tells several times about her problems as a young woman to decide between motherhood and professional realization:

And the [boss, FK] also told me when I wanted to leave, the company is growing and I could then manage the shipping department and so. Unfortunately, these are things that I wasn't aware of, you know. When you're actually very, how should I say, girly and actually say, I want to get out of home, I want to have children. That was something very important to me! I know I would have believed it of myself, not just that others would believe it of me. But the female clock ticked so loudly and said: No! No! No! No! No! (J, 7:26ff)

It seemed to be her own responsibility to find a practical answer to the contradiction between the demands of motherhood and the need for occupational advancement. She formulates it in retrospect as always having to "manage her little family business and [keep] a lot in mind." (J, 8:24ff) This is in line with Speck's (2016, p. 38) statement that in the contemporary model of good motherhood, the mother is "responsible for a kind of small business." Structural double burden is reinterpreted as an individual ability to organize oneself 'well enough'. The practice of (in-)reconciliation results in an excessive amount of planning, organizing, and 'time management' – and "depression" (J, 15:43).

Motherhood lends itself to naturalizations in a special way, as it contains both societal and biological-nurturing components (Steins, 1994, p. 63ff). However, (intersectional) class boundaries and unsatisfactory working conditions are also seen as personal problems in the interviews. Maria (32 y.) talks about worsened working conditions as a nurse:

You worked a lot of extra hours because jobs were cut. [...] Then the first step was that I thought, okay, you have to apply for something else, you have to do something else. (M, 20:7ff)

During this time (2010 - 2013), large-scale industrial dispute and nursing strikes took place, directed against staff shortages in hospitals (Wolf, 2013, p. 16). In the quote above, the need for change is experienced as a necessary change in the 'private' (you have to apply away) - an individual solution possibly seemed more sensible and promising than participating in protests. Marion also mentions several times that her income was "really lousy" (Ma, 23:6). If the 28-year-old could have made up her mind again at the time of the interview, she does not know if she would go back to hotel management training, "just because of the pay" (Ma, 23:6). The salary of hotel specialists is on the borderline of low pay (WSI, 2013, p.6) and Marion considers herself responsible for having chosen a

low-paid profession. Julia experienced discrimination in the labor market as a mother and as a wage-dependent employee:

Yes, I had a very bad experience with a boss. [...] And then she called me in, because it was the probationary period, [...] and she was very satisfied with the work, but I should guarantee her that my child would not get sick, only then would she extend my contract. And then I said, despite all the hardship, give me the papers, I can't guarantee that. (J, 8:6ff)

In all cases, "particularly poor working conditions, particularly low pay [emerge], [...] without penetrating the appearance of possible 'wage justice,' without capturing the 'structural' nature of job insecurity and unemployment" (Holzkamp, 1985a, p. 366). The problem of low pay is not seen as a structurally bound class and gender relation. Working conditions were given, but they did not become the starting point of the double possibility: common representation of interests. However, it is also visible that women struggle in a restrictive way to expand their agency - and they succeed in doing so.

But what practices are realized when social aspects such as social inequality and gender relations are mapped in terms of their own situation? For the first time, Vanessa (31 y.) consciously perceived social inequality she switched to a gymnasium after elementary school. She experienced that she was "picked on" (V, 4:30) - because her parents were poorer. Structural inequality and unequal starting conditions were personally evident. Thus, Vanessa connected her immediate life situation as a mother with social structures of female double burden ("Of course I am doubly burdened" [V, 21:14f]). She defines her own experience of structural disadvantage as an injustice. From social references to social inequality and her own experience with it, a way of thinking was developed in which the societal-normative claim of having to secure one's own existence in an apparently private responsibility can be reinterpreted as a common task of the family and the circle of friends. Vanessa is currently dependent on social benefits when she tells us:

When I hear, 'Its hard for you, single parent and so on! I don't have to do many purchases for the kids. That's actually always taken care of, my mother takes care of that. Or my father did, when he was still alive. And that is actually my fortune. I receive a lot of gifts from the outside. I do have friends who are good to me. And my boyfriend is good to me. That is, no, that holds the balance. So that's, everything goes. I can also go to the movies. I can also go on vacation and I do that. (V, 19:23ff)

Vanessa also lent money when she had financially 'better' periods:

I: [...] So how do you assess your financial situation?

V: Critical. Critical at the moment. But I have good friends who have also lent me a lot of money. And I have also lent a lot of money in the last few months. (V, 19:12f)

Against the background of social inequality, the need-oriented redistribution of money becomes a principle and a social practice, whereby one's own and others' life situations are understood within social inequality. The connection between social inequality, gender relations, and conditions of production and reproduction is not theoretically reconstructed, but nevertheless a conception of society as a social mediating instance existed.

Dunja, on the other hand, sees her working and living conditions as rooted in the "capitalist state and system" (D, 28:22), in the contradiction between ownership and non-ownership. She describes herself as a Marxist in the interview and it is evident that she reconstructs social problems and her life situation against the background of Marxian thought:

I've always been a worker. I have always had a boss. I have lived with a low wage. Or with two jobs. And yes, I always think that work is exploitation. You get up in the morning, then you leave, and then you come home at 4 pm. And what do you have in your hand? And what do you earn? (D, 27:27ff)

Her situation appears to her to be rooted in the global conditions of production and reproduction, as well as gender relations, "especially for women, it's (working, FK) a double job." (D, 28:2f)

Although Dunja feels constrained to provide for her livelihood (and that of her daughter) in a private way ('two jobs'), she does not see herself as directly personally accountable for her situation, nor does she face an unchangeable social structure on which she has no influence. In her view, the condition for change is not individual effort, but social struggles for "equal rights for all people financially, in all things" (D, 28:30f)

D: I always have hope and I live with my hope. I always think, one day all the workers will wake up, they will realize what is happening. Because, maybe then it will be completely different.

I: Change of circumstances?

D: That's coming, that's coming. (D, 28:16ff)

c) Subjective assessment of the risk of financial dependence

The interviewees often describe experiences of financial dependence. Before it appears and becomes noticeable as such, it usually manifests itself as a gender-specific, traditional division of labor. This is partly a satisfactory and desired practice. Nina (66 y.) had completed an apprenticeship as an industrial clerk. When she became pregnant (1972), she left the labor force altogether. She was involved in the family, met her mother for washing, maintained social contacts. "My parents, my mom, they supported me quite well there." (N, 14:27f) In the interview, she justifies her re-entry into the workforce with the fact that the possibility of traditional work and role division was no longer given after the divorce: "Because I had to work again." (N, 4:21f) In contrast, Julia (66 y.) and Vanessa (31 y.) found themselves in an unwanted practice of gender-specific-

traditional division of labor within the partnership after their first child. Julia did not find a part-time job in her original qualification level and started "working at home" (J, 6:26) far below her qualification. At the same time, she took care of the joint children. This work annoyed, isolated, and overworked her:

Well, that's annoying, you know. [...] When I had a 120-page assignment, I wrote until ten in the evening. That was of course hard, because the kids were often sick or something, you could have them at home, but you couldn't concentrate very well, especially when you have such a hyperactive child like the big one. With Philipp I could say, play now, mummy comes to the side. And with the big one it was very, very difficult. (J, 6:26ff)

Subsequently, she worked "in the laundry [...], by the hour," then in a pipe cleaning business and in a chocolate factory. "The main thing was to earn a few marks." (J, 7:1) Her husband financed the family for the most part and "retreated completely" (J, 15:16).

Julia took care of the children, worked, and she had "the household under control" (J, 15:13). But she suffered emotionally from the situation: "I always had depression during that time, of course." (J, 15:26) Julia, well qualified and with a desire to remain gainfully employed, found only low-wage jobs as a mother of two. Her income was so low that she only "earned two-thirds of the rent" (J, 30:34f), the rest of the household income being acquired by her partner. The *practice of (in-)reconciliation* is similar to Nina's (J, 66), but satisfaction differs in advance.

Vanessa also stayed at home for a year and a half and then "[w]ith a bit of a job" (V, 13:30). She received ALG II for a total of four years. Vanessa's partner, the children's father, continued to qualify at university despite parenthood, while Vanessa dropped out of the workforce altogether. Like Julia, Vanessa found herself unhappily shouldering the quasi-sole responsibility of raising children. She "was just really alone a lot and also sad about it" (V, 14:3f). Both planned to take on somehow more responsibility for childcare, but then had the impression of being entirely responsible for the children on their own.

Traditional gender division of labor did not appear as financial dependency until the case of separation and divorce. This is because the practice is based on conditions of normality and stability that do not always materialize. The partnership must remain stable and both partners must share the income equally. Nina (66 years old) had been unemployed for five years when the marriage broke up:

I didn't work then either, I was financially dependent on my husband. [...] Then I also lived for a short time from the social welfare office. But it was not so easy to go there. I had problems with that, I must say. (N, 15:19ff)

In her eyes, receiving social welfare came unexpectedly. Separations and divorces are usually not planned, while traditional divisions of labor are entered into. They are only statistically, but not subjectively predictable and thus belong to the subjective unplannability. Julia (66 y.) was also still on parental leave

during the divorce, which meant a considerable financial, logistical and organizational effort.

But now first see, how do you manage? At that time there was a law that you could still get unemployment benefits up to two years after the birth. But you had to register as a job seeker and that meant looking for a place in kindergarten. That was difficult, of course. But then I registered, looked for work, and then found one [...]. Then I had four more months of unemployment benefit and then I separated. That is, it is not so easy to separate, not. (J, 14:3ff)

Vanessa (31 y.) was also separated at the time of the interview. The economic dependency (on the ex-partner or on social benefits), leads to economic precarity in case of separation and divorce. Furthermore, an additional educational effort followed:

Of course, I am doubly burdened. And I am often also really tired. And also angry and desperate. (V, 21:17f)

Vanessa sums up though: "But in the end I feel better." (V, 21:18) But the stress of a separation combined with economic dependence on the partner and the perspective of being a single parent and not earning much afterwards, leads in other cases to the conclusion that a separation seemed unmanageable. Julia's second marriage did not work out well. When the therapist advised her to separate, this had brought her "close to such a 'suicide attempt'" (J, 25:1f). Julia did not see herself coping with a divorce, nor could she bear the idea of staying in the marriage:

How am I supposed to manage all this! First of all, I fought for survival, actually, for years. And then my second husband started drinking even more. That's when you have the right touch! I just wanted to realize how I'm going to do it, how I'm going to manage it! With the apartment, with the children? Because one thing was clear, I would have dared to live with Philipp [2nd son]. But where should Steffen [1st son] go? To the first father, who drinks. With the stepfather, there's no right at all. (J, 25:2ff)

The fact that separations and divorces were a burden cannot be understood independently of the assignment of female caring responsibilities and the accompanying social assumption and high willingness of the interviewees themselves to forego financial autonomy in favor of motherhood. Julia had the impression of being trapped in the marriage situation, of not being able to change or end it on her own. But it is also the social conditions that drive women into this situation.

On the one hand, they are supposed to take on the main responsibility for child-rearing and caring activities; on the other hand, there was no social structure available to them that would provide relief in the case of separation and divorce. I understand this as an objective risk of traditional gender-specific division of labor. In the process, the minimal financial security one had through

one's own salary is abandoned. The collective repression of this circumstance can certainly be understood as an attempt to circumvent the powerlessness that this situation can trigger. But only the confrontation with it, can give insight into the necessity of its change and drive to generalized forms of agency.

d) Social inclusion: Paths to self-determination

It also turned out that social relationships and involvement outside of the partnership made a fundamental difference in the experienced opportunities for shaping life and the forms they took. Some women were more socially involved than others. Important social relationships included friendships, parents, and siblings. Nina (66 y.) was supported by her parents from the beginning when she became a mother at the age of 23. In the interview she tells:

I was actually quite, how do you say, secure [after birth, FK]. My parents, my mom, they supported me quite well. I can't say anything else. [...] Everything was new for me. It wasn't wanted, let's put it that way. [...] But as I said, I had a lot of support from home. (N, 14:27ff)

Family support made the transition and coping with the demands as a mother easier. While at this point, she foregrounds the emotional support of parents (sheltered), in coping with the divorce and its financial consequences, economic help also became relevant:

But my parents, my sister, they also supported me, again. As a family, we have always stuck together. (N, 15:30f)

She emphasizes cohesion with her parents and sister, who also supported her financially, because her husband refused to pay alimony ("I even had to sue him, it all went through a lawyer."). [N, 15:20f]). And although Nina was a single parent for the next six years, she completed two retraining programs and found a permanent job as a kindergarten teacher in her mid-30s.

The support in the supervision and education of the children was also decisive for Vanessa's (31 y.) further professional qualification. When asked about difficulties as a single parent, she replies:

I get quite a lot of gifts from the outside. So that's, anything goes. I can also go to the movies. I can also go on vacation and I do that. (V, 19:24ff)

She also emphasizes at another point:

I just also have a really strong social network. For example, [male friend] also looks after the children from time to time. They know him well and I have, well, I have male role model functions for them. My brother lives on the next street. My friend. (V, 20:22ff)

The function of the family of friends includes emotional and economic support, the willingness to (also) take on educational tasks, and the function of a solidarity community. Vanessa finds herself several times in the situation of not having enough money to live. There was no need for serious accountability. Vanessa's family and friends "stand up for each other. " (V, 22:25f) Within the social network, the circle of friends takes over family tasks through economic support⁹. The demands of reproductive work and financial security thus had to be carried only in part by her, opening up other spaces of opportunity despite her low income.

How important social relationships can be in breaking free from financial dependencies is shown by Julia (66 y.), whose early adult life was characterized by isolation and lack of social contacts. Julia's "first real friend" (J, 25:28f) was in her 20s, when she became a mother for the first time. When she moved with her husband to metropolitan-A, 600 kilometers away, she had "[missed] that, of course, after the move." (J, 25:33) The father committed suicide and the mother lived in a nursing home. Without parental support and further isolated, Julia filed for divorce. She justifies the second marriage with the fact that she expected relief:

And that year I couldn't have done it without him [second husband]. He took all his vacation time because Steffen [first son] was sick a lot. [...] We somehow fit together well as a team. My second husband was a good craftsman and he always felt I might need him. (J, 14:21)

Julia saw remarriage as a way to cope with multiple stresses that she had previously faced not only being divorced and a single parent, but also without the support of a circle of friends or family. At the same point, she describes being underweight and a six-week stay in the hospital as consequences of the overload. Without the 'really strong social network', as Vanessa puts it, and the security of a family of origin that provided protection and support, as in Nina's case, the demands of motherhood and working life could not be managed without a partner. When the second marriage for Julia also went badly and Julia again considered separation in early 1990, she became desperate. A divorce with two children in the meantime seemed unmanageable to her:

How am I supposed to manage all this! First of all, I fought to survive, actually, for years. And then my second husband started drinking even more. (J, 25:2ff)

Julia did not separate. The only friend with whom she had deeper contact saw her "about once a month" (J, 26:4). Opportunities for interpersonal cooperation, help, and solidarity hardly existed. Julia saw no way for herself to change and break free from the dependencies and burdens: "There is no way out. But, believe me,

⁹ The generative transmission of economic support is the social norm: Parents support their children financially and are legally obliged to do. They bequeath their wealth to their children. Although none of the women comes from a 'higher-earning' household, economic support plays a role in all six interviews. The special role of the extra-familial economic solidarity network, as found in Vanessa's case, should be emphasized at this point.

one has been depressed many times." (J, 26:20) She would have needed cooperation and support to cope with the separation and raising her sons alone. Private relationships such as friendships, peer groups, parents and siblings are particularly conducive when the interviewees are trying to break free from dependencies (in the case of divorce or separation as well as professional training). In the absence of such private relationships or if they are only rudimentary, an endeavor such as separations could appear in the subjective frame of the unfeasible.

Another relevant form of social involvement was activities in formal groups. Nina (66 y.) highlights several times that she was a member of the basketball club from adolescence "until she was a senior citizen" (N, 5:15). The club was a place of competition and success as well as exchange and meeting:

We then also had success pretty quickly, because we then became second, there, in the [name] championship and then we always played tournaments and so. And then we also traveled around a lot within Germany and so on. [...] [And] when we had games on the weekend, [...] then my sister always picked me up and then we always drove around within the city of A. And that was fun, yeah. And that was fun, yes. [...] And my daughter, she came along a lot, on weekends we were out and about playing basketball. (N, 5:19ff)

Nina practiced regularly and participated in games on weekends during the season. Her sporting activity was a family spectacle: partner, children and sister came together regularly. She also says it was a teammate who recommended that she retrain as an educator after her divorce: "I heard from a sports teammate, they're looking for employees in an educator's job." (N, 3:30f) The formal group thus became a place for informal exchange. Social contacts were made, knowledge was exchanged, and paths and opportunities were illuminated that might have remained closed without membership in the association.

Another group biographically highlighted by Nina is a local group for single mothers:

And only there [in the women's group, FK], only there I became somehow more self-confident, I think. And I was no longer isolated like I used to be. (N, 12:33ff)

In the case of the women's group, not only was social participation and exchange important, but also acceptance and understanding. By attending the group, Nina learned about different, tested ways of responding to the problems of single parents (e.g., increased problems of compatibility, problems with alimony payments, possible dependence on state social benefits, which are perceived as unpleasant) that had already proven to be workable or not.

Women's groups can make it understood that experiences are structured based on social inequality categories, contributing to the pervasiveness of immediacy. They can also be places of joint representation of interests.

One of the interviewees is an active trade union member and works council member at her workplace in order to represent and defend labor law interests as a wage-dependent employee. She negotiates with superiors, too.

At the beginning of the unions, people worked 50 hours or had no holidays. They fought very, very hard. And they got rights. But unfortunately, the new generation, today's generation, loses the rights again very quickly. But they don't think about the fact that these people fought for these rights. Such rights, nobody comes and says 'Here you go.' People fought for them and got them. Now we're losing them again real fast. (D, 28:10ff)

Dunja understands formal groups as a place where interests and needs are thought of from a social position. They are communities of solidarity with strangers that are not entered into on the basis of sympathy or shared hobbies, but on the basis of shared positions and interests. In most interviews, social relationships and friendships are not seen as a possibility of collective interests(representation), with which generalized agency can also be won.

6. Discussion and Outlook

In the present paper, I have summarized the results of a comprehensive biographical study (Kalkstein, 2021) and significantly shortened them in many places. Nevertheless, it is to be hoped that the results are comprehensible and conclusive. At the beginning of the article, the state of research was used to show the situation of mothers in low-paid jobs and at the same time to highlight how many women still face considerable difficulties in standing on their own two feet financially. In addition to structural problems, the norms that are applied to mothers and the idea of a natural female competence advantage with regard to child rearing were addressed. This abstract description has replaced the concrete description of the situation of the individual interview partners at this point; it can be read in detail if interested (*ibid.*). Despite the initial situation described as *structural (in-)reconciliation*, it was shown that mothers consider different possibilities of acting for themselves depending on individual conditions and premises and open up or close off corresponding spaces for action.

In relation to norms, it was shown that this can be interpreted with varying degrees of rigidity and that some women also make use of this leeway. The relationship that emerges is relatively simple: the more one can distance oneself from norms, the newer spaces for action emerge. After all, with regard to motherhood and compatibility, women from working classes are evaluated on the basis of norms that are oriented toward the lifestyle of the middle classes (Speck, 2016, p. 60; Dreßler, 2018, p. 67f).

But those who turn away from social norms run the risk of social exclusion. The degree to which the threat of social exclusion was experienced through norm violation sometimes depends on the salience, quality, and norm and value structure of the immediate social environment. Thus, it was no coincidence that it was Vanessa, who had herself grown up in a sub- and counterculture, who saw the greatest scope for herself to turn away from norms - to the limits of legality.

Under b) the question of structural categories was discussed. There was a qualitative difference in how the women felt whether they perceived their

situation as an expression of individual failure or whether they could relate it to social inequality or societal conditions as a whole. Poverty and motherhood increasingly appear as the result of inverted (or completely lacking) individual planning¹⁰ (McRobbie, 2010, p. 176f; Malich, 2014, p. 159). In the interviews, the financial situation as a mother is one of the key topics but is not always framed as a political-social problem. Motherhood represents the core of the material difference between men and women in Germany (Barišić/Consiglio, 2020, p. 4f). Again, the greatest emotional despair was shown where one's own situation is experienced in an individualized way. Julia's despair even drives her to attempt suicide (this can certainly not be explained monocausally as an individualizing form of thinking, but it does not remain completely irrelevant either). In the media, there are hardly any critical discourses about the financial situation of mothers: financial problems remain surprisingly quiet. Dominant forms of thinking are also subject to societal guiding and popular sciences (which currently include psychology), which influence everyday understanding. Critical psychology points out that the understanding of everyday life within the existing social structure is susceptible to the individualization of socio-structural problems, because individualizing forms of thinking start with what can be directly experienced: First of all, everyone is responsible for themselves and for the success of life tasks - such as compatibility. It also became apparent that it was precisely the recognition of a structural situation in one's own situation that opened up the possibility of solidarity and emotional comfort, as Nina experienced in the women's group for single parents.

Against this background, the results under c), the subjective assessment of the risk of financial dependence, can also be classified. They show a clear tendency to underestimate the risks of traditional, gendered family work. The functionality of this immediately strikes home: without the repression of the risks, neither the desire to actually take care of one's offspring can be pursued, nor can part-time work with a small number of hours be seen as a satisfactory compromise. It is precisely society's repression of this extremely uncertain initial situation that allows it to keep shifting the restriction on maternal agency, but not to lift it. With divorce rates ranging from 22% (1975) to 35% (2015) (Radenacker, 2018, p. 7), women seem to underestimate the risk of gendered division of labor to them. Often couples live relatively egalitarian relationship concepts until childbirth and then lapse into a traditionally gendered division of labor (Kortendiek, 2010). This happens even if it was previously planned differently by the couple (Flaake, 2014, p. 140f). Although studies indicate that the acceptance of equal partnership has increased, there is - in the words of Kerschgen (2010, p. 8) - a "gap between a verbal openness and a simultaneous behavioral rigidity, especially with regard to men and their participation in family work". The one-sided reference to the increased occupation of mothers can be understood in the language of critical psychology as leading to the "repression, denial, dissociation, mystification" (Holzkamp, 1985a, p. 379) of the risk of financial dependency, from which emerge the "participation in my

¹⁰ This refers to the dominant media representation. Other representations can also be found, but they are more marginal (see also McRobbie, 2010; Skeggs, 2005, 2001).

oppression" (ibid.), the restrictive entanglements of one's practices – an aspect Holzkamp identifies in domination-bearing social forms of thought (ibid.).

In this regard, the present study points to the importance of mothers' informal social involvement. In the narrated biographies it becomes clear that social support is essential in order to be able to attempt to realize independent life plans as a mother. The importance of the social integration of mothers from working classes for the possibilities of self-determined lifestyles with regard to compatibility has hardly been researched so far. The present study provides initial evidence that in times of financial hardship and periods of emotional overload, social relationships are an important resource for coping with the demands of work and family life without becoming psychologically or emotionally overwhelmed. If the children's partners and/or fathers are not integrated into family work to the extent needed, the social environment becomes an important factor in making reconciliation (more) self-determined.

There is a need for further research in this direction: On the one hand, the importance of social integration of mothers from the working classes in order to break free from restrictive and dependency-promoting arrangements would have to be investigated specifically and in depth. This remains to be investigated both from a subjective point of view (for one's own satisfaction, psychological well-being, etc.) and with a view to the material side, for example related to financial independence. The study by Braun et al. (2008) indicates that mothers from the working classes are more at risk of entering a period of isolation after childbirth than mothers from the middle classes. This is attributed to the fact that many typical ventures for mothers with their young children tend to be commercial (early music education, etc.) or focused on visiting each other's homes. Mothers from the working classes often do not have the appropriate spatial and financial resources. Together with the results from the present work, this points to the importance of low-threshold, free-of-charge offers of encounter.

The lack of thematization of financial dependency evident in the interviews calls for further research regarding the question of how women, if they want children, later 'think' about themselves financially (and what reasons they have for doing so in each case).

Here, further research remains desirable that not only reconstructs women's orientations and tacit knowledge around motherhood (e.g. the study by Dreßler, 2018), but also approaches that give space to discuss the ideal of the good mother and examine it for its restrictive parts. In any case, with regard to practices of motherhood and reconciliation, there remains a need for further research that defines class not merely as socioeconomic status, but likewise as a social relation of power and inequality from which opportunities and obstacles emanate.

How the reference to common sense psychological concepts de-thematises gender inequality: A couple's interview on tensions in an egalitarian relationship model

Katharina Hametner, Natalie Rodax, Nora Ruck, Paula Krüger, Johanna Nitsche, Vanessa Payr, Hannah Poltrum, Sandra Reisch & Isabella Schludermann

Abstract

Social scientific studies show that gender inequalities within couples' relationships continue despite the widespread ideal that relationships in the 'West' were – in the meantime – primarily egalitarian in nature. This therefore opens up an ambivalence for everyday couple life: While the narrative of equality may direct couples as an *ideal*, it is the socio-political structures that frame everyday life *practice*, some aspects of which, in subtle forms, precisely do not enable equality. In this article, we therefore explore the question of how a couple who identifies their relationship model as egalitarian negotiates this ambivalence with each other in their everyday lives and focus on the role of their common sense psychological knowledge: Which role does it play when experiencing a conflict between ideal and practice? We present a qualitative case study of a couple's interview. The results highlight that the couple de-thematises tensions due to pervading gender-inequality structures by two strategies: the first draws on common sense psychological knowledge to justify a rather orthodox distribution of roles by making use of narratives of personality traits and self-expression. The second strategy of de-thematising gender equality conflicts is a switch from telling concrete stories about their lives (e.g., when the male part feels offended by the female doing too little in the household) to negotiating their ideals (gender-equality should exist on general societal level).

Keywords

de-thematisation, egalitarian relationship model, gender inequality, psychological common sense knowledge, tensions

Introduction

Young women in countries of the Global North increasingly grow up with a rhetoric of choice that poses that every woman can choose her own life free from (patriarchal) restrictions. However, social and/or cultural scholars currently critically interrogate this trope. For instance, they argue that young women frequently stress that they – mostly considered as White middle-class women – have already won full gender equality and view ‘feminism’ an antiquated concept that could not sufficiently adapt to the diverse needs of a new generation (Rowe-Finkbeiner, 2004). This rhetoric on already established gender equality feeds into discourses on modern, respectively egalitarian relationship models, which assume that men and women meet in relationships at eye level and conduct their relationship as equals. This is in line with narratives proposed by modernity theories that emphasise that ‘modernity’ is providing individuals with a chance to choose ‘life’ individually everyday anew (Beck, 1992 or Giddens, 1991). What is considered evidence for the gender equality is that women can succeed in formerly ‘manly’ domains: they can make a professional career, as it used to be reserved for men, and can become more visible on behalf of their own choices, to name but a few (Budgeon, 2001; Harris, 2004). Especially from a feminist view on structures of patriarchy, McRobbie (2009, p. 46) criticises that stressing this freedom of choice and individualism masks “the continued existence of gender hierarchies and the perhaps more subtle ways in which these are constantly being reproduced”. She also argues that neoliberal policies perpetuate a de-politicisation and exposes women to the competition of capitalist markets which are permeated with still pervading gender hierarchies – in part precisely through the de-politicisation. More recently, McRobbie (2020, p. 76) analyses that “work and career become goals instead of struggles for changes to work and for gender equality. (...) Employment for women becomes a defining mark of status and identity”. She highlights the role of the media, specifically “the informal power of social media, to create a new moral economy of gender, which legitimates the further dismantling of social security and the welfare state” (McRobbie, 2020, pp. 96-97). Therefore, the field of ‘modern’, egalitarian relationships seems to be more ambivalent than the modernity theory of individualism proposes.

Feminist-critical scholars also emphasise that we need to understand more about the “affective” and “psychic life” (Gill, 2017) in order to be able to explore how the concrete ways in which people deal with such ambivalences promote gender inequality in everyday life. Consequently, we argue that an analysis of a couple’s concrete relationship practice – a close look into heterosexual couple’s interactions and negotiations in the private sphere – is essential for exploring how gender inequalities can persist even within couples committed to an egalitarian relationship model within a wider culture that values gender equality. Interestingly, Csurgó & Kristóf (2017) published a study on the span of egalitarian relationship-norms and practices, analysing a Hungarian sample of elite couples. As the authors stress, the Hungarian elite is a “social group who still experience significant gender imbalance, even in most gender-egalitarian countries” (p. 2108). Amongst other findings, their analysis suggests that a) the

egalitarian relationship model is considered a norm on which the couples must take a stance b) that it creates tensions when the couples do not live up to this norm. According to the authors, these tensions could be minimised by externalising the problems to a higher level of e.g. politics and/or by arguing that ‘the elite’ being predefines rather orthodox gender relations.

Against this background, in this article we present an in-depth analysis of a couple’s interview and explore the strategies this couple uses to cope with emerging conflicts and ambivalences in their everyday lives that concern gender inequality. We argue that a single-case analysis is appropriate because it allows us to interpret in detail what the individual statements mean in their respective (social) context, how they develop further and what overall “gestalt” their practice takes on. Therefore, our analysis by the Documentary Method can further develop Csurgó’s and Kristóf’s finding of externalising conflicts from the individual sphere to a political sphere and follow Gill’s call for understanding in more detail the “affective” and “psychic life” by examining whether and to what extent everyday psychological knowledge plays a role in coping with these tensions. We aim at deciphering where (pseudo) psychological formulas and knowledge are referred to in everyday life and to what extent this plays a role in negotiating (political) gender issues in everyday couple life. To employ a critical perspective on practicing gender-equality in everyday practice, we will frame our analysis by the current state-of-the-art knowledge of the postfeminist critique of contemporary representations of femininity. In our analysis and critical examination of the couple’s interview, we will highlight the role of everyday psychological references, especially where the couple either reports on conflicts of equal action in everyday life, or talks about more orthodox gender roles. We then continue with a description of the methodical approach and, finally, proceed with a detailed presentation of the qualitative single case study.

Postfeminist critique deciphers existing gender inequalities

We have argued so far that the ‘modern’ egalitarian forms of relationship outlined above are riddled with ambivalences arising from neoliberal policies, de-politicisation and still persisting gender inequalities. To make such ambivalences accessible to analysis, we make use of a postfeminist critique. Mainly from cultural- and social-theoretical points of view, postfeminist criticism proposes that pop-cultural discourses construct subjects by the following features (Gill, 2007, p. 147): (1) free choice and decision making (2) emphasis on individuality, (3) repudiation of feminism, (4) focus on competition, self-surveillance, self-discipline, (5) emphasis on the subjected (not anymore primarily objectified) female body. Even though ‘classical’ feminism – the “bra-burning women, women who refuse to shave their legs or armpits and angry man-hating ‘femi-nazi’ lesbians” (Riley et al., 2018, p. 3) – is repudiated, feminism has not ‘vanished’ but was rather fed into pop-cultural discourses, making it more acceptable and ‘fancy’, thereby less threatening (McRobbie, 2009). By explicitly accentuating stereotypic (hyper)femininity, women do not

jeopardise the classic male/female heterosexual order. By an analysis of the media discourse, McRobbie (2009) shows how women's participation in the education and labour market is portrayed as an indicator of fully actualised gender equality. Departing from that, she stresses that female visibility in the form of the "well educated working girl" (McRobbie, 2009, p. 72) is subject to various restrictions and that it comes with a price: According to McRobbie, the working girl must "learn how to dress so that she too embodies 'complete perfection'" and at the same time she must "remain endearingly feminine", must show "conventional female vulnerability" (2009, p. 79). Importantly, this masks persisting inequalities in the gendered division of labour that have been described as women's 'double burden' – being involved in both paid labour and unpaid family and household responsibilities and as typical for neoliberalism.

Additionally, Gill (2007) suggests that there is no coherent picture of 'the postfeminist femininity', but rather, she identifies a "distinctive sensibility" (Gill, 2007, p. 147) – constructed and offered by discourses – that provides female individuals with a "way of making sense about what it means to be a woman and to live a good life" (Riley et al., 2018, p. 1). The entanglement of related discursive subject positions and the ways in which people navigate them in their everyday lives has been of major interest in various contemporary social-scientific and psychological research efforts. Over the past years, interdisciplinary studies have increasingly focussed on how women – though primarily in Anglo-American areas (dominantly UK, Australia, New Zealand, USA) – negotiate their subjective images of femininity in relation to postfeminist narratives in their everyday lives. Referring to the focus of this article, we argue that there is lack in knowledge when it comes to *doing couple*, especially when couples position themselves as modern/egalitarian. This refers to the question how heterosexual romantic partners explicitly negotiate their gender positions and divisions of labour in the private sphere in relation to each other and how gender (in)equality is enacted in everyday practice. As we have already emphasised above, we also address the question of whether and to what extent everyday psychological knowledge plays a role in this. This interest is not accidental, as both Gill (2007) and newer also McRobbie (2020) repeatedly – though not explicitly – address the fact that psychological concepts such as knowledge about personality traits and/or concepts such as 'resilience' play a role in postfeminist discourses. Gill (2007), for example, argues that there has been a shift from the naturalisation of gender (a man is like this because a man is like this from birth) to a form of psychologisation: a man is like this because it is his personality. She reconstructs this narrative as she reads self-help literature critically: Her point is to show that in her reading of this literature, the difference in character between women and men is important because it keeps the sexes attractive to each other (following the narrative 'opposites attract').

McRobbie (2020) is less explicit about the importance of psychological concepts in postfeminist discourses: She originally analysed pop-cultural film products in the early 2000s – such as *Sex and the City* or *Bridget Jones* – and derived from this the ambivalence between, on the one hand, the reference to feminist values (the 'phallic girl' in leading roles: women can also become

visible in male domains) while at the same time, heteronormative love and relationships are still represented as the most fundamental source of happiness for a woman (McRobbie, 2009). In one of her more recent publications (McRobbie, 2020), she states though that the ways in which pop cultural media products consider feminism while at the same time maintaining entangled with the patriarchal matrix (mainstreaming feminism), has changed over the years. McRobbie (2020, p. 7, pp. 42-72) analyses ‘modern’ capitalist resilience rhetoric and states that feminist claims (such as a “capacity for reflexivity”) allow young women to use it as a kind of “therapeutic strategy” while at the same time commercialising feminism (it is for instance celebrities such as Lady Gaga who advocate against body shaming, embracing how we were “born this way”). She analyses “three interconnected elements” on how feminism is “mainstreamed” (McRobbie, 2020, p. 42):

These are the ‘perfect’, which appertains to lifestyle and the terrain of the feminine ‘good life’; the ‘imperfect’, which offers some scope (but within carefully demarcated boundaries) for criticism of and divergence from these ideals; and finally ‘resilience’, which becomes the favoured tool and therapeutic instrument for recovery and repair. (McRobbie, 2020, p. 42)

We can see that two psychological concepts play a role at this point: ‘resilience’ and ‘perfectionism’. Even though McRobbie ‘borrows’ terms from psychology, she does not reflect the power of these psychological concepts. We argue, that in a social order that relies strongly on individualisation (in a neoliberal logic, everyone is the architect of their own happiness), the everyday use of scientific psychological terms becomes important in everyday life negotiations.

An empirical approach to the tacit knowledge in a couple’s everyday practice

In order to empirically address on the one hand, which ambivalences of gender (in)equality are experienced and negotiated in day-to-day couple life, and on the other hand, which role the reference to everyday psychological knowledge plays in this, we suggest that we need an analysis of *explicitly* negotiated positions and the *implicit, tacit* knowledge that is embedded in everyday practice. We will address these two layers of explicit and implicit knowledge in a twofold way: (1) On the level of data collection, we use a semi structured interview with a couple on their everyday life as a couple and gender issues in their relationship. (2) With regards to data interpretation, we employ the Documentary Method (Bohnsack, 2014). (1) Interviews with couples are explicitly suitable for examining gender relations (Przyborski & Wohlrab-Sahr, 2014, p. 111), as researchers gain in-vivo insight into couples’ (talking) practice. The interview started with an open introductory stimulus (“please tell me about all the experiences you made as a couple”), leaving enough space for interviewees to narrate what is relevant to them in their everyday practice. This employs the principle of openness that is a crucial standard practice in social-scientific interviewing as it allows participants

to enfold their frame of reference (Mruck and Mey 2005). The first open interview phase was followed by questions that aimed at further developing selected topics the interviewees had previously touched on. Subsequently, another set of more reflexive questions was directed at what the interviewees thought about media representations regarding gender and gender inequality more specifically. With this procedure, both everyday practice knowledge and reflexive knowledge can be accessed.

(2) These two types of knowledge are also at the heart of the Documentary Method of interpretation, which we used to analyse the data. The Documentary Method – to some extent similar to discursive methods – aims at deciphering speaking practice as a social enterprise. It reconstructs patterns of incorporated social practice by drawing on Mannheim's (1980) concept of the so-called 'conjunctive experience' and – by that – goes beyond the face value of the uttered content. Thus, it helps identifying rhetorical patterns that provide insights into the ways in which gender inequalities are masked. This helps us understand how structures of the patriarchal systems tacitly works through talk.

To better understand how the Documentary Method works, we now expand on its basics. Mannheim had shown that due to the social positions individuals inhabit in their everyday lives, they develop a tacit knowledge that guides everyday practice (*Handlungswissen*). This implicit knowledge that is self-evident to individuals who share the same milieu becomes 'conjunctive' as it is produced by shared practices and interactions of individuals. Therefore, this type of knowledge – as is developed in daily practice – is enmeshed in our *doing* and is oftentimes not reflexive. To trace this implicit knowledge, the Documentary Method distinguishes two levels of knowledge: Reflexive, communicable knowledge on the one hand and implicit, a-theoretic knowledge on the other hand. The first type of knowledge refers to what individuals can directly articulate and is addressed methodically by the first step of interpretation called 'formulating interpretation' that mainly consists in summarising the themes and content of the interview or discussion (Bohnsack 2014, 225). The second step addresses implicit knowledge by the so-called 'reflecting interpretation'. This interpretation step aims to move beyond directly uttered contents and to identify tacit patterns of perception, thinking and acting that guides a person's actions/interaction: 'orientations', as they are called in the Documentary Method (Bohnsack 2010, 111). Importantly, the Documentary Method proposes that these orientations come to fore once we decipher the performativity of language. Therefore, during analysis, we focus on the performative sequence of speaking-acts (how does one utterance follow the other, what is particular about an utterance beyond the content). In terms of analysis, the transcript is categorised in different forms of discourse that organises the talk, e.g. "proposition", "elaboration", "divergence", "conclusion", etc.. For instance, statements wherein an orientation is documented for the first time is called a 'proposition'. Elaborations are identified when an orientation is further developed by the talk of the interviewee(s). A divergence is an utterance that is seemingly expressed within the framework of what was previously proposed, but in fact the participants are talking past each other. After categorising the text by the forms

of discourse, it is further interpreted by its semantic meaning. It is thus paramount to view utterances in their specific context and in their specific sequential order to identify the “inner logic” of the talk.

The Documentary Method thus aims at tackling the ‘untold’ stories and conceptualises these via the notion of orientation (reflecting interpretation) but does not neglect the content of what is explicitly said by interviewees (formulating interpretation). By differentiating the content of talk from the ways in which it is performed and organised, the Documentary Method can shed light on a couple’s explicit theories of gender-(in)equality, but also on the underlying frameworks of orientation that guide the practice of a gendered division of labour that does not necessarily need to correspond to their explicit theories. A detailed account of the methodical benefits the Documentary Method has for analysing research questions that tackle the ideal vs. practice gap can be found in Hametner et al. (2022).

The Case Study

Based on the introduction, the meta-theoretical framing of the postfeminist critique and the methodical approach of the Documentary Method, we now present a detailed, qualitative analysis of a heterosexual couple talking about their relationship. The interviewed couple – Jane² and Mike – is in their mid-end twenties to early thirties, White and lives in Austria. The interviewer was one of our students and authors of this contribution (female, White and in her mid-twenties), who conducted the interview in the course of an introductory seminar on qualitative methods. The interviewees were invited to take part in a study on their stories and everyday lives against the backdrop of various social debates about gender. The interviewer got in touch with Jane and Mike via snowball sampling. The interview lasted about an hour and was conducted in a private setting. Senior research fellows of the project team developed the informed consent according to data privacy standards, which was presented to the interviewees prior to the start of the interview by the interviewer. The university’s ethical board approved the consent files.

The interviewees had recently got engaged and bought an apartment. Both have a steady job and are economically well-situated. Jane works for a TV station and Mike works in air traffic. His job is better paid but Jane’s job offers better career prospects. Jane also has a social media profile via which she blogs semi-professionally. Mike takes her pictures from time to time and has his own account, but only for private purposes. We consider both Jane and Mike as social actors who are explicitly interpellated by pop cultural narratives: Not only do they regularly consume social media, they also frequently engage in social media by posting themselves.

Within the course of the interview, both position their relationship within an egalitarian relationship model. To the question of how both stand on gender issues, e.g. equality, Mike responds: “So I think everyone should have equal rights, of course, and within a relationship (.) it should be; it’s always a question

of balance I just think it should be balanced;” and Jane a few lines later continues: “Yes, don’t keep tally lists of who does what and how often, so there are also phases (.) when he works especially hard and then maybe I do a bit more and then I work especially hard again and then maybe he does a bit more again for a few days; so that’s just also; you mustn’t be such a bean counter”.

We now chronologically present our analysis of the interview, starting from the beginning of the interview and continuing with relevant statements of the interview that can show rhetorical patterns that provide insights into how they construct their “we” and the ways gender inequalities are masked by doing so.

The romantic narrative: The male man and the female woman

Already at the beginning of the interview it becomes apparent that the interviewees develop their couple’s story together, proposing a romantic narrative. After being asked about the story of their relationship, they start by narrating how they first met³:

- 1 Jane: well (.) we’ve met in [a ski-resort] (.) at the: ski-opening-concert of [a band] (.) and I
 2 was there with my girl-friends (3) and you should tell your part of the story;
 3 Mike: @(..)@ I was there with my friends well () both of us didn’t () both did (.) we
 4 nearly didn’t go there but still happened to be there by a happy coincidence a:nd (.) then we
 5 met by chance and got into talking and I am from [a city] and she is from near [another city]
 6 and well, so,
 7 Jane: □ and
 8 Mike: □ we both drove home and,
 9 Jane: □ but ehm the funny part was that e:hm (.)
 10 that w- we just hit it off right away a:nd w- we were talking so much and were together all the
 11 time and I was even @sitting on his shoulders@ and e:hm (.) then he gave me his number but
 12 his battery was low; (.) e:hm so this is why we coul- couldn’t really () communicate via
 13 Facebook or anything else so he just gave me his number and then we’ve somehow we got
 14 into texting the other days a:nd (.) then after one month °I think it was°;
 15 Mike: three weeks or so;
 16 Jane: he came to [my city];
 17 Mike: again with my friends
 18 Jane: □ ehm
 19 Mike: □ so we had a night out and met her (.) gang; then they came to
 20 [my city] again and well this is how it came
 21 Jane: □ so on- well three weeks later
 22 they again came to [my city] exactly and this well th- the starting gun has been fired for our
 23 relationship

On the level of content, we can observe that the interviewees talk about the process of getting to know each other as something that happened “by chance”, i.e., as beyond their control. By referring to the coincidental conditions of getting to know each other, they introduce chance as an important force in their romantic relationship. When interpreting *how* they elaborate this content, we can see that they co-develop the narrative, they naturally take turns, and when they interrupt

each other, they do so to complete each other's sentences. When Mike provides too little detail (line 15), Jane elaborates the “funny part” that emphasises the romantic character of “hitting it off right away” as she “was even @sitting on his shoulders@”. The interviewees then further develop their talk in the first person plural, constructing a “we”.

In this first sequence, the couple's story is presented as a narrative of romantic togetherness characterised by sharing the same orientation of gradually becoming a ‘we’ (from a long-distance relationship to settling down together). It is interesting to note at this point that the interviewees talk about their decisions (buying a house, getting a dog) but do not reveal anything about the decision-making processes (should we buy an apartment, should we get a dog?). Their togetherness thus appears as a given and not up for discussion. Even if both are in favour of an egalitarian relationship model, certain – traditional – aspects of their choices (getting engaged, buying property, settling down as a family) do not become an object in question, as there seems to be no need for further negotiation or explanation.

McRobbie (2020, p. 49) would talk about perfectionism at this point:

The perfect extols a vision of life that foregrounds an array of well-groomed bodies, beautiful spaces, tasteful things and exciting identities, which indicate a sense of belonging within a comfortable family and consumer-oriented milieu. The idea of the perfect hinges on a fantasy of middle-class futurity

The “comfortable family and consumer-oriented milieu” (McRobbie, 2020, p. 49) - moving in together, buying a house, getting a dog in Jane's and Mike's case - is not explicitly negotiated by the couple, possibly precisely because it serves a psychological concept. Thus, the form of perfectionism described by McRobbie is performed in the couple's everyday narrative.

In a similar way, also their gendered positions do not come up as subjects of negotiation but as facts. As part of this presentation, their ‘togetherness’ is strengthened by the fact that both have developed distinct roles in their relationship:

- 1 Mike: Well, I'm the planner
- 2 Jane: @(.)@ he is the planner (.) right and I (.) live in the moment @to put it nicely@
- 3 Mike: □@(.)@

A few lines later (247-255), Jane states: “@right@ (2) no but he's very e:hm (.) he thinks strategically and I:: (.) thi:nk e:hm (.) very @emotional@ (.) and very” and Mike completes her sentence:

yes I have; th- th- you can actually see this in our jobs; I am ha- w- well as a [job] I have to plan much ahead (.) and actually have to think pretty structured and (.) and logically and that also suited me in school (.) maths and stuff; and [Jane] was always a bit more of the language type which you can also see in her (.) job and she is a bit more eh bit temperamental than me; I am a bit more quiet and sh- Jane is temperament- the more temperamental person of the two of us

Jane and Mike develop this rather traditional gender dichotomy – her being “emotional” and him being more “rational” – without explicitly reflecting on this stereotypic binary. Their romantic narrative is secured by the traditional ‘opposites attract’ metaphor. As we have already shown, Gill (2007) suggests that assuming a character difference between men and women serves to maintain sexiness while at the same time this narrative of difference is being dusted off from an ‘old’ biological essentialism. It is no longer biological characteristics that make the difference, but psychological character traits and these secure that men are still men, and women still women (Gill, 2007, p. 159). Regarding our interview, we can see that there is agreement between the two: There should be balance and equality. But at the same time everyday psychological knowledge about character traits (this is his or her personality) legitimises why they would still behave gender stereotypically and why this is no problem. Since their behavioural patterns are conceptualised as personality traits, this is not something they have to critically deal with. Personality is not something changeable but stable, it enables the ‘opposites attract’ narrative and thus becomes a strategy to legitimise their rather orthodox position by referring to psychological knowledge about personality traits.

However, when paying close attention to the ways in which they develop this theme, we can see that these elaborations are shot through with tensions on a more tacit level: In this sequence, Jane laughs a lot, especially when calling herself “very @emotional@” and Mike often stops while talking, repeats words or does not finish them. In the way in which a stereotypical gender positioning is discussed, the laughter teases and thus gently ironizes this position; his attempt to correct himself again and again, to stop himself, and to start again also indicates that it is not easy for him to unfold his elaboration uncritically in this context.

Conditions of visibility: Jane as working girl

After the sequence interpreted above, Jane and Mike come to a preliminary close of their couple-story. In a short meta-communication, they ask the interviewer what else she wants to inquire about, to which the interviewer answers “everything about your relationship”. Subsequently, Jane and Mike address gender, commenting that their gender roles are actually inverted:

- 1 Jane: (4) well maybe what is also quite important is () maybe what is also important to say
- 2 is that ehm that at home it is (.) he cooks (4) e:hm a:nd @(.)@
- 3 Mike: I would from time to time I would even say that for our case the roles are even a bit;
- 4 these classic roles are almost almost reversed; ((breaths in deeply)) because you (.) are a bit
- 5 more (.) career-driven; so you can do your thing and I support that (.) and for me it is well (.) I
- 6 have this great amazing job and stuff but this job is well this job is a very safe job and I I (.)
- 7 you don’t have this (.) in my position you don’t have this (.) you hard- actually don’t have
- 8 these promotion prospects well there are a few that do some kind of office jobs in other jobs
- 9 or (.) someone will be the boss at some point but m- 99 per cent of us don’t really have these;
- 10 (.) strive to the top; and for me it is this work-life-balance thing and and I am then (.) in this
- 11 gender role almost more the classical woman th- that I cook and ra- rather (.) do a little (.)

- 12 something at home and Jane who is the this career girl
 13 Jane: mhm (4) yes its true; I mean well I hardly ever cook but on the other hand I clean the
 14 bathroom //@(.)@// that's how it is- I always told him that ehm; (.) he can (.) if; he enjoys
 15 cooking- I don't enjoy cooking but I love cleaning the bathroom; that's fun; I like doing that
 16 @(.)@ but that's just; it's not that I don't do anything in the household

While Jane's (male) role is framed as intrinsically motivated, his 'female' role is presented as the result of external factors. Jane agrees but adds that she also does housework, for instance cleaning the bathroom (line 302-303). At this point, there is also an intersection with pleasure (respectively task-enjoyment) that reveals a neoliberal argumentation pattern (self-fulfilment, enjoying the work one does). While the traditional heteronormative romantic narrative occurs almost quasi-naturally, their 'non-traditional' exchange of gender roles is in need of explicit justification; it is determined, on the one hand, by individual character (she has a stronger career-drive) and, on the other hand, by external limitations (safe job without promotion possibility vs. unsecure job situation with the necessity of investing a lot). Interestingly, everyday psychological references occur here again: On the one hand, the concept of self-realisation or self-expression is used. It is about being able to realise oneself in the household and its activities, to be able to do something that one really likes, that fulfils one ("I always told him that ehm; (.) he can (.) if; he enjoys cooking- I don't enjoy cooking but I love cleaning the bathroom"). On the other hand, we see a reference to the concept of "work-life balance" for describing and legitimising their role reversal. By recourse to psychological concepts, the need to legitimise changed gender roles is de-thematised: It seems natural to justify 'inverted' roles psychologically.

In the subsequent part of the transcript, the two talk about how they manage their everyday relationship life: They elaborate that Mike keeps track of important 'dates' Jane often fails to remember since she is mainly focussed on her career. They stress that their roles are in this respect "completely different" from how their parents – one generation earlier – 'do' their couple life. However, Jane notes afterwards: "It's just generally very mixed with us, because in other aspects it's not like that" (line 340-341). Jane represents the 'female' role on the personality level, which is described by the example of her emotional reactions, while Mike performs the 'male' role, as he is presented as a rational thinker. Mike's positioning as 'feminine', on the other hand, is based on his household activities and not on his personal traits. Therefore, the tentative inversion of roles is mainly reflected in terms of the gendered division of work (job, household); while on the personality level, they both ascribe gender-conforming attributes to themselves and each other:

- 1 Jane: but right that; that with me this; I have this feminine part and he has this masculine
 2 part in the relationship like as a person; its only in he does a little more in the household and I
 3 am more career oriented but we also see it for example with friends that; u:hm that it () is
 4 actually not so self-evident that the man does everything in the household because (.) women
 5 Mike: or does anything at all @(.)@
 6 Jane: or does anything at all @yeah@ °true° so that has somehow not yet gotten through to
 7 everyone; so with friends of ours, for example, she studies; two courses of study and works

8 and cooks but and cleans and does everything and he works has a secure job and (.) actually
 9 does nothing (.) so there's still that and that's just with us whenever we're with them we find
 10 that quite terrifying somehow; because (1) u:hm; I mean he also cooks and I often don't help
 11 him in the kitchen because firstly the kitchen is small and secondly he's much faster without
 12 me @(.)@ but then somehow I clean up or so; and when we are at their place for example and
 13 she says yes? clear the table or uhm do the dishes; that he then still sits in front of the
 14 computer and plays; or sits in front of the play station and plays so; [...]so in our relationship
 15 it's also the case that (.) both have the say-so (.)

This passage shows Jane's and Mike's egalitarian relationship model whereby their friends serve as markers of distinction and comparison. In contrast to their friends and to "everyone", in Jane's and Mike's relationship, "both have the say-so" (line 371).

A few lines later, they talk about their decision-making. Jane keeps on saying that it is balanced in their relationship ("in some situations he lets me decide because he knows I make the good decisions; so it's not that what he says is what we do or what I say is what we do, but it's just very (.) very (.) balanced;"; lines 379-382). Mike however subsequently stresses "I mean I'm often very (.) convinced that my @decisions are the best@" (lines 383-384). Again, this is accompanied by laughing that shows a form of teasing each other on that topic, a subtle way of also teasing his rather orthodox gender position. What is important though, is that Jane emphasises that Mike's conviction in being right has nothing to do with gender:

but that has nothing to do with you believing that as a man you are worth more or that you believe that your opinion is worth more but you are generally a bit know-it-all; but that has nothing to do with your gender @(.)@ so that yes? you're just like that (3) that's just one of your traits. (line 388-391)

Therefore, a possible imbalance in decision-making is not attributed to a gender issues but explained by personal characteristics. Mike's know-it-all nature is a character trait "that has nothing to do with your gender" (lines 390-391). A traditional gender-position is circumvented by an individualisation and gender stereotypical behaviour is legitimised by individual character *traits* that are considered immutable and not subject to volition or choice. By contrast, their professional activities, where choice explicitly functions to bring their 'modernity' to the fore (she is the "career girl" who can 'do her thing'), give the impression of "mixing" (line 346) roles.

Ambivalences also become apparent when the couple talks about posting on social media:

1 Mike: and then it got to the point where I suggested that hey let's take a picture here and
 2 there and; so [Jane] is the one who is perfect in front of the camera (1)

3 Jane: □ @(.)@

4 Mike: □ and I can
 5 take good pictures; the other way around I often (.) didn't like it so much in front of the
 6 camera, so except for this typical laughing photo haha super here? (.) ahm and [Jane] (1) I
 7 don't want to say that she does it @bad@

8 Jane: □ @ (2) @ @gosh@

9 Mike: □ @(.)@ you can

- 10 do it too but if I just I am quite convinced of my photography skills
 11 Jane: **yes of course** but you took this course
 12 Mike: □yes yes
 13 Jane: □and I didn't take this course; but I think that I
 14 can
 15 Mike: □and when I say hey and when I say then hey try that ()
 16 Jane: □considering that I didn't take this course I think I can take nice pictures
 17 and I can edit them well
 18 Mike: □@(.)@ yes in the meanwhile you can do it you can do it well
 19 Jane: because you showed it to me yes; that's just the way it is he did the course and I didn't
 20 do it although he said he did the course do the course
 21 Mike: □exactly I have said 15 times
 22 hey look do this the course too ()
 23 Jane: I didn't want to do it; e:hm but he; so I can edit the pictures well now because he
 24 showed it to me, so that's something, too (.) he just showed it to me and I find that much nicer
 25 than sitting in front of the computer and looking at it, I think it's nice when you just °show° it
 26 to me.
 27 Mike: in any case the roles are just (.) well assigned; (.) me behind the camera you in front
 28 Jane: yes; so he is the typical Instahubby

Here, Mike's important role for Jane's social media representation becomes explicit. Jane shifts from position where she tries to insist that she could very well take over Mike's tasks and edit her pictures alone, to a position where she emphasises that she owes her skills to him. In this transcript excerpt, it becomes apparent that Mike feels that Jane's social media representation is successful because of him, and Jane encourages this view. The division of roles and work regarding the representation and posting is traditional ("Jane is perfect in front of the camera" and Mike "behind the camera"), and Jane even calls him a "typical Instahubby⁴". His dominant position of being the one who has 'the' photography skills is followed by teasing each other (when he criticises her photography skills both laugh and Jane mucks about it – "gosh" – but laughs at the same time).

Afterwards they elaborate on the effects of Instagram on their daily lives and stress the importance of "Instagram-free time" (e.g. lines 591-592). They drift off the theme of posting on Instagram, reflect upon how they are influenced by media, and talk about turning off the TV more often, to have more time for each other. They then get back to the topic of posting about their private lives again and touch upon how Jane and Mike select the extracts of reality that Jane posts on her professional account. At this point, Mike's dominant position comes to the fore more directly, as her visibility happens on his terms. Mike states:

but (.) apart from that (1) yes you sh- you post the things you edit the pictures; she often asks me if the picture is nice; so she almost always asks me for my opinion; (.) with pictures and also with the texts (.) I just look over it; as proofreading in a way ehm (lines 665-668)

This is where his interpretational sovereignty comes into play and where her *luminosity* (as McRobbie (2009) puts it) is framed by his (male) action – she adorns the picture; he makes a decision about her representation. Overall, this is a sequence in the transcript in which their seemingly egalitarian relationship is riddled with tension: on the one hand, it is his authority with which he signs off which pictures she should post on Instagram. On the other hand, this also puts

Jane in the stereotypical position of being better off as a woman in front of the camera overall. That there is something not quite right about it – and that the two of them at least sense this – becomes explicit in the fact that these sequences are accompanied by a mutual, subtle laughing, teasing each other.

Gender (in)equality conflicts in the relationship: Between theory and practice

In the further course of the interview, the interviewer first asks about conflicts and then how Jane and Mike position themselves to gender issues. In their answers, they depict their conflict management as rational and functional, mentioning only minor conflicts (“peanuts”, line 755) that they were able to solve within one day. Regarding their position on gender issues they problematise the power of language: On the one hand, they agree that it was important to represent women via language practice, on the other hand they criticise gender stereotypic attributions Jane has encountered in her professional practice. Generally, both agree that “everyone should love whom they want” (line 803). However, while they agree on gender-equality on a content level, ambivalences become evident when it comes to practice: In an interview extract in the last part of the interview, they are explicitly asked about their views on “equality” (line 923). After reflecting on the fact that this is more a “matter of opinion what makes one happy” and that there should not be any “tally charts” within a relationship, Mike talks about his difficulties in everyday practice:

- 1 Mike: tha- that's still difficult because every now and then that happens to me, too; that I; (.)
- 2 I'm at work all day for 11 hours and then I ((coughs slightly)) come home shortly before or
- 3 I'm on the way home and think well great now I was at work for 11 hours I hope there is at
- 4 least something to eat at home because I'm hungry (.) and then I come home and then of
- 5 course (1) which is ok; then there were days when [Jane] was maybe (2) super unproductive
- 6 and she says she complains about herself I didn't do anything today was only in front of the
- 7 TV and on the cell and yes I am totally dissatisfied; and I just come home and see nothing no
- 8 loaded dishwasher no laundry washed no (.) no cleaning or something and no food; I think
- 9 perfect if I'd been home for 11 hours I would have done all that and I am still hungry and then
- 10 ((coughs slightly)) I am dissatisfied for myself (.) and then often don't say that well great
- 11 either I provoke an argument and say why didn't you do these things or I did; she notices that
- 12 I am dissatisfied so it's just (2) it always depends on the attitude with which one approaches
- 13 the whole thing
- 14 Jane: yes, and to come back to equality on a larger scale now, not in a relationship I just
- 15 think it's extremely important that women not only have the same opinion () that they have
- 16 the same value as men (...)

Attending to the way in which he begins his narration, we can see that he is referring to his own relationship experience. Realising gender equality in practice seems difficult to him, because 'it' happens to him, too. Mike is sometimes "dissatisfied" with Jane 'doing her thing' when she is not productive while he seems to engage in both: the domestic and the sphere of gainful employment. It is interesting at this point that we do not know whether he is talking about a regular workday, Jane is not spending productively, or whether he talks about a day where he works, but she does not (e.g. at the weekend). Her non-productivity affects him and involves him emotionally, as he directly articulates his dissatisfaction repeatedly. Mike's narrative opens up the possibility of moving their discussion on gender equality from abstract general reflections to sharing concrete relationship experiences. However, Jane does not take up his experience by relating her side of the story but continues with a more general reflection; regarding the mode of discourse there is a divergence with Jane's turn-taking and switch to "equality on a larger scale".

We can see here a rhetorical pattern that seems to regulate a tension shooting through their ostensibly egalitarian model: Although Jane and Mike agree on gender equality on a reflexive opinion level, in practice Mike is dissatisfied when she does not cook while he works. At this point, Jane's moving away from experience to a reflexive level can be interpreted as one mode of dealing with this discrepancy that allows for agreement, as she shifts to the more general opinion level again, away from difficult practice.

Tension shooting through egalitarian practice: An outlook

Drawing on a case study of a heterosexual couple talking about their relationship, we have shown that the couple enacts theoretical consensus regarding gender-equality while on the level of practice their ostensibly egalitarian relationship model is shot through with tensions and thus becomes more ambivalent:

Jane Mike position their relationship model as modern, respectively egalitarian. By arguing that there are inverted gender roles: while she engages more strongly in paid work, he invests more in the private sphere by cooking the meals. By pointing explicitly to this inversion of roles, the couple indicates their modernity in respect to gender roles. The couple frames this shift of roles as the result of choice (for her) and external conditions (for him). Furthermore, their shifting of gender roles predominantly seems acceptable for a specific area; when it comes to describing their personalities, they adhere to rather traditional images: he is portrayed as rational, while she is pictured as emotional. At this point, we see the first strategy of de-thematisation that they use: It is everyday psychological knowledge that allows them to avoid critical discussion or negotiation of their own entanglement in rather orthodox roles. On the one hand, they reassure themselves about concepts such as self-realisation (this task is no fun for me, but it is for him), if they do not conform to the corresponding gender role. On the other hand, where they perform more orthodox roles, they legitimise

them with another psychological concept: it is their personality and thus, it cannot be changed. Psychological concepts – as Gill (2007) also suggests – are involved in de-thematising something potentially conflict-laden in relation to gender inequality. Therefore, even though the couple's reference to psychological concepts in a specific area of everyday life secures their supposedly egalitarian way of living it at the same time allows masking the traditional distribution of roles in other areas. This also produces tensions as can be seen in the fact that both ironise these self-descriptions, tease each other when it comes to rather orthodox gender position they find themselves in.

As a second strategy of de-thematisation we identified a specific reflexive modus: When referring to situations in which their practice diverges from their shared ideal of gender equality and inverted roles, they switch from telling concrete stories about their lives (e.g., when the male part feels offended by the female doing too little in the household) to negotiating their ideals (gender-equality should exist on general societal level). Referring back to abstract ideal levels this conflict in an intellectual way, nevertheless leaves the practice untouched. This strategy of de-thematisation is also discussed by Wetterer (2003). Wetterer does not directly analyse empirical data but rather reviews existing sociological studies in terms of what they reveal about gender discourses in general. She posits that

The disappearance of inequality from discourses that revolve around equality and self-realisation, the insistence that it is not normative gender standards and traditional models but one's own decisions that determine one's actions, obscures essential aspects of social reality. The de-thematisation of inequality between the sexes and increasingly also between women does not eliminate inequalities from the world but removes and protects them from criticism and in this way indirectly contributes to their persistence in practice.⁵ (Wetterer, 2003, pp. 89-90)

Our data shows that Jane in the sequence presented above (lines 939-955) does not only diverge from the topic of relationship practice that seems shot through with tensions but also does Mike highlight at the end of his statement that it “depends on the attitude with which one approaches the whole thing”. So it becomes – like Wetterer suggests – an individual problem that could be thought away by means of individual attitudes. This rhetorical pattern allows us to better understand the function and the problem of McRobbie's (2009) double entanglement. Affirming equality on levels of content – in the presented case – appears like a truce. A truce, however, indicates that there is a form of conflict underneath, i.e., that the language of gender equality is used to understand their relationship in ways that enable and/or mask gender inequality on levels of their practice. We thus consider it especially important to draw attention to the “subtle ways” (McRobbie, 2009, p. 46) that everyday psychological knowledge plays in reassuring individuals tacitly to reproduce gender-inequality and structures of patriarchy in the heterosexual relationship-practice.

Endnotes

¹ The term postfeminism has a double meaning: On the one hand, it refers to the empirical phenomenon of postfeminism (e.g. repudiating feminism, while at the same time assuming that gender equality is an important value of ‘modern’ societies) and on the other hand, it refers to the critique that tries to unmask postfeminism as ideology.

² All names, jobs, and locations do not reveal real names but have been pseudonymised by the authors. The interviews were originally conducted and analysed in German and were translated to English by the authors of this article.

³ The excerpts were transcribed by the Talk in Qualitative Social Research (TiQ) transcript-system. This is a guide to the used symbols (Przyborski & Wohlrab-Sahr, 2014, p. 167):

[name]	pseudonymised content
(.)	short pause
()	incomprehensible words
(2)	two second pause
□	direct turn-taking
@(.)@	shortly laughing
@funny@	a word said while laughing
Funny	loud
<u>Funny</u>	emphasised
Fu-	broken off
Funny;	slightly sinking intonation
Funny?	strongly rising intonation
°funny°	low voice
Fu::nny	stretched word

⁴ Abbreviation for Instagram husband („The husband of a blogger or online influencer who takes photographs for his spouse and is tolerant of the constant interruptions that come along with the blogging business”, see <https://www.urbandictionary.com/define.php?term=instagram%20husband>)

⁵ Wetterer’s text is originally in German and was translated to English by the authors of this article.

Katharina Hametner is an Assistant Professor at the Faculty of Psychology of Sigmund Freud Private University Vienna, head of the Institute for Qualitative Social Research and co-coordinator of the master program specialization in social psychology and clinical psychology. Her research and teaching expertise lies within the social psychology of social inequality, resentment and racism and qualitative methods. She is co-editor of “Psychologie und Gesellschaftskritik” (psychology and social criticism).

Natalie Rodax is a senior fellow at the Faculty of Psychology at SFU Vienna who teaches in the fields of research methods in psychology, social psychology and general psychology. Her PhD thesis addressed epistemological questions about the conditions of production of introspective research in the 19th and 20th centuries and its relevance today.

Nora Ruck is a psychologist with an additional academic background in cultural studies and feminist science studies. Presently, she holds a position of Assistant Professor of Psychology at the Faculty of Psychology at the Sigmund Freud Private University in Vienna, where she serves as Vice Dean for Research, as head of the PhD program in psychology, and co-coordinates the master program specialization in social psychology and clinical psychology. Her research centers on examining the interplay between psychology and societal inequalities, as well as social movements, from a feminist, historical, and critical participatory action perspective. She is currently principal investigator of the feminist critical participatory action research project “The Psychological is Participatory”.

Paula Krüger is a Master's student in Psychology at Sigmund Freud University Vienna. Building on her Bachelor's thesis, which explored the habitual development of young feminist women's self-images in postfeminist societies, she is currently working on her Master's thesis. Her research focuses on how men construct their masculine identity in everyday practice, with particular emphasis on their approach to emotions and emotional expression.

Johanna Nitsche is a psychology master student at the University of Vienna. For her thesis she analyses a digital application (App) on Women Empowerment. The core objective is to identify and make visible the discursive knowledge and power effects therein and to question to what extent Women Empowerment is shaped in such a way that it works towards the neoliberal regime of the self, thus supporting the neoliberal governmentality of the present.

Vanessa Payr is currently working as a psychologist in an addiction clinic in Vienna where she is responsible for the women's ward. Her professional journey is deeply rooted in her academic focus on gender studies, which began during her university education. Today her main focus lies on developing gender-sensitive therapeutic approaches and to improve treatment outcomes for women struggling with addiction.

Hannah Poltrum is a clinical psychologist. She currently works as a kindergarten psychologist for the city of Vienna. Amongst other things her work focusses on inclusion and the developmental support of children with developmental delays, behavioral problems or disabilities. She plans to start her doctorate in September 2024 at the Sigmund Freud University in Vienna. Her thesis will focus on the portrayal of mental disorders in children and teenagers in feature films and series.

Sandra Reisch is a pre-doc researcher at the Sigmund Freud University (SFU) Vienna since the beginning of 2023. She teaches research methods and currently works on her PhD thesis. The thesis addresses gender psychological questions focussing on the representation of femininity in the context of media debates on the newly released Barbie film from 2023 and its everyday relevance.

Psychology as an oppressive tool during the ‘Woman, Life, Freedom’ uprising in Iran

Laya Hooshyari

Abstract

The Woman, Life, Freedom (WLF) uprising in Iran like other social movements has its own narrations of the people’s courage and resistance versus the brutality and oppression of the regime, i.e. the Islamic Republic of Iran (IRI). In this article, I try to show only one part of this brutality by the hand of psychology. In this article, I am trying to talk about four parts: Firstly, I discuss the psychological oppressions inflicted by the IRI regime since the beginning of the WLF uprising. Secondly, I address the relationship between the Iranian psychologist community and this uprising, highlighting three different groups: 1) Advocates of oppression, 2) The pragmatic reformists, 3) The activist minority. Moreover, I explore how psychology discourse, in general, has a direct or indirect relationship with the oppression of social movements and how we can go beyond that by creating an organic link with neighbourhood committees in Iran.

Keywords

Iran, neighbourhood committees, protests, psychological oppression, social movements, Woman, Life, Freedom uprising

Introduction

The Woman, Life, Freedom uprising is tied with the name of Jina (Mahsa) Amini who was arrested, beaten, and killed by Guidance Patrol due to wearing an inappropriate hijab in September 2022 in Iran (Hooshyari, Öztürk, Goikoetxea, 2022). This uprising started with a protest gathering in front of the hospital where she died in Tehran and spread from Jina's hometown of Saqqez to all 31 provinces of Iran in the following days. Protesters abroad also held rallies in more than 150 cities around the world.

From the first days of uprising, like other similar past movements, the IRI authorities severely suppressed all the widespread demonstrations and all the

activities of protesters. Several hundred people were killed, and several thousand people were arrested and imprisoned. These clashes were more deadly in Sistan, Baluchestan, and Kurdish regions, than in other regions of Iran.

Apart from physical violence the significant part of the oppressions were related to psychological oppressions. In this article, I will look at an essential aspect of the regime's repressive face: the psychological oppression inflicted on people, particularly women, during the Women, Life, Freedom uprising. It does not mean that only during this uprising IRI used psychology as an oppressive tool, but in this uprising the amount and timing of usage was completely more than past. This article uses the recent Iranian experience as a case study in how social movements generally might experience psychological oppression.

I am trying to show not only some concerted examples of IRI psychological oppressions of people (like stigmatizing people by mental illness), but also I am trying to show both the direct connections of some psychological communities with IRI in suppressing people *and* the indirect collaborations of psychologist with the regime. By “direct connections” I am referring to some statements published by some groups which encouraged IRI forces to suppress people and severely punish the protesters, or those psychologists who eagerly joined in the psychological tortures of people in prisons, schools, and hospitals. By “indirect connections” I am referring to mainstream psychologists who although are against the IRI regime but whose actions will not create revolutionary movements and will not change anything, but will only lead to conforming activities. These activities refer to efforts that promote adaptation to the current situation or, at the very least, aim for a smooth and gradual change instead of dismantling all the regulations of the existing subversive structures. Basically, some psychologists do not engage in fundamental changes and prioritizes gradual individual changes over radical economic and political changes, since for many psychologists the individual mind is at the centre of ‘change’. Moreover, I want to highlight minority psychologists and psychology students who have the potential to move beyond traditional psychology discourse while maintaining the radical elements of protest. By taking inspiration from neighbourhood committees in Iran I am outlining the first steps of a psychology that can have a revolutionary essence to change the current situation.

1. Psychological oppressions of the Islamic Republic regime

Portrayal of government killings as suicides

Perhaps one of the most significant psychological oppressions of the IRI is the portrayal of government killings as suicides, both in detention centres and on the streets. IRI authorities tried to indicate that the victims had taken their own lives due to their personal issues and the mental illnesses they were allegedly suffering from. They continuously pressured families to confess that their loved ones had a mental illness.

One of those people was Nika Shakarami, a 16-year-old girl who went missing in Tehran during the first days of the uprising. According to her aunt, her family received news of her death ten days later (Shakarami, 2022). The online News outlet Mizan, affiliated with Iran's judiciary, published a report asserting that Nika had died by suicide, citing a Tehran prosecutor (Mizanonline, 2022). However, there is a video of her standing on top of an overturned garbage bin, waving her headscarf as it is engulfed by flames, amid chants of death to the dictator, that showed she was very active during the uprising. Moreover a death certificate initially obtained by BBC Persian and verified by CNN reveals that Shakarami died from multiple injuries caused by blows with a blunt object (CNN, 2022).

Rape and sexual harassments

Apart from verbal and physical violence, sexual violence has been one of the oldest tools of the IRI regime to exert pressure on women and mostly used to degrade, torture, and exert power (McGlynn, 2011). In several accounts recorded in the book "White Torture," there are explicit references to the interrogators' attempts to sexually abuse female prisoners (Mohammadi, 2020). These forms of violence often remain silent due to societal taboos, and unfortunately, society tends to avoid discussing the root causes of this gender-based violence and its consequences (Aghtaie, 2017).

CNN, after a two-month investigation (October and November 2022), confirmed in a comprehensive report that detained boys and girls in Iran are subjected to sexual violence, and in some cases, rape occurs in prisons. The physical assault and sexual harassment of female prisoners, especially those seen as "beautiful", are more severe. CNN, citing informed sources who have interviewed the victims, reported that IRI agents have filmed scenes of sexual violence and used those films as a tool for extortion from the protesters or to silence them (CNN, 2022). One of the individuals who has been subjected to sexual abuse and even physical injury multiple times is A.A. In the "disclosed conversation," doctors have expressed horror upon seeing signs of abuse on A.A (Iranwire, 2022). Furthermore, according to the report from the Councils of Student Associations of the Country, Soha Mortezaei, an active student, was subjected to beating, assault, and sexual harassment during her arrest (HRANA, 2022). According to a feminist activist in Iran at least three women were expelled from their homes and forced to leave their families because they thought the women were raped in prison and therefore no longer have any place in the home.

Distribution of psychiatric medications among the prisoners

Vida Rabani, a jailed journalist, published an open letter expressing her objection to the disclosure of her private medical information by Mizan News Agency on 26th of May 2023. Mizan is affiliated to IRI and stated: "Vida Rabani has a

history of using neurologic and psychiatric medications and has been examined by a specialist neurologist and psychiatrist in Evin Prison" (Mizan, 2022). In a section of the letter, she writes, "You have detained me in my own home four times in four years, to the point where every doorbell makes me jump. You know that detention, solitary confinement, uncertainty, and unawareness are forms of torture that are both damaging and invisible." She also mentioned in another part of the letter, "I am not ashamed to say that my mental state is affected, and I take anxiety and depression medications. It is not shameful." She also said: "I wish at least psychiatric and psychological associations would protest disregarding their professional protocols... What happens if a patient in a treatment room can no longer speak up about everything?" (Shargh, 2022). She also said: "Inside Gharchak Prison, officials said they would provide Band 8 prisoners (detainees of the WLF Uprising) with as much sedatives and tranquilizers as they wanted. Oxide, Clonazepam, Tranqopin, and others were distributed easily. At first, I could not believe that they would give you as many as you asked for. They referred to the medications as the 'Trolley of Happiness!' One night, I became concerned about the condition of some girls. I tested it myself and asked the nurse at Gharchak to please give me two Clonazepam pills, and they gave them to me! Right there, I returned the pills and expressed my objection to this situation" (BBC, 2022). By stating that the prison officials did not consider the pressures endured by the detainees, she described the detention centre as a "method of exerting pressure and torturing the accused." She highlighted the "trauma, anxiety, and fear" experienced by the detainees and referred to the suicide of detainees after release from prison. Some previous prisoners confirmed these issues. Mona Maafei, a detained psychologist and social activist, Zahra Kashkaki, a detained student, and Nasim Soltanbeigi, a detained journalist, have shared their conditions in prison and the easy distribution of drugs in prison. One of them told: "few days before they took me in front of the camera for forced confession, they had discontinued my medications and replaced my regular pill with a stronger one ... with the discontinuation of one of my pills, I had reached a point where I felt trapped and contemplated suicide" (Ibid).

Before her, Sepideh Farhan a previous political prisoner who sadly chose to end her life on 11th July 2023, stated in an interview with Radio Zamaneh that: "The prison is a bleak place where inmates lose their human identity... during my detention at the Ministry of Intelligence's detention centre, they give me 9 pills every day for 10 days. Later, when I investigated, I found out that these pills were addiction withdrawal pills specifically for those with severe addiction to morphine" (Radio Zamaneh, 2021).

Sending students to counselling centres and opening psychiatric and psychological files

During the WLF uprising, primary school and high school students actively participated in these protests, demanding their basic human rights (Jay et al, 2022). An unpublished study conducted in 20 girls' schools in Fars province

revealed that, apart from offices, school counselling rooms were used as places for interrogation and psychological torture. Various tactics have been employed to harass students. Constant humiliation and criticism of girls by school counsellors, and in some cases by intelligence forces and the Basij¹, saying, "You receive money from foreign media and Ms. X., how much money did you get?"

In some cases, students were sent to counselling and psychological centres in the Ministry of Education and the Correction and Rehabilitation Organisation to establish counselling and psychological files. In a state media interview, the Minister of Education in Iran mentioned that "school-age students who were arrested during the protests were being sent to psychological centres, claiming that it was done to reform them as they might have become anti-social individuals" (CNN, 2022).

Forced sending to mental hospitals & psychological clinics

Forced sending to mental hospitals has been one of the oppressions of the IRI. Behnam Mahjoubi, a member of the Sufi Gonabadi order who was jailed because of a 2018 protest by a religious sect, perished after authorities failed to care for his medical condition in a mental hospital in Tehran. He rightly pointed out: "we are witnessing the decline of humanity in these centres" (VOA, 2018). In recent years, several political prisoners in Iran have been forcibly hospitalized in mental hospitals. They said that during this period, they were injected with drugs that sometimes caused them to have trouble moving or speaking, and some of them were treated with electric shocks (BBC, 2021). Melika Gharagozlu, a journalism student and one of the protestors of compulsory hijab, was among the people who were forcibly sent to a psychiatric hospital during the WLF uprising.

Forced referrals to psychological clinics also occurred prior to the WLF uprising, but I was unable to find information on prisoners from this time. Banafsheh Jamali was sentenced to participate in the therapy sessions of the Mawa counseling center located in Qom city to "learn the methods of controlling emotions and calmness". The Maawa Counseling Center is affiliated with the Imam Khomeini Educational and Research Institute, where "divisional counsellors" provide psychological counselling in various fields. This centre is also engaged in the production of psychological products with an "Islamic approach" (Bidarzani, 2023).

Naming the biological terror of students: The collective hysteria

The chain poisoning in girls' schools in Iran began in November 2022, and it appears that a "mostly inhalation-stimulating substance" has been the cause of poisoning among the students. (Scientific Committee of the Ministry of Health). Typically, students have reported the throwing of an object into the classroom or schoolyard that releases gas, resulting in symptoms such as fatigue, throat

¹ One of the five forces of the Islamic Revolutionary Guard Corps (IRGC).

irritation, dizziness, nausea, and headaches. Since then, more than 5000 students in 25 provinces and approximately 230 schools have been affected by this incident (Shargh, 2023). The exact cause of this event is unknown, and there are debates about this issue. The cabinet ministers and officials each give information that the other official rejects. For example, Iran's deputy health minister said: "some people wanted to close all schools, especially girls' schools", but he denied these statements a day later. Gholamreza Jalali, an official in IRGC, called the issue of poisonings real, but said that: "now Iran's schools are caught in a phenomenon called social fear" (Eghtesad News, 2023). Majid Mohebi, vice president of Qom University of Medical Sciences, denied the poisoning of these students and said: "Most of us feel that the emotions of the students and the environment have been transferred to these students and they are suffering from anxiety. They think they have some problem, so they go to the hospital (Isna, 2023). In the meantime, people who support the Axis of Resistance, the anti-Western, anti-Israeli, and anti-Saudi political and informal military alliance between Iran, militant groups in Palestine, the Syrian Government, and the Lebanese called these series of poisonings "mass hysteria" (Fars News, 2023). A BBC World² report about this chemical attack is a resource for them because they mentioned, in a long report, that mass hysteria as a reason of these bodily reactions (Iranwire, 2023).

Labelling women with mental disorders is not a recent phenomenon. Throughout history, hysteria has served as a tool to suppress courageous women (Harris, 2011). For centuries, the term "hysteria" has been actively employed to dismiss and confine women within the oppressive confines created by patriarchal systems (Amin, 2022). It has been a means of demonizing women, subjecting them to persecution, and fabricating false mental illnesses like "hysteria." Hysteria is just one of the many ways femininities has been pathologized to enforce conformity to imposed gender norms. The exploitation of women's bodies to exert power remains prevalent today, whether through the pink tax, sexual violence, or restrictions on abortion rights (Thelandersson, 2022).

In general, there was a recurring emphasis on mental issues and linking the protests to psychological issues (psychologizing) by the media and officials of the Islamic Republic. IRI authorities in collaboration with the Psychological and Counselling Organisation (PCO), claimed that psychological factors had caused the start of the protests, they argued, "Due to the three difficult years of the COVID-19 pandemic, society has been confronted with an eruption of anger, and we are witnessing its emergence on the streets. Therefore, we should consider the happiness, social enjoyment, energy release, and emotions of individuals in society..." (Arman News, 2023).

One might ponder whether the gruesome actions I've detailed fall within the realm of the Islamic Republic of Iran's propaganda. Why, then, am I characterizing them as psychological tactics of oppression? While I fully concur that these actions indeed serve as part of the Iranian government's propaganda, it is essential to recognize that the field of psychology itself can wield its own oppressive language, potentially functioning as a tool of oppression in its own

² BBC World, a few days deleted the article and apologised.

right. Expanding on this idea, psychology, as a discipline, is not immune to misuse or manipulation. It possesses the potential to employ language and concepts that can inadvertently perpetuate oppression. I'm emphasizing that while every scientific discipline and philosophy can potentially contribute to oppression, in the case of the IRI, psychology appears to have played a more prominent role in facilitating oppression compared to other fields of study. This viewpoint underscores the idea that psychology possesses a unique capacity to be harnessed as a potent tool for control and manipulation. This stems from its ability to shape public opinion, influence societal norms, and provide a framework for justifying specific actions or policies. Furthermore, psychology's insights into human behavior make it particularly influential in the hands of those seeking to exert control.

2. Psychology, politics, and oppression: A deep dive into Iran's psychological landscape

On one hand, we are faced with the Psychological and Counselling Organisation (PCO) and its affiliated institutions as the main suppressive entities of psychological well-being in the IRI. The PCO seems to be an independent non-governmental body functioning within the borders of Iran. The primary objectives of this establishment are to enhance the depth of psychological understanding and therapeutic practises, safeguard the entitlements of clients to receive services from psychologists and counsellors, and promote the professional rights of psychologists and counsellors. Nevertheless, it is imperative to acknowledge that this organisation maintains a significant association with the IRI system. The leadership of this organisation frequently comprises persons with conservative origins who have previously or presently occupied key positions within the Iranian government. The laws and regulations of the organisation are mostly shaped by the leader and their associates, who adhere to the values of the IRI. As a result, member debates and contributions hold relatively little significance. The organization's primary objective is to offer support and advocate for the principles of the IRI regime within psychology institutions. On the other hand, we observe various psychological groups and associations that, although associated with the PCO, have empathy with the protesters and are against the IRI authorities. While many celebrity psychologists or Instagram psychologists closed their pages or remained silent, some of them attempted to analyse the uprising from an individualistic perspective and constantly advocating for emotional acceptance, distancing themselves from the News and posing challenges related to reading books and other activities. Moreover, some tried to be volunteer psychologists and made free individual and collective sessions to solve the emotional problems that happened to the protesters or everyone who has affected by the WLF uprising. For this reason, many of them made great efforts to inform the public about the increase in mental illnesses following the WLF protests: "Nervous attacks, panic, anxiety, and depression have increased after September 2022, and more people have sought clinics for help" (Danaei,

2022). Beyond disseminating information, these groups also aimed to publish statements on the matter.

For example, the Iranian Psychological Association published a guideline titled: Telephone or Online Psychological Counselling for Individuals under Stress and Trauma. At the beginning of this guideline, they emphasized: "After experiencing the COVID-19 pandemic and dealing with the pressures of sanctions, Iranians have found themselves in a situation where they face increasing negative emotions and higher levels of stress due to recent social events..." They attempted to address abstract and ambiguous points about how to provide free telephone or online counselling, limited to a maximum of two half-hour sessions (Iranian Psychological Association, 2022). Some psychologists and mental health professionals who were more radical passed motions and statements in condemning IRI strategies which abuse the psychology. For example, associations in the field of mental-social health have protested the misuse of psychiatry and psychology in a statement: "In these complex times and amidst social crises, it is our human duty as professionals in the field of mental-social health to take care of the well-being of individuals in society... Unfortunately, recently some officials have made inaccurate and incorrect remarks, referring to protesters as psychiatric patients which fuels the suspicion of misuse of psychiatry and psychology... Statements implying inappropriate use of psychiatry and psychology in such cases will exacerbate the stigmatization of psychiatric and psychological disorders and treatments... We emphasize that we strongly oppose the use of psychiatry and psychology as a punishment or a means to deprive individuals of their social rights and consider it contrary to professional principles" (Iranian Psychological Association, 2022).

A group of psychologists apparently outside of Iran, in support of the Iranian people, made a petition and have called for an immediate end to violent crackdowns on protesters and the release of all detained individuals, including children and students, under the slogan "Psychology against Despotism." They declared, "In the path of the noble freedom-seeking movement of the Iranian people, we position ourselves not alongside them, but as part of them" (Psychology against Despotism, 2022).

In an open letter to Ebrahim Raisi, [President of Iran], the Iranian Association of Psychiatrists highlighted that the 44-year compulsory hijab rule has contributed to the weakening of mental health in society. They called for a "reconsideration of the fundamental law or at least its implementation methods." They also warned about the periodic shortages of neurologic and psychiatric medications, which have put a significant number of patients at risk (VOA News, 2022).

Some psychology students in six Iranian universities, on the occasion of "Psychologist's Day in Iran" published a statement condemning the "government's abuse of psychological sciences for oppression and tyranny" and the "psychological and academic institutions of the country that help to reproduce oppression". The signatories of this statement pointed out that "the government authorities attributed the deaths of children, teenagers and young people of this country to suicide, and added that even the country's mental hospitals have turned

into torture centres for political prisoners". In another part of this statement, they condemned the "abuse of the field of psychology in the path of oppression and tyranny" and wrote: "We will not allow the field of mental health to be used as a tool for political exploitation and oppression." And we ask for the acquittal of those who, with any position in the psychological and academic institutions of the country, help to reproduce oppression" (IranWire, 2023).

Within the realm of psychology in Iran, it has come to my attention that there exist three distinct groupings.

1. **Advocates of Oppression:** The initial category encompasses those affiliated with the field of psychology and counselling organization who publicly support oppressive policies. They demonstrate alignment with the principles of the IRI regime and actively advocate for its ideologies.

2. **The Pragmatic Reformists:** The second group comprises individuals who, while privately opposing the IRI's oppressive policies, choose to work within the system. They endeavour to obtain the endorsement of organisations in order to gain employment as psychologists and establish psychology clinics. Despite having objections towards the dictatorship, these individuals in question uphold a conservative outward appearance, prioritising personal validation, financial gains, and the establishment of clinics. They may be perceived as advocates of some kind of reformism, while some in this group advocate for the regime's overthrow, but not a revolution in different spheres of the regime.

3. **The Activist Minority:** The third group, a field minority, is mostly made up of politically active students. They do not hide their resistance to the regime's harsh activities, unlike the second category. Inside psychology departments, they actively engage in various forms of activism and are linked with seeking change and questioning the status quo rather than working inside the present system. They reflect a more combative approach to dealing with challenges in Iran's psychological area.

My primary concern with these actions is that all of these three groups of psychologists and mental health professionals are believed to view the authorities as abusing psychology. However, the truth is that psychology itself is inherently insulting and oppressive. Even when a psychologist attempts to genuinely listen and empathize with their clients while addressing their problems, they inadvertently create a situation where the client remains trapped in the same social position without initiating any meaningful change. The therapist fails to explore the roots of oppression with the client and instead reduces the issue to a purely intrapersonal level. Clients are merely encouraged to adapt to their environment and return to their work and family, without being guided to understand the underlying causes of their problems or helping them to fight against them. Consequently, while clients may make some changes in their lives, they are rarely presented with the opportunity to enact fundamental changes that would impact everyone's lives.

In addition to this central point, psychologists typically hold weekly sessions with clients, where they become aware of the most private and personal issues of the client's life. However, these significant interactions often remain confined to the realm of interpersonal relationships throughout the therapist's

lifetime. The therapist fails to connect the personal issues to broader political contexts, which perpetuates a form of oppression. How can it be possible to deal with anxiety, depression, and constant insomnia even after the passing of years solely by analysing and discussing one's relationships with parents and loved ones? Does not this constitute a form of client abuse?

3. The discourse of psychology

Although WLF uprising was one of the first times that Iranian psychologists, especially female psychologists, dealt with social issues beyond individual concerns, their analyses and prescriptions were ultimately tied to individual issues and perspectives. This is not a new issue. We have already learned that many psychologists ignore the social structures of oppression, and this leads to a false perspective and ineffective demands, and this is not only the problem of psychologists, rather, but the dominant discourse of mental health professionals is also often incapable of social understanding and alternative social narratives. (Teo, 2005, Parker, 2003, Schraube, & Osterkamp, 2013). At the same time, we are also aware of dialectics in the sense that we cannot understand people apart from their environment (Blunden, 2016). We have learned that people are shaped and influenced by the society they belong to and change their society through their own praxis (Marx, 1888). But unfortunately, this understanding is ignored by the dominant discourse of mental health professionals. An Individualistic approach of understanding without social understanding not only fails to facilitate change, but also helps to reproduce the prevailing conditions (Schraube, & Osterkamp, 2013). Actions such as those contained in short-term statements of psychological associations seek to conform and maintain loyal to the system or, at best, try to overthrow the regime (without making) a revolutionary change.

The reality is that we cannot deny the growth of problems that occur at the individual level. The simplest example is that we wake up and go to sleep with anxiety. However, psychologists do not address the fact that our internal problems arise because of living in this turbulent society, and revolutionary changes in the relationship between the individual and fundamental structures are needed to disrupt/tackle these problems (Parker, 2007). The problems created by this flawed system are categorized, labelled, and attributed by mental health professionals. Following these labels, most therapeutic approaches begin, are usually based on the interests of capitalists rather than revolutionary theories and empirical experiments (Schraube, & Osterkamp, 2013). In the logic of capitalism, a person either must work in an office, factory, or at home (being exploited and alienated) or to be prisoner, a patient in hospitals, or a client in psychotherapy clinics (being disciplined and rehabilitated). In both cases, individuals become a means for the economic goals of capitalists. Psychological discourse, despite its efforts to assist individuals in addressing mental health issues, can inadvertently assume the role of an oppressor.

Capitalism, which subsumed patriarchy and misogyny (Fraser, 2022), while there have been some improvements for women, imposes its own suppression on

women. It is not surprising that women are the largest recipients of psychological and psychiatric services. In these circumstances, it easily marginalizes women, constantly instils doubt in their abilities, justifies oppression to the oppressors, and ultimately limits their freedom. These conditions become even more pronounced when it comes to women in the lower layers of the working class, who are doubly oppressed. Despite the limitations of psychology in providing objective understanding and clear prescriptions, it employs alternative methods and tools for them in the best-case scenario. The essence of psychological understanding in this statement can be summarized as: "These women need to become empowered." However, empowerment in this context has been emptied of its true meaning and mostly implies that these women should learn resilience to contribute to the empowerment of capitalists and become facilitators of entrepreneurs' profits. On one hand, it perceives working-class women as weak, incapable, and insignificant, requiring guidance from the elites and the powerful. On the other hand, after years of implementing neoliberal policies, not only is there no evidence of women's empowerment, but there have not been significant changes in poverty reduction either. Instead, women have been subjected to even greater exploitation. Since patriarchy ensures that it is men who enjoy the benefit of wielding economic power, the fight for the emancipation of women also entails a fight against capital.

According to the psychology framework, my argument is that even when a psychologist desires to radicalise a social movement and instigate change, they frequently face significant obstacles in making this connection. It appears that psychologists face a binary choice: either they explicitly associate themselves with the government, thereby contributing to suppression, or they indirectly, albeit in a less obvious way, help to maintain the current conditions. As a result, psychologists are frequently at risk of unintentionally maintaining current society norms and institutions.

4. Moving towards the impossible

Considering the arguments and concrete examples I have presented; it becomes evident that the concept of psychology is fundamentally flawed. Nevertheless, can psychology still be harnessed for the benefit of revolutionary movements? Despite initial scepticisms, it is worth exploring the realm of critical psychology and its potential to navigate this seeming impossibility. In the subsequent discussion, I aim to illustrate how psychology can actively contribute to serving revolutionary movements, utilizing a suggestion. I think a type of psychology that tries to transcend the individualistic approach to mental issues and instead connects an individual's concerns to their societal origins, thereby changing personal matters into political ones, has the potential to affect significant and successful change in current circumstances. In my opinion, the third group, the activist minority, has the potential for revolutionary change if they become aware of the underlying elements and roots of psychology, as well as its role in sustaining oppression.

If we look at the neighbourhood committees during the WLF uprising, we can observe they play a crucial role in amplifying the voices of the Iranian people within the country. These committees have emerged because of the spontaneous participation of young individuals in protests the (IRI) regime across various provinces. While they are still in the early stages of self-organisation, they possess progressive and radical agendas and perspectives, actively working to mobilize the residents of their respective neighbourhoods. The primary objective of these committees is to uphold a revolutionary discourse and maintain their independence from political parties with reactionary backgrounds. They strive to create a platform that represents the aspirations and grievances of the people, focusing on the needs and demands of their local communities. By doing so, they aim to unite individuals, fostering a sense of collective identity and solidarity among the residents. These committees serve as a guiding force for protesters within their neighbourhoods. They provide essential information, coordinate actions, and offer strategic guidance, ensuring that the demonstrations remain organised, purposeful, and impactful. They are acting as a bridge between the protesters and the wider society. They seek to tie the concerns and demands of the people to the larger street protests (Manjanigh, 2023). While facing numerous challenges and obstacles, including government repression and surveillance, these committees persevere in their efforts to bring about meaningful change. They represent the hopes and aspirations of a generation of Iranians who seek a revolutionary society. Through their grassroots organising, progressive agendas, and determination to remain independent, they continue to inspire and mobilize the local people, contributing to the ongoing struggle for a better Iran.

At first I thought if we consider neighbourhood committees as the healthy nucleus for revolutionary change, what if psychological clinics were organically linked to them? In Iran today, even in small towns, there is at least one psychological clinic in each neighbourhood. However, the predominant focus of these clinics is not on genuine emancipation of the people but rather on individualistic understanding and analysis, their own financial interests, and monthly profits. It is evident that if they were to change their strategies for interacting with neighbourhood committees, they would be at risk of losing their professional identity. To achieve true alignment between these clinics and the goals of neighbourhood committees, a fundamental shift in their approach is necessary. They must go beyond limited financial pursuits and embrace a broader vision that prioritizes societal emancipation. By doing so, the clinics would undergo a profound transformation that entails a complete change in their name and the elimination of the core discourse of traditional psychology. To effectively engage with neighbourhoods, these clinics must adopt a comprehensive understanding of human experiences, including the concept of "Perezhivanie" - experiences in which individuals change their relation to their environment (Blunden, 2016). They need to develop a materialist understanding of history and familiarize themselves with the social-political context in which events unfold. However, from an ontological perspective, I believe that such a profound change is impossible; psychological clinics cannot fundamentally alter their entire ontological structure.

Yet, I believe that the minority activists who are actively challenging the IRI regime and aim to employ psychology as a revolutionary tool, making nuanced changes, may gradually bring revolution in the discourse of psychology. The potential of these people to establish connections with neighbourhood committees holds the promise of transforming their approach and moving away from repressive discourse. For example, psychological sessions would no longer take place behind closed doors but would focus on collective problem-solving. By collaborating with neighbourhood committees, (apparently) personal issues will be examined in connection with everyday social events, including the current social movement(s). All individuals participate in committee sessions and learn to understand and analyse the link between personal issues and current and historical social movements in the country, rather than solely acquiring coping mechanisms and anxiety reduction techniques. It will become evident that despite of individual suffering; all individuals share a common pain. By observing and analysing these connections, these people in connections to neighbourhood committees can effectively address fundamental issues and promote changes within society.

Furthermore, these new forms of psychology should actively seek to establish connections with global movements and recognize the interconnectedness of social struggles beyond borders. For instance, by studying the other global movements, they can strengthen the sense of solidarity and leverage successes and challenges faced by similar movements worldwide. This broader perspective enables them to provide more comprehensive and relevant support to individuals in their immediate vicinity. Additionally, an interdisciplinary approach is essential for them to fully address the complex nature of psychological well-being. They must actively engage with other scientific fields such as sociology, anthropology, and political science to gain a more holistic understanding of the individual and their social context. Their interdisciplinary approach help them to create new forms of community-oriented entities instead of profit-driven institutions, actively contributing to the emancipation and consciousness of the people.

Conclusion

The uprising of Women, Life, Freedom (WLF) in Iran has revealed the cruelty and brutal violence of the Islamic Republic regime more than ever. In this article, I tried to deal with the psychological aspects of this oppression and clarify how psychology is used as a tool to suppress and control the uprising. The dominant discourse of psychology has often failed to address social structures of oppression, leading to limited understanding and ineffective solutions. The individualistic approach of psychology ignores the influence of society on individuals and perpetuates the prevailing conditions. Moreover, the flawed system of capitalism, patriarchy and misogyny exacerbates women's marginalization and limits their freedom. The concept of revolutionary psychology is fundamentally flawed within the current structure of psychology,

but there is potential to overcome this challenge. I believe that a transformational change can occur by creating organic connections between minority activists, psychologists who actively engage in protest movements and recognize the significance of political issues and their links to individual problems- and grassroots neighbourhood committees. This combination can adopt a holistic understanding of the human experience, prioritize social emancipation, and engage in collective problem solving with a focus on social movements. Recognizing the interconnectedness of global movements and adopting an interdisciplinary approach, these clinics can actively contribute to the liberation and well-being of people in their communities. This requires a fundamental shift in approach, moving beyond profit-based interests to becoming community-oriented institutions that promote meaningful change and challenge the status quo. I believe that the emerging models of psychology will revert to traditional psychology clinics if they do not actively engage with protesters in a radical manner. Establishing an organic connection with protesters and addressing their issues can bolster the strength of these movements and give rise to innovative forms of psychology.

Hope in the wake of rape: Mourning, rage and refusal in womxn's accounts of sexual violation

Rebecca Helman

Abstract

This paper explores if hope is possible in the wake of rape. Drawing on in-depth interviews with 16 womxn who have been raped in South Africa it explores how hope emerges within the context of endemic sexual violence. Moving beyond individualistic, (neo)liberal conceptions of hope proposed by mainstream psychology, I offer a social-political conception of hope that is bound up with mourning, rage, and refusal. This is a hope both constituted by and disruptive of the current state of sexual violence in South Africa. Womxn reflected on the normalisation of sexual violence and how this constrains the possibilities of constructing a different society. Yet, simultaneously, womxn's refusal of dominant understandings of rape demonstrates how sharing stories provides opportunities for solidarity which disrupt the isolation and alienation produced by rape. In the face of dismissal, denial, and shame, sharing their pain and violation, womxn perform a hopeful act, which demands care and empathy both within and beyond the interview. Womxn articulate hope in the wake of rape enmeshed with hopelessness and the pain of the present, without foreclosing possibilities for less unequal, less unjust, and less violent futures.

As we face ongoing crises in relation to climate change, war, the cost of living, migration, and the COVID-19 pandemic, among many others, questions about the possibilities of or hopes for a better future loom large. In my own work with womxn¹ who have been raped² in South Africa, I found myself often returning to questions of hope – could there be hope in the wake of rape, and if so, what kind of hope would this be? In this paper, I present a critical and situated exploration of hope within the context of endemic sexual violence, developed in relation to the narratives of the 16 womxn I interviewed. Moving beyond individualistic, (neo)liberal conceptions of hope proposed by mainstream psychology, I offer a social-political conception of hope that is bound up with mourning, rage, and refusal. This is a hope both constituted by and disruptive of the current state of sexual violence in South Africa. I begin by outlining the dominant ways in which hope has been conceptualised within mainstream psychology, as well as the problematics of these conceptions. I then discuss more critical conceptions of hope which are embedded within the inequalities of the present. I outline the

¹ The term ‘womxn’ is used to refer to all people who identify as women, female, femme, or trans. This term is intended to highlight the diverse and fluid ways in which gender is experienced and constructed.

² Within feminist scholarship there has been significant debate about whether to use the terms “victims” or “survivors” of rape. The term “victim” is seen to denote powerlessness and passivity, while “survivor” denotes resilience and agency (Alcoff & Gray, 1993). However, these binary categories preclude more complex understandings of how individuals may negotiate their post-rape experiences (for example, as simultaneous “victim-survivors” or by oscillating between these two categories). I have therefore chosen to use the term “womxn who have been raped”.

ways in which hope/hopelessness are socially and politically constituted in the South African context, including in relation to sexual violence. I then turn to hope in the wake of rape, as developed within the narratives of 16 womxn who have been raped in South Africa.

Conceptualising hope

Hope has a long history as an object of philosophical, religious, and artistic exploration (Kleist & Jansen, 2016). Within the humanities and social sciences, the notion of hope has been explored from many different disciplinary perspectives (Lopez et al., 2003). Broadly, hope has been defined as “what sustains life in the face of despair” (Zournazi, 2002, p. 15). Hope is also commonly bound up with orientations towards the future (Hage, 2016; Kleist & Jansen, 2016). Within the discipline of psychology, one of the central conceptualisations of hope was developed by Charles R. Snyder. He proposed that: “hope is defined as the process of thinking about one’s goals along with the motivation to move towards (agency) and the ways to achieve (pathways) those goals” (Snyder, 1995, p. 335). This two-factor model of hope has been central to the development of positive psychology (Colla et al., 2022). Psychological science has demonstrated the benefits of hope for individual functioning, with psychological conceptions of hope being linked to post-traumatic growth, resilience, and recovery (Colla et al., 2022; Mosley et al., 2020; Park & Chen, 2016; Saint Arnault & Sinko, 2019). For example, hope is seen to promote feelings of well-being (Bennett, 2015; Cherrington, 2018). In contrast, a lack of hope or hopelessness is seen to be linked to depression, distress, and suicide across a range of different contexts (Abramson et al., 2002; Cohen et al., 2018; Klonsky et al., 2012; Liu et al., 2015).

Within mainstream psychology, hope (and hopelessness) tend to be conceptualised in liberal, decontextualized, and individualist ways, focusing on individual capacity, subjectivity, or behaviour (Bennett, 2015; Colla et al., 2022; Mosley et al., 2020). More critical scholarship (both within and beyond psychology) has highlighted the problematic effects of these kinds of constructions of hope. Individualistic conceptualisations of hope make individuals responsible for cultivating and sustaining hope, while failing to engage with the broader contexts in which hope is produced. Katie Stockdale (2021) has argued that it is necessary to attend to how oppression, privilege and power produce, shape, and damage people’s hopes. In certain contexts, “people, in virtue of their social, political, and locations must ‘hope against hope’ for many of their desires to be fulfilled, if they are capable of hope at all” (Stockdale, 2021, p. 27). For example, in conditions of extreme poverty where people are struggling to survive day by day, there are limited possibilities for hopeful orientations towards the future (Long, 2021). Within (neo)liberal contexts hope may also operate to create particular kinds of aspirations which obscure the structural conditions of capitalism and inequality; for example, hope for upwards social mobility through ‘hard work’ (Hage, 2003; Wrangel, 2017). These kinds

of hopes may simultaneously create tolerance for uncertainty, insecurity, and poverty in the present, suspending people in a continual not-yet, rather than producing desires for political mobilisation, refusal, and the imagining of alternative worlds (Wrangel, 2017).

In contrast to mainstream psychological conceptions, more critical conceptualisations of hope engage with the painful inequalities of the present (Boler, 2004; Wale, 2022). These conceptualisations of hope are entangled with feelings of anger, bitterness, unhappiness, despair, and melancholy (Stockdale, 2021; Thaler, 2019; Unni, 2022; Winters, 2016; Wood & Litherland, 2018). For example, Winters (2016) has proposed a melancholic hope, which “in opposition to triumphant, overconfident narratives, tropes, and images, suggests that a better, less pernicious world depends partly on our heightened capacity to remember, contemplate, and be unsettled by [...] violence and suffering” (p. 16). A critical version of hope is thus one that critiques the past and troubles the present in order to seek what could be in the future (Cahill et al., 2010; Zembylas, 2022). In line with this critical approach, and in order to situate hope amidst current harrowing inequalities, I now turn to hope and hopelessness in the South African context.

A hopeful/less nation

In this section, I outline the broader context of hope and hopelessness in which my research is located. This includes the broader politics of hope, as well as the ways in which hope and hopelessness are entangled with sexual violence. The notion of hope has been central to the democratic project in South Africa. Describing the new South Africa, Ian Shapiro and Kahreen Tebeau (2011) write:

How could one overstate the hope and enthusiasm that accompanied its improbable birth? Millions throughout the country and around the world cheered as long lines of first-time voters queued patiently for hours in those three days in late April 1994 to legitimate the peaceful transition from apartheid and to select their first democratic government [...] it was a dream that many South Africans [...] never believed would come true (p. 1).

For millions of people, the hope of the new South Africa was the hope of living free from segregation and police harassment, the hope of access to basic amenities including sanitation, water and electricity, the hope of having a house made of bricks, the hope of new possibilities for dignity and respect (Ross, 2009). It was the hope of ‘a better life for all’, as articulated in the ANC’s 1994 election campaign. Since 1994 however, this hope has been repeatedly frustrated, as social and economic inequalities continue to haunt South Africa (Ndlovu-Gatsheni, 2018; Wale, 2022). Amongst recent responses to the painfully slow process of societal change were the Fallist³ student movements in 2015 and 2016.

³ The Rhodes Must Fall (RMF) movement began at the University of Cape Town (UCT) in 2015. Rhodes Must Fall (2015) describes itself as “an independent collective of students, workers and staff who have

These protests signal the ending of a politics of patience and hope (Pillay, 2016). The students, who have been ‘born free’⁴, ragefully⁵ disrupt discourses of healing, reconciliation, and ‘transformation’ that have characterised the post-apartheid context, thus demanding an end to a permanent state of ‘waithood’ (Ndlovu-Gatsheni, 2018; Riaz-Mohamed, 2015). Kim Wale, Pumla Gobodo-Madikizela and Jeffrey Praeger (2020) have referred to this as ‘haunted hope’, through which students (re)live the inequalities of the past, both within and beyond the university. The protests are disruptions of the ‘new South Africa’ as a project of hope – the students (and many others) are no longer prepared to wait hopefully for that which has been promised to them.

The issue of endemic gender-based and sexual violence in South Africa is also one which evokes both hopelessness and hope. South Africa is frequently referred to as ‘the rape capital of the world’ (Dosekun, 2013; Jewkes & Abrahams, 2002; van Schalkwyk, 2018). Research has repeatedly demonstrated alarmingly high rates of sexual violence. For example, one study found that 27.6 % of men reported having raped a woman (Jewkes et al., 2011). Another study found a lifetime sexual violence prevalence of 24.9% among women aged 18-49 (Steele et al., 2019). A third, (37.9%) of 17-24-year-old women surveyed at a university, reported having experienced sexual violence (Ajayi & Ezegbel, 2020). These statistics are accompanied by a “grammar of horror such as endemic baby rape, corrective lesbian and grand-mother rapes” perpetuated by the South African media (Hirschauer, 2014, p. 84). Pumla Gqola (2015) has proposed that contemporary South Africa is constituted by “the female fear factory” or “the manufacture of female fear”, through which the threat of rape works to “remind wom[x]n that they are not safe and that their bodies are not entirely theirs” (pp. 78-79). Within this context the sexual violation of womxn has, to a great extent, become normalised, creating a widespread sense of hopelessness about the possibilities of intervening in and disrupting this status quo.

come together to end institutionalised racism and patriarchy at UCT” (n.p). Following the Rhodes Must Fall student protests, Fees Must Fall began in October 2015, as a student movement to protest against annual fee increases. Collectively Rhodes Must Fall and Fees Must Fall are referred to as the Fallist student movements.

⁴ The term ‘born frees’ refers to the generation of South Africans who were born after 1994.

⁵ I articulate rage as a particular kind of anger. While anger is an affective response to (perceived) injustice, rage is a reaction to the refusal to attend to this appeal for justice (Lyman, 2004). Rage is, thus, an affective response produced by being unable to take any more suffering, anguish, or distress, unable to remain painfully constructed any longer (Canham, 2018).

<https://www.groundup.org.za/imagegallery/photo/1317/>

In the face of continued violation of womxn’s bodily autonomy and the failure of various institutions, including the state and the police, to take this violence seriously, activist and performative interventions have been staged with increasing frequency to call attention to and challenge the ongoing onslaught of violence against womxn in South Africa (Shefer, 2019). Recent interventions, which I outline briefly below, include #RememberKhwezi⁶, #RURreferenceList⁷ and #TotalShutDown⁸/ #AmINext17⁹.

On the 6th of August 2016, during the Independent Electoral Commission’s (IEC) ceremony announcing the results of the election, Simamkele Dlakavu, Tinyiko Shikwambane, Naled Chirwa and Amanda Mavuso stood up as, then president, Jacob Zuma was addressing the nation. With their backs to Zuma, facing the crowd and the cameras, they held up placards that read “I am 1 in 3”¹⁰ “10 yrs later” “Remember Khwezi” and “Khanga”¹¹ (Wazar, 2016). The protest was a disruption of the narrative of democratic progress in South Africa, demanding that the nation reflect on how womxn are continually failed within

¹⁰ This is a reference to the widely circulated statistic that 1 in 3 womxn in South Africa will be raped in her lifetime.

¹¹ ‘Khanga’ refers to the draped cloth that Fezekile was wearing on the night that she was raped by Zuma. During the trial Zuma testified that her wearing of the khanga was an invitation for him to have sex with her.

the new South Africa (Gqola, 2017). The reference to “10 yrs later” was a prompt to reflect on the fact that it had been 10 years since Jacob Zuma was acquitted of raping Fezekile Ntsukela Kuzwayo.

On the 17th of April 2016 a list of eleven men’s names and “et al” (denoting “and others”) was published on the Rhodes University Queer Confessions and Crushes Facebook page – entitled “Reference List” (Seddon, 2016). The list was posted as a response to the university management removing posters protesting against sexual violence. One of the posters stated: “You are more likely to be excluded for plagiarism than you are for rape” (Haith, 2016, n.p.). Following the publishing of the RU Reference List, womxn and queer students disrupted university classes and marched topless to protest against the university management’s repeated failure to respond to rape on campus (Gouws, 2018). The protest quickly spread to other South African universities, including UCT, the University of the Western Cape (UWC), the University of Kwa-Zulu Natal (UKZN), and the University of Witwatersrand (WITS) (Shewarega Hussen, 2018)¹².

In August 2019, which is celebrated as ‘Women’s month’ in South Africa to commemorate the 1956 Women’s march to the Union Buildings, at least 30 women from a range of different backgrounds, in different parts of the country, were killed, many of them by their partners (Davis & Kubheka, 2019). Widely publicised cases included those of Uyinene Mrwetyana, Leighandre ‘Baby Lee’ Jegels, Janika Mallo, Jesse Hess, Meghan Cremer and Lynette Volschenk (BBC, 2019; Merten, 2019). Many of these womxn were subjected to sexual violence before being killed. August 2019 represented just one moment in the relentless assault, both embodied and symbolic, on the bodies and senses of womxn in South Africa (Gqola, 2017). In particular, the rape and murder of Uyinene Mrwetyana by a post-office worker when she went to collect a parcel, provoked wide-spread outrage and horror (Levitt, 2019). Uyinene’s murder sparked hashtags such as #AmINext and #SAShutDown (Levitt, 2019; Lyster, 2019). Protests, led by womxn and queer people, were staged in both Johannesburg and Cape Town in response to what many called “the war on womxn’s bodies” (Hoosain Khan, 2019, n.p.).

I read these protests as acts of critical hope, which are “radically unreconciled to the present” (Eagleton, 2015, p. 69). Through these protests womxn make the pain of rape intelligible, while demonstrating rage that these conditions prevail (Gouws, 2018). These are acts of collective mourning – for all the womxn (and people of other genders) that have been violated. These protests refuse and disrupt dominant narratives about rape – as individualised acts committed by a select number of perpetrators and which blame womxn for being raped. Instead, they assert that rape is rooted in cultures of patriarchy which denies womxn’s humanity, dignity, and rights, in line with critical feminist perspectives (Alcoff, 2018; Gqola, 2015; Mazibuko, 2018). These protests are

¹² Both the Remember Khwezi protest and the RU Reference list occurred within the context of the Fallist student movements and calls to decolonise institutions of higher education in South Africa. Within the Fallist student movements there were multiple instances of violence against female and queer activists by their male comrades (Lujabe, 2016; Ndlovu, 2017; Ratele, 2018).

also examples of how hope is cultivated alongside rage under conditions of oppression (Stockdale, 2021). Here rage is both a response to the injustice of the violation of rape and a response to the failure to take it seriously. Thus, rage is not only directed towards rapists but also towards “a world that reproduces that violence by explaining it away” (Ahmed, 2017, p. 31). In demanding the protection of womxn’s rights and dignity, they demand a different future. Thus, these protests “provide hope and inspiration for collective action to build collective power to achieve collective transformation, rooted in grief and rage but pointed towards vision and dreams” (Cullors in Solnit, 2016, p. xiv). They are examples of how hope can be cultivated through solidarity or hoping together (Stockdale, 2021). It is within this context in which hope is enmeshed with hopelessness, mourning, rage and refusal in which my own research about rape is located. Below I provide a brief overview of the research project before turning to my analysis of hope in the wake of rape.

“Hundreds gather outside the Johannesburg Stock Exchange (JSE) to protest against gender based violence” on 13 September 2019. Photo by Zoë Postman. © 2016-2020 GroundUp. 

<https://www.groundup.org.za/imagegallery/photo/1324/>

Exploring experiences of rape

Broadly, my research explored how womxn’s feelings about their experiences of rape are structured by the social context of sexual violence in South Africa. Here feelings are conceptualised not as individual psychological dispositions but as mediations between the psychic and the social and between the collective and the

individual (Ahmed, 2015). This approach was informed by affective, feminist, decolonial and African-centred perspectives. I was interested in “processes of affecting and being affected” and affect and affectivity in relation to what bodies can, and do, do in relation to other bodies (Ahmed, 2015, p. 208; Lykke, 2018). This included attending to the ways in which the womxn I interviewed and I are deeply *affected* by being situated in (South) Africa (Ratele, 2019). My approach builds on the work of both feminist and decolonial scholars who have demonstrated the ways in which oppression is enacted at the level of feelings¹³ (e.g. Ahmed, 2015; Lorde, 1984; Fanon, 1967). This approach pays attention to “how power circulates through feelings and how politically salient ways of being and knowing are produced through affective relations” (Pedwell & Whitehead, 2012, p. 116). As well as the ways in which what is felt has the potential to break down, reinforce, build up and bring into focus the multiple frames through which life is structured (Engle & Wong, 2018). I understand hope as a relational, political, visceral, and embodied element of everyday life, constituted by structures of power and operating as a possibility for resistance (Suffla et al., 2020).

I recruited participants via the Rape Crisis Cape Town Trust Facebook page¹⁴. Anybody who identified as having been raped and who identified as a womxn was eligible for inclusion in the research. I interviewed the first 16 womxn that contacted me. The interviews were conducted between August 2018 and May 2020. I also drew on my own experience of rape and shared this with participants in the interviews (Ellis & Bochner, 2000). I interviewed each participant twice, to build trust and develop in-depth, nuanced understandings of their experiences. Participants selected the time and place for the interviews. Two interviews were conducted over the phone due to my inability to travel to those parts of the country¹⁵. The interviews were semi-structured, guided by open-ended questions about participants’ experiences of rape, as well as their reflections on rape within the South African context more broadly. Prior to the initial interview I provided each participant with an information sheet, outlining the details of the study. Participants were required to sign a consent form before the interview began. Participants who were interviewed over the phone were asked to give verbal consent. I provided each participant with a list of counselling resources they could access in the case that they experienced the interview as distressing. Despite the sensitive nature of the topic, most of the participants appeared to experience the opportunity to share their experiences as largely constructive, cathartic and affirming. Some of them explicitly reflected on this in the follow up interview. I shared my analysis with all my participants to ensure that they were comfortable with the ways in which I had represented

¹³ I have chosen to employ the term feelings in recognition of the “the ambiguity between feelings as embodied sensations and feelings as psychic or cognitive experiences” (Cvetkovich, 2012, p. 80).

¹⁴ I chose this strategy so that the invitation to participate in the research would not be completely out of the blue, in order to avoid triggering people. Through this platform, participants were already engaged in a space in which rape was discussed.

¹⁵ Despite the less personal nature of a phone interview, I felt it was important to include the experiences of womxn who live outside of the main national metropolises in order to diversify the perspectives offered by my research.

them and their experiences. None of the participants raised any concern with my analysis and some of them acknowledged the significance of being able to read what I had written.

Participants

The womxn I interviewed were aged between 19 and 50, with the majority of them being in their late 20s. Nine participants self-identified as ‘white’, six as ‘black’ and one as ‘mixed heritage’. Nine participants self-identified as heterosexual, five as queer, one as lesbian and one as bi-sexual. Most of them lived in middle-class neighbourhoods (12) and had completed university level education (13). All participants identified as South African, except one, who identified as Zimbabwean. Six of the participants indicated their first language as English, two as Shona, two as isi-Xhosa, two as Afrikaans, two as both English and Afrikaans, one as Sotho, and one as Venda. Due to my own linguistic limitations, all the interviews were conducted in English. Most participants (10) lived in Cape Town, two in Pretoria, two in Johannesburg, one in a town in the North West province and one in a township south of Gauteng. I have used pseudonyms to protect all participants’ identities. I provide details of each of the participants whose narratives I share below, in recognition that their identities and experiences are not reducible to the categories I have provided here.

Analysis: Hope after rape

I have felt utterly hopeless in many moments during my research with womxn who had been raped. The magnitude of the violations that were shared with me, not only the acts of rape themselves but the lack of care by medical personnel, the police, family members and friends, as well as society more broadly was, in many moments, beyond comprehension. Simultaneously, as I was collecting narratives from womxn, I was constantly bombarded by newspaper headlines proclaiming grotesque acts of violence: ‘HALF-NUDE TEEN FOUND DEAD IN TOILET’ and ‘RAPED BY FIVE MEN IN ONE DAY’. Thus, a sense of deep hopelessness was a key part of what it felt like to do this research. This feeling of hopelessness was echoed by Jamie¹⁶ in our initial interview. She said: “there’s a lot more of... like hopelessness, I suppose. Like ‘ah fuck is this shit ever gonna end?’” And yet, as the project was drawing to an end, in awe of the fierce vulnerability of all the womxn who had shared with me, I found myself returning to hope (Helman, 2022).

In engaging with (critical) hope, I seek to disrupt racist and colonial constructions of South Africa as a place ‘without hope’. As Floretta Boonzaier (2017) has powerfully demonstrated, poor, ‘black’ communities with high rates

¹⁶ Jamie described herself as: “I... er am a counsellor [...] I am a white queer person [...] Um... so... middle-class upbringing, Joburg all the way. Um... er a mixture of private and public schooling throughout primary and high school”.

of violent crime in South Africa are repeatedly represented in the mainstream news media as hopeless spaces. She shows how one particular community is described as “as a place of hopelessness, with ‘social ills’, including high levels of alcohol abuse, ‘broken families’, unemployment, poverty, high school dropout rates, drug abuse, and teenage pregnancies” (Boonzaier, 2017, p. 474). These images form part of a broader archive through which African people are rendered as passive victims of violence, trapped in conditions of unlivability (Judge, 2015; Mavuso et al., 2019; Shefer, 2018; Tamale, 2011). Thus, to construct people as being without hope is to deny possibilities for resistance, refusal and re-making of the world. To deny hope in the wake of rape is to reproduce notions of womxn who have been raped as ‘irreparably damaged’ (Barker & Macleod, 2018). Yet, I remain cognisant that a focus on hope in the wake of rape also has the potential to reinscribe glorified conceptions of survivorship, which deny the ongoing pain that ‘survival’ entails. Thus, I develop a social-political conception of hope in the wake of rape; a hope bound up with mourning, rage and refusal. As I will show this is a hope which is full of pain, rooted in woundedness and committed to mourning what has been lost (Bozalek et al., 2014; Thaler, 2019; Winters, 2016).

My analytical approach was guided by the following (entangled) questions: what are participants’ affective responses to their experiences of rape? How are these affective responses entangled with the socio-political context of rape in South Africa? How am I affected by what participants tell me? What does my affective response indicate about the broader affective context of rape? My analysis was developed through multiple close readings of interview transcripts and extracts from my research diary, which I used throughout the research process to record reflections. The interview transcripts and research diary extracts were coded in relation to different affective responses to rape. Through repeated engagement with each individual transcript, as well as reading the transcripts as a ‘whole’, I identified the most dominant affective responses to rape, of which hope was one.

The pain of hope

All the womxn I spoke to reflected on the endemic nature of sexual (and other forms of gendered) violence in the South African context. This normalisation of sexual and other forms of violence against womxn constrains the possibilities of constructing a different kind of society.

Buhle¹⁷: Society is shaped in a way that healing is not something that supposedly happens naturally, that when you get your, when you you you you, when you get raped [...] the society is is is channelled in a way that um everything that they do in society just drive you to feeling more unworthy [Rebecca: Mhmm], more unnormal [Rebecca: Mhmm] [...] I think if society was welcoming of victims er

¹⁷ Buhle described herself as: “I’m a 27 year old. I am married. I’ve got two kids. I’m a stay at home mom. Um but I do have a qualification that I did at UJ. Um I love my kids. I love my life. Um ja there are still things that I you know have to work through as a survivor but generally I’m a happy person [...] I’m black... um straight [my home language is] Xhosa”.

and survivors it would, healing would come easier (Second interview, phone, 23 May 2020).

Tanya¹⁸: I really hope that...in a generation or two from now people will...have to think hard about what is rape again and... [Rebecca: Mhmm] things like- that would make me happy...if it could be like that, I'll be very happy. And if I can- in my generation get to a point where, when things like this happen to women...they feel free [Rebecca: Mhmm] ...to...report it...[Rebecca: Mhmm] to see justice being done [Rebecca: Mhmm]...and to feel that...there's a society around them that will embrace them [Rebecca: Mhmm] (Second interview, coffee shop, Johannesburg, 5 May 2019).

Both Buhle and Tanya articulate how the contemporary context creates barriers to “healing” and “justice” for womxn who have been raped. They reflect on how shame is a central affective barrier as womxn are made to feel “unworthy” and “unnatural” and they do not feel “free to report” rape. This echoes other research, which has shown how womxn who have been raped are shamed (Fleming & Kruger, 2013; Gavey, 2005; Gordon & Riger, 1989; Womersley, et al., 2011). Here, Buhle and Tanya express the pain and the struggle that ‘surviving’ rape entails. It is in response to this pain and struggle that they imagine a different kind of society – one in which “healing would come easier” and in which womxn who experience rape will be “embrace[d]”.

Alongside this, Tanya also articulated a hope for a society in which rape is unimaginable. I argue that these are examples of hope intertwined with despair (Thaler, 2019). It is in recognising and explicating the current situation of survival as untenable that Buhle and Tanya are able to articulate a need for transformation (Eagleton, 2015). Their notions of “healing”, “justice” and being “welcomed” and “embraced” are constituted in relation to the current configurations of pain, shame, silencing, alienation and isolation produced by rape. In gesturing towards hopefulness Buhle and Tanya do not banish their despair (Mayes & Holdsworth, 2020), nor do they embody a hope that escapes from the present (Zaliwska & Boler, 2019). In fact, it is the acknowledgment of past and present pain, despair and horror that comes to circumscribe the possibilities of a different future (Thaler, 2019). While both Buhle and Tanya present (hopeful) imaginings of a different society, they simultaneously construct this alternative society as a distant possibility. Tanya’s reference to “in a generation or two from now” suggests that shifting social conditions in relation to rape will be a long process. This comment points to the entrenched and normalised nature of sexual violence in South Africa and how this constrains opportunities for hope. The hopelessness of the present recalls Jamie’s comment, mentioned above, which evokes the relentless of sexual violence: “Like ‘ah fuck is this shit ever gonna end?’”. This hopelessness is entangled with a broader state of hopelessness, about the lack of meaningful change that has taken place in

¹⁸ Tanya described herself as: “I’ve had a vary varied career. So I worked in... in IT and I’ve worked I’ve now recently started e- I’ve started my er being a lawyer... White, Afrikaans-speaking, I am financially comfortable. I’m extremely determined...I never stay down...I’m *extremely* resilient... I’m...I-or-I think...I’m the type of person that people like to take to war with them. Um...I’m dependable... but I’m also adventurous. I’m a pioneer...um...I *love*...breaking moulds I love enabling people...I *love* people. Um...I like helping people. Um...I’m a *strong* personality”.

South Africa since the birth of democracy and the promise of ‘better lives for all’. Buhle and Tanya’s hopes for a different future, entangled with the pain of the present, echo the demands of those protesting against rape and other forms of gender-based violence in South Africa.

Performing hope

For many womxn to talk about rape is a difficult and painful experience. In my interviews there were frequent silences and whispers as my participants struggled to share their violations (Helman, 2022). Within a context steeped in shame, as Buhle describes above, to come forward to talk about rape, to share painfully despite past experiences of dismissal and denial, is to perform hope. As Terry Eagleton (2015) has argued, “hope is not simply an anticipation of the future but an active force in its constitution” (p. 84).

Faith¹⁹: Some people are also in my position. It might be a boyfriend or someone else [Rebecca: Mhmm] [...] ja so I know that for someone who would listen to my story or read my story they would probably be encouraged that you don't, it

¹⁹ Faith described herself as: “Well I’m thirty years old. I’m mother of two. My first girl is th- turning thirteen now and the other one is turning seven. But I live by myself i- here in Cape Town, my kids live with my mom in Zimbabwe. So um I work for a company that we... um they got contracts o-of new houses and they ma- let them out [...] and part-time I also do I’m a nanny [...] I’m well I’m a black girl, woman. Um... I’m from Zimbabwe. I speak Shona and... I go to church, part of the time I go to church but I’m I’m a Christian”.

doesn't, it d- it's it's not about the relations that you have [Rebecca: Mhmm] with someone else. If someone did that kind of thing to you it is still rape [Rebecca: Mhmm] you know? [Rebecca: Mhmm]. It doesn't matter who who who who did that to you [Rebecca: Mhmm] you know? (Second interview, coffee shop Cape Town, 12 May 2019).

Bianca²⁰: Shit there was a 17-year-old girl... who went through all of this um... who... who did e- I went through that alone... and... I don't want that for... for other people [inhales] (First interview, Bianca's house, Cape Town, 22 August 2018).

Here both Faith and Bianca articulate the hope for social responses to rape that are different from those that they experienced, in a similar way to Buhle and Tanya above. This performance of hope is linked to a desire to disrupt shame and silencing. Since the rapist was her ex-husband, Faith articulates how the myth that rape is perpetrated by strangers (Abrahams & Jewkes, 2010; Gavey, 2005) limits the support that womxn receive when they are raped by someone that they know. As Bianca recounts, she did not tell her family about the rape and so had to cope unsupported. Here she reflects on how she hopes that other womxn will not have to experience their rapes alone, as she did. Bianca's articulation of "shit" is full of both pain and rage, mourning her 17 year old self. This rage and mourning reverberates with that expressed by those involved in the #RememberKhwezi, #RURferenceList and #TotalShutDown and #AmINext interventions. Thus, Bianca and Faith's hope for something different emerges within the context of pain, shame and rage. This is a hope which recognises the ongoing difficulties of articulating the harm that rape wreaks. It is a hope which acknowledges the ongoing power of shame to blame and responsabilise womxn for being raped. It is a hope with mourns the isolation and lack of support that rape produces.

Faith and Bianca do not merely articulate hope for a different future but they *perform* this hope. In the face of shame, denial and dismissal, to come forward to share one's experience of violation is a hopeful act, which demands care and empathy both within and beyond the interview. For Bianca, Faith and many of the other womxn I interviewed, hope is performed through resisting shame and silence, in the act of daring to share despite these negative possibilities. It was through these hopeful acts, entangled with mourning, rage and refusal, in which womxn engendered care towards themselves in (re)articulating the locus of the violence and shame that had been inflicted upon them. It is these performances of hopeful love and care, which have evoked a sense of hope in me. In sharing their painful stories, the womxn I have interviewed hope to give hope to other womxn; a hope that they are not alone, that the rape is not their fault, a hope that places of support, love and rage, in

²⁰ Bianca described herself as: I'm doing my internship for to register with the [Health Professions Council of South Africa] as a research psychologist... I used to model and sometimes I miss that a lot. Um mainly because of the money [laughs][...] I'm a white female. I come from a er middle-class family. Um, English but I was raised in a fairly um conservative Afrikaans area [...] So ja it sort of like that was that was very interesting growing up s- um identifying as a feminist".

which the pain and shame of rape can be worked through, can be found or created.

Hoping with others

For all the womxn I spoke to, rape operated as an act of dismemberment, which cut them off from their bodies, their sense of themselves, as well as their relationships with others. The shaming and blaming, that they experienced made them feel in many moments that the rapes were their own fault. Yet, as I have shown above, the interview operated as a space in which they could re-member themselves, and tell different stories about the causes of their violations. In this way, the grip of the present was loosened (Eagleton, 2015) and a different future was made possible.

Camille²¹: as like women sharing information and sharing personal experience... [Rebecca: Mhmm] feel like that is you know like it's a really, it's a really important connection and it's a really important way of understanding our-ourselves through other people [Rebecca: Mhmm] and other people's experiences and that is like the essential humanity (Second interview, coffee shop, Cape Town, 22 May 2019).

Refiloe²²: And also as we're doing this interview you know I'm just sitting here thinking about it, as much as you're doing this interview to get like individual experiences and [inhales]... but you made me sort of like... I- I'm able to understand in the broader... social context [Rebecca: Mhm. Mhmm] You know [inhales] you know I-I'm able to sort of like from a moment stop saying 'me me me me me' [Rebecca: Mhmm] that this happened to me me me me [inhales] but also to understand it from a broader social perspective [Rebecca: Mhmm] that as much as this is my experience [inhales] but this is also your experience. This is something that we [inhales] we-we've gone through you know. It might have been at a different place, [Rebecca: Ja] at a different time but it somehow we share common experiences [Rebecca: Ja] and that's liberating [Rebecca: Ja]. For me I'm finding it very very liberating. I know that [inhales] now onwards I don't have to think about it as something that is shameful [Rebecca: Mhmm. Ja]. I don't have to think about it as something that is just an individual experience [Rebecca: Ja, that belongs to you. It doesn't belong to you] That is ja. [Inhales] Ja (First interview, hotel, Pretoria, 10 December 2018).

²¹ Camille described herself as: "Um I'm four percent South East Asian, according to 23andme, and like two percent African. So I'm like super white. And my family is like half Afrikaans, half English. I grew up speaking English, just [inhales] all the privilege, middle-class, private schools. Um... always just had... like a really [exhales]... I guess protected life but also like lots of opportunities, never doubted myself, never doubted my ability to do what I want. Um... very sexual and sexually active. I've slept with like 40 partners and sex is something that I really enjoy and you know have a good time with [...] I'm so straight [both laugh]"

²² Refiloe: "I'm the oldest child, which means I'm also the oldest um granddaughter. [Inhales] Er I was brought up by my grandparents in a very very very small village. But then er coz my parents has me when they were very young [laughs] [...] I'm currently doing my PhD in criminology [...] I identify as what a black female [...] I think middle-class ja. Middle-class ja [...] I date guys".

Here both Camille and Refiloe reflect on how, through sharing experiences of rape, these “individual” experiences of rape were re-conceptualised as fragments of a much broader social and political problem (Alcoff, 2018; van Schalkwyk, 2018). Camille reflects on how the sharing of experiences enables alternative humanising understandings of rape. As Refiloe reflects here, the sharing of experiences within the interview (in which both she and I shared aspects of our experience) allowed her to disrupt her own sense of individualised responsabilisation and shame for ‘having been raped’. These are examples of refusals of dominant understandings of rape. They show how sharing stories can provide opportunities for solidarity, which disrupts the alienation and isolation that rape produces (Padmanabhanunni & Edwards, 2016).

The interviews operated as a space in which my participants and I engaged in attempts to repair and extend our ‘worlds’ in hopeful ways (Fisher & Tronton, 1990). These are hopeful repairs and extensions in the face of dehumanisation and silencing. These are collective acts of “re-membering, practicing hopefulness that... reconfigur[e] possibilities for the future, finding possibilities to endure” (Flint, 2020, p. 59). This is reflected in my own sense of hope that remained in the wake of this research about rape. It was also reflected in other moments that extended beyond the research. After participating in the research project, Buhle contacted me to say she had established a space for womxn in her community to come together and share their experiences of rape. In our second interview, Tanya told me how, following our first interview, she spoke openly for the first time about her experience of rape in her church in the hope that this would disrupt the silence about rape in this space. These are acts of solidarity, which hope with others, in the face of denial, dismissal, silencing and shame. They demonstrate how hope is both constituted by and of the social.

Conclusion

In proposing a socio-political conception of hope in the wake of rape, I have sought to situate hope within endemic sexual violence in South Africa. This conception of hope is an attempt to wrest hope from the narrow confines of mainstream psychology (Malherbe, 2022). Rather than reproducing a psychological conception of hope which responsabilises individuals to feel hopeful, promoting adjustment to the harmful conditions of present sexual violence, a critical, social-political conception of hope holds together moments of hopelessness, mourning, rage and refusal. This is a hope enmeshed with the hopelessness and pain of the present, without foreclosing the possibility of a less unequal, less unjust, less violent future (Thaler, 2019). This conception of hope recognises the ongoing struggle to ‘survive’ rape, amidst persistent victim-blaming, shaming and silencing. This conception of hope recognises that while the pain of rape may persist, womxn who have been raped are not ‘irreparably damaged’, fixed in positions of victimhood. As Laura Halperin (2015) powerfully writes:

hope exists in attempts at resistance, however futile these attempts may be or seem. It exists in the sharing of painful individual collective historias (histories and stories) and in the remembrance of harm in order to move past it and seek to rectify it. Remembering in these narratives doesn’t just consist of recollecting the

past; it entails recalling the past so as to remember it, giving it new shape in order to move forward towards a less harmful world” (pp. 3-4).

These are small, powerful acts of hope, which chip away at the isolation, shame, and pain in the wake of rape. This is a hope which refuses dominant narratives of rape, and through this refusal different possibilities of relating, both to the self and to others, are kindled. Through solidarity and hoping with and for others, the womxn I interviewed both demand and begin to construct a different future.

She holds a PhD in Psychology from the University of South Africa. Rebecca's work explores violence and its effects, with particular emphasis on the role of intersecting forms of inequality.

Struggles, Visions, and Future Possibilities

The daily struggle for social change: Psychology as politics

Raquel S. L. Guzzo, Eduardo Alessandro Kawamura, Antonio Euzébios Filho & Larissa Baima

Abstract

In a country like Brazil, unequal and violent, Psychology assumes an inescapably political role in its production of knowledge and professional practice in different fields of activity. Psychology either organizes itself to contribute to social changes and questioning of individualistic theories or it develops theoretical contents and oppressive practices to contribute to producing suffering, remaining hegemonic, in harmony with the model of capitalist exploitation. The contrast between these positions is clear, especially when analysing the different positions expressed in scientific productions and technical references made available to Psychology professionals in the country. Understanding why people do not react collectively to the current threats and the destruction of public health, education, science, and technology policies facing the authoritarian project underway by the current government has been a very important ask in Psychology. This occurs precisely because psychological science still adheres to the dominant neoliberal ideas that produce trauma, disarticulate community groups and feed individualistic behaviours with the logic of care which insists on not realizing the fundamental role of economic and political organization in the production of suffering and illness. Based on critical psychology, this article demonstrates how Psychology is political, as a science and as a profession, that is, either in the elaboration of theories which corroborate liberal principles nor that contextualize the psychological phenomenon from a critical reading of capitalism. Psychology also manifests itself in practices that move towards conformism, adaptation and reproduction of social roles contributing to overcoming fatalism in its different dimensions. For democratization and community strengthening, it is necessary to understand suffering as political, facing adverse conditions. Psychology should be an instrument for promoting awareness, through the recuperation of historical memory and through action, through its collective and political impacts, through changes in individual behaviours and in overcoming psychosocial trauma. Psychology is always political in one direction or another; for this reason it is important to think about to whom it is serving as a science and a profession.

Keywords

community, ideology, liberation, political psychology

1.Introduction

Psychology as a profession was regulated in 1962, a time when Brazil went through a troubled political moment - a coup d'état was enacted in response to a popular and democratic government. A new professional training model was established with five-year regulated undergraduate courses. In sixty years of its regulation as a profession and science, psychology has undergone important changes, always related to the social and political conjuncture present at the historical moment.

This development of the discipline was strongly affected by the 1964 civil-military dictatorship, which had a great impact on the life of the Brazilian people with a dynamic of restrictions imposed on individual freedoms, on the right to information, and marked by violence, death, and disappearances. In vocational training courses, psychology was not unharmed. The restrictions involved access to knowledge in the field, especially from a more social and critical perspective. Professional practices and knowledge arising from diseases and mental disorders, conceived individually were prioritized through the surveillance of the faculty and curtailment of the right to student and professional organization. This led to a depoliticised, non-critical, mostly bourgeois profile that, although it recognized the limits of the profession to deal with social reality, reproduced in professional practice and its academic background an uncompromising and colonized attitude in the face of needed social change. A hegemonic psychology was taught and learned, which did not offer effective and radical possibilities for social change, did not respond to the contemporary demands and real living conditions of most of the Brazilian population, and did not engage with the specific Brazilian and Latin American context. Nevertheless, professionals who practiced in different fields of action and felt the distance between what was learned in undergraduate courses and the lived reality of their workspaces, began to mobilize, advocating for the necessary changes in public policies, especially in the training environment, reinforcing the commitment to human rights, to theoretical-methodological plurality, with human diversity, inclusion and ethical and scientific quality.

Brazil today has approximately 1075 training courses in psychology, according to the portal of the Brazilian Federal Psychology Council¹ and 425, 968 professionals, with very different characteristics and profiles, according to their training trajectories, highlighting the time when they graduated and the type of training institution. Psychology courses are, at present, offered mostly by private and religious institutions responsible for approximately 85% of trained professionals. Different training and professional practices occur in public institutions. With a progressive conception of the profession expressed in the national curriculum guidelines, but with a conservative training practice developed by university institutions, there is also the need to overcome the distance between what a political psychology could be and what, in fact, it mostly is when professionally practiced. We can understand this distance as the result of a conservative psychological science orientated to the demands of the

¹ <http://www2.cfp.org.br/infografico/quantos-somos/>

market which therefore does not engage in the critical, liberating and transforming formation of reality.

Our view is that fighting social inequalities is a political task for psychology. As Genaro (2022: 1)² notes, the abyss that separates the poor from the rich is the result of an economic system that, to concentrate resources in the hands of the few, must deepen the exploitation of the many anywhere on the globe. For this author, social inequality bothers those who point to capitalism as capable of providing for the well-being of all, so many aspects of social reality are obscured by naturalising the distance between rich and poor. The accommodation of most people and their inability to properly analyse the economic reality, which covers the determining role of social relations of production, diminishes the chance of enabling radical social changes. And that is why psychology can only contribute to needed social change when it is assumed that this field of knowledge and training must stop being an instrument for maintaining the *status quo* (Parker, 2009). This work has as its main objective to deepen the understanding of the history and role of psychology in Brazil, as well as glimpse the possibilities of a counter-hegemonic psychology in the face of the dismantling of science in the country with the rise of the far right and, consequently, with the deepening of inequality.

2. Psychology and the socio-economic context

We know that psychology as an autonomous science is born in a context of consolidating bourgeois society, responding and serving this process (e.g. Danziger, 1990³). Its foundations, in this sense, allude to the liberal ideological principles that are based on the notion of an autonomous individual, essentially free and responsible for her or his destiny. Its extensive historical contribution to processes of pathologizing, homogenization and segregation express well their theoretical and practical assimilation with these principles and the reproduction of the capitalist social order in Brazil and in the world.

This capitalist order, although hegemonically consolidated since the eighteenth century, has experienced, over time, moments of crisis, setbacks, and counter-offensives in its economic and social project. These different moments, in turn, impacted the theories and practices developed by psychology in the course of their history. Not by chance, revolutionary historical periods, marked by advances in class struggles, directly influenced the formulation of critical projects in psychology, which fought their individualizing, dehistoricizing and depoliticizing trends. The current historical moment, however, has been of the retreat of subaltern struggles, while the projects of structural social change and the advance of the offensive of capital have presented a new intensity.

³ Danziger, K. (1990). *Constructing the subject: Historical origins of psychological research*. Cambridge University Press.

To understand how psychology has possibilities of either serving as a tool for maintenance or facilitating a rupture with the dominant social order, requires analyzing its links with this process, because it is through them that the psychosocial conditions, to which it is called to respond, are articulated. In this reflective effort, we need to analyze psychology's more general nexus with the process of capitalist social reproduction, as more specific to the current moment of crisis and neoliberal restructuring. By neoliberal restructuring, we refer to the economic and social process that has become widespread in the world, especially from the 1980s, which represented capital's response to its structural crisis, which began in the previous decade.

Appearing in the 1940s and made up of distinct intellectual currents, neoliberal theory gained greater relevance during the crisis and capitalist reorganization of the 1970s and 1980s. It was during this period that the first socioeconomic experiences inspired by the neoliberal think tanks were applied, first in Chile, during Augusto Pinochet's coup government and then in the United Kingdom and the United States, with the governments of Margaret Thatcher and Ronald Reagan, respectively. Despite the theoretical differences between their distinct currents and the geographical and temporal particularities of their experiences around the world, it can be said that neoliberalism has developed as a political-economic theory founded on the premise of the promotion of individual entrepreneurial freedoms and abilities, in the struggle against collectivism and in the alleged combat of state interventionism (Harvey, 2008).

As an economic and government experience, it developed based on the productive restructuring of post-crisis capital, leading to a large-scale privatization prescription in the world's central and subordinate countries, to the downsizing of the state in areas such as services of social welfare, the reduction of public spending, in part through the means of monetary policies, and the dismantling of social and labour rights (Antunes, 2009). The effects of these social and economic measures aided the reconfiguration of accumulation and capitalist expansion. Its impacts, however, are not restricted to the economic and social sphere, but they have decisive impacts in the reorganization of fields such as culture and production of subjectivity.

It is precisely in the context of neoliberalism that the ideological movement of propagating subjectivism and individualism is most intensified, with the liberal ideas of individual dignity and freedom, raised to become the central values of 'civilization'. Neoliberalism has consolidated its hegemony not only by applying an economic prescription and political and social measures, but also by the "conquest of hearts and minds", as expressed by Thatcher, incorporating itself into the ways of thought and "In the daily ways of many people interpret, live and understand the world" (Harvey, 2008, p. 04).

With neoliberalism, the hypertrophy of individual action could achieve its maximum development. An expression of this is in the widespread use of concepts such as "human capital" (Becker, 2009; Schultz, 1972), which moves to the individual sphere the mediation of the logic of the commodity that is inherent to the relationship between capital and labour. One of the most significant implications of this is the constant demand for self-valorization that is placed on

individuals who, converted into capital, are seen as rulers of themselves. In this conversion, which also makes the economy a personal discipline, to fulfil their interests, supposedly autonomous and free individuals are compelled to survive and act in an environment of amplified competition and fragile solidarity (Dardot & Laval, 2010).

This results in a new mode of subjectivation, where the logic of social and class conflicts is replaced by the rationality of self-management and the logic of individualization. Social issues come to be addressed in increasingly ideological terms (Dardot & Laval, 2010). An example of this is the space that notions such as risks and vulnerabilities (World Bank, 2001), multidimensional poverty (Sen, 2018) or resilience have gained as categories of psychosocial analysis, in a process that, to a greater or lesser extent, naturalises and removes discussion from the “social question”.

The material effects of capitalist social inequality, manifest in an increasingly intense manner in the daily life of large population masses around the world, are, within this logic, approached in an isolated and individualized way. It would not be about transforming economic and social conditions that produce inequality, risks, and vulnerabilities because these are ideologically viewed as inherent to the nature of human beings, their abilities and their personal choices. Thus, state intervention via policies to combat social inequality is increasingly replaced by policies focused on the rationality of individual management, the construction of active individuals and managers of their own risks (Dardot & Laval, 2010).

Through its development, not only as an economic program, but as a form of social engineering that profoundly affects the field of subjectivity production, neoliberalism has also forged new forms of psychosocial suffering and new policies to confront these sufferings. An articulation is established between the alienation of work and the alienation of the subjects of the real determinations of their suffering, that is quite functional to the dynamics of expansion of the logic of capital. This occurs as its fundamental ideological content does not seek to explain, but to mystify contradictory capitalist social relations, which is effective in the displacement of social class conflicts to the individual plane (Safatle, 2021).

Evidence of this, in the clinic field, as Safatle (2021) shows, was a profound reformulation of the grammar of psychic suffering in the third edition of the American (sic) Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* (DSM-III) in the 1970s. It rejected all psychodynamic diagnostic trends that were still present in the previous editions, supplanting them with overwhelmingly biomedical and behavioural criteria and emphasis on symptoms. This biological movement in psychiatry was reinforced with the publication of the subsequent editions of the manual, which further contributed to accentuating the neoliberal logic of individualization of psychic suffering in the field of discourse and *psi*.

Psychology, which makes up part of the knowledge and institutionality of this so-called psychological field (Parker, 2006), opens a new range of theoretical and practical problems. This is called upon to respond to the most diverse effects

of economic, political, social, and subjective transformations of this context. To the extent that neoliberalism is effective as a strategy that maximizes individualization in opposition to social and class conflicts, it is not surprising that individualizing and dehistoricizing perspectives gain so much space among psychological theories today.

Expression of this is the wide dissemination, in the last two decades in Brazil, of cognitive behavioural therapies, which are based on individual diagnostic premises, quite compatible with psychiatric references, and interventions focused on behavioural changes of the subjects. In their marriage to hegemonic psychiatry, these modalities of psychotherapy are also strengthening with the advent of neuroscientific research and the development of new antidepressants and other neurotransmitter regulators (Dunker, 2021).

This trend is also verified in the dissemination of psychological currents that supposedly developed against the pathologizing diagnosis of dominant psychiatry and its manuals. The so-called Positive Psychology, created in 2000 by the American psychologist Martin Seligman, is an example of this. Developed with the proposal to emphasize human qualities and virtues, not its negative and pathological aspects, positive psychology has gained significant space in the field of scientific research in psychology, where it could count on significant financial investments from large companies (Cabanas & Illouz, 2022).

In Brazil, an important expression of the approach to the premises of positive psychology has been taking place in the field of psychosocial work in communities (Gonçalves, 2020). Within the most widespread productions in the field in recent decades, it is possible to highlight a category that has acquired great centrality in community work in psychology in the country. This category is “community health”, which brings to the scope of these works an emphasis on “the empowering action of the individual and the community to care for its residents and the environment” (Góis, 2008, p. 104). As Gonçalves (2020) notes, the centrality acquired by this concept in community work in psychology in Brazil reveals the assimilation of the premises of positive psychology in the field, where the health (individual and collective) is prioritized as an axis of intervention, to the detriment of community psychosocial analysis articulated to social processes.

Whether in the field of clinical practice or in the field of psychosocial analysis, the precepts of this positive psychology have been showing their effectiveness and functionality to neoliberal ideology, especially from the accentuation of the capital crisis since 2008. Since this period, many countries have sought, in the indicators of happiness, references to the elaboration of policies to confront the effects of the real decline of the material conditions of life of their popular majorities. Research in positive psychology and its emphasis on psychological attributes and individual responsibilities have served as a basis for the application of public policies aimed at the development of “potential” and “human capacities”, to the detriment of policies intended for the confrontation of the material determinants of Social Inequalities (Cabanas & Illouz, 2022).

This attraction between psychological theories and practices and neoliberal assumptions, however, is not fortuitous. Although, historically, some of their

scientific perspectives have been striving to defend a posture of political neutrality of their agents and practices, we know that psychology, in their research and interventions, is political. Its models and concepts are theoretical responses to the psychosocial problems emerging from the inseparable relationship between individual and society, subjectivity and objectivity, in different political and historical contexts. The fact that this science, throughout its development, has formulated theories that served the maintenance of the capitalist social order through individualizing explanations of the social does not express an ethical or political deviation of its representatives. This is not a deviation, but the very nature of its foundations, which are the bourgeois ideological foundations of individual freedom, competition, and naturalization of the social. Thus, it is no coincidence that, in a context of generalization of neoliberalism as an economic, social, and cultural project, we are witnessing the growth of such psychologizing and dehistoricising trends in psychology, as the examples briefly mentioned here. These trends have been present in fields such as psychotherapies, but also in the field of community and public policy work (Gonçalves, 2020; Baima, 2019).

It is therefore of fundamental importance that, in order to glimpse paths to the construction of a psychology capable of contributing to demystification and breaking with the capitalist social order, we seek to anchor our analyses in other models and concepts. In models and concepts that operate in the opposite direction from individualisation, legitimization of competition, naturalization of social inequalities and the pathologisation of differences and resistances. May they operate as theoretical tools and practices of unveiling and changing social reality, contributing to the confrontation of fatalism, the strengthening of processes of resistance to neoliberal policies, and the construction of anticapitalist collective struggles.

3. Processes of change and the overcoming of fatalism

We have seen discussing that psychology is political and that it manifests itself in this direction as the product of capitalist society. Paradoxically, it can also manifest itself as an anti capitalist criticism and as a tool that contributes to overcoming liberal principles - the same ones that founded the science and psychological profession. It is this path against hegemony and overcoming the liberal way of life, that sustains critical psychologies⁴, and that, in this topic, becomes our object of reflection.

In this article, we have already dealt with the genesis of psychology as science and profession as it contributed - and continues to contribute - to the production of a conforming, competitive, individualistic, and meritocratic

⁴ We have already discussed on other occasions (Euzébios Filho & Gradella, 2020), that there is not only a theoretical and methodological affiliation committed to processes of social and economic changes. It is for this reason that we speak of Psychology('s) criticism(s). But there are undoubtedly ethical-political principles that unify them in a critical field, and they are: (1) Abandoning the political intentionality of social control and adaptations of dominant psychology; (2) Recognition of the need for overcoming the capitalist mode of sociability for the development of human potentialities

subjectivity, which pathologized not only the “different” but also those who promote counter-hegemonic alternatives.

Among the broad list of themes and challenges that critical psychologies are concerned with, we will now talk about some steps that could be taken by them to strengthen marginalized groups and for democratization of society.

Our choice, from among a number of possible theoretical frameworks, is that of liberation psychology, especially for the work of Ignacio Martín-Baró, since it makes an important contribution to identifying and reflecting on the psychosocial consequences of oppression (Martín-Baró, 1998). It would be the first step towards building a psychological praxis committed to social changes. A second step – as we will explore later in this text – would then demarcate conceptually what we mean by social change and the role of the psychologist within it.

Fatalism and the psychosocial dimension of oppression

To identify some aspects of the psychosocial dimension of oppression, we utilise the concept of fatalism (Martín-Baró, 1998). When thinking about the role of the psychologist in a process of social change, we have used the concept of conscientization of Paulo Freire (2001), who also advised Martín-Baró to think of a transformative psychological praxis (Martín-Baró, 1996).

According to Martín-Baró (1998), fatalism corresponds to the psychosocial dimension of the dominant ideology, which is understood as falseness of reality. In this conception, fatalism finds a practical purpose: the maintenance of the bonds of power inscribed in the processes of socialization of a conflicting class society, the capitalist society. It especially manifests itself in the family and social institutions, at school and at work. Thus, ideology can enter human groups, establishing mediations between particular individuals and the structures of society.

In general, fatalism manifests itself in individuals and groups as naturalization of social injustice and different power relations. It is the idea of fate, the impossibility of changing their own living conditions (Martín-Baró, 1998). It thus interferes with the elaboration of the past, in the absence of historical memory⁵, affecting the projection of the future. It is a condition of resignation about the future, an ignorance of the past, corresponding to the internalization of the conditions of oppression and exploitation.

Another aspect related to fatalism and observed by Martín-Baró (1998), is the bond between the lowering of future expectations and the depreciation of the image itself, the latter that manifests itself psychologically-especially in those subjects whose rights are daily denied, who live to survive, in the acceptance of fate or more specifically, in the shame of the class condition itself, in which case it may be an important component of what Gonçalves Filho (1999) described as the phenomenon of social humiliation.

⁵ Historical Memory is a concept coined by Martín-Baró to designate a historical reading of reality that can function as a strengthening element of groups in facing adversity conditions.

Fatalistic ideas are also manifest with a subject who does not recognize themselves worthy of a better life, a good job or even - in cases of extremely oppressive relationships - perhaps it was admissible not to be treated simply as human, with respect, attention, and caution. This is where it reveals an important aspect of fatalism (which, moreover, refers to the dialogue between Paulo Freire and Martín-Baró): the emotional dependence of the oppressed in relation to oppressors, manifested in a sense of worship and submission before the strongest, the victorious. The way of life of the oppressors, thus, becomes the parameter of self-image depreciation (Freire, 2001; Martín-Baró, 1998).

But despite fatalism being an indicator of asymmetry of social bonds, Martín-Baró (1998), more recent studies of the Brazilian reality (Cidade & Ximenes, 2012; Rosa, 2020; Euzébios Filho, 2022) confirm that it is also necessary to observe two aspects: (i) the adaptive character of fatalism; (ii) that it does not necessarily nullify the intentionality of the subject.

For an understanding of the adaptive character of fatalism as a psychological resource of adapting a certain condition of oppression, we can think of the binding between fatalism and psychosocial trauma which, according to Martín-Baró (2000a; 2000b), corresponds to a trauma caused by political violence, which materializes in the fragmentation of a social and community fabric that contributes to isolate people, fostering immediate and individualistic responses to problems whose context is the community.

However, if trauma manifests itself in an unbearable situation of oppression, often escaping psychological elaboration about what the individual and the group has been experiencing, the naturalization of bonds and power relations can be the only way to support relegation and social humiliation. This can often be indicated in the language and understanding that certain social bonds and institutions have of the fate of the popular classes: “God determines our destiny,” say certain religious institutions; “The boy should act as a boy and the girl as a girl,” is heard at school and in the family (Martín-Baró, 1998).

And thus, at the same time, the person’s psychological resources will be deformed to accept the relegation and submission before the victorious (since God wanted it so, etc.) and the self -image of the obedient subordinate, both being fed on the reproduction of desirable social roles for those who is at the top of the social pyramid. How could it not be political?

Regarding the fact that fatalism does not necessarily nullify an intentional action, we can give as an example the movements of social conservatism ongoing in the past and present, movements that correspond, among other aspects, to the active defence of hegemonic social roles (Pettigrew, 2016). We see, then, that there is conservative militancy (that is, a collective, organized, and intentional action) in defence of a naturalized understanding of power relations between genders, between rich and poor, etc. The phenomenon of the Brazilian far-right, for Euzébios Filho (2002), is an example of this he called reactionary fatalism.

We note, then, that fatalism does not manifest itself only as the absence of action or total acceptance of destination, but also as an adaptive resource, and it can also contain an intentional action of defence of a naturalized position within power relations.

Dialectic Fatalism/Awareness and the challenges of the psychologist

For Martín-Baró (1996) and Paulo Freire (2001), the process of awareness-raising (conscientização in Portuguese - “conscientisation”) represents, dialectically, the opposite direction of fatalism. As Moreira and Guzzo (2015) demonstrate, this dialectical understanding does not nullify the possibility of a limit situation⁶ (that unbearable, trauma promoter) boost a reverse process: awareness.

Before dealing, specifically, with the role of the psychological, it is necessary to briefly mention one aspect: in the dialectic between fatalism and awareness there is a conception of society with strong influence on critical thinking and Marxism. It is important to recognize that it is from this that Martín-Baró establishes ethical-political parameters to think of the psychologist's action (Blanco, 1998; Dobles, 2020).

In the classic manuscript *The role of the psychologist*, Martín-Baró (1996) drawing on Paulo Freire states that awareness corresponds to a process of decoding power relations, that is, the appreciation of the self-image of the oppressed, which occurs by the recovery of historical memory, the appreciation of culture and popular knowledge, overcoming class shame and social humiliation, etc.

On this basis, Martín-Baró (1996; 1998) argues that the role of the psychologist would be precisely to contribute to the tasks of breaking the emotional dependence of the oppressed and the decoding of relationships that produce injustice and social inequality. To this end, considering that this is a group task, the psychologist must assist in strengthening social and affective support networks, the development of class solidarity bonds and cooperative forms of conflict resolution.

The psychologist must also act, according to Martín-Baró, for articulation between biographical memory and collective memory, thus contributing to the feeling of communitarian belonging and grounding. She/he must also contribute to the elaboration of political trauma among other challenges that the author calls the “psychosocial task” (Martín-Baró, 2000).

It is necessary to understand that all these actions involve, of course, an effort to democratize relations and decision making (Freitas, 1998) - which reveals the importance of dialogue as a tool for social inclusion and promotion to spaces of participation and political representation (Freire, 2001). For Freire, dialogue is not just a conversation, but an ethical-political posture.

4. Psychology is political: Pathways for change

In his last course at Collège de France in 1984, Foucault (2014) discusses the concept of *parresía* (παρησία), that is, to use his definition, the courage of truth. It

⁶ A limit-situation is a historical condition that prevents people from having freedom. Any limit-situation implies that some groups of people will benefit from it, while other people will be harmed.” <https://www.litcharts.com/lit/pedagogy-of-the-oppressed/terms/>

was not, at the time, to glimpse the truth as something simple and crystallized, but especially the action made[?] fearless by its search and exposure. To this end, Foucault analyzes some works of western philosophy from the Ancient period to the Middle Ages, with particular emphasis on the tradition of the Cynics in philosophy and the figure of Diogenes de Sinope (404 and 412 BC), not only for its influence on cynicism as a philosophical perspective, and stoicism, but also for wandering the streets of Greek cities seeking to carry what he considered the minimum necessary for his survival, sleeping, for example, in a barrel, something that, as Foucault characterizes (*ibid*, p. 209) refers to a principle of cynicism: in the face of the practice of *parresia* and the need to “occupy itself”, one must seek by philosophy a “preparation for life”. That is, in short, in Foucault's understanding, the courage of truth also refers to a freer way to live, with respect to ties with other humans, probably not very receptive to inconvenient truths, and to the material possessions that could make us prisoners of petty needs.

This is not an example at random. Interestingly, hegemonic medicine used the life of Diogenes to pathologize a certain set of behaviors. The “Diogenes Syndrome”-a term coined by Clarke et al (1975) in one of the world's leading medical scientific journals, *The Lancet* according to Stumpf and Rocha (2010, p. 156), “characterized by an extreme carelessness with personal hygiene, negligence with the cleanliness of their own housing, social isolation, suspicion and paranoid behavior, and the occurrence of collecting”. In this case, it is not only a rough reading of the life and philosophy of Diogenes or an inability to those who propose and defend the existence of this syndrome in understanding the reality of life of the subjects in the face of their objective and subjective conditions of life, but of the patent and essential reconfiguration of the content in an “ideological form”.

If we really want to counter hegemonic psychology in a class society, even more in a context of extreme individualism imposed by neoliberalism, “seeking the truth” requires more than a “preparation for life”. This is not an option. That is, the more we practice *parresia* in a political and economic system based on the distortion of reality, the closer we are to living in a barrel. This is clearly reflected, especially in Latin America, in the lack of funding for really critical research, especially in humanities, and in an “epistemic injustice”, rescuing the concept elaborated by Fricker (2007), which gives the poorest countries only the role of location for field studies in the production of scientific knowledge, culminating in what Spivak (1994) called “epistemic violence”, the colonizing imposition of the predominantly male hegemonic intellectual production of the richest countries that deeply contributes not only to the discredit of scientists from the “peripheries of the world”, but for the silencing of the “subordinate subject” - and, more specifically, of the “subordinate woman”.

With rare exceptions, due to the strengthening of neoliberalism and the far right around the world, psychology in Brazil is even more impregnated with epistemological subordination. And this is directly reflected in the strength that the main hegemonic, conservative or reactionary currents have not only in the clinic, but in all areas where psychology has historically acted in the last decades, especially education. If, for example, the ideal of intellectual emancipation has

become, inspired by the French Republican School, fundamental to the educational proposals of the twentieth century in Brazil, now we have the goal in public policies, as well as in many other countries, especially the “common national base Curriculum”(BNCC, 2017) and the discourse of entrepreneurs who are increasingly appropriating Brazilian education, which hegemonic psychology calls “socio-emotional skills” and their derivations from Gardner's work (1995, 1996). This label itself, devoid of any scientific reality, demonstrates not only that there is not, in fact, the least political and economic interest in promoting any kind of emancipation, whether objective or subjective, but that hegemonic psychology in neoliberalism will individualize, to the maximum, human issues and place further responsibility on subjects for their successes and failures.

If hegemonic psychology is historically marked by reducing “complex relations between humans to the world of ideas and linear causality” (Schraube & Sørensen, 2013, p. 3) and thus promote “strategies to persuade the oppressed that their own problems are, in reality, only deep psychological problems”(Parker, 2007, p. 199), then, a psychology that is just “criticism” is insufficient, rather like trying, for example, to produce a “Kritik der Kritischen Kritik”, as suggest and mocked Marx and Engels in the original title of “Die Heilige Familie”, 1844. It is necessary to make a psychology that *confronts* hegemony, which exposes the contradictions of our political and economic organization, a counter-hegemonic psychology that collaborates, necessarily, for the process of emancipation (political, intellectual, affective) of the subjects in the sense of a real transformation of the world. According to Martín-Baró, psychology also needs to emancipate itself.

This emancipation must occur with the breaking not only of its historic and close relationship with capitalism, but also the crystallized forms of acting centralized in vertical relations. In this sense, a more egalitarian and democratic position between the research subject and the research subject eventually becomes the first point of inflection. Agreeing with Parker (2007), psychology, and any other science that intends to be counter-hegemonic, must be defeated as a discipline-power. And this not only in the relationship of psychologists with the research field, but with the colonizing theoretical references that feed on the patriarchal-capitalist ideology. It is important, thus, even if bourgeois hegemonic psychology is centred on the study of psychological phenomena exclusively at the individual level, that counter-hegemonic psychology does not despise the aspects of individuality and guiding itself for a praxis capable of collaborating in the promotion of human capacity of self-transformation and the world.

The perspective we bring here from historical and dialectical materialism, unlike strictly economic Marxist tradition, seeks to reiterate that we are historical subjects and thus exercises a protagonism in the transformations of social life. That is, agreeing with Eagleton (2017, p. 27), by defining the subjects as “historical” we are stating that “we are constitutively capable of self-transcendence (...)”. Thus, we established here that even in the face of powerful structural, political, economic and ideological factors that there is a margin, even apparently small in certain cases, to go beyond. Collaborating in promoting the movement of this power inherent to the human is one of the most important tasks

of counter-hegemonic psychology. It is not just about whether or not to defend the revolutionary process as a subjective process, but understanding and defense – otherwise our work would make no difference – from the protagonism of the subjects in historical events. Thus, we must be vigilant and always suspect the idea that there is no intimate relationship between superstructure and infrastructure, that objective conditions unilaterally determine subjective conditions. The method of historical and dialectical materialism does not only analyze economic, political, ideological and institutional aspects, but also the relevance of the subjects in history.

Therefore, the task of always advancing in the concepts we use from the possibilities of contribution of psychology is essential. That is, no matter how obvious, it is not enough to employ philosophical, sociological, anthropological, economic, etc. concepts, without an analysis of reality, relevance and weaknesses of this concept in the light of our knowledge area. As much as it is desired that scientific knowledge becomes more accessible and conceptual, superficiality should never dictate the *modus operandi* of the sciences. To do science against hegemony is also to explore and confront the words we use so much, because treating concepts without the proper depth does not mean making a certain more “palatable” knowledge. Quite the contrary, acting in this way will only demonstrate the possible weaknesses of our work, the inconsistencies and contradictions of what we think and publish. Superficiality is a task of hegemony.

Raquel Guzzo is a Full Professor of the Pontifical Catholic University of Campinas (PUC-Campinas) of the Graduation and Postgraduate Programs., Master and Doctorate in School Psychology and Development from USP. She has completed a Postdoctoral Internship at the University of Texas/USA, in Psychological Evaluation and at the University of Rochester/USA in Development of Mental Health Prevention Programs. President of the National Association for Research and Postgraduate Studies in Psychology (2018-2020). Current Editor-in-Chief of the Psychology Studies Magazine (Campinas). Today she is a full member of the Municipal Council of Education of Campinas, and she participates in the Working Groups School and Educational Psychology and Community Psychology at ANPEPP.

Eduardo Alessandro Kawamura is a pedagogue with a doctorate in Psychology from PUC-CAMPINAS and a doctorate in Education from UNICAMP. He currently works with public education systems in Brazil, discussing ways of combating and preventing violence in the school context based on the development of collective work for education professionals.

Antonio Euzébios Filho is a psychologist and professor at the Institute of Psychology at São Paulo University (USP - São Paulo, Brasil), Department of Social and Work Psychology. He develops studies on topics such as: psychosocial trauma, political participation and psychology and public policies. He is a member of the Psychosocial Trauma Observatory: national thematic network of research and professional practice.

Larissa Baima is a psychoanalyst member of Tykhe - Lacanian Association of Psychoanalysis in Campinas, São Paulo, Brazil. She has a doctorate in psychology from the Pontifical Catholic University of Campinas and currently works as a psychoanalyst in a private practice. She is interested in the history of

psychology, more specifically the history of Brazilian community social psychology.

Abolition Psychology: Principles for a decolonial liberation psychology *hacia El Mundo Zurdo*

Jesica Siham Fernández¹

Abstract

Abolition is the eradication or elimination of conditions and circumstances that encroach our humanity, and our more than human relationships. To be free is to live with dignity, and abolition as freedom is to experience relational wellbeing, intergenerational healing, and collective thriving (Davis et al., 2021). In this paper, I define *abolition psychology* as a set of principles—*theory in the flesh*, *research justice*, and *decolonial love*—that can help actualize decoloniality and liberation. Abolition as a movement, acts to address, transform, and eradicate hegemonic forms of power that are necessary for decolonial liberation. To advance decolonial liberation, psychology must engage abolition to disrupt the coloniality of power entrenched in systems of oppression. Thus, three abolition principles are described in relation to case study examples aligned with radical hope and imagining *otherwise* toward what Gloria E. Anzaldúa (1981) names as *El Mundo Zurdo*—a liberated world, one where we all co-exist. Abolition psychology as principles of *theory in the flesh*, *research justice* and *decolonial love* help foster a decolonial process to cultivate and sustain a disciplinary shift in pursuit of and for liberation.

Keywords

abolition, critical psychology, liberation psychology, decoloniality

Can a psychology grounded in Western/Eurocentric epistemologies actualize emancipatory conditions of transformative justice, decoloniality, intergenerational healing, and liberation? How can critical psychology and allied psychologies committed to disrupting oppressive systems of power re-center its

¹ The author thanks Drs. Janelle Silva, Nuria Ciofalo and Deanne Bell for their encouragement, support, wisdom, and guidance in the development, as well as writing/revising process. An expression of heartfelt gratitude as well to students in the *Imagining the New University* seminar, and the *Youth for Justice Project* (YJP) afterschool program youth, YJP co-facilitators Maria de la Lima and Jackie Ramirez, and school-community partners and allies who continue to support our work. Lastly, thank you to the *Madres Emprendedoras* for allowing me to be a part of their lives and welcoming me into their family and community experiences.

pulse—or heart—while interrupting the machinations of a discipline that has colluded to maintain whiteness, patriarchy and capitalism, and preserve the *status quo*? Is *abolition psychology*, or a psychology *of* and *for* decolonial liberation possible? As complex and nuanced as these questions may seem, they aim to animate a critically reflexive process of bringing into fruition what I characterize as abolition psychology. Expanding on the themes of the special issue on the politics of psychology, or “critical psychology by any means necessary,” I offer a reflection on three interconnected principles to encourage critical psychologists and allied practitioners to consider abolition as necessary paradigm to actualize what Anzaldúa (1981) describes as a place-space where we all fit: *El Mundo Zurdo* (e.g., Left Handed World). Abolition is being and existing in *El Mundo Zurdo*. It is a world with many worlds² where we are *de corazón a corazón* and *mano a mano* (heart to heart, hand in hand) collaborating toward transformative justice that brews decolonial liberation.

Situating this piece in conversation with writings on the *decolonial turn* (Maldonado-Torres, 2017), and disciplinary interventions aimed to disrupt the coloniality of power in psychology (Malherbe, Ratele, Adams, Reddy, & Suffla, 2021; Macleod, Bhatia, & Liu, 2020), I offer an opening reflection on how/where I am located. In Western contexts, most notably in the United States, psychology and psychological inquiry has often served to affirm and reify hegemonic discourses about communities often without them knowing or having a say in how these discourses circulate and impact their lives. The politics and polity of psychology is still tethered to whiteness, coloniality and positivism, as well as *apolitical* theories, research and practice. Community psychology in the U.S. is slowly shifting away from the Eurocentrism that heavily shaped the discipline, yet these transformations are rather noted at the micro-level of individual interventions, frameworks and discourses. The politics of U.S.-based psychology must be troubled and contested if the discipline is to actualize its purpose to support community struggles for transformative justice, and intergenerational healing. Psychology must align its theories, research and practice with abolition, which scholar-activist-healer adrienne maree brown describes as “a future in which we all know we can belong, be human, and be held” (brown, 2020, p. 1). That is, where systems, institutions, relationships, and ways of being are life-affirming, sustainable, and aligned with equity, justice, emancipation, and sovereignty.

Abolition is a word that in popular culture and public discourse has come to mean different things. With the rise of social movements and hashtag-activism, abolition has made its way into varied forms of media, from calls for the abolition of police, prisons, and detention centers, to the disavowal of intersecting institutions or policies that sustain the carceral state (Klukoff et al., 2021). Abolition is active, not theoretical, symbolic, or metaphorical. It is enacting a set of principles—attitudes, actions, and relationships, coalitions or

² Anzaldúa’s characterization of *El Mundo Zurdo* holds resonance with Zapatismo, or Zapatista ideologies that purport the construction of a “world where many worlds fit” (*un mundo donde quepan muchos mundos*). That is, where Indigenous autonomy, sovereignty and dignity are affirmed—and in relational co-existence with multiple communities and cosmovisions toward the viability of pluriversality (Ciofalo, 2022).

movements aligned with liberation, and a decolonial acknowledgement of our co-existence and interdependence with all beings (Davis et al., 2021). Abolition is a verb - it is active. Enacting and embodying abolition means cultivating and sustaining the dignity, thriving and sovereignty of all beings in moments and movements of struggle. By outlining the principles that comprise what I describe as abolition psychology this proposal invites psychology, and psychologists to (re)imagine the discipline—the critical, liberation, community, and allied psychologies. By highlighting three abolition principles I am responding to calls to engage with abolitionist practices (Klukoff et al., 2021), as well as two themes of the special issue. First, mainstream psychology often structures academic and scholarly inquiries, as well as dominant frameworks that overlook the significance of experiential knowledge. Second, quotidian activities, such as reflection and relationality, can provide the basis for resistance to contemporary disciplinary regimes or epistemic forms of psychological violence. Thus, attending to our everyday subjectivities or ways of knowing, and framing these as lived psychologies is necessary.

Abolition principles that are aligned with decolonization and liberation are imperatives toward an ethic of love, wellbeing and healing. My intentions, therefore, are to offer a reflection on the importance of abolition in psychology. Abolition psychology as decolonization and liberation is grounded in principles of *theory in the flesh*, *research justice* and *decolonial love*. *Decolonial love* is characterized as free expression or an embodied enactment of affect that is distinct from sociocultural constructions of love or expectations of performative care. Unlike transactional individualized notions of love, *decolonial love* acts/actions are unconventional expressions of authentic care, connection, mutuality and relationality (Figueroa, 2015; Maldonado-Torres, 2007, 2020; Sandoval, 2000). I engage with these principles to surface the implications and possibilities of abolition psychology with/in communities. I define abolition psychology as decoloniality and liberation that moves beyond critique to carve a path toward *El Mundo Zurdo* where transformative justice, healing and pluriversality³ are possible.

Abolition psychology is oriented toward decolonial liberation that encompasses transformation. My proposal for an abolition psychology aligns with Davis et al (2022), brown (2020), Anzaldúa (1987), among other decolonial feminist scholars (Anzaldúa & Morraja, 1981; Figueroa, 2015; Lugones, 2003; Maldonado-Torres, 2008; Sandoval, 2000; Smith, 2012; Tuck, McKenzie, & McCoy, 2014), as well as critical community psychologists rooted in the Majority World (Atallah & Dutta, 2022; Boonzaier & Niekerk, 2019; Ciofalo, 2022; Domínguez, 2022; Dutta, 2021; Dutta, Azad, & Hussain, 2021; Fernández,

³ Pluriversality is an ontological and epistemological way of understanding the world, and the conditions by which we come to know and understand what and how we know, or construct knowledge. In the words of Escobar (2016), “the pluriverse is a way of looking at reality that contrasts with a “One-World” World assumption that there is a single reality to which there corresponds multiple cultures, perspectives, or subjective interpretations” (p. 22) In other words, that there are multiple ways of knowing, or realities, and that no one view is an absolute truth. Furthermore, “the pluriverse is a tool to first, make alternative to the one world plausible to one-worlders, and, second, provide resonance to those other words that interrupt the one-world story” (p. 22), thereby nuancing the dualistic, binaries of knowledge production and existence.

Sonn, Carolissen, & Stevens, 2021; Fernández, 2022; Kessi, Suffla, & Seedat, 2021; Lau, 2017; Montero, 2007; Montero, Sonn, Burton, 2017; Pillay, 2017; Silva, Fernández, & Nguyen, 2021; Sonn & Stevens, 2021). With these intentions, I invite psychologists to imagine, envision and ideate a psychology grounded in abolition that while critical it is also decolonial and liberatory. To begin, I briefly describe links between critical and liberation psychologies, and how these align with abolition. Next, I characterize elements of critical psychology that reflect abolition principles toward the formation of *El Mundo Zurdo*, or the place-space where relationships of emancipation from the coloniality of power are possible. Finally, I outline three principles of abolition psychology—*theory in the flesh*, *research justice* and *decolonial love*. I conclude with few reflections on how to advance emancipatory transformative justice praxes that strive for dignity, wellbeing and sustainability.

Threading Critical, Decolonial and Liberation Psychologies

Critical psychology is a constructivist, political and sociologically oriented paradigm. Centered in a critique of positivism and neoliberalism, critical psychology is oriented toward a Marxist approach. In relation to liberation, critical psychology notes the importance of historic and contemporary sociopolitical contexts in shaping individual and collective action across multiple systems (Burton & Kagan, 2005; Montero, 2007). Critical psychology in the U.S. emerged amidst a crisis of civil and human rights violations. Transgressions on people's rights led to questioning the significance and value of psychology as a discipline to address systemic injustices (Burton & Ordóñez, 2015). Critical psychology was thus a response and mode of resistance to the empiricism, positivism, and Eurocentrism of a seemingly *apolitical* discipline.

Noting the limitations of psychology, and its complicity with the *status quo*, critical psychology was conceived to address three issues or limitations. First, the discipline was seen as irrelevant and holding little value for addressing concrete social problems locally, nationally, and globally. Second, psychology was detached from the real-life circumstances or conditions that were impacting communities and society. Knowledge was produced or generated in seemingly artificial or simulated contexts where communities were being observed through what can be described as a settler colonial gaze. Third, in attempting to present itself as a legitimate science, psychology purported being unbiased, objective, and neutral—an *apolitical* preference that has remained (Burton, 2004). The result has led to a psychology that is devoid of disciplinary critique, lacks processes of accountability for its contributions and complicity in systems of power, and has superficially acknowledged the histories of coloniality that created systemic injustices in the first place (Roberts, 2022; Roberts, Bareket-Shavit, Dollins, Goldie, & Mortenson, 2020). Some of these limitations are still applicable, and merit further interrogation.

Relatedly, another characteristic of critical psychology is its capacity to simultaneously hold critique alongside possibility, or to exist within the

complexities of refusal, resistance, radical hope, and imagination of what could be. Generating value-free inquiry that is detached from the political subjectivities of the researcher-practitioner is not a goal of critical psychology. On the contrary, critical psychology is oriented toward addressing the “very conflictual realities of the social world” that is oriented toward social critique (Batur et al., 2019). The critique centers on the social conditions of life that reproduce hierarchies of power and oppression via discourses, ideologies, policies, and practices. Expanding upon these characteristics, another aspect of critical psychology is to transform, reimagine, and co-construct psychological theories, methods, and research paradigms (Batur et al., 2019, p. 6). Critical psychology, although rooted in critique, also develops “a new, critical, situated, and socially embodied conception of psychology” (Batur et al., 2019, p. 6). Relating to liberation, critical psychology paradigmatically shifts away from positivism, individualism, deficit-based, and pathologizing/medicalizing interventions, whilst trying to understand the everyday conditions that impact communities. Yet among some liberation psychologists critical psychology remains limited in its scope because of its Eurocentrism, and application in Westernized contexts (Ciofalo, 2022; Montero, Sonn, & Burton, 2017). Although critical psychology strives for a psychology *of* and *for* liberation *by* and *with* communities it falls short of actualizing its purpose.

Moving beyond the critique of traditional psychology and psychological perspectives, Comas-Díaz and Torres Rivera (2020) expand upon Martín-Baró’s (1994) definition of liberation psychology as the use of psychological approaches to understand and address oppression among individuals and groups. Drawing attention to the role of psychologists, a liberation-orientation purports that we must embody decolonial accountability to communities on the margins. As allies and accomplices with communities who are change agents, psychologists must “anchor their knowledge in *vivencia* (lived experience), *lo cotidiano* (everyday reality), and the recovery of historical memory of oppressed individuals and communities” (Comas-Díaz & Torres Rivera, 2020, p. 8) with the aim of actualizing transformative justice and intergenerational healing—key characteristics of *El Mundo Zurdo*. To redress suffering and systemic injustices, psychologists must engage in actions that strengthen, uplift, and sustain communities, whilst co-creating conditions that affirm their power. This conceptualization of liberation psychology bridges a critical intersectional perspective (Comas-Díaz, Hall, & Neville, 2019; Neville et al., 2021) with a decolonial standpoint (Reyes Cruz & Sonn, 2011) toward abolition where justice is not predicated on the duality or dialectics of injustice, scarcity and precarity. Instead, liberation is abolition, abolition is justice, and justice is an affirmation of our coexistence to thrive.

The emancipatory nature of critical and liberation psychologies resembles a decolonial standpoint that moves beyond critique toward imagination, action, and transformation (Bell, 2022; Bell, Canham, Dutta, & Fernández, 2020). Liberation, like critical psychology, is an oppositional psychology to the instrumentalization of scientific theories or paradigms that limit possibilities to *be/become*. Instead of testing theories the focus is on creativity, transformation,

and healing. Thus, reflecting on the writings of Martín-Baró (1994) that were largely informed by Freire's (1970) existential necessity for liberation, Montero and colleagues (2017) propose four pillars for a liberation-oriented psychology. Inclusive of critique, the four pillars serve as a prescription for abolition. The first pillar is disillusionment with psychology's Eurocentric perspective. Second, reactive critical engagement that aims to disrupt hegemonic psychological research and theories. Third, re-constructing psychology via inclusion of silenced perspectives and of groups on the margins. And lastly, emancipatory conditions, which align with abolition. Critical community psychologists describe these pillars also in relation to a decolonial standpoint (Reyes Cruz & Sonn, 2011), constellations of co-resistance (Atallah & Dutta, 2022; Atallah et al., 2022), *conocimiento* (Fernández, under review), pluriversality (Beshara, 2021; Ciofalo, 2022; Pickren, 2021; Seedat & Suffla, 2017) and relationality (Dutta, 2021; Fernández et al., 2022). Abolition psychology specifically aligns with the fourth pillar as it exemplifies *El Mundo Zurdo*.

The decolonial critique and criticality that are central to liberation psychology allows for the interrogation of what is conceived as natural, normal, and static. Yet, because theory and critique are limited or can only achieve so much, abolition is essential to transformation. Given the definitions of critical and liberation psychologies, the decolonial standpoint emerging within the discipline, and the four pillars outlined, I offer three interconnected abolition principles: *theory in the flesh*, *research justice* and *decolonial love*. To illustrate that abolition psychology is possible, I describe these principles via examples of my work with college students, middle school aged youth, and Mexican immigrant mothers. The intent is to offer perspectives on critical, decolonial and liberation psychologies *of/for* abolition. Liberation as emancipation is the eradication of oppression, which materializes as an end to suffering. Thus, liberation is transformative, emancipatory, and the recovery of historical memory to heal (Martín-Baró, 1994; Montero, 2007; Montero, Sonn, & Burton, 2017; Neville et al., 2021). Ending suffering is not a naïve desire; liberation can and must be actualized through abolition principles as praxes unshackled from colonial power. Liberation is a constant struggle to transform circumstances for the better so that we may experience decolonial liberation as existence in *El Mundo Zurdo*.

Abolition Feminism as Decolonial Liberation

Abolition psychology is a set of interconnected principles that support the creation-ideation of *El Mundo Zurdo*. Decolonial liberation is and exists via the relational experiences where we know and feel that we belong truly and fully. Since the publication of Davis' (2003) *Are Prisons Obsolete?* abolitionist movements to dismantle the carceral state have become commonplace. The Black Lives Matter movement, along with the activism of Dreamers advocating for comprehensive immigration reform, have expanded notions of abolition to include the elimination of institutions, policies, and discourses that reproduce

violence, injustices, and intergenerational trauma (Domínguez, 2022). Black Lives Matter demands the abolition of racialized policing (Klukoff et al., 2021; Phelps, Ward, & Frazier, 2021), while Dreamers call for an end to anti-immigration policies, legislation, and discourses that materialize as crimmigration (Jean-Charles, 2021). Abolition movements have a principle in common: to affirm human dignity in pursuit of liberation via the eradication of systems of hegemonic power.

In resonance with a conceptualization of abolition as decolonization, Davis et al (2022) propose *abolition feminism*. Abolition urges and encourages resistance and refusal to myopic or individual conceits; it shifts its focus to draw attention to systemic conditions that reify and reflect broader social problems. Abolition feminism allows people to render visible threats to safety and freedom that would not be so obvious when considered independently or in isolation from larger socio-structural conditions. As a relational movement, abolition feminism embraces multiplicity and a pluriversality of theories of change and liberation (Domínguez, 2022) that involved accompaniment, accountability and fostering other ways of being, not in isolation but *in* and *with* communities relationally situated and implicated in decolonial liberation struggles.

As a movement or emergent strategy (brown, 2020), abolition is a theory of change, a philosophy, and a tradition of resistance as productive purposeful tension; a form of refusal that holds onto radical hope alongside the forging of what is perceived as unimaginable yet can be. Abolition is a principle that must be put into practice; it must be embodied and enacted in ways of living, being and doing that interrupt, refuse, resist, reimagine, and act against systems of violence that diminish our human and more than human relationships. Abolition is a movement that is constantly evolving to tip the scales of injustice toward feminist, decolonial, liberatory conditions (Domínguez, 2022; Gilmore, 2007). The restituting of accountability to coexist, requires enacting abolition principles to co-create a life of dignity, thriving and healing—which Anzaldúa (1981) describes as *El Mundo Zurdo* or an decolonial liberated world where we all fit.

Characterizing *El Mundo Zurdo*

In envisioning a world of decolonial liberation for groups on the margins, Anzaldúa (1981) coined *El Mundo Zurdo* as a place-space of alliances built on relational differences. As a metaphor for a world where Majority World communities are acknowledged and embraced as they are, *El Mundo Zurdo* fosters possibilities for abolition delinked from colonial power. As a co-existence devoid of fragmentation, Anzaldúa describes *El Mundo Zurdo* as the place where:

We are the queer groups, the people that don't belong anywhere, not in the dominant world nor completely within our own respective cultures. Combined we cover so many oppressions. But the overwhelming oppression is the collective fact that we do not fit, and because we do not fit, we are a threat. Not all of us have the same oppressions, but we empathize and identify with each other's

oppressions. We do not have the same ideology, nor do we derive similar solutions. Some of us are leftists, some of us practitioners of magic. Some of us are both. But these different affinities are not opposed to each other. In *El Mundo Zurdo*, I with my own affinities and my people with theirs can live together and transform the planet. (p. 209)

As described, it is a new world with a different set of relationships and ways of being that sustain abolition. According to Anzaldúa (1981), *El Mundo Zurdo* is “a two-way movement—a going deep into the self and an expanding out into the world, a simultaneous recreation of the self and a reconstruction of a society” (p. 208). The proposal for an abolition psychology is to actualize *El Mundo Zurdo* where coalitions across differences, and radical dreams are possible possibilities.

In *El Mundo Zurdo* decolonial liberation as abolition is strived for because it is “where people from diverse backgrounds with diverse needs and concerns coexist and work together to bring about revolutionary change” (as cited in Keating, 2009, p. 321). In other words, in *El Mundo Zurdo* there is a commitment to the everydayness of coexisting as people with diverse realities (Henderson-Espinoza, 2013, p. 116). *El Mundo Zurdo* reflects our inclusivity of differences, the holding of complexities in distinct lived experiences and positionalities, that together move toward decolonial liberation. Because *El Mundo Zurdo* is necessary, I offer three abolition psychology principles. I humbly offer these principles to psychologists, and psychology as a discipline with the intent to help us transverse oppression and critique in pursuit of abolition as decolonial liberation. An openness to complexity and imagination is thus necessary as we walk a path toward abolition where *El Mundo Zurdo* is a possibility rather than a vision.

Three Principles for an Abolition Psychology

Abolition is intentional and actionable rather than passive. Because abolition is liberatory, decolonial, feminist and transformative, paradigms rooted in embodiment (*theory in the flesh*), epistemic justice (*research justice*) and relationality (*decolonial love*) are needed. The three abolition principles I offer are interconnected, and characterized by *theory in the flesh*, *research justice* and *decolonial love*, which I illustrate via reflections from my work with college students, middle school aged youth, and a group of immigrant Mexican mothers. A decolonial liberation psychology oriented *hacia El Mundo Zurdo* is anchored in these abolition principles.

Theory in the Flesh: A First-Year College Student Seminar

As a faculty member I strive to challenge both the implicit and explicit institutionalized forms of discrimination and *othering* that some students experience. *Theory in the flesh* in the university context reflects my embodied critical reflexivity on dynamics of power between students and university

administrators. Students often perceive faculty as holding status or power, and while some do the influence some faculty hold is limited by their positionalities. In my case, it is shaped by who I am and what I look like, and my standing as a pre-tenure faculty. *Theory in the flesh* is the experience of engaging in an embodied ethical critical reflexivity that is attuned to dynamics of differential power, privilege and positionality within contexts and relationships. That is, a process by which awareness of how the personal becomes entangled with the political, as well as the body and affect. According to Moraga (1981) *theory in the flesh* “means where the physical realities of our lives—our skin color, the land or concrete we grew up on, the sexual longings—all fuse to create a politic born out of necessity. Here, we attempt to bridge the contradictions of our experiences ... we do this bridging by naming ourselves and by telling our stories” (p. 23). Embodiment serves as a source of knowledge where experiences, memories, and hope are possible. In prior work, I describe *theory in the flesh* as an ethical critical reflexivity, a subjective encounter, where “tensions, bridging, and contrapuntal experiences, as well as process of critical reflexivity” (Fernández, 2018) that move within the body.

To demonstrate the principle of *theory in the flesh* I offer reflections from a five-week seminar called *Imagining the New University* with first year college students. Through this case study I illustrate how *theory in the flesh* was embodied, and facilitated among students to affirm their knowledge and hopes, as we troubled the university’s discourses on equity and inclusion. The seminar was offered in winter 2022 and it was co-taught with a university administrator engaged in diversity affairs. The motivation for such seminars was to help build community; however our seminar also focused on the history of student activism and social movements in the Greater Bay Area, whilst re-centering student organizing within our specific university context.

The history of social movements and civil rights struggles in the Bay Area, which are often associated with San Francisco and Oakland, also has a place in San José. Making visible these historic links inspired the seminar’s goals, and was noted in the course description:

In 1968, the Third World Liberation Front (TWLF), composed of student activists in San Francisco, Berkeley, and the Greater Bay Area, came together to organize a movement to decolonize the university. Today, decades later, students continue to advocate for diversity, equity, inclusion, voice, and representation in higher education. In this seminar we will engage with these histories, as well as the contemporary experiences of student organizers and activists. Together, and in community, we will imagine the New University, engage radical hope, and pursue opportunities for solidarity-in-action to create a more just and inclusive SCU.

Students in the *Imagining the New University* seminar engaged a sociohistorical analysis and critical reflexivity of the past through readings and archival materials that helped them contextualize activism and organizing in relation to the present. By comparing contemporary student activism and social movements within and beyond our university, and in relation to the 1968 Third World Liberation Front, we discussed transformation at multiple levels of

analysis. We grounded our understandings of transformative justice and institutional change in Bolman and Deals (2013) four-frame model of organizational change, as well as la paperson's (2017) proposal for the *Third University* that aligned with Anzaldúa's (1981) vision of *El Mundo Zurdo*.

Through reflexivity and dialogues anchored in their experiences as students of color, students of marginalized genders, and undocumented or mixed-status students, we facilitated the abolition principle of *theory in the flesh*. Specifically, we described what it feels to belong, to be seen/unseen, heard/silenced and/or misrecognized/othered within the university. We formed connections by sharing moments when we felt othered, where we differed in our experiences, yet held space for care and healing among us. We engaged in reciprocal recognitions where rather than seeing each other as students or instructors, we acknowledged our complex personhood within communities and histories beyond the university. The moments of silence in our seminar allowed us to process our feelings, and the sensations that moved through our body.

One of the activities that we engaged in the seminar was the *By Us, For Us: Photo-Narrative Exhibit*, which helped students imagine a more affirming and inclusive campus. The activity sparked students to respond to some of the reflections, or photo-narratives, featured in the exhibit. To do so, we collaboratively developed prompts that guided students' reflections: 1) *Take a photo of a condition on our campus that you find challenging, difficult or would like to see change. Write a narrative to go with the photo.* 2) *Take a photo of what you wish to experience, or that captures how you imagine the New University.* 3) *Write a narrative to go with each photo.* The culmination of students' reflections were thus visualized in the *Imagining the New University Photovoice Project*. *Theory in the flesh* is embodying and enacting critical reflexivity, and students engaged this through their photo-narratives, which I feature below.

Welcoming vibrations from buildings! – Arturo (photograph of murals and blank walls on campus, slide #12)

When I Imagine the New University, I envision a place where Black students and students of color feel heard and celebrated. Part of this includes learning about historical figures and voices like ours. These books are all the required materials for my political philosophy class, and the picture speaks for itself. I recognize the importance of these texts, but the lack of diverse voices is overwhelming. I'm sure there were Asian, Latinx, and Black political philosophers with similar, if not better, perspectives. Why must we only focus on white authors? Just because they are well known does not mean they are the only materials worth studying. Political science is already dominated by white males and POLI 30's exclusive curriculum makes it less appealing to students who already feel like the field wasn't made for them. If Santa Clara truly values diversity, this needs to be reflected in classrooms/teaching materials. – Denise (photograph of books from Political Science course, slide #6)

I imagine a university that prioritizes the environment and doesn't invest its endowment in the fossil fuel industry. As a Jesuit university, I believe that Santa Clara has a moral obligation to work towards investing in green energy and protecting the environment. This issue was initially brought up to the university many years ago yet remains a problem. It's simply not right to preach the importance of saving the climate while actively investing in fossil fuels. –Anonymous Student (photograph of birds eye view of campus, slide #9)

I chose a picture where the sun is visible because it represents something that future students look forward to when coming to Santa Clara. The sun is a symbol for the warmth that students experience temperature-wise however, how I envision the New University is as promisingly warm and accepting of all regardless of background into classes and the campus community. Just as students are promised a warm climate here at Santa Clara, I hope that when the school is advertised as welcoming and allowing students to be seen in their smaller class lives, the school lives up to the expectations because the temperature outside should not be the only promise being fulfilled. – Alex (photograph of sunshine on campus, slide #11)

The residence hall that I live in has the main entrance facing the street, which you are forced to enter through after 7 pm when the side doors close. Because I am consistently coming back after 7 pm I must walk on the sidewalk next to a busy road to get into my building. When coming back late after working in the library or the art building it can be kind of scary if there is a person standing on the corner or if there is a car parked near the door. While this is not a racially motivated issue it often makes me feel unsafe in my living environment. I would like the side doors to be always open rather than closing early. – Sophie (photograph of residence hall, slide #15)

The photo-narratives capture students' dreams for the *New University*; a place where they are seen, feel safe and cared for. According to Alex "*the New University is as promisingly warm and accepting of all...*" which resonates with Sophie's hopes for a safe and inclusive campus culture.

Feelings of care are also characteristics of *theory in the flesh*, which acknowledges the contradictions of lived experiences, yet the need to cultivate community despite differences. For example, Arturo notes the need for an inclusive campus that embraces the whole student. Denise echoes this as well by describing a campus environment "*where Black students and students of color feel heard and celebrated.*" To be seen and understood, according to Arturo and Denise, is to be recognized as a rightful member of the university. The photo-narratives demonstrated *theory in the flesh* via students' desires to exist in a *New University* where they can thrive and experience *El Mundo Zurdo*. In the seminar, students' hopes for the *New University* were guided by a *theory in the flesh* that connected their struggles for justice with demands by Third World Liberation Front student activists. The seemingly parallel experiences between students then and now did not make students in the seminar hopeless. On the contrary students saw validation in learning these histories, and it inspired them to "*pick up the torch,*" as Arturo remarked, toward a *New University* where *El Mundo Zurdo* as a place of abolition is not a dream but a reality of higher

education. Such subjectivities toward an *otherwise* were also expressed among youth in the *Youth for Justice Project* (YJP), which highlights the second principle: *research justice*.

Research Justice: *The Youth for Justice Project* (YJP)

Research justice is a paradigm that recognizes communities as powerful agents with control over their lives, and the right to wield knowledge and actions toward their liberation. Within this paradigm, research is utilized as a tool for the active disruption of colonialism that contributes to the reproduction of systemic inequities and epistemic violence in research, theory, practice, and policy. *Research justice* also seeks to address inequities in the research process. That is, justice is actualized when communities most impacted by systems are recognized, affirmed, and supported in their knowledge and positionalities as experts of such conditions with the capacities to reclaim, leverage, and wield all forms of knowledge and experiences to advance their agendas for systemic change, transformation, and liberation (Jolivéte, 2015). Prioritizing community voice in the deconstruction of knowledge and power is central to *research justice* as it aims to foster community leadership toward social change, whilst supporting the political power of communities of color, Indigenous peoples, and disenfranchised social groups.

In alignment with abolition psychology, specifically a critical and emancipatory analysis of power—locating both the oppressive dimensions of power at multiple-levels, and the power communities or collectives hold to wield their own liberation—*research justice* is the second principle. *Research justice* re-centers and strengthens communities in their efforts to respond, identify, and lead systemic change in the ethical, culturally grounded, and decolonial ways. Underscoring that all research processes must be accountable to communities impacted by systems, *research justice* is a collaborative and relational process grounded in community knowledge (Jolivéte, 2015). As a collective endeavor of shared knowledge and action, *research justice* sustains engagement with, and knowledge by and for communities best positioned to know or address their condition, which also aligns with liberation psychology (Montero, 2007).

To further demonstrate *research justice* as the second principle in abolition psychology, I offer a case study of a collaboration with middle school aged youth in the *Youth for Justice Project* (YJP) afterschool program. The YJP is an afterschool arts, advocacy, and critical ethnic studies oriented program that I, along with a team of two undergraduate student co-facilitators, have been leading since the fall of 2021. Located in the Guadalupe-Washington community, the middle school is the only private Catholic school in the area. Most of the students who attend the school are youth from the surrounding neighborhood whose siblings also attended the school, and/or were accepted into the school because of their academic performance and financial need. The YJP strives to foster the leadership, civic engagement, and community-based research skills of middle school aged youth, the majority of whom are Latinx, via art projects that

integrate advocacy and social action. We engage with as many as twenty youth to as few as seven youth who join our afterschool program sessions once a week for one hour. Although the YJP afterschool program is open to all youth, the majority of participating youth self-identify as girls.

The YJP follows a PAR (Participatory Action Research) approach, which is aligned with *research justice*. Through a PAR process, youth identify and determine an issue or condition that impacts them, they learn about the root causes of the condition, what caused it and why, and then together we develop an action or project to address it. Because PAR is an iterative, cyclical, and relational process, our work is ongoing and illustrative of *research justice*. One of the elements of *research justice* is that communities should own, wield, and leverage resources to sustain their voice, power, and agency. Thus, the YJP aims to cultivate this among youth through art and advocacy projects. The intentions of the YJP are to support youth sociopolitical development, and leadership via art-based advocacy projects that foster radical hope, and social action to redress environmental health conditions impacting their school-community contexts.

Through a PAR process we have supported youth in creating art projects, such as self-portraits, collages, photographs and art exhibits that document via images and stories, their hopes for their neighborhood. As a collaborative team, we integrate art to support youth in creating self-portraits and photo-narratives that capture their radical hopes to thrive and live in healthy environments. For example, during our sessions we engage youth in icebreakers or community building activities, as well as discussions about social issues, such as diversity, misrepresentation in the media, homelessness, unemployment, poverty, and gender rights, among other topics and intersectional injustices. All the topics are also discussed in relation to their school, neighborhood and community experiences and contexts. Then, through art centered activities youth depict community challenges about these issues in relation to their living conditions or concerns with public safety and housing insecurity. Youth create artwork from self-portraits to sketches to collages to illustrate a vision of a present-future. The abolition principle of *research justice* is demonstrated through youth artwork that advocates for resources, support and access to decision making power for their community. Drawing on reflections from the YJP, I highlight how youth developed skills to engage in critical research and inquiry that centered their lived experiences while imagining *El Mundo Zurdo*. I highlight some of their art to illustrate how abolition is possible when approached through a *research justice* principle.

The first art activity we led were *auto-retratos* (self-portraits). Youth drew how they see themselves, how others see them, and how they wish to be seen or see themselves in the future. The sociopolitical elements of this activity, for instance, are reflected in Veronica's drawing that features her dream of becoming a doctor to heal and care for people who are in pain:

"My dream is to become a doctor. I can change the world by treating people in need."
 – Veronica, 6th grader (drawing of cat and youth inside bubble, slide #7)

Imagining herself in a future where she has the skills and capacities to care for others, Veronica's drawing is politically oriented toward a radical form of relationality and accountability to support others with unmet health needs. By encouraging youth to describe aspects of themselves, they drew their dreams as reflections of the issues they wished to address. *Research justice*, like abolition, is about ideation and action. Lived experience can and must guide the vision of abolition as a possibility. The ongoing public health concerns associated with COVID-19 led some youth to acknowledge the urgency to care for communities in need. By encouraging youth to think about their futures we were having them reflect on the challenges alongside their hopes.

The *auto-retratos* were an opening to foster radical hope, a sense of community, and an understanding that while we are each unique, there are aspects of ourselves that we share or experience, such as a neighborhood. We encouraged youth to think of solutions to help create change in their environments by facilitating dialogues on youth futures and desires for themselves and society. A topic that surfaced frequently, for instance, was environmental justice. In an *auto-retrato*, Roxy illustrates themes of environmental sustainability in response to the question: *"How can you make a change in the world?"* Youth engaged this question through a series of smaller drawings and captions that illustrated possible strategies. Some of these strategies, although focused on surface level solutions such as minimizing carbon footprint and consumption, were nevertheless youth reflections on environmental justice concerns. Among some of the drawings were plant-based items, such as a

bamboo toothbrush, eco-friendly supplies, recycling, and composting. I offer Roxy's drawing and accompanying statement:

"You can change the world for good by throwing your trash in the garbage. Also having eco-friendly supplies, including plant-based items." The youth then chose to represent themselves through volleyball, signifying how they enjoy the sport and how to preserve our environment so they can continue to play, "before it's too late." – Roxy, 6th grader (earth drawing)

Through these activities and facilitated dialogues we provided opportunities for youth to creatively represent social issues, as we fostered radical hope, imagination, and visions for change. By creating self-portraits, some with depictions of themselves and others of the earth or what mattered to them, youth captured their aspirations toward imagining *El Mundo Zurdo*.

The second activity that we facilitated was collage making where youth captured visually their thoughts on society and the environment. One collage, for instance, highlighted youth views on society in relation to the environmental health, social relations, and overall quality of life. In describing her collage, Frida shared that it represented *"what is wrong with society:"*

“The pictures with the trash on the sidewalk make me sad because it shows how people don’t take care of the planet [earth] when they don’t recycle.” – Jonathan, 7th grader (photo #15)

“Turning the newsstand into a trashcan is not okay. This is for the news and not the trash. People who deliver the newspaper cannot do their job because they don’t have a place to put the news articles.” – Emily, 6th grader (photo #27)

Youth created artwork that was displayed in the hallway of their school as a way to share and connect with their school community. Most importantly, their art exhibit conveyed who they are—their identities, lived experiences, and future aspirations—along with their hopes and dreams for their school, families, and the surrounding neighborhood communities. Youth engaged *research justice* through art that situated them as experts in discerning or determining social issues of concern impacting their environments. At the same time, they also reflected upon and crafted futuristic narratives of themselves that featured their agency to redress some of the wrongs they were witnessing in their immediate contexts.

The art and advocacy engaged by youth in the YJP illustrates *research justice* as an abolition principle toward fostering *El Mundo Zurdo* against a backdrop of injustices. The activities that we facilitated helped scaffold youth action-project, which was a school exhibit featuring drawings, collages, and photo-narratives of community assets and challenges. Although our goal is to support youth in their sociopolitical development process, and raise awareness about community concerns to foster social change, as facilitators we also affirm that youth have power and agency. Thus, the principle of *research justice* aligns with *theory in the flesh*, and is also vital to creating relationships that allow for the third and last principle: *decolonial love*.

Decolonial Love: *Madres Emprendedoras* Organizing Community Care

Decolonial love involves solidarity and accountability (Dutta, 2021). It is a form of embodied (e.g., who or how we are) and enacted (e.g., what we do) relationality that “emerges as an antidote to dehumanizing narratives and processes, whether they are imposed internally or manifested as colonial wounds of self-hate” (Atallah et al., 2022, p. 8). Solidarity, often represented via relationships or interactions among individuals within communities can manifest in the physical, material objects or artifacts that help unite, connect and encourage collective care. Unlike the previous examples of *theory in the flesh* and *research justice* as abolition principles, the third example demonstrates *decolonial love* among the *Madres Emprendedoras*. The former case studies highlight my pedagogy and research, yet my work with the *madres* demonstrates my accompaniment and solidarity beyond our community research collaboration.

To contextualize the mobilizing by the *madres* in a predominantly Latinx and Spanish-speaking low-income community in San José (CA, USA), I describe *decolonial love* as the third abolition principle. In the context of COVID-19 many communities experienced the amplification of systemic injustices and inequities. Nevertheless, communities and groups, such as the *Madres Emprendedoras*, came together to mobilize resources for themselves. The *madres*, drew on their sociocultural, navigational, linguistic, and aspirational capital (Fernández, Guzmán, Bernal, & Flores, 2020) to develop strategies to care and support each other. The *madres* leveraged their collective resources to meet their needs, and found a means of being at ease in a world of unease. By enacting what Lugones (1987) describes as a process of resistance to oppressions

the *madres* embodied *decolonial love* via activities that allowed them to be “humanly bonded ... having a shared history with others, a daily history” that helped disrupt the coloniality of gender within systems of power. Thus the *madres* resisted hegemonic discourses about Latinas, who are often described as passive, disempowered or victims.

By supporting each other’s social, economic, and wellness needs during the pandemic the *madres* enacted *decolonial love*, and they strategically utilized social media to disseminate information about community resources. Through their use of social media, they sustained their relationality, accountability and community care aligned with *decolonial love*. Facebook, for example, was used to inform the community about local resources, as seen in their posts.

From access to free food to COVID-testing to virtual education resources for their children, the *madres* utilized the live streaming feature on social media to share information about services and events in their community. They also publicized their stories of living through the pandemic, and this helped foster support for one another. Sharing stories to conditions of life that would otherwise remain silent, unheard, and unseen, affirmed the *madres*’ agency and dignity.

Thus, in addition to utilizing the social media feature to support their needs, the *madres* also formed connections with local leaders and stakeholders. A few months into the pandemic a new community health center opened its doors to the community, and several of the *madres* leveraged their connections and affiliations with city and county stakeholders, as well as faith-based organizations and nonprofits to advocate for the health and wellbeing of their community. One *madre*, for example, helped organize public events with stakeholders. The events

ranged from vaccination drives to public health resources to food and housing support in times of precarity to help meet their community's needs. The innovation and drive with which the *madres* engaged their resources and networks to support each other demonstrates *decolonial love*.

Several of the *madres* cultivated a sense of community and accountability by organizing *kermeses*, or food sales, to support families with limited financial resources. The *madres* pursued these and others form of economic support via informal labor, such as making face masks, delivering food and groceries, and creating goods to sale. *Decolonial love* was sustained by the *madres*' unwavering mutual care. Specifically, by the relationality that manifested as family-like ties, which they affirmed through their advocacy and creative entrepreneurialism, especially when civic and social institutions failed to offer social and economic aid, support, and resources.

Prior to COVID-19 resources were often centralized in existing organizations, such as the neighborhood association, community centers, faith-based organizations, and nonprofits. To access resources, however, community members must demonstrate or provide evidence of need, or be positioned as recipients deserving of services. Under COVID-19 these resources became incredibly limited, and even inaccessible to some families. This led some of the *madres* to shift their roles from receivers of services to providers, advocates, and organizers of these resources.

The *madres* engaged in volunteer and leadership opportunities as *promotoras de salud*, or health promotion workers, who connected families with local resources—from health clinics to testing sites to shelters and affordable housing, especially for evicted families. When a community member experienced a difficult situation, the *madres* organized themselves to lift each other up, and provide care and support. This attests to *decolonial love* as an abolition principle where people do not rely on the state or its institutions for support, but rather they rely on each other.

In learning from and accompanying the *madres* in their organizing process, I consider their actions as embodiments of *decolonial love* aligned with abolition because they fostered solidarity and accountability in the absence of failing systems and institutions. The *madres* demonstrated qualities of *El Mundo Zurdo* where in the words of political activist James “Jimmy” Boggs, “It is only in relationship to other bodies, and many somebodies, that anybody is somebody” (2016, p. xiv). Affirming relationships of mutuality through collective relational care rooted in solidarity and accountability as mutual care is the *madres’* expressed *decolonial love*. Through their organizing and fundraising efforts they provided materials, resources, support, and services to each other, and created a community of care at a time when feeling connected was severely compromised by social distancing protocols and COVID-19 health concerns. The *Madres Emprendedoras* enacted a counter-discourse of Latinx agency, resilience, and collective determination via their community grassroots organizing efforts embodied as *decolonial love*. *Decolonial love*, like *El Mundo Zurdo*, are not abstractions, it is an act of being or co-existing in ways that heal and sustain even in the worst of times. Anzaldúa’s (1987) vision to “act in the everyday world” in ways that create and bring *El Mundo Zurdo* into being was exemplified through *madres’* embodied abolition principle of *decolonial love*.

The community mobilizing efforts led by the *Madres Emprendedoras* is an example of abolition as *decolonial love*. *Decolonial love* is the embodiment of solidarity and accountability that unshackles communities from a state of oppression to one of liberation that sustains and affirms dignity. *Decolonial love* unites through humanizing reciprocal relational recognitions. *Decolonial love* is an abolition principle that reflects Lugones' (1987) notion of world-traveling, or entering each other's lives with the intent to experience mutual liberation. Yet the traveling is not voyeuristic or disembodied, rather it is relational or in *acompañamiento* with others fostering communities of co-resistance to power. *Decolonial love* is synergistic; it allows for individual, relational and collective growth, fostered through relationships of mutuality, or accompaniment via shared experiences. *Decolonial love* is a process of personal and collective healing where Freire (1970) notes that dialogue sets the foundation for love. To achieve this, the conditions and discourses that reify the existence and maintenance of dehumanization must be abolished. The *Madres Emprendedoras*'s dialogues via social media carried onto public community organizing efforts that served to create elements of *El Mundo Zurdo*, and thus the third abolition principle.

Concluding Reflections and Visions of Abolition

Abolition psychology is oriented toward a decolonial liberation psychology, a psychology *of* and *for* liberation. The examples I provided illustrate the possibilities of a decolonial liberation psychology rooted in abolition. By challenging the pervasiveness of individualism, objectivity, and disembodied inquiry within psychology, and among communities living on the margins, an abolition psychology toward *El Mundo Zurdo* is possible. As an embodied critical ethical reflexivity *theory in the flesh* (Fernández, 2018), and *research justice* with communities in action, can carve a path of *El Mundo Zurdo*. Decoloniality, as Daigle and Ramirez (2019) contend, "is an affirmative refusal of white supremacy, anti-blackness, the settler colonial state, and a racialized political economy of containment, displacement and violence" (p. 80) (as cited in Atallah et al., 2022). Love becomes critical because it is an expression of being that turns wounds or rage into a bridge to build and transform (Atallah, 2022, p. 10). *Theory in the flesh*, *research justice*, and *decolonial love* are thus interconnected abolition principles.

Abolition, in resonance with Fanon's (2008) conceptualization of decoloniality is an active attitude and openness to shift away from the hierarchical norms imposed upon colonized peoples. It is the desire to be/become vulnerable and intimate in one's relations, to learn and generate radical hope, and pluriversal possibilities. Abolition psychology that affirms dignity, supports community struggle, and fosters knowledge, practices, and relationships in the pursuit of and for liberation, is possible. The antidote to the despair and disillusionment with the extant state of the discipline, especially in the U.S., is abolition. Thus, what can we cultivate, sow, and see grow from a place of abolition? What are the possibilities for abolition psychology anchored in

decoloniality and liberation, and in principles of *theory in the flesh*, *research justice* and *decolonial love*? *Decolonial love* is ideation that is embodied and enacted in and through refusal, resistance, and radical hope cultivated in relationship with ourselves (*theory in the flesh*) and others (*research justice*). Such decolonial encounters assert for us that another way of being is possible—we have the skills, capacities, and resources to bring it into being.

Abolition psychology can help actualize *El Mundo Zurdo*, and this requires we engage and develop new praxes, embodiments, enactments, and epistemologies that are transgressive to existing standards, and ontological or epistemological conventions of psychology. The call to enact abolition psychology requires a disciplinary paradigm shift. Anzaldúa (1981) alerted us to change when writing that change “requires both the alchemist and the welder, the magician and the laborer, the witch and the warrior, the myth-smasher, and the mythmaker. Hand in hand, we brew and forge a revolution” (p. 196). The change desired, requires that psychology be undone and transformed with, though, and from the underside—with the communities we engage with but seldom involve in decision making, the participants we observe and often misrecognize, and the groups or peoples we categorize when we know we are much more than a mere labels.

Abolition psychology is a decolonial liberation psychology that disrupts systems of power. Abolition is the eradication or elimination of conditions and circumstances that impinge upon people’s humanity—the freedom to be and experience freedom, intergenerational healing and wellbeing, and conditions of living with dignity. Thus, abolition psychology is a movement that acts to address and transform circumstances of hegemonic power and oppression that foreclose possibilities of dignity, justice and thriving. To engage abolition is to support, foster, and sustain the wellbeing and thriving of communities as a process of thinking and doing *otherwise*. Instead of focusing on problems or deficits presumed to be found within communities, abolition psychology prioritizes community strengths and assets, dreams and desires, hopes and imagination. It fuses this to create conditions of existence aligned with decolonial liberation tied to transformative justice. Abolition principles enact refusal, resistance, and radical hope. The imagination, joy and relationality that characterize it also involve understanding historic and contemporary forms of dehumanization to instead affirm dignity and liberation. Abolition psychology works to delink ourselves from coloniality and colonization, and to cultivate liberation as a way of living. Without romanticizing the experience, liberation is capacious, live-giving, healing, and wholesome, and I have offered three principles toward enacting abolition.

To interrupt the conditions that dehumanize and disenfranchise those on the margins is a necessary abolition principle to our survivance. Abolition is the principle that all beings should experience a healthy, thriving life unconstrained by the coloniality of power that compromises wellbeing, dignity, and sustainability. Abolition at its very core is a simple concept. Yet it is often seen as an otherworldly, radical, or even militant idea. What is threatening about abolition is that it challenges structures of power and systems of violence that

have been rendered normal. Abolition interrogates the *status quo* as it deconstructs “the social lie” (Martín-Baró, 1994, p. 188), or the stories that reinforce a sense of normalcy yet leave power intact. To bring abolition visions and movements forward, we must challenge hegemonic systems of power. Reflecting this vision Gilmore (2007) affirms that abolition is the presence of all we need to sustain ourselves through transnational intergenerational liberation. I am enlivened by the principle and acts of living for abolition as decolonial liberation *hacia El Mundo Zurdo*..

Jesica Siham Fernández (surname: Fernández) is an assistant professor in the Ethnic Studies Department at Santa Clara University. Grounded in a decolonial feminist praxis, and informed by critical race and ethnic studies, she received her Ph.D. in Social Psychology and Latin American & Latinx Studies from the University of California, Santa Cruz. Trained as a community psychologist, Jesica engages in community-based and participatory action research (PAR) paradigms, projects and collaborations to support the sociopolitical development, liberation and thriving of communities, youth of color, and student activists. She is the author of “Growing Up Latinx: Coming of Age in a Time of Contested Citizenship,” and the recipient of the 2023 Early Career Award from the Society for Community Research & Action (SCRA). Historical-Cultural Psychology: What is it intended for?¹ Theses on the inseparability of psychology and politics

Bruno Peixoto Carvalho, Silvana Calvo Tuleski & Terezinha Martins dos Santos Souza

Abstract

This discussion aims to highlight the social purpose of a given theory, specifically Historical-Cultural Psychology. It starts from the historical-dialectical materialist position for which every theory, however abstract it may be, has a concrete root has a historically determined genesis and development. The psychological currents that have developed since the birth of Psychology as a science in the early twentieth century have been and are crossed, albeit with different nuances, by conceptions in which both idealism and mechanistic materialism predominate. This opposition also characterizes the reading of certain contemporary interpreters of Historical-Cultural Psychology. Entering the debate, the text is articulated around the defense of three theses, which are related to each other: 1) every psychological theory has an implicit or explicit political position; 2) what validates a theory is its ability to historically update itself in essential explanation of the phenomena it faces, and 3) The only approach possibility concerning theories is due to their philosophical-methodological basis. This text aims to draw attention to the risk that Historical-Cultural Psychology may be so transformed as to conform to the bourgeois social order from reformist positions. Hence, the defense that the abandonment of historical-dialectical materialism, the analytical basis of Marx and

¹¹ The article's title was inspired by a verse from the song "Cajuína" by the Brazilian singer and composer Caetano Veloso. This song was released on the album "Cinema transcendental" in 1982 and pays homage to Torquato Neto, one of the founders of the Tropicalist movement. At the age of 28, the day after his birthday, Torquato Neto committed suicide after much suffering because of the corporate-military regime (1964-1989) and the exile of his friends. Caetano Veloso, in this song, tributes to Torquato's father and his friend. The verse that inspired the title is: "We exist, what is it intended for?" (Existirmos, a que será que se destina? Available at: <https://www.youtube.com/watch?v=nmd7Nw9KqaE>).

Engels' social theory, is the key point for identifying what presents as misrepresentation/distortion or necessary transformation. The assumption expressed in the 11th thesis on Feuerbach affirming knowledge is an instrument of transformation defends the historical-dialectical materialist method. At the same time, it should guide us so that Historical-Cultural Psychology advances as science and praxis, not becoming a dogma or reducing itself to an empty encyclopedism. The point is to affirm it as a material force that assists in the revolutionary transformation of reality, contributing to the construction of knowledge committed to human emancipation and not to the deepening of barbarism. This is its political purpose.

Keywords

Historical-Cultural Psychology, Marxism, policy, socialism

Introduction

This article originates from a malaise related to the discussions that circulate within the Marxist tradition, particularly by authors affiliated with Historical-Cultural Psychology. As with any theory, the psychological currents that have developed since the birth of Psychology as a modern science in the early twentieth century have been and are crossed, albeit with different nuances, by conceptions in which both idealism and mechanistic materialism predominate. This pendulum is not exclusive to non-Marxist psychologies. Still, as paradoxical as it may be, it has an impact within Marxist approaches, as Löwy (1987) exposes, and in Historical-Cultural Psychology. These positions also divide contemporary interpreters. On both sides, we come across forms of abandonment - partial or total - of the historical-philosophical foundations of this tradition in psychology, especially the Marxian legacy and its entrenchment in the Russian revolutionary movement of 1917.

From the methodological point of view, making the historical-dialectical materialist method autonomous from the social theory elaborated by Marx and Engels is impossible. In the perspective of totality, a rigorous separation between procedure and factual investigation is illegitimate. More than a personal mistake, we understand such interpretations are rooted in the psychology crisis itself, as discussed by the creators of Historical-Cultural Psychology, a methodological crisis. Vygotsky (1996) conducted an exhaustive study of what he called the "historical meaning of the crisis in Psychology", demonstrating the materiality of the clashes in the field of psychological ideas in his time. Materialism and idealism represent not only sterile philosophical discussions but rather the philosopher's position facing the objective and social world, and therefore concerning social classes and their historical interests. In

turn, Vygotsky, Leontiev and Luria performed numerous studies demonstrating the limits of the psychological currents of their time, part of them linked to the heritage of philosophy that preceded them, but also due to the previously existing (im)possibilities of objectively overcoming this dualism. Thus, they denounced in their time the political implications and the compromise of the existing psychological currents by spraying or non-identification, fragmentation, or partiality in the analysis of its object, with the maintenance of the capitalist society, which made them denominate such currents of bourgeois psychologies.

Vygotsky (1996) diagnosed that overcoming the psychology crisis would favor the emergence of a new psychology for a new human being, who would be responsible for unveiling his object in motion, in transformation and from the concreteness that determines him. The struggle for a contemporary classless society could not be done without psychological knowledge, knowledge of the essence and multidetermination of its object. Besides, Historical-Cultural Psychology, since its roots, has not intended to be “neutral” or “apolitical,” and, thereby, we defend it should be essentially anti-capitalist in its most diverse fields of activity, aiming for a socialist society. A Historical-Cultural Psychology that is not guided by the historical perspective of the construction of socialism cannot claim to continue the work of Vygotsky, Luria and Leontiev.

Reflecting and positioning ourselves before the possible destinations of Historical-Cultural Psychology in the context of the ideological decadence of capitalist society (Lukács, 1979) - marked by the almost absolute hegemony of positivist science in psychology, combined or not with various nuances of neoliberal postmodern thought - we assume the explicit revolutionary radicalism of this theory to the detriment of the vulgarization and degenerations that have been suffering more intensely in this first quarter of the 21st century, which we will address throughout the text. The organization of our text, in defense of the revolutionary radicalism of the cultural-historical theory for those subjects committed to overcoming the bourgeois order, is articulated around three interrelated theses.

The **first thesis** seeks to demonstrate the path taken by a school of social psychology in Brazil, The São Paulo School (Escola de São Paulo), delimiting two distinct periods of its intellectual evolution. The authors representing this perspective produced their first investigations and theoretical elaborations in the context of the corporate-military dictatorship in Brazil (1964-1989) and asserted a radical critique of capitalist society. In the second moment of its theoretical elaboration, from the 1990s - marked by the defeat of the experiences of Soviet socialism - the São Paulo School of Social Psychology undertook a reformist theoretical turn. The brief demonstration of this school's course can guide us to the dangers of a similar process with Historical-Cultural Psychology.

The **second thesis** advances the current debate within Historical-Cultural Psychology in contemporary times. Is Historical-Cultural Psychology, whose origins date back to the Russian Revolution of 1917, a dated and outdated theory or can/should it be updated?

Trying not to fall into the traps of superficiality, we base the analysis on what is hidden behind the various forms of dissemination and vulgarization of a theory whose genesis is effectively revolutionary. We seek to explain that the attempts to disconnect Vygotsky from Marxian social theory, which presupposes a specific method of analysis of reality, reveal a political position to neutralize the radicality of Historical-Cultural Psychology.

The **third thesis** concludes our argument by demonstrating how Vygotsky (1996) laid the ground-stones for what he called the Capital of Psychology in his classic text analyzing the crisis of Psychology at that time. For that author, producing the Capital of Psychology is to approach its object in its concreteness and multidetermination, apprehending its genesis, structure and development in the historical movement. We highlight that Historical-Cultural Psychology is sustained on Marx's elaboration on world conception and general philosophy. From the same totalizing perspective, Vygotsky understands the necessary articulation of the most varied sciences in and for explaining society and the social being. They both attempt to explain social life and its contradictions in capitalism, to transform it in the direction of the full development of human potentialities, fighting for maximum personality growth, as Leontiev also advocates(2021).

Thesis 1 – Every psychological theory has an implicit or explicit political position

The statement that every psychological theory has an underlying political position is already - in a way - a truism. However, it is expected that the necessary theoretical-practical consequences do not accompany this assertion. In Brazil, the popularization of this thesis gained a truly national reach, with the authors representing the São Paulo School of Social Psychology (Lane & Codo, 1984) from the 1980s on. Paradoxically, the same formulators who, in the 1980s, pointed out the need for psychology to clarify the socio-political commitments engendered in its theories and methods and affirmed the responsibility to contribute to the overcoming of capitalist society adhered - from the 1990s onwards - to an abstract, generic social transformation perspective, in which every kind of apology (overt or covert) from the bourgeois order fits, as the ideology of anti-Marxism, yet they are not openly committed to such ideology. In

what will follow, we will initially examine the format the São Paulo School gave to the thesis presented in this section to demonstrate how the abandonment of Marx and Engels' social theory and an emancipatory project of social transformation was incisive - but not explicit or declared - carried out by this same school.

A tradition in Social Psychology that was built in direct opposition to American cognitive social psychology is referred to by this same school, guided by the experimental perspective, the study of small groups, the abandonment of significant theories and the view of totality and by the phenomena naturalization and/or psychologization that are, at their root, social. The School of São Paulo's authors consulted the social theory of Marx and Engels - besides other classics and contemporaries of Marxism - for the foundations of social psychology committed to overcoming class society. São Paulo School authors sought in Marx and Engels' social theory - besides other classics and contemporaries of Marxism - the foundations of social psychology committed to overcoming class society. Other important influences for this tradition were Historical-Cultural Psychology (which even inspires some of the categories considered essential in social psychology, namely: activity, consciousness and identity [the latter replacing personality]), the emerging Theory of Social Representations by Serge Moscovici, the Social Identity Theories of Israel and Tajfel, and the production of Latin- American social psychologists such as Martin-Baró, Alberto Merani and Maritza Montero, as well as other intellectuals of Latin-American social thought such as the sociologist Orlando Fals Borda and Paulo Freire. The scientist production of this group, from which we highlight the contributions of Silvia Lane, Bader Sawaia, Wanderley Codo and Antonio Ciampa, originates from the studies initially guided by Silvia Lane and later by her first graduate students in Social Psychology Postgraduation at the Pontifical Catholic University of São Paulo, which, even today, is the main center of research production of this school. It is essential to underline that this theory in social psychology was developed in the context of the corporate-military dictatorship imposed by the Brazilian ruling classes between 1964 and 1989. The commitment to the social transformation of reality needs to be apprehended precisely in this context: that transformation that marches on in overcoming class society and labor exploitation (Carvalho, 2014). A vital mark present in the theses and dissertations of these intellectuals is evident in the fact that, in general, the first chapter of these productions was dedicated to - starting from the object of investigation in question - analyzing how the classical theories in psychology and social psychology conceived the relation between individual and society in the examination of that object. Let us briefly see how Sawaia (1979), in the Marxist phase of his production, conducts this in his master's dissertation by

pointing to the intrinsic relation between any psychological theory and its correspondent in the field of social theory.

When performing, in her master's thesis, an examination of the great traditions in social psychology, Sawaia (1979) highlights the existing common conservative fund as in the sociologizing as in the psychologizing approaches of social psychology, with the following:

The two theoretical lines, however contradictory they may seem, contain a conservative perspective and can be seen as an ideological manifestation to avoid effective changes in the lived reality. Emphasizing the importance of the social over the individual, reifying society, and showing that it has its order of explanation, means nullifying the possibilities of a transforming action on the part of the individual.

On the other hand, stressing the psychological dimension of problems arising from an objective social system, saying that therein lies their solution, considering that psychological facts have their order of explanation, means alienating the individual from the social totality in which he lives. They all end up being (directly or indirectly) a justification of what exists, the legitimation of the social system in which they operate, and the acceptance of present social structure. (Sawaia, 1979, p. 9).

The author establishes an essential relationship between psychological and social theories in the work mentioned above. With Skinner's radical behaviorism, Sawaia relates the extension of Durkheim's socio-determinism, for whom the individual has little freedom of action before the regularity of social facts (Sawaia, 1979). On the methodological level, both identified their theories' alleged axiomatic (and, by extension, political) neutrality with scientific objectivity. Here are two examples of how the hypostasis of social (Durkheim) and environmental (Skinner) determinations can lead to a conservative position in a world where the margin of human action is omitted. On the other hand, Kurt Lewin overestimates the role of the individual in social changes, in addition to identifying the virtuous characteristics of a group and of leadership as those compatible with the values of bourgeois liberal democracy in its opposition to authoritarianism (democracy, formal equality, individualism, naturalized relationship between leader and group members) by recognizing the importance of meaning and intentionality of human action – just like Weber in sociology – as an essential element in the psychological investigation of small groups. Skinner's psychology, by transforming environmental contingencies into an absolute in which freedom of human action has little significance and Lewin's psychology of small groups, by identifying as universal characteristics of groups and

leaderships, those values proper to liberal democracies, cooperate - rarely explicitly - in maintaining bourgeois social order.

According to Sawaia (1979), the only social theory capable of adequately equating the relation between the individual and society is historical-dialectical materialism, insofar as it situates the individual's margin of action (historically variable) within the constitutive relations between material productive forces and social relations of production. Lane (1984a), in turn, repeatedly directed her criticism to the pragmatic orientation of the American perspective of social psychology, which, when studying the theme of groups, reduced this object to small groups, to which any proposal for social change would be tied, leaving out of their formulations and investigations the analysis of the totality of social life and how groups and individuals participate in this whole. Ultimately, this orientation (which had in Lewin, its most important representative) of the group analysis process concluded the need to construct a "strong democratic [group] leadership" (Lane, 1984b, p. 15). This political orientation (democratic and conservative) of social psychology had significant resonance in the American post-war, with the newly defeated Nazi-fascism and liberal and bourgeois democracy figuring as a horizon for the reconstruction of the world. Lewin translated - into his group theory - the most sincere and naive beliefs in American liberal democracy.

While on the one hand, it is easy to retain the meaning of the thesis presented in this section from the works of Sawaia (1979) and Lane (1984b), when the authors analyze widely established psychological theories such as those mentioned above (behaviorism, Lewin's group psychology, etc.), on the other hand, the task becomes more complicated when we examine the political commitments of those theories that criticized hegemonic ideas in psychology, such as the São Paulo School of Psychology itself and - recently - some formulations of Historical-Cultural Psychology.

In the São Paulo School studies until the late 1980s, their political commitment to social transformation of reality had a sense that - although rarely explicitly affirming the social revolution as a necessity for human emancipation - placed it alongside those social forces that considered the capitalism overcoming to be the goal to which science should contribute. After all, the economic foundation of this society is that one through which "[...] a few dominate, and many are dominated through labor power exploitation." (Lane, 1981, p. 23). Codo (1984) argued not only that psychology should contribute to the process of developing class consciousness and struggle "for a new social system" (p. 142) but that the workers' struggle for a new society "requires a political intervention (passion) which destroys its [capitalism's] genesis (the individual as the means of production ownership), that promotes a revolution in the economy" (Codo, 1985,

p. 94) and further, “[...] only a revolutionary party is capable of making revolution” (Codo, 1985, p. 94). Although the assumption of the need for social revolution is quite evident in Codo’s works from the 1980s, it is necessary to say that this position was not homogeneous in the group’s works of that period. Still, they all affirm that the need to overcome capitalism is inevitable, whose fundamental contradiction is between capital and labor. Psychology should also contribute to this process of radically overcoming class society alongside the exploited.

A small space of time and a series of events of enormous world-historical significance separate this first and fruitful phase of the intellectual production of the São Paulo School from that period that was opened in the 1990s onwards, when Soviet socialism was defeated – whose dramatic outcomes were represented in the fall of the Berlin Wall and the dissolution of Soviet Socialist Republics – and intellectuals on the right (Francis Fukuyama) and on the left (Habermas e Heller²) rush to present their formulas to reform the new-old-bourgeois world. With Heller, social contradictions come to be translated in terms of civil society’s struggle for universalizing civil and democratic rights. Although he does not deny the persistence of class struggles, Heller (1984) states the goal of class struggles is to force the dominant part of society to listen to the reasons of the exploited and to give in to their demands, not the seizure of power by the exploited. Habermas (2000), in his turn, transforms social contradictions into a kind of philosophical clash in which the world of life (the space of communicative action) is constantly threatened by instrumental reason and, therefore, the horizon of social struggles should be the broadening of communicative action, oriented toward consensus. These two philosophers, whose political commitment is the full realization of bourgeois democracy, form the pair of theorists with whom the São Paulo School has abandoned Marxism’s fundamental concepts and ideas, such as a) labor centrality; b) the objective contradiction between the interests of the main classes of society (bourgeoisie and proletariat); c) the idea that the working class is the revolutionary subject in capitalism, as pointed out by Carvalho (2014). No wonder the multilateral institutions of imperialism, such as the United Nations, will be intoned by Ciampa (2003) as a plural space for realizing the abstract utopia of communicative action. For him, “With all the undeniable problems and difficulties, the UN has always represented the possible advance in the civilizing process. Their human rights policy can be seen as an expression of emancipatory ethics with universalist pretensions” (Ciampa, 2003, p. 242). The subject of social transformation in Ciampa appears as “each and everyone”, regardless of their class belonging or commitment, and social institutions (since plural and not

² The latter in his post-Marxist phase.

fundamentalist, to use the author's empty words) figure as the subject of social transformation. The bourgeois attitude of the political commitment of the São Paulo School acquires quite dramatic contours when we observe what Silvia Lane – the prominent architect of that school – wrote about social transformations: “[...] it is not necessary to have class struggles – as recent events in Eastern Europe - but ethical changes at the individual level” (Lane, 1994, p. 79). Even though the São Paulo School of Social Psychology has two very notable moments of its intellectual evolution - a first, explicitly and implicitly committed to Marxism and the overcoming of class society, and a second, marked by the implicit abandonment of Marx and Engels' social theory and by the adoption of a progressive social-liberal approach - the teaching of social psychology in Brazil is still performed as if the current thinking of this school still corresponded to what it was until the 1980s.

Just as societies are in perpetual change, the political commitment of psychological theories is not invariable. And that goes for Skinner and Lewin's theories and the São Paulo School. The emptying of the radical content of social transformation that marks the production of the São Paulo School from the 1990s onwards (Carvalho, 2014) is a tragic example of the historicity of psychological theories. Although tragic, this fate is a reference for what we must fight against in defense of Historical-Cultural Psychology, its vitality and historical viability.

In the Historical-Cultural Psychology debate, it is already commonplace criticism of those appropriations of the theory that try to distance Marxism from it or, unfoundedly, to relate the abundant references to Marxism present in the works of this school to concessions and protocol citations made to avoid censorship and please the Soviet authorities. This anti-historical approach was already well denounced by Tuleski (2008, 2015) and Duarte (2001), and in Brazil, it is rare to find anyone defending such a position. However, there is another expedient in progress to undermine the radically Marxist political content of historical-cultural psychology and make it compatible with the social-liberal ideals. We refer to those attempts to minimize its relevance without denying the Marxian and Marxist basis of Cultural-Historical Psychology. We refer to those attempts to reduce its significance without denying the Marxian and Marxist basis of historical-cultural psychology. This position is evident in those attempts to maximize differences between Vygotsky and Leontiev until making them incompatible authors (which sometimes includes bringing documented personal ruptures and disagreements, as if they were sufficient proof of such theoretical distancing), in the hypostasis of Judaism and Spinozism present in Vygotsky's intellectual formation to the detriment of Marxism, or even in the invention (in our view absurd) of creative and original materialism by Vygotsky in opposition to Leontiev's allegedly mechanistic and non-dialectical materialism. In sum, just

as the theories, their interpretations carry an implicit or explicit political positioning. The omission of the fundamentals in the case of Historical-Cultural Psychology is evidenced as a conservative maneuver.

Thesis 2 – What validates a theory is its ability to historically update itself in essential explanation of the phenomena it faces

In the previous thesis, we briefly discussed two moments of the intellectual evolution of the São Paulo School, whose propositions started from the explicit commitment and need to overcome class society for an adherence – not always apparent – to bourgeois democratic order. We are concerned with the existence of reformist tendencies within Cultural-Historical Psychology - at the current level of bourgeois society's ideological decadence (Lukács, 1979) - whose destiny may be the conformity to the order, as it had occurred with the São Paulo School of Social Psychology, either as a result of an ideo-political shift or a “revisionist revolution” in the historical and theoretical understanding of the Historical and Cultural Psychology, its schools, and its relation to Marxism.

What has been exposed so far brings us to the second thesis. Knowing that theories are in permanent transformation since their objects and relations framework in which they are included are also in transformation, we need to establish the conditions in which theoretical changes represent an advance in the direction of better apprehending the object for which they are intended and those in which such changes best mean an abstract need to update theories whose meaning is the emptying of their revolutionary content. About Historical-Cultural Psychology, it is common to allude, in favor of its updating, to the fact that its origin is linked to the October Revolution of 1917 and, therefore, a series of revisions and adjustments would be necessary to serve the Brazilian reality of the 21st century. Explicitly or implicitly, it is argued that this theory can only respond to our needs if adaptations and simplifications are made and junctions with other more “current” or “updated” theories. Duarte (2001) performs an in-depth analysis of authors who, even claiming Historical-Cultural Psychology, approach and defend those so-called progressive pedagogies in educational debate. Still, in essence, they are conservative since, in practice, they deflate the teacher's role in instructional processes and minimize the importance of scientific knowledge to be transmitted by the school and, with that, radically distance themselves from the historical-cultural conception of relations between teaching and development and – by extension – from its theory on the formation of the individual.

Among the ideological strategies denounced by Duarte (2001), but also by Tuleski (2015), Ratner (2019) and Silva (2022), we can list: 1) junction or approximation of Historical-Cultural Psychology with Piaget's Genetic Psychology, joined as complementary; 2) attempts to distance Vygotsky's and Leontiev's formulations, either by raising differences and divergences to the degree of theoretical-methodological incompatibility or by transforming episodes of personal confrontation (whose motivations are essential to be stressed but not sufficiently documented) into evidence of this incompatibility; 3) replacement of Vygotsky's writings by summarized/censored and/or edited interpretations or translations; 4) defense of eclecticism as a "newly" way of doing science, as advocated by neoliberal postmodern conceptions.

While, on the one hand, we reject eclecticism and revisionism as ways of giving to Historical-Cultural Psychology the up-to-dateness that a theory needs to respond to the exploited demands of our time and our national reality, on the other hand, we reaffirm the fact that the theoretical-conceptual evolution of any theory requires the correct positioning of objective parameters that support the proposed revisions. In short, in the object to which a given theory is dedicated, to identify what is fundamental, essential, and more permanent is necessary, as well as what is lateral, apparent and precise, to situate better the nature of the changes/transformations through which the object has gone, and that claims its counterpart in terms of ideas processing. In the specific case of Historical-Cultural Psychology, whose object is psychism, in its human quality, consciousness, due to its Marxist base, approaching it within capitalist sociability, detaching it from the current alienation processes is impossible. Without this, any reassessment or reformulation of a theory is subject to the researcher's subjectivity, who wants to see in the science he practices expression of his best wishes, even if at mischaracterizing cost or principles and foundations changing of that theory or – at the limit – elaboration of a "newly" approach under the same label.

We understand that this process of metamorphosis of theories of genesis revolutionary is part of capitalism's logic, which transforms everything into merchandise, whose use values are subsumed by the value form. The Historical-Cultural Psychology customization- with the consequent emptying of its revolutionary content, the fading of Marxism within it and the demonization of the Soviet experience in which it was initially developed - serves this perspective adjustment to the prevailing conservative ideologies, albeit discursively progressive, and, more importantly, makes it more palatable in the production, diffusion and research financing circuits dominated by capitalist production demands and value valorization. There is a reversal of the purposes of a theory

whose development was intended to contribute to the formation of the new socialist man and woman (Vygotsky, 2004).

But what parameters can guide us to unveil the pertinence or not of the transformations within a theory over time, advancing from apparent progressive discourse to fidelity to its fundamental principles? What does it tell us if this theory is still valid in our historical period? The answer to these questions takes us back to the material base, the phenomena these theories initially addressed, from which their object of study and methodological principles emerged. Do these phenomena still exist, even if historically transformed? And if they still exist in an altered form, what is the nature and extent of these changes?

We exemplify based on Marx's studies in his workbook *Capital* (Marx, 2006), elaborated in the 19th century. Can his theories at that time still guide us in the 21st century? We defend that the answer is affirmative because the object Marx committed to investigating - the bourgeois society's genesis, development, crisis and trends - was not overcome in its foundations. The capitalist production mode is still based on labor exploitation in wages, extraction of surplus and consequent value appreciation as the ultimate end of the production process. Despite these essential elements, capitalist modes of accumulation and work management have not been the same since Marx's theorization, and it was up to Marxists to advance in the understanding of Fordism, Taylorism and Toyotism and the hybridity of these patterns that characterizes the work organization in the set of dominated economies of the capitalist system. The more the power of capital over all spheres of social life is amplified, the more the forms of domination multiply. Despite these essential historical transformations that capitalism has undergone, the General Law of capitalist accumulation still prevails. The more the economic foundation determines the tendency toward expanding the concentration of wealth, the more social wealth is produced by the working class. Recently, the social democrat Thomas Piketty (2014) conducted rigorous research gathering statistical information on income, wealth, and capital from over three centuries, demonstrating the concentrations nature of the capitalist production mode has not ceased to operate for a moment, as stated by Marx above. Hence, we have briefly exposed some aspects of Marx's object, which remain what they were (labor exploitation, wage formation, capitalist accumulation general law, and social classes). At the same time, there are elements of capitalist development that objectively demanded updating (such as the imperialist concepts, capitalist accumulation patterns and labor management, domination forms, etc.) from the Marxist field. Thus, Marx's theory is still relatively current - and will remain so if we do not overturn the economic and social foundations of the capitalist production mode - but his theory's vitality lies precisely in the fact that it must permanently monitor its object development.

Regarding Historical-Cultural Psychology, we have the same perception: do the understanding of psychism formation and constitution and the personality in its singularity remain crossed by the class society contradictions? As Leontiev (2021) shows, is the cleavage between meaning and significance in human activity still a current phenomenon? Is the fierce struggle, using Vygotsky's (2001) words with the social environment, in the consciousness formation process still present? Does the labor social division corrupt the human personality, making us unilateral in our development, as Vygotsky (2004) denounced? Suppose the answer to these questions is affirmative. In that case, this theory, in its fundamentals, remains completely current, even if we must deal with phenomena that did not exist at the time of its developers.

Given our understanding of what actualization is, in terms of developing a theory, we will approach two essential aspects of this discussion, namely, the constitution problematic of Marxism multiples (Löwy, 1987; Mészáros, 2006) and the fact that the dispute over Vygotsky's production partly follows the same logic as the dispute over Marx's production and legacy (Séve, 2018; Tuleski, 2015; Silva, 2022; Prestes, 2014; Prestes and Tunes, 2022; Duarte, 2001).

Concerning the first aspect raised, Löwy (1987) points out that the existence of Marxism multiples results from the innumerable contradictions existing in the capitalist reality itself and from the search for its interpreters to translate them into a theory that can explain them. Part of this diversity within Marxism is expressed in the dispute over Marx's work, which brings us to the second aspect listed. Mészáros (2006) highlights how this dispute was made around the problem of alienation: based on a split between a young Marx and a mature Marx. Some Marxism theorists will reject the former - whose theoretical elaboration did not yet have the totalizing foundation of the critique of political economy - as a qualified disciple of Hegel committed to bourgeois society but still tied to philosophical humanism and idealist philosophy (expressed in the alienation concept and which would have been, according to these interpreters, abandoned by the Marx in *Capital*). On the other hand, there are those who, claiming the young Marx, marginalize the role of the critique of political economy in the dynamic analysis of social totality and end up falling into one or the other mode of politicism. The unilaterality of these positions on Marx's work is debilitating to Marx and Engel's social theory. With one, the political will of the working class, its vanguard and its intellectuals are affirmed as the driving force of social transformation, making a case for a concrete and dynamic analysis of the current stage of capitalist development, of the conjuncture in a particular social formation, etc. On the other hand, the impotence of political Praxis is asserted since the social transformation engine becomes closely identified with elements that constitute the economic basis of society. In both cases, Marx's

workbook is denied the proper dialectic of his intellectual evolution by the formalist apprehension (formal logic) of one or another moment of its production. According to Mészáros (2006), there is also an established split - a rather prevalent position among academics - between the Marx scientist of society and the Marx formulator of a communist societal project. The roles in these divisions concerning Marx's intellectual legacy express the contradictions of social praxis; in this respect, they are far from innocent.

In the section dedicated to commodity fetishism, in his mature work, *Capital*, it is essential to point out that Marx situates that phenomenon as arising from the same form of value assumed by the labor products and relates to it the abstract cult of Protestantism, as the most appropriate religious form to the dynamics of a society governed by the logic of commodities. In the same way, Marx links the possibility of surpassing fetishism (the inverted representation of social relations among individuals as if they were social relations among things) to the overcoming of capitalist society by a society of freely associated humans. From the preceding, it does not seem Marx abandoned the topic of alienation. Still, on the contrary, the conquest of the commodity fetishism concept (only made possible by the competition of the critique of political economy) allowed him to totalize the particular forms of alienation (political, religious) concerning the fundamental one involved in the value form. In his masterpiece, Marx deals with the problem of alienation more concretely and objectively than he had addressed in his debate with Bauer (Marx, 2009) and his *Economic-Philosophical Manuscripts* (Marx, 2004).

And so, Marx updates and renews his theory, following the real movement of the object to which he dedicated himself (bourgeois society), deepening and totalizing those partial apprehensions that still lack objective links with the totality that explains them (such as the alienation concept of his youth production) and organizing its most essential determinations, to overcome the phenomenal apprehensions of the object.

Tuleski (2015) demonstrated that such divisions are also very present in the dispute around Vygotsky's intellectual legacy. They created more obstacles than helped in Historical-Cultural Psychology understanding and development. As Vygotsky died young, the split between immature and mature is not present in this dispute, but rather the departmentalization of this thinker as an epistemologist, psychologist, educator, and art critic, as if there were several "Vygotskys" according to the reader's taste. Interpreters such as Newman and Holzman (2002) claim that "mine", "your", and "our" Vygotsky exists. Nothing could be more conniving with neoliberal postmodern thinking. To this, add the problem of dissemination and diffusion of Vygotsky's thought, an object of tortuous and dubious translations, the process of Stalinization in the USSR –

which resulted in the characterization of Vygotsky as idealist and anti-Marxist, for disagreeing with the canonization of official Marxism - and the double censorship that the circulation of his work suffered for approximately 20 years, both in the USSR and the West (for a pretty different reason) and the edited circulation (adulterated) of his workbooks, consisting from removing excerpts in which the Marxist foundation of his thought was evident until the complete re-elaboration of his texts, as occurred in *The Social Formation of Mind* (Sève, 2018; Duarte, 2001; Tuleski, 2015; Prestes, 2014; Silva, 2022). Sève summarizes the issue: “For the Stalinists, Marx was not sufficiently present in Vygotsky; for those American translators, on the contrary, Marx was too much evident” (Sève, 2018, p. 1).

Supporting the centrality of Marxism in Vygotski’s work cannot be done by quantifying citations and references to Marx, Engels, and the Marxism classics. By the way, this is contrary to the position expressed by Vygotsky in his famous text on psychology crisis (Vygotsky, 1996), who criticizes the method of building Marxist psychology by simply adapting the phraseology of psychological science to concepts, terms, and expressions of Marxism’s classics. For Vygotsky, more critical than bringing quotations from Marx to psychology is to apprehend Marx’s method, the way he proceeded to analyze society, to build scientific psychology from its factual material and the very logic of its object to overcome both idealism and mechanical materialism. Instead of self-proclaimed assertions of Marxism in his theory, Vygotsky dedicated himself to developing a psychological science from the investigation of phenomena concerning this field, from the review of empirical material from researchers from other countries, and from the study of psychological theories that generalized a particular set of factual material, starting from the historical-dialectical method of analysis. To Sève (2018, p. 7), “Much more than a Marxist psychologist, Vygotsky is a Marxist psychologist”.

The analysis logic used by Marx in *Capital* is an evident element in Vygotsky’s investigations and formulations for those who dedicate themselves to studying historical-dialectical materialism. However, for those who did not appropriate Marx’s writings and his internal analysis logic, which is quite common due to the lack of disciplines that address this content, especially in Psychology courses in Brazil, their understanding becomes nebulous, favoring simplifications and distortions. Without mastering the categories of the method, it becomes challenging to identify the use of analysis and synthesis, structure and process, internal/external and natural/social unity, contradiction, and overcoming, among many others linked to Vygotsky’s Marxist heritage (Sève, 2018; Tuleski, 2015; Prestes, 2014). According to Sève (2018), Vygotsky’s General Psychology is the legacy of social theory elaborated by Marx.

For historical-dialectical materialism, dividing social and personal processes is impossible. This is evident in at least five essential concepts: 1. **Productive activity** in which the human being performs his metabolism with nature; 2. **Mediation**, which explains the characteristic of the first, is an activity that differs from that of the animal due to its mediated character through the instruments created by the human being to act in nature and by the symbols that guide the behavior of others and own in the activity, giving it a social character; 3. **Objectivation**, as the result of the movement, is the external and proper nature that is altered in the process, ways of being, feeling, thinking and acting, and the work products themselves; 4. **Appropriation**, as the specificity of becoming a human being, is impossible without each singularity incorporating what has already been produced by previous generations as its inheritance; 5. **Alienation** concerns the conditions in class society that favor or prevent each singular being from realizing his potentiality, whether or not he integrates into humankind. Such concepts, as the basis of Historical-Cultural Psychology, anchor the understanding of how and under what social conditions the singular development of psychism occurs, allowing the identification of social obstacles not only to denounce but to exercise practices that affect and intensify radical processes of revolutionary transformation. Any attempts to subordinate such concepts, segment or disarticulate them from Vygotskyian psychology are due either to a gross misunderstanding of its foundations or to a purposeful attempt to make it compatible with adaptationist or conservative followers in class society.

So, we return to the question posed at the beginning of this thesis, what can guide us concerning a critical analysis of the interpretations made by the authors of Historical-Cultural Psychology who aim to “update” the theory? We indicate that the purposes for which such performances compete help us discern whether they operate a distortion or constitute themselves as continuators. We shall use Löwy’s (1987) reflections, based on Marx’s *The Eighteenth Brumaire of Louis Bonaparte*, as a support for the conclusion of this topic, systematizing some of the ideas therein:

1) Each class develops social worldviews (superstructures) that their ideologues systematize. These worldviews correspond to ‘material class interests, but also to its social situation’ (Löwy, 1987, p.97).

2) Intellectuals possess relative autonomy concerning their class. Their situation does not necessarily coincide with the class interests to which they belong or from which they originate since the ideology they reproduce makes them representatives of a given class.

3) What defines a revolutionary/conservative ideology are not ideas taken in isolation, but a certain ‘way of thinking’, a given problematic or intellectual horizon/limit, which indicates that ideology is not necessarily a deliberate

falsification of reality but can be an illusory or self-delusory process historically constituted

From the above, we reaffirm that there is no “pure” or “neutral” philosophy or science, even when they claim to be that way. They are born into a given society and are immersed in its contradictions. The class origin of a given thinker is not the definitive marker, that is, a univocal determinant of the commitment of his theory or interpretation. It would also be simplistic to say that every science born in bourgeois society is itself conservative. On the contrary, it was the fact that it was objectively situated within bourgeois society which allowed Marx to analyze it in its essence, its movement and dynamism. Psychology, like so many sciences, was born in bourgeois society. Some of its theories have limits not because of that but because of their link (worldview and social practice) that corroborate with their maintenance. The disputes over the Vygotskian legacy also oppose the central class conceptions of the bourgeoisie, the petty bourgeoisie, the proletariat, and their fractions. Marx considered political economists classical and vulgar, but we can think of psychological theories. The analytical key lies in the very movement of the real and in the position that intellectuals assume before contradictions in the most critical moments, of convulsions or imminence of them, as we will see in the following thesis.

Thesis 3 – The only possibility of approaching theories is due to their philosophical-methodological basis

In a positive formulation, establishing the foundations that support dialogue and the critical appropriation of social and psychological formulations made from theories alien to Marxism and Historical-Cultural Psychology is necessary. The starting point of this undertaking is the recognition that Marx is the founder of a radically new understanding of the social being. Thus, his social theory is no longer in dialogue with other ideas and concepts, which is the foundation to which the investigation about any object concerning the social being must be referred, under penalty of incurring into theoretical eclecticism.

The totalizing analysis that Marx undertakes in the investigation of his object, the bourgeois society, has two fundamental characteristics: 1) his formulations are rigorously historical, that is, the essential determinations of the object and its movement must be verified; 2) his primary concern does not consist in the establishment *a priori* any method of knowledge of the object (epistemological point of view), but it seeks in the very logic and internal dynamics of the object (ontological point of view) the foundations of his rational elaboration, that is, Marx’s methodical tradition is the one that understands that it

is the very essence of the object and its attributes must condition the method of investigation, as opposed to those traditions – such as positivism, for example – imposing the method on the object and thus deforming it (Netto, 2011; Tonet, 2013). As heir to this methodical tradition, Vygotsky builds his work incorporating the categories of Marx's method, investigating the psychism of social beings existing in bourgeois order and identifying tendencies to overcome this order (in terms of investigating its object). Unlike other approaches in psychology, Historical-Cultural Psychology elaborated critical syntheses on how human beings (de)humanize themselves within social relations based on the cleavage between social classes. Born and engendered by the social revolution of 1917 in Russia, Historical-Cultural Psychology captured the contradictory trend between barbarism and emancipation and its impact on human consciousness and personality formation (Vygotsky, 2004). Vygotsky, like Marx, never detached himself from political praxis in his intellectual elaboration and the attempts to separate the founders' work of this psychology from their theoretical-political intentionality of building socialism constituted political opportunism and theoretical misrepresentation. The eclectic junctions made by those interpreters who claim that it is necessary to fill the gaps in historical-cultural theory with Piaget's genetic psychology or who invoke Vygotsky as the founder of the constructionist movement – as analyzed by Duarte (2001) and Costa (2015) – pay attention to his method and abstractly take his concepts. On the other hand, the demethodization of Vygotsky also occurs by the hand of those interpreters who, without failing to release Vygotsky his decisive link to Marxism, remove him from the construction of the Soviet socialist experience and commitment to the destinies of that revolution (Silva, 2022), either by inventing holy materialism and distinct from Leontiev's alleged mechanistic materialism, or by presenting him as an intellectual who managed to survive the regime, making concessions to it and hiding his authentic understandings about that experience. For these interpreters, Vygotsky is just another academic, a psychology theorist, and not a Marxist engaged in constructing a new science committed to building a contemporary society.

In this thesis, we reaffirm that the only way to unite conceptions, concepts and factual materials from different theoretical positions is based on their radical basis in historical-dialectical materialism. The two trends mentioned above transform Marxism into an academic theory detached from a real commitment to the construction of socialism and communism, disembodied from its *raison d'être* and, thus, make practical and deformed use of formulations and concepts coined by Historical-Cultural Psychology theorists. An essential part of the polemics surrounding Vygotsky's legacy revolves around the question of whether there is a rupture or continuity between Marx and Vygotsky (for those

who reject Vygotsky's Marxism) and whether there is compatibility or incompatibility between Vygotsky and Leontiev (for those who without leaving Vygotsky's Marxism, try to bring him closer to "true Marxism" and to characterize Leontiev as a Stalinist, distancing the former from what they indeed consider a tragic experience of humanity, the 1917 revolution). Once the problem involved in these two trends has been exposed, establishing the theoretical meaning of the need for a radical basis in historical-dialectical materialism when appropriating theories and formulations from others is convenient, as mentioned at the beginning of this paragraph.

For Lukács (2012), orthodoxy does not refer to the profession of faith concerning the Marxian work but to the rigorous use of the analysis method categories. We understand that the Historical-Cultural Psychology creators (Vygotsky, Luria and Leontiev), regardless of the events that occurred in the USSR after Lenin's death, did so. On the other hand, part of contemporary interpretations, by making the method secondary or even using it pragmatically and breaking with the perspective of totality, seek to hide an element in Marx's work and the authors mentioned above: knowledge construction committed to social revolution. The Marxian theory, the founding basis of Historical-Cultural Psychology, is a revolutionary theory insofar as it does not only propose to think about the world but to transform it (Marx, 2007).

The Marxist tradition directly denounces the capital order's exploitative character. Therefore, its secondary status plays a functional role in maintaining the capitalist logic. Such concealment is sometimes carried out openly by postmodern conceptions that have elected Marxism as their main enemy, others in a subliminal way. Formulations that appear as capitalist order criticism act for its maintenance by removing the need to destroy the bases on which the capitalist production mode is built, and which sustain the particular forms of oppression they aim to combat. The apparent criticism gives a varnish of actuality to the new/old practices put into action by capital, which affect social beings' psychism and mental health.

The use of historical-dialectical materialism necessarily means rejecting the autonomy of each branch of science or its specialization, which would translate into a Marxist psychology, a Marxist sociology or a Marxist economy. Rejecting autonomy does not mean despising the particularity of each science, as Vigostki (2000) attests when he recognizes Psychology as a concrete science of what is properly human. Let us see some of Vygotsky's (2000) fundamental postulates expressed in his *1929 Manuscript*: "Behind all the higher functions and their relations are genetically social, real relationships of people" (p. 26); "They are transferred to the personality, internalized relations of social order, the basis of the social structure of personality" (p. 26); "The individual, the personal – is not

‘against’, but a superior form of sociability” (p. 27). Next, Vygotsky (2000) paraphrases Marx stating that the “psychological nature of the person is the set of social relations, transferred inwards and which become functions of the personality and forms of its structure” (p. 27). In these excerpts, the basis from which Vygotsky starts and which is also expressed in the writings of Luria and Leontiev is explicit, for appropriation and objectivation mechanisms understanding, the constitution of higher psychological functions as an overcoming by incorporation of elementary ones, elaboration on the periodization of human development, centered on the guiding activity that promotes the new psychic formations in each period, contradictions that cross the constitution of personality (meaning and significance, motives of the movement) in class society, relation between brain and behavior, and processes of disintegration of the human psychism, resulting or not from brain damage.

Historical-Cultural Psychology, therefore, studies the singular human being. For that, analyzing the mode of production in which this human being is inserted is mister since the process of constitution of each individual occurs in the web of social relations in such a way that he carries within himself the society as a whole (Marx, 2004). The emphasis on the materiality of the capitalist production mode is necessary to oppose idealistic and ideological views of trends in Psychology, which abstractly consider the singular, taking it without mediation, without relation with the universal. Marx’s social theory, whose object is the capitalist production mode, states that the apprehension of this object in its multiple determinations involves analysis from historical totality, whose theoretical foundations reside in the Workers’ Political Economy.

There remains to be examined the (apparent) contradiction between claiming Historical-Cultural Psychology and proposing its distancing from Marx (from the most vulgar to the most sophisticated forms) or even the defense – more or less explicit – of the capitalist production mode. It is possible to point out two elements to explain this apparent contradiction, one of a sociopolitical nature and the other of a theoretical nature. The sociopolitical element refers to the class situation of most Psychology professionals and to the concrete conditions in which professional practice occurs, which takes place within the framework of confrontation with human suffering, against poverty, alienation, etc. The “social issues”, that is, the set of immediate problems posed by order of capital and in which users of their professional practice are immersed, are directly affected by the practical action of them, leading them to seek quick answers (always partial), which tend to remain within the scope of citizenship – when successful. This determined insertion, inscribed in an ineliminable daily life, can result in the disengagement of these professionals and their practices from the historical interests of the working class, such as the revolution. Even

psychology sectors claiming to use the method bequeathed by Marx do so far from the confrontations with the labor work, which provides a distance from the working-class concrete struggles. They act in the social movement but cannot transpose the method of theoretical accumulation to the action, engendering a gap between a relatively consistent academic production and a sociopolitical practice restricted to the everyday sphere.

The second element that may engender this estrangement is theoretical and is expressed in the fact that the presence of Workers' Political Economy is still almost non-existent in psychology training courses and, by extension, in its literary production. We defend that abandoning workers' political economy may lead to theoretical pragmatism. But what constitutes Workers' Political Economy or the Critique of Political Economy? According to Netto and Braz (2007), Engels defines it as the science of laws that regulate the material means of production and exchange of human beings' existence, while Lenin stresses that the Critique of Political Economy does not deal only with "production" but embraces the social relations that are constituted among human beings to carry out this production, that is, the production social structure, which is nothing other than the social totality. The processes of the Historical-Cultural Psychology study object, such as the consciousness formation as a psychism quality, and its inter-functional systems, dynamically incorporate the affect-cognition, individual-society, and biological-social units to the scope of the mentioned totality. Social relations can only explain such departments and the dynamic characteristics produced there, and the object of study of psychology is part of the Study of the Workers' Political Economy.

The estrangement, the split between political economy and psychology, has a historical explanation. In the process of bourgeois society's emergence from the entrails of the feudal world, knowledge of that production mode and the assertion of commerce and industry superiority – promoted by the development of the commercial bourgeoisie – also, on the rational level, became necessities for that class that built a world in his image and likeness. The intellectuals who expressed those materials, economic and social interests gave rise to a social theory, Political Economy, with clear objectives of social intervention, synthesizing the ideals of the revolutionary bourgeoisie in the period in which it was at the forefront of social struggles. However, the bourgeois revolutions resulted in a new class domain whose contradictions and limits soon appeared within the capitalist production mode. Unable to know the world in its entirety, under penalty of revealing the very form of its class domain and the root of capitalist exploitation, the bourgeoisie denies its emancipatory ideals and transmutes itself into a conservative class, renouncing the enlightened culture of which it had been heir, which resulted in the classical Political Economy crisis

between 1825 and 1848 (Netto & Braz, 2007). The high point of this crisis culminated with the working class rise in Europe in 1848 as a per-self class, which not only struggled for better living and working conditions but understood that its class interests were antagonistic to those of the bourgeoisie. Therefore, its realization depends on overcoming this mode of production by a socialist society. The social research of classical Political Economy, which was based on the study of the economic output, became antagonistic to the interests of the conservative bourgeoisie since it provided for investigation and demonstration of the capitalist order's exploitative character, which now had to be concealed.

The scientific findings of classical Political Economy, such as the statement that value is the work product, were taken up by the socialists. Political Economy was dissolved, giving rise to two excluding theoretical lines: conservative intellectuals named their discipline Economics and revolutionary intellectuals, Marx at the head, called the new discipline Critique of Political Economy or Workers' Political Economy. The former is constituted as a highly specialized scientific branch, markedly technical - the economic science -expurgating any historical, social and political consideration. Dealing with the various aspects of social life, highly specialized and watertight disciplines emerge, separated from each other, responding to a specific concern, definitively breaking with the totality. The latter, in which Marx elaborates, states that in social reality, rigorous knowledge is central to revolutionary action, depending directly on the truth and objectivity of theoretical knowledge. Therefore, the theory linked to the interests of the proletariat must structure a social approach that enables the apprehension of the effective movement of society (Netto, 2011) is mister. The emergence of psychology as a modern scientific subject occurred precisely from the second half of the 19th century onwards, under the historical validity of the mentioned movement above science specialization. Hence, it is not surprising that individual science – in its genesis and for a long time – has made abstraction of social relations, institutions, history, ideology, alienation and other socio-material phenomena decisive in the individuals' constitution under the capitalist production mode, treating mental functions and behavior either as special spiritual faculties without specifying their genesis, or tributing their origin to nature or the immediate environment with no historicity.

Inside the universities and in the various ideological apparatuses of social life existing in this period of the flexible accumulation of capital, two movements can be observed: 1) the movement conducted by intellectuals openly linked to bourgeois interests who spread the idea of economics as a mathematical technique, separated from social life (which other sciences would account for), and; 2) the movement performed by postmodern thought which, in Psychology, is expressed by separating psychic phenomena from economic relations, and

which calls itself progressive. But both movements, overtly or covertly, contribute to the concretization of bourgeois order interest.

The abandonment of the workers' Political Economy by Psychology is expressed when theoretical formulations take the Work category as a synonym of work in its historical form: the alienated work product of capitalist society. Thus, they deny the ontological dimension of work and the possibility that it opens up for the construction of the human race, the objective overcoming of alienated labor forms, as Mészáros (2006) points out. Contemporary bourgeois psychology, in its studies, takes this particular form of work, naturalizing it. Hence, the psychic consequences of this concrete way of being at work, the alienated and oppressed subjectivities, are naturalized. From this, practices derive aimed at adapting subjects to society and, at most, subtle criticisms of social relations, which are the generators of suffering or prevent singular development. Most theoreticians or activists do not consider the concern about breaking the subsumption from labor to capital, and the reference to class disappears in theoretical-political formulations.

In contrast, references to citizens' rights abound. Placing the discussion of class as the main thing in the planning of struggles is necessary. For this, rescuing the Workers' Political Economy to the scholars of Historical-Cultural Psychology is essential and urgent.

Establishing which working-class sectors can objectively confront and destroy capital is necessary. An adequate characterization of the working-class profile involves an analysis of the objective and subjective dimensions that affect it, under penalty of falling into politicism or mechanistic economism. Subjective factors are essential. The occurrence of the socialist revolution, overcoming the capital order without the will of concrete social subjects, the class and its perspective allies, is impossible. But objective factors are central and essential for this confrontation. Capital does not move (and therefore cannot be destroyed) for moral or ethical considerations but for economic, objective reasons.

In the capitalist production mode, both contradictions and the conditions for overcoming them are created at the same time. Such a way of exploring work makes economic crises inevitable. The antagonisms between fundamental classes (bourgeoisie and proletariat) are potentiated, a process that has consequences in all societal spheres since capital is a totalizing (and totalitarian) process. The historical approach has demonstrated that the vital interests of most human beings are incompatible with the capitalist production mode, making the tearing of this societal order imperative for humanity's existence. However, this rupture process is not automatic but "the organized political will of the laboring class to break with this order" (Netto, 1998, p. 30). For that, Historical-Cultural Psychology could well lend its efforts.

Final considerations

In this paper, we reflect on the destinies of Historical-Cultural Psychology to point out the real danger that some of the interpreters of this tradition are operating an ideo-political turn in theory - which can go from revolutionary to conservative - in the same direction of what happened to the São Paulo School of Social Psychology. The historical-cultural idea is a field of dispute through the praxis of those dedicated to continuing their theoretical elaborations as a weapon of criticism, supporting revolutionary social actions.

Vygotsky, Luria and Leontiev, the early elaborators of this Psychology, took as a base the Marxian categories of the capitalist society analysis, developing and systematizing intermediate classes aimed at studying its object: human psychism. However, this psychism could not be studied apart from social relations and could not be taken in an abstract, atomistic manner, as the other bourgeois psychological theories did. On the contrary, understanding and explaining how social relations expressed themselves in the singular psychism, discussing the implications of objective/subjective alienation in ontogenetic development, was urgent and necessary for them. The distinct social psychism shapes the contradictions of class society, which affects how the person acts. For this reason, the categories of activity, consciousness and personality are so dear to Cultural-Historical Psychology theorists.

Considering that in the stage of flexible capital accumulation, whose consequences in societal terms are the structural crisis and the intensification of ideological decadence expressed in reactionary neoconservatism, Historical-Cultural Psychology is not only current in its object and principles but also its policy purposes. Precisely because of its radically revolutionary position, the dangers of vulgarization, distortion, simplification and adaptation to a type of progressive neo-conservatism become even more hazardous. The tendency for bourgeois thought to incorporate revolutionary theories is an old phenomenon that occurred and still occurs in Marx, Engels and Lenin's writings and Vygotsky, Luria and Leontiev's Psychology field. According to Löwy (1987), this incorporation can never be radical in the sense of going to the roots of revolutionary conceptions since this would require going beyond capitalism's limits. The incorporation is achieved by obscurization, simplification and adulteration, a phenomenon which is not strictly subjective but is an objective consequence of the economic structure, which prevents the theorist, whose class position is bourgeois or petty bourgeois, from going beyond this limit.

We briefly demonstrate what happens when the bourgeoisie, in defense of its interests, appropriates Marxism and a psychological theory he inherited, such as Historical-Cultural Psychology. Incorporating it in its essence is impossible

because, in doing so, it would have to fight against itself and develop a theory that promotes actions to overcome it. Its incorporation is only possible by operating distortions in its foundations, obscuring its analyses, distorting its concepts, and splitting the authors among themselves as opponents of a personal nature or even by areas of knowledge. Such simplifications and vulgarizations thicken the chorus of relativism and irrationalism of certain scientific conceptions, including within the Psychology field, which we call a vulgar apology for capitalism. They align perfectly with the dichotomous, partial, pragmatic, practical and analogical structure of everyday thinking that thrives in common sense endorsing scientific denialism (flat earth theory, antivaccine and so on), combined or not with religious or conspiratorial conceptions.

Alienation, based on the way labor is organized in the capitalist production mode, produces harmful effects on all human life, so the struggle to overcome it is a task to be undertaken by all those with a revolutionary class perspective. For historical-cultural psychology also accomplishes this task, entering into the discussion of its object of study from the Workers' Political Economy perspective is necessary, resuming the debate on the relation of human psychism constitution - as the proper object of psychology - with the material interests (economic and social) of the laboring class, both immediate and historical. Without this, we believe understanding the assumptions and purposes of Historical-Cultural Psychology with the necessary radicality is impossible, though an essential task for those who advocate being its continuators.

And here comes the question that gives title to this article: Historical-Cultural Psychology: what is it intended for? It is destined to help construct a world where "To enjoy the best of the good is common, for anyone, whomever he/she may be" (Gilberto Gil).

Against the superegoic community: Community psychology, psychoanalysis, and the consolidation of political communities

Nick Malherbe

Abstract

Within much community psychology, the notion of community has been deployed rather uncritically. For many community psychologists, community represents a set of characteristics that can be clearly defined or categorically known. This has material effects. When those in power claim to know what a community definitively is, they can better exercise control over what they believe it should be. Recent work in critical community psychology has, however, sought to trouble such rigid understandings of community. This work has challenged community psychologists to engage with the contradictory, psychic, and political character of communities. Situated within this critical psychology work, I draw on psychoanalytic insights in this article to conceptualise community. Specifically, I argue for Lacan's reading of the superego as a structuring principle of community. Unconscious communities, Lacan posits, are formed by those who respond to the superego's command to enjoy transgressing what he called the Law (i.e., the principles underlying social relations) in accordance with the logic of capital. I insist that the ethical task of a critical psychoanalytic community psychology is not to eradicate the superego, but to minimise its influence by making clear its obscene and unrelenting commands. This ethical task requires that community psychologists assist community activists who are involved in consolidating what I am calling *political communities*. For the political community, the subject's enjoyment is structured through sacrifice and commitment to the democratically constituted political goals of the collective, unlike superegoic transgression that demands our relentless enjoyment of capitalism. Political communities undoubtedly require transgression, but only insofar as such transgression serves an emancipatory cause.

Keywords

superego, community psychology, lack, Lacan, community, psychoanalysis

Introduction

Communities - whether they be ideological, value-driven, geographic, or political - change all the time, and yet they retain identifiable characteristics (Williams, 1975). This makes conceptualising community a rather tricky task, especially for community psychologists, for whom community has been central since their discipline's formal inception in 1965 (Dutta, 2018; Sonn, 2016). Much of community psychology has fallen into the trap of striving to delineate a community's static or unchanging coordinates so that we might better know what a community fundamentally *is* (Coimbra et al., 2012; Malherbe, 2022). This is not accidental. It speaks to the ways by which the discipline has collaborated with dominant powers that seek to 'know' communities so that they might exercise control and domination over them (Dutta, 2021). While there is certainly critical community psychology work that has troubled the notion of community (see e.g., Butchart & Seedat, 1990; Coimbra et al., 2012; Dutta, 2018, 2021; Evans et al., 2017; Heller, 1989; Kloos et al., 2012; Sonn, 2016; Malherbe & Cornell, 2022; Mannarini & Salvatore, 2019), more work is required that links this nebulous concept to a democratically constituted political project of emancipation.

Psychoanalysis, despite its usefulness in theorising unstable, contradictory concepts like community (see McGowan, 2013), remains largely absent in community psychology's engagements with and formulations of community (Caputo & Tomai, 2020). Jacques Lacan's (1988) re-reading of the Freudian superego is, I believe, an especially useful means of bringing a conceptually nuanced - and, importantly, a politicised (see Tomšič, 2015a) - notion of community into community psychology. Lacan broke from Freud in that he did not conceptualise the superego as an unspoken command to obey an omnipotent paternal figure and/or a set of cultural mores (McGowan, 2019). Rather, for Lacan, the superego commands subjects to transgress the Law (i.e., the principles underlying social relations) in accordance with capitalist logic (Lacan, 1988). Lacan's superego, in other words, is one that repeatedly demands transgression, or an obscene enjoyment of capitalism that can only be obtained through excess, unrestrained consumption, antipathy towards the Other¹, and brutally individualised competition (see Tomšič, 2015a). The Lacanian superego, I argue, affords to community psychologists a useful means of understanding how the unconscious operates to form communities whose seeming dissidence enables them to cohere with capitalism's symbolic structure all the more powerfully. When we consider the Lacanian superegoic community, I posit, the ethical task

¹ Throughout this article, I use "the Other" to refer to those subjects who have been made other through the discursive and ideological mechanisms of a racist, imperialist, and patriarchal capitalist system, a system that depends on the exploitation and even destruction of the labour, lives, and lands of the Other. The Other, we might say, is made into an other through a process of othering which relies in large part on violently divisive rhetoric (e.g., racism, sexism, xenophobia, heteronormativity) that coheres with coloniality's hierarchicalisation of being (see Ndlovu-Gatsheni, 2018). Therefore, I use "the Other" somewhat differently to Lacan, who deployed this term in a rather complex, often quite confusing, manner to refer to an imagined figure or a structuring order, both of which are constructed out of material social relations (see e.g., Žižek, 2022).

of community psychology is to assist those activists engaged in constructing what I call political communities. As I will argue, although political communities undoubtedly require transgression, unlike superegoic communities, these transgressions cohere with a shared set of democratically constituted political commitments, rather than capitalism's symbolic order.

In what follows, I examine how mainstream community psychology has tended to engage with community and the problems therein, after which I consider what so-called community psychoanalysis has to say about community. I then outline Lacan's conception of the superegoic community, which I contrast with what I am calling political communities. Following this, I draw on a case example from my own community psychology work that demonstrates how a political community intervened in the superegoic command. I conclude by reflecting on what the political community and the superegoic community could mean for how community psychologists understand and engage with community in ways that break from some of the politically regressive tendencies exemplified by much of their discipline.

Community Psychology and the Problem of Community

Within community psychology, the concept of community remains in large part bound up with positivism. For most of community psychology, community is used conceptually to fix and separate the ontologies and epistemic capacities of community psychologists and the communities with which they work (Sonn, 2016). Community remains a coherent (if also multi-level) object of inquiry that can be definitively known or defined in ways that separate it absolutely from the community psychologist (Coimbra et al., 2012; Dutta, 2018). This separation, Dutta (2021) demonstrates, is not innocent. It reflects coloniality's dehumanising epistemological project that seeks to determine where legitimate knowledge can be produced and where it cannot, and thus also which lives matter and which do not (see also Ndlovu-Gatsheni, 2018). For instance, delineating a fundamentally known or stable community speaks to questions of power, or who it is that defines a community and for what purposes (Kloos et al., 2012). Dominant powers can naturalise perceptions of community through definitions of what appear to be irrefutable community characteristics (Evans et al., 2017). Determining good communities from bad, for example, facilitates the exercise of control over communities, that is, the distinction between (good) communities that behave 'correctly' and in accordance with the requirements of an exploitative capitalist order, and (bad) communities that do not (see Coimbra et al., 2012; Malherbe, 2022). The 'bad' community is oftentimes an othered, ghettoised space that represents unsurpassable disadvantage, hierarchical social ordering, dispossession, brokenness, and pain – much of which can be leveraged by those in power to justify the separate development of poor, oftentimes racialised, communities (see Butchart & Seedat, 1990; Dutta, 2018; Evans et al., 2017). On the other hand, the apparent 'good' community emerges as the embodiment of consensus, connectedness, and peace, with little critical

consideration of the normative practices in this community (Malherbe & Cornell, 2022; Williams, 1975), or the reliance that these usually wealthier communities have on the underdevelopment of poor communities (Malherbe, 2022). Fanon (1967) wrote that the colonial obsession with taxonomising the world into motionless, puritanical categories represents a “Manichean delirium” that prioritises an essentialised ontology over politics. Community psychology’s unspoken designation of *known* communities into moralistic categories (‘good’ or ‘bad’) represents a delirium of this kind; confining community engagement to ‘helping’ or ‘giving voice’ while ignoring existing grassroots and community-led insurgency that seeks to destroy the structural basis of colonial capitalism’s Manichean delirium (see Dutta, 2021).

Kloos and colleagues (2012) note that community psychologists tend to understand community as a locality (i.e., a geographic area) or in terms of relationality (i.e., shared interpersonal relations). These two (oftentimes rather static) understandings of community are not necessarily mutually exclusive, evidenced by community psychology’s abiding concern with “psychological sense of community”, an influential concept developed by Sarason (1974). Indeed, psychological sense of community speaks to relationality within a particular locality. It refers to people’s willingness to enter into interdependent relations with one another, and the psychological effects thereof (McMillan & Chavis, 1986). Although useful in some respects, those who evoke a psychological sense of community tend to ignore the fact that such a concept is always remade and reconfigured in the face of broader structures of power (Dutta, 2021). As such, community psychologists’ engagements with psychological sense of community oftentimes reveal the discipline’s inclination to definitively know communities for purposes of management and control (see Coimbra et al., 2012). McMillan and Chavis (1986) appear to openly admit this when they proclaim that a psychological sense of community is especially pertinent for those in power seeking to intervene in community life (a life that, it is implied, is to remain necessarily separate from those in power). Understanding communities in terms of a psychological sense of community does not speak to those who do not fit within this conceptual frame, those who challenge it, or those who unconsciously undermine it (Dutta, 2021). Although Sarason (1974) notes that “[a] community has changed, is changing, and will change again” (p. 131), his conception of a psychological sense of community appears, for the most part, unable to adequately accommodate this important point.

It should be noted that static notions of community do not, in every instance, represent the nucleus around which community psychology orbits. There is oftentimes a tension between community psychologists who favour community (i.e., unity and coherence) and those who favour diversity (i.e., a celebration of difference) (see Neal & Neal, 2014). There have, however, been several attempts to disrupt the binary opposition between diversity and community (see e.g., Rochira, 2018; Stivala et al., 2016). Mannarini and Salvatore (2019), for example, note that community and diversity should not be understood as antithetical concepts. Instead, they should be placed in a dialectical relationship whereby ‘community’ encapsulates different community

memberships; a “community of others” (p. 30). It is, in this sense, possible to build community in ways that encourage diversity (Malherbe & Cornell, 2022). Work of this kind must strike a difficult balance between retaining a community’s definitional fluidity and ensuring that diversity does not collapse into a liberalised sort of multicultural tolerance that embraces difference only insofar as it aligns with a broader system of capitalist oppression (Malherbe & Dlamini, 2020).

Challenging how community psychology attempts to definitively know and rigidly categorise communities requires us to look beyond community psychology and towards complex and insurgent ways by which communities seek to ‘know’ themselves. Communities throughout Rojava, South Africa, Kurdistan, Palestine, and many others have demonstrated what a fluid, self-determining, and defiant community might look like. These communities identify and are identified in certain ways, but they also push back against oppressive forces that seek to fix their definitional coordinates in alignment with colonial capitalism’s imperial mandate. Such insurgent definitions of community are perhaps best understood as what Williams (1975) refers to as *knowable communities*. Although knowable communities are identifiable in several respects, the arbitrariness of these identifications is continually emphasised and contested (i.e., they are knowable rather than known), and thus how a particular community is identified can be made and remade by collective struggle. Although knowable communities take seriously people’s meaning-making practices, these communities are able to hold such practices accountable to a broader set of political commitments, and thus the knowability of these communities is contingent; always subject to the political will of the demos.

Community psychology need not abandon its various conceptions of community (e.g., psychological sense of community; locality; relationality; diversity). Instead, we should work to unmoor these conceptions from the will to *know* a community by embracing *knowable* communities (see Williams, 1975). This is, of course, a difficult task that requires rejecting moralisation and binary logic while, at the same time, remaining attentive to how conceptions of community can be mobilised to advance the kinds of critical solidarity required for a broader project of emancipation. As noted earlier, while there are several critical community psychology interventions that have taken up this task, the psychoanalytic notion of the unconscious (i.e., a kind of force within our thinking that undermines and opposes our supposedly rational wishes; Lear, 2005) remains neglected within this work. As such, we might consider what it is that community psychologists who are committed to troubling and politicising community can learn from psychoanalysis.

Psychoanalytic Conceptions of Community

It is inaccurate to proclaim that psychoanalytic thought is entirely absent in community psychology. We have seen community-engaged psychological work (some of which identifies as community psychology) adopting psychoanalytic

theories of community (see e.g., Borg, 2010; Gibson & Swartz, 2008; King & Shelley, 2008; Long, 2002; Malherbe, 2022), and there is an increasing body of work on what has been called “community psychoanalysis” (see e.g., Bruns & Barron, 2022; Clarke et al., 2006; Roehrle & Strouse, 2019). Psychodynamic and psychotherapeutic theories, in particular, have been taken up by a number of community psychologists. It is perhaps, then, more correct to note that psychoanalysis remains on the margins of community psychology (Caputo & Tomai, 2020), especially in relation to how community psychologists conceptualise community (see King & Shelley, 2008).

Community psychology’s neglect of psychoanalytic conceptions of community is somewhat peculiar when we consider that psychoanalysis has always had much to say about community². In his work on group psychology, Freud (1921) wrote about the libidinal organisation and unconscious processes at work within collectives, or what he called “the mass”. Freud’s work on group psychology has been especially influential in psychoanalytic scholarship on groups and community. This is perhaps most notable in the work undertaken by Wilfred Bion, the A. K. Rice Institute, and the Tavistock Institute (Rustin & Armstrong, 2019). Yet, even in therapeutic settings, psychoanalysts have tended to understand the clinic as a point at which different communities converge and reconstitute themselves (Bruns & Barron, 2022).

From their systematic review of psychodynamic theories in community psychology, Caputo and Tomai (2020) conclude that for most psychoanalysts, community is a complex object that, rather than forming the sum of its individual subjects, represents a constant interplay of individual components, and thus represents a series of ever-shifting tensions, power differentials, and opposing forces. This does not mean that a community cannot signify anything stable. The psychoanalytic conception of community, Caputo and Tomai (2020) insist, understands communities as governed by rules, repetition, and meaning, all of which shift with the tides of history. As such, contestations over what a community means, or the identifications that it offers, determine the possibilities for cohesion and belonging within a community (see Laclau, 1995; Malherbe, 2022). A community can thus offer subjects identifications that promise to (but cannot ever completely) overcome unconscious anxiety (see McGowan, 2013). Such identifications are significant because they need not be recognised by broader society. In fact, the identifications made available by a community are often psychically appealing precisely because they account for the values, politics, and meanings that broader society represses. A community’s identifications are nonetheless complicated. They are indicative of the dialectic between our conscious wishes for social change - the better life - and our unconscious impulses to repeat (see Caputo & Tomai, 2020). Psychoanalysis, in short, offers to us a notion of community that straddles the subjective and the objective (i.e., conscious knowledge of self, others, environment, and experience, and unconscious disruption of such knowledge – both of which are mediated by material reality).

² It should, however, be noted that psychoanalysis has, for its part, almost completely ignored community psychology.

In recent years, Eugen Koh and Stuart Twemlow have, over a series of papers, begun the work of systematically conceptualising community from a psychoanalytic perspective (see Koh & Twemlow, 2016a, 2016b; Koh & Twemlow, 2017; Koh & Twemlow, 2018). They insist that because a community is both a subjective and an objective entity, psychoanalytic theory can assist us in understanding the dynamic qualities of a community, including the individual and collective experiences of community (Koh & Twemlow, 2016a). They posit that a community

emphasizes the unconscious, collective, psychological tasks involved in creating and sustaining a community, as well as those tasks involved in it achieving its reason for being. The core psychological tasks are those concerned with the creation of bonding among a community's membership and formation of its boundary and identity. Each of these psychological tasks is underpinned by unconscious psychic processes (Koh & Twemlow, 2017, p. 270).

Koh and Twemlow (2016b) have outlined ten principles that undergird their psychoanalytic formulation of community, namely: 1) the unconscious facets of community life; 2) the social interactions, common interests, and shared symbolic systems undergirded by unconscious processes; 3) the group dynamics - large and small - that make up community life which are in flux and connected to acknowledged and unacknowledged trauma; 4) the identifications that bind individuals within a community; 5) the abstract or symbolic qualities of a community; 6) the symbolic functions of a community that are determined by individual subjects; 7) the role of intersubjective experience in forming community; 8) how symbolisation, or making sense of experience, forms community; 9) the ways people benefit from a community and how a community influences internalisation; and finally 10) the ways by which a community can be assessed in relation to its ability to facilitate a subject's capacity to relate and produce. The effectiveness by which a community embodies these principles, Koh and Twemlow (2018) propose, depends on its capacity to facilitate how people process tension and conflict, defend against anxiety, and adapt to challenges.

Within psychoanalytic work on community - as well as in the community psychology work that draws on psychoanalytic thought to understand community - the superego remains neglected. This is unfortunate given the political insights that conceptions of the superego can afford to us. Therefore, it is to the superegoic community that we must now turn, after which we will consider how political, knowable communities can combat the politically regressive tendencies of the superegoic community.

Capitalism and the Superegoic Community

The superego, like several other psychoanalytic concepts (e.g., ego, the unconscious, narcissism, the 'Freudian slip'), has entered into popular parlance, and is therefore not a wholly unfamiliar term. To invoke the superego is typically

to refer to a vague sense of personal morality or an ethical code of some sort. This is not quite what Freud meant by the term. He spoke of the superego as a kind of authority - one that is both socio-cultural and parental - which supplants itself in the psyche (Freud, 1924). Nothing is hidden from the Freudian superego, not even our thoughts. The superego is always judging the ego against an impossible ego ideal (Freud, 1930). Our striving towards this ideal is what structures our desire. Therefore, for Freud, the superego denotes a kind of libidinal authority whose judgement over us results in anxiety and determines our psychic drives (McGowan, 2013).

What does the superego mean for community? Freud (1921) theorised that people, when in group settings, turn their superego judgements over to a leader and subsequently internalise the leader's commands. By obeying the leader's commands, the individual subject is afforded a sense of security and belonging, and in this regard the superego psychically binds subjects into a community. At the same time, the sense of belonging afforded by the Freudian superegoic community is usually premised on hostility towards an outgroup which is said to pose a threat to the kinds of psychic security afforded by one's own superegoic community. The superegoic community, in this sense, attempts to secure its own identity by defining what it is not which is also what it opposes. Yet, although the superegoic community claims to oppose particular communities, it depends on these communities for its own self-identification (it *is* only through what it *is not*).

The Freudian superegoic community, while certainly finding some resonance in our contemporary conjuncture (the global rise of right-wing populism and neo-fascism come to mind here), should nonetheless be understood against Freud's particular cultural, social, and historical milieu. As Tomšič (2015b) explains, the industrial capitalism of Freud's time (which was, we must not forget, being forged during wartime) ushered in a culture of prohibition. This meant that the Freudian superegoic community required that subjects give up, postpone, repress, or lose something in accordance with their duty to a social and/or political authority of some kind (see Stavrakakis, 2007). The neoliberal capitalism of today, however, functions quite differently. Our epoch is characterised by mass consumption, continuous economic growth, and ever-expanding value (see Tomšič, 2015a, 2015b). It is in the context of this sort of capitalism that Lacan (1998) undertook his re-reading of the Freudian superego in the mid-twentieth century. For Lacan, the superego commands of the subject what he called *jouissance*, or enjoyment, which refers to an unconscious investment of pleasure into the sorts of displeasure that come from not quite fitting in with a prevailing order (Stavrakakis, 2007). We do not enjoy spontaneously (Žižek, 2022). Our enjoyment always forms part of a psychic duty to transgress. As such, the superego of neoliberal capitalism commands that we enjoy transgressing the social limit (McGowan, 2013) - or the principles underlying our social relations; what Lacan called the Law (McGowan, 2019) - in line with neoliberalism's consumptive logic. Put differently, we could say that neoliberal capitalism manages our enjoyment by demanding that we enjoy through surplus (Soler, 2014). It should, however, be emphasised that the

superego, for Lacan, is defined by its unrelenting command to enjoy rather than the attainment of enjoyment. Indeed, the enjoyment that the superego promises is non-existent precisely because it is always prohibited by the Law (Žižek, 1994). In short, then, Lacan makes clear that the superego no longer commands in accordance with prohibition, but rather in accordance with unrestrained excess. Community is then formed among those committed to the superego's command to enjoy such excess.

The Lacanian superego is unrelenting. It mocks the subject's inevitable failure to meet its impossible demands while the subject, in turn, experiences an increasing sense of guilt that stems from repressing their sinful strivings to meet the superegoic command (Žižek, 2022). Therefore, the more we give in to the superego's commands, the more it asks of us (McGowan, 2019). The continual pressure to transgress that which the superego commands (a pressure sustained by the libidinal energy of the id; Žižek, 2022) mirrors the kind of continually deferred satisfaction promised - but never delivered - by neoliberal capitalism (i.e., a satisfaction that never arrives is promised to those who work harder, consume more, produce better, eviscerate competition more completely, etc.). The superegoic command to enjoy, we might say, has ceded our enjoyment to an unending capitalistic demand to enjoy (Soler, 2014); with the true injunction of the superego being to enjoy our suffering and, ultimately, to enjoy our capitalism (Tomšič, 2015a).

Although the Law being transgressed through the superegoic command may be unjust, this is not why the superego commands transgression of the Law. It is simply transgression for transgression's sake. In other words, the superego does not command that we transgress capitalist Law to challenge or dismantle this Law, but rather to reinscribe capitalistic desire in new, seemingly subversive ways. In this sense, the superegoic command to enjoy appropriates our dissident unconscious energies; ensuring that we transgress social relations in accordance with capitalism's logic of excess (McGowan, 2019), thus securing our libidinal investment in capitalism (see Žižek, 2022). The superego cannot represent an ethical or emancipatory force because of its entwinement with capitalism. It can only produce unreflective, guilty subjects who are envious of the Other's enjoyment (McGowan, 2013). Indeed, these subjects are bound together by a paranoia of the Other's enjoyment. The superegoic community thus resists any sort of democratic ethos precisely because it is a community that positions the Other as preventing or stealing the enjoyment that was promised to community insiders (Žižek, 1994, 2022). As per the dictates of racial and patriarchal capitalism, the Other in this case usually refers to those with the least power in the capitalist order.

The Lacanian superego produces a paradoxical kind of community. Where the community of the Freudian superego invests libidinal power in the leader and thus the political project represented by this leader, the Lacanian superego invests libidinal power in the logic of capital. As such, the libido turns inwards to produce "an extreme, selfish, narcissistic individualism. The leader is no longer an authoritarian father figure, but a mirror in which the hyper-alienated, socio-pathic, self-obsessed consumer-spectators of an atomised social order see

themselves” (Faulkner, 2021, p. 57). Put differently, community is created through the subject’s adherence to a neoliberal subjectivity that commands its enjoyment of capitalist excess and a commitment to private property. Transgression of the Law can thus only assume forms that are approved by the (fundamentally capitalist) superegoic community. In this, Žižek (1994) posits that the guilt of transgressing the Law, or rather the fetishistic disavowal of guilt, creates among those within Lacan’s superegoic community a solidarity-in-guilt, which serves as the structuring principle for the psychic binds of this community.

It is because the capitalistic enjoyment for which the subject strives in obeying the superego’s command is never spoken that the superego operates on the level of the unconscious, and thus functions all the more effectively (Žižek, 1994). Therefore, we cannot do away with or entirely eradicate the superego because we cannot completely ‘settle the score’ with our unconscious (Soler, 2014). We can, however, assume some distance from the superegoic community; speaking its commands in order to weaken its psychic grip over us (McGowan, 2019). Although the superego commands that communities enjoy in accordance with capitalist excess, we can also attain enjoyment from constituent sacrifice (McGowan, 2013); from missing the absent cause of our desires (Žižek, 2022). In particular, the sacrifices required by an anti-capitalist political cause (e.g., the sacrifice of time, resources, energy, security, and/or the mythic solace of capitalist identifications) can move the subject to break from libidinal attachments to the superegoic command.

Consolidating the Political Community

With reference to decolonial praxis, Dutta considers how community psychologists might think of the community in political terms. She writes that:

[D]ecoloniality demands a radical transformation in how we think about community in community psychology—namely, abandoning notions of community as phenomenon of interest or site of inquiry/intervention to focus instead on a radical relationality capable of dismantling or rendering extraneous colonial patterns of power and relationality [and to] reclaim community as political, as resistance, in contrast to essentialist (biological, cultural, or sociological) conceptions of community, while underscoring the criticality of lived engagement with struggles (Dutta, 2021, p. 61).

Our dissident psychic energies - our unconscious drive to undermine and transgress (see Lear, 2005) - need not necessarily be appropriated by the superegoic community. Such energies can also be harnessed by political communities that create psychic binds through a shared commitment to a radically democratic political programme (see Malherbe, 2022; Mouffe, 2005), commitments that undoubtedly require sacrifice. To resist the superegoic command by reconstituting ‘community’ as a fundamentally political signifier is, of course, not to do away with the imperative to transgress the social Law. However, when transgression forms part of a political community, it is not

transgression for the sake of it. It is, instead, to transgress in the service of emancipation. Committing to a political community thus allows us to take a position relative to the superego and to determine our desires in accordance with a political project predicated on political solidarity rather than solidarity-in-guilt. Importantly, the political community is not immune to capitalist co-optation. Many formerly radical political communities have been subsumed into neoliberalism's ideological apparatuses. The political capacities of the political community must, therefore, be understood against an intersectional anti-capitalist politics which take seriously capital's racialised, gendered, heteronormative, and imperial operations.

Is there a place for Lacanian psychoanalytic theory in consolidating progressive political communities? Glynos offers some provocative, though rather non-prescriptive, remarks here:

[W]hat kind of *community* is (even theoretically) possible for subjects of the drive? What insights can Lacanian clinical theory offer us? Since a Lacanian conception of community eschews ideas of shared values or common symbolic identifications; and since it suggests that our social bond should also not be based on a common fantasmatic transgression (which makes possible a community of subjects of desire), what other ways are there of thinking a community of subjects? Indeed, is a *social* subject of the drive possible? (Glynos, 2001, p. 103, emphasis in original).

As I read him, Glynos is considering the problem of establishing a political community without a firm, fantasmatic investment (such as the fantasy of enjoyment promised by the superegoic community, a fantasy whose coordinates and constitutive desires are determined by capitalism; Žižek, 2022). What Glynos seems to point to here is the need to hold the political community's cause to a radical kind of openness that builds anti-capitalist political commitment and solidarity through what Mouffe (2005) calls conflictual consensus – an ongoing process of democratic deliberation. As such, the political community need not assume a definitive or unchanging formation, and those who comprise such a community need not resort to psychotic foreclosure nor to neurotic repression. Instead, those within the political community are compelled to hysterically question how capitalism manages our enjoyment and in so doing strive to reveal capitalism's inability to secure its promise of “an autonomous ego, one whose identity is secure in a complete self-knowledge” (Newman, 2004, p. 304). Caution must, however, be taken here precisely because the Hysteric's continued questioning of capitalism's claim to the Master's discourse³ can function in lieu of a political programme, that is, questioning for its own sake. Thus, the Hysteric's questioning discourse should lay the ground for moving into the discourse of the Analyst, whereby the limits of knowing are institutionalised within an anti-capitalist political programme (see Stavrakakis, 2007). In taking up the Analyst's discourse, the gap in how the world is symbolised is made part

³ For Lacan, discourse refers to a socio-structural position that, despite being formed through language, is not necessarily utterable (Newman, 2004).

and parcel of political efforts that seek to break from the lie of capitalist mastery by changing the world.

The radically democratic political community constantly makes and remakes itself through collective, yet agonistically conceived, fantasies of emancipation (see Stavrakakis, 2007). When we understand emancipation not as a fixed ideal but as a state of desire that is always undergoing democratic determinations, then lack - rather than excess - becomes part and parcel of our political project. Those who compromise the political community institutionalise limits (i.e., acknowledge their lack of mastery) and in this derive an enjoyment based on sacrifice (Stavrakakis, 2007), thereby opposing the capitalist logic of excess and consumption (see McGowan, 2013). Indeed, it is through lack, rather than excess, that the subject embedded within the political community can enjoy, thereby instating freedom from the superegoic obligation to enjoy excessively (Žižek, 2022).

The political community, as I conceive of it here, resembles Williams' (1975) conception of the knowable community (i.e., an identifiable rather than concretely identified community). The knowable community, unlike the known community, does not seek refuge in the University discourse, whereby knowledge is used to justify the stable 'truth' of the Master's discourse (Newman, 2004). Rather, the knowable political community is composed through the Analyst's discourse. It is a community constituted by commitments to an anti-capitalist cause, commitments that are repeatedly reformed - rather than predetermined or eternally known (see Žižek, 2022) - through conflictual consensus (Mouffe, 2005). This cause, we might say, lacks precisely because it refuses a definitive or foreclosed political programme (moving instead with the emancipatory demands of the moment). Thus, the political community's cause is knowable and democratically contingent, rather than known or fixed. It is a cause that is as desirable and enjoyable as it is politically necessary.

Community psychologists should not, however, understand the political community as one that is entirely unwilling to fix meaning. Indeed, we cannot assume an ironic distance from all meaning that claims to be completely outside of ideology (Parker, 2011). Meaning is utterly necessary for consolidating a community of any sort. As Laclau (1995) puts it, meaning is both impossible (i.e., it cannot be determined with any finality) and necessary (i.e., it is a requirement for driving emancipatory politics). Fanon (1967) argued that a kind of counter-Manichaeism, or an assertion of the liberatory good, can be important for advancing political struggle. However, he tempered this argument somewhat, proclaiming that unlike the Manichaeism of colonial capitalism, collective anti-capitalist struggle renders counter-Manichaeism a human and more complex phenomenon. If meaning within knowable political communities is fixed, it is a fixity that is partial, contingent, and always open to the radically democratic demands of emancipatory struggle. Political commitments can and should change in contexts of struggle; adapting without compromising.

The political community does not seek to offer *the* answer to the riddle of human history in the way that Marx (1844/1978) believed the arrival of communism would. Instead, by traversing democratically constituted visions of

emancipation, the political community draws from people's dissident psychic energies to advance community-led projects of emancipation (see Malherbe & Cornell, 2022). The political community, therefore, eschews the Master's discourse (i.e., it institutionalises lack and thus requires sacrifice), meaning that its psychic appeal lies in how it produces desire through continually traversed visions of collectively determined emancipation.

Case Example

While I do not believe that considerations of the superegoic community are, in every instance, essential to community psychology praxis, I do believe that engaging the superegoic community and - even more importantly - consolidating political communities - represent significant yet almost completely neglected pathways through which community psychologists can break from static conceptions of community. Turning away from the superegoic community by working with activists to consolidate knowable political communities represents a genuinely psycho-political project, one that is alive to the materiality of domination as well as the unconscious forces upon which dominant social powers so often rely. To demonstrate this argument in less abstract ways than I have hitherto, I consider in this section an example from my own community-engaged work in Thembelihle, a low-income community in Johannesburg, South Africa. Although I have analysed this example in other contexts (e.g., Malherbe, 2022; Malherbe & Cornell, 2022), I have neglected to consider its psychoanalytic valances.

In 2015, socialist activists from the Thembelihle Crisis Committee (TCC), a grassroots organisation movement, initiated a series of protests and demonstrations. The TCC was demanding that the South African state provide basic public services (e.g., sanitation, parks, housing, improved roads, clean water, electricity) to Thembelihle. It was during these protests that several protesters and, it is believed, others who were not affiliated with the protests began to steal from and even destroy some of the homes and small businesses belonging to foreign nationals living in Thembelihle. A number of foreign nationals were also physically assaulted during this time. Those enacting such xenophobia were able to pursue the capitalist logic of individualistic accumulation through transgression. The superegoic command to enjoy was, in other words, adhered to, with the excessive foundations of capitalist Law transgressed rather than challenged. Indeed, those stealing and assaulting foreign nationals were involved in transgressions that differed from the modes of political dissidence embodied by the protests coordinated by the TCC. The transgressions represented by the protests were put into the service of a broader socialist agenda, rather than a command to 'enjoy capitalism' (see Tomšič, 2015a). The point to be made here is not that those engaging in xenophobic violence were in an especially dominant societal position. They were, themselves, living in conditions of grinding poverty. We should also not psychologise their actions. Stealing from the stores owned by foreign nationals

was certainly driven in part by material need. However, it remains true that wealthier individuals were not targeted during this time. Moreover, stealing took place in conjunction with violence (several foreign nationals were assaulted), which points towards the ideological - rather than the merely opportunistic - character of such xenophobia. The common struggles faced by those comprising the xenophobic superegoic community and foreign nationals were obscured by the superego's hyper-individualised command to enjoy.

The xenophobia exhibited in Thembelihle at this time is not anomalous in South Africa. Poor foreign nationals living in the country regularly incur blame for centuries of colonialism as well as the contemporary crony capitalist state (see Ndlovu-Gatsheni, 2018). Several prominent politicians and news media personnel have, over the years, perpetuated such divisive xenophobic sentiments (Neocosmos, 2008). Like other incidents of xenophobic violence in South Africa, those occurring in Thembelihle during the 2015 protests received considerable coverage in the South African media, oftentimes in an attempt to delegitimise the protests (Malherbe, 2022). Yet, the manner by which the TCC intervened in these xenophobic attacks, taking direct action to stop them, received virtually no media coverage (this kind of neglect on part of the South African media is a commonplace strategy of making state-led, oftentimes brutally violent, police interventions appear legitimate; Malherbe, 2022; Neocosmos, 2008). Despite the political traction it was gaining, the TCC suspended its protests in order to work with foreign nationals to ensure that that which had been stolen from them was returned. Later, TCC members collaborated with foreign nationals to host a series of community events that aimed to promote cohesion and solidarity within the community (Tselapedi & Dugard, 2013). It was only after the safety of foreign nationals in the community was guaranteed that the TCC resumed its protest activities.

Incorporating the struggles of foreign nationals into TCC's political purview altered not only how the TCC undertook political action, but also expanded the emancipatory fantasies ungirding this action. Fantasies of emancipation were emboldened and rendered more ambitious by attending to and making connections between a multitude of struggles. In this, the TCC did not offer coherent or definitive identifications to those aligning with its political agenda. Instead, the TCC sought to facilitate a space within which people could democratically negotiate - and agonise over, in a collective fashion - how they would action their fantasies of emancipation (Malherbe & Cornell, 2022). The political community thus ensures that fantasies of liberation were shaped by and held accountable to the struggling collective, thereby reconstituting the political through the human (see Ndlovu-Gatsheni, 2018).

Soon after the protests, I - along with several colleagues at the University of South Africa's Institute for Social and Health Sciences - worked with TCC activists, foreign nationals, and others in the community to produce a documentary film that participants titled *Thembelihle: Place of Hope*. Much of this film focused on the TCC's anti-xenophobic interventions rather than the xenophobia which had preoccupied most media reporting at the time. At a series of public screenings of the film (e.g., in community halls, at community events,

and in several commercial districts throughout Johannesburg), TCC activists presented their political work, emancipatory projects, and underlying fantasies of liberation to different audiences. It was at these public screenings that TCC activists fostered avenues of solidarity with workers, community members, and other activists facing similar struggles and who were committed to a comparable (although not identical) anti-capitalist programme. As community psychologists, we were invited by community members to assist with facilitating some of these public screenings. However, the TCC also screened the film at several political meetings which we were prohibited from attending. The consolidation of the political community may very well be hindered by psychology (and its assumptions of mastery) or the presence of psychologists (see Parker, 2011). Community psychologists must remain in constant dialogue with activists so that they are aware of what their role should and should not be within this consolidation process.

It may be argued that the xenophobic superegoic community operating in Thembelihle at this time also enjoyed a sacrifice of sorts (e.g., sacrificing good standing in the community). However, such a sacrifice was always held accountable to the superegoic command to enjoy in excess. In other words, the superegoic community moved through sacrifice in order to enjoy excessively. This was not the case with the TCC, whose sacrifices were held accountable to its socialist commitments – a sacrifice in service of an emancipatory cause. Thus, at public screenings of *Thembelihle: Place of Hope*, the TCC as a political community structured enjoyment by appealing to the kinds of sacrifices, fantasies of liberation, and commitments required to advance political struggle, rather than a command to enjoy excessively *a la* the xenophobic superegoic community.

Our particular community psychology intervention was not concerned with consolidating TCC's political community from scratch. This work was already taking place to remarkable effect. Community psychologists are instead to work with members of political communities to advance their struggles in self-determined ways. Work of this kind may involve working with political communities to communicate their politics to new publics - as was the case at the public screenings of *Thembelihle: Place of Hope* - or it may involve community psychologists drawing from available resources to assist activists in ways deemed politically useful by activists themselves (e.g., making available psychological services to those experiencing trauma or burnout; facilitating political meetings; counselling; providing transportation; assisting with access to venues; mediation). This is especially important in places like South Africa where grassroots struggles for liberation are repeatedly silenced, repressed, or brutally suppressed. In short, community psychologists who wish to assist in consolidating political communities (and thus contribute to efforts that turn away from the commands of the superegoic community) must be guided by the emancipatory requirements articulated by political communities themselves.

Conclusion

Without community there is no liberation, only the most vulnerable and temporary armistice between an individual and her oppression. But community must not mean a shedding of our differences, nor the pathetic pretense that these differences do not exist (Lorde, 2017, p. 18).

Formalised community psychology has struggled to break from static conceptions of community (i.e., community as a geographic locale or community as a binding set of values; Kloos et al., 2012), and has sought to know the community definitively, thereby lending itself to projects that seek to control and manage communities in accordance with capital accumulation (Malherbe, 2022). Many critical community psychologists, unsatisfied with how community has been engaged by so many within their discipline, have sought to stretch and expand the notion of community by engaging with it as a complex, ever-shifting site of political interests, affective interactions, and material mediations. In this article, I have sought to contribute to this critical community psychology work by drawing from the Lacanian conception of the superego to understand how unconscious mechanisms psychically bind people into a community defined by a mode of transgressive yet essentially capitalistic enjoyment. It is against these superegoic communities, I argue, that community psychologists can work with activist groups to consolidate political communities through which different struggles can find expression and where solidarity can be established via an agonistic democratic process, one that structures enjoyment through sacrifice and commitment.

In the *Economic and Philosophical Manuscripts*, Marx (1844/1978) argues that individuals are free only when their nature is owed to themselves; when their sources of life, creativity, energy, and reproduction are not determined by or sold to others. This situation, Marx argues, produces communities of things rather than communities of people. He was referring here to the material circumstances of labour under capitalism, however, there are surely also psychic effects engendered by these circumstances. These psychic effects should not be ignored by community psychologists committed to an intersectional anti-capitalist politics. When we take seriously the superego, we take seriously how the community of things co-opts our unconscious, dissident energies to advance a neoliberal rationality based on excess, hyper-individualisation, and consumption. A critical psychoanalytic community psychology need not only consider the kinds of unconscious mechanisms that structure community life. Work of this sort should also strive to make itself of use to political communities that redirect people's dissident psychic energies into the realisation of a humanistic community that breaks from the community of things. Such political communities are of course not shorn of unconscious desire, but they can offer us the psychic tools needed to impede the superego's unrelenting command to enjoy capitalism.

Nick Malherbe is a researcher at the Institute for Social and Health Sciences, University of South Africa, and the Violence, Injury and Social Asymmetries Research Unit, University of South Africa and South African Medical Research Council. He works with social movements, cultural workers, and young people. His research interests include violence, resistance to violence, visual methods, and discourse.

Critical psychologies of climate change and the politics of temporality

Andreas Vavvos

Abstract

Psychologists and social scientists have been impelled to generate more comprehensive conceptualizations of socio-ecological systems as a result of the recent surge in environmental research, the outbreak of the pandemic, and the urgency of climate change. This paper suggests that the temporal theorizing of psychosocial phenomena is an approach psychologists can employ to deal with impending crises, address the terminological cacophony in environmental studies, and advance conceptual clarity. The paper starts off with a critique of mainstream psychological and social science approaches that tend to portray psychosocial phenomena as mostly immutable, static, unchanging, and unaffected by politics. A presentation of the ethnographic research conducted in Western Macedonia and Crete (Greece) ensues. The empirical part explores two distinct temporal orientations associated with the energy transition in Western Macedonia and Crete: the energy future as the perpetuation of an unjust past and as a violent rupture. In the last section, the paper ties the research results to broader anthropological, sociological, and psychological literature, while considering how temporal approaches may aid us in addressing the ongoing endeavors to depoliticize climate change.

Keywords

critical psychology, climate change, temporality, energy transition, Greece

Introduction

The climate disaster fills us with viruses that swarm over us, but you do business with medicines and turn vaccines into commodities. You will be proposing that the market will save us from what the market itself has created. The Frankenstein of humanity lies in letting the market and greed act without planning, surrendering brains and reason. Kneeling human rationality to greed. *Gustavo Pedro, President of Colombia, General Assembly of the United Nations (UN), Tuesday, September 20, 2022*

"If all you have is a hammer, then everything looks like a nail," is the proverb that best summarizes psychological experts' position on the climate question. Psychology circles have largely concentrated on the same study topics (mental health resilience, etc.), methodological frameworks (online quantitative surveys, etc.), and therapeutic techniques (positive psychology, cognitive-behavioral treatment, etc.) when addressing ecological threats like the recent pandemic¹. Similar assertions have been made by certain early-career researchers regarding the field of management. Outlining their personal aspirations for the field of sustainability management, these researchers contend that sustainability issues have not transformed the discipline's core principles, but have just been sketchily incorporated into current conceptual frameworks and methodologies (Baudoin et al., 2022). In a similar vein, the emergence of climate change could have supplied psychologists with an unprecedented opportunity to review and revise their axiomatic principles and theoretical frameworks, spur them to conceptualize human-nature and multi-species relations in more emancipatory ways, and urge them to critically respond to the numerous and escalating crises that have beset the discipline for more than a century (for the crisis in psychology, see, e.g., Sturm & Mülberger, 2012).

Regretfully, the discipline has not yet taken on the task of effectively combating climate change. As a Ph.D. candidate at a Department of Psychology researching energy futures and collectives, I am constantly frustrated and perplexed by the fact that all of my peers and colleagues work on "traditional" and supposedly more "legitimate" micro-level psychological phenomena like behavioral disorders, attention deficit hyperactivity disorder, parental rejection, emotional regulation, illness representations, and so forth. I personally feel uneasy and anxious every time I am asked to explain how a project on energy studies is housed under the Department of Psychology in Crete, but I harbor the hope that this subjective positionality of pariah might upend the outward harmony and order that prevail in Psychology Departments. This portrayal of critical environmental psychologists as misfits and outcasts does not comprise just a personal, auto-ethnographic, or impressionistic view. Despite the recent expansion of the environmental psychology literature (Adams, 2021; Değirmencioğlu, 2022; Räthzel & Uzzell, 2019), data indicate that there are relatively few papers on climate change and global warming in APA and non-APA psychology journals (American Psychological Association, 2022). Mainstream psychology has a tendency to glaringly overlook macro-aspects of the socio-economic systems and to misrepresent systemic contradictions as individual pathologies and failures (Evans et al., 2017; Mentinis, 2013). Therefore, it is hardly unexpected and unanticipated that there has been a chronic

¹ This scathing opening statement applies to philosophical thinking as well. Giorgio Agamben's and Slavoj Žižek's responses to the pandemic were entirely distinct, which may be indicative of how environmental and social phenomena are conceptualized—as transformative forces or as instruments for bolstering pre-existing frameworks. Giorgio Agamben, one of the sharpest-minded European intellectuals, in his hastiness to (mis)apply his own approach to interpret government measures to the coronavirus pandemic, has partly failed to illuminate facets of the social landscape that do not fit with his own research agenda (Agamben, 2021). Unlike Agamben, Slavoj Žižek (2022) asserted that the pandemic is a transformative force that has shaken the world, with influential neoliberal political figures now proposing measures that flagrantly violate all of the market's so-called "natural laws."

lack of attention directed to the structural causes of climate change (Adams, 2021).

This paper advances the argument that it is of the utmost importance for environmental psychologists to thoroughly investigate the temporal character of psychosocial phenomena that are associated with climate change. Psychology and other social sciences should reconsider their core epistemological assumptions and give temporality and the climate issue more serious consideration. The paper's thesis goes beyond simple theoretical pursuits; instead, it mostly draws on the daily struggles of an emerging academic precariat. In a neoliberal academic context, as psychologists, we are obligated to work as researchers in various environmental research programs in order to afford expenses and live within our means. Several of these projects uncritically advance hegemonic conceptual frameworks that do not quench our thirst for knowledge about the underlying causes of climate change and the pressing need to investigate alternative viable futures². The present contribution to the call for papers, *Critical Psychology as Politics by Other Means*, was driven primarily by this paucity of structural opportunities for exploring the potential of critical psychologies of climate change.

The paper is set up as follows: The first section focuses on a critique of how traditional conceptual paradigms in environmental social sciences and environmental psychology address politics. The next section examines how social sciences and psychology have investigated the temporal and future facets of human agency and how this relates to politics. The methodology of the paper, based on ethnographic findings, is discussed in the part that follows. The empirical part explores two distinct temporal orientations: energy future as the perpetuation of an unjust past and as a violent rupture. The paper culminates in tying the research results to broader anthropological, sociological, and psychological literature, while considering how temporal approaches may aid us in addressing the ongoing endeavors to depoliticize climate change.

Mainstream Environmental Approaches and the Depoliticization of Climate Change

Systematic efforts to conceal the political implications of climate change persist in traditional fields of study as well as mainstream psychology. Three brief examples will be enough to demonstrate how the political facets of climate change are being repressed by traditional social sciences. The first relates to the notion of the Anthropocene, which sparked controversy when it was first

² These dominant theoretical models frequently obscure and mystify our day-to-day experiences with housing insecurity, energy poverty, precarious employment, burnout, the mental health epidemic, xenophobia, class, gendered and racial inequalities, rising university tuition costs, redundancies, militarism, and eco-anxiety. The challenge is that research programs in critical (environmental) psychology receive much less funding than those in traditional fields of psychology. Under these circumstances, academic employment in research initiatives that support precepts and theoretical tenets that clash with critical psychological conceptions of human agency and appear to be completely detached from the experiences of the subaltern classes is a one-way street for some of us.

proposed a few years ago. Since then, the term has drawn criticism for perpetuating the notion of human exceptionalism by naming an entire geological epoch after our species. Additionally, assigning equal culpability to all human beings or abstractly responsabilizing the species *Anthropos* appears to conceal and disguise the capitalist relations that contributed to the degradation of ecosystems (Moore, 2016). This flawed and problematic framework has even crept into critical environmental psychological research (Adams, 2020). As is unfortunately always the case, more dynamic conceptual frameworks like those of the Capitalocene (Moore, 2016) or the Cthulucene (Haraway, 2015) have remained confined to academia and never attained the level of popularity of the Anthropocene paradigm³.

The WEF (Water, Energy, Food, and Ecosystems) Nexus framework, which seeks to conceptualize and explain the linkages and interrelationships among natural resources, is yet another instance of how ambiguous the terminology in environmental social sciences can be. The emergence of this theoretical framework has urged researchers to work collaboratively and explore the complexity of socio-ecological systems in very dynamic ways. In vulnerable regions, like Crete (Greece), which in the future are going to suffer from decreasing water reserves, more frequent meteorological and hydrological droughts, and less frost (Georgoulas et al., 2022; Tapoglou et al., 2019), nexus studies that capture the complicated interplay between socio-political and environmental systems are of utmost importance (Canessa et al., 2022). However, an insightful critique of the concept has revealed that it comprises a depoliticized framework that capitalizes on the naive belief that the market and technology are the only forces capable of resolving the looming and impending environmental and social crises. The concept seems to mask the power disparities involved in the management and utilization of natural resources, to disguise essentially political issues as technical ones by subscribing to mainstream discourses of the "technical quick fix," and to reinforce conventional assumptions in neoclassical economics (Allouche et al., 2015; Müller-Mahn et al., 2022).

Like other traditional social sciences, mainstream psychology is reluctant to acknowledge how politics permeates all of our interpersonal interactions (Parker, 2007). This depoliticization of the political sphere in psychology becomes apparent in the recent report of the APA task force on climate change. The report unquestionably comprises a positive development and initiates a dialogue on the role of psychology in times of climate change (American Psychological Association, 2022). The report examines a wide range of additional contributions that psychologists can make to address the effects of climate change and makes the case that mitigation (how carbon emissions can be reduced) and adaptation (how people can adapt to climate change) are the main responses to climate change. It is evident that the necessity of climate change adaptation and mitigation should not be understated. However, the study makes no mention of

³ The focus of this paper does not allow for a thorough analysis of these theoretical frameworks. It is sufficient to note that academics have also criticized the theoretical underpinnings of the Capitalocene and Cthulucene's approaches. For a critical analysis of Moore's body of work, for instance, see Foster and Angus (2016).

the causes of climate change, and the brief and cryptic references to fossil fuel combustion and carbon emissions are insufficient. The research glosses over the factors behind climate change and the urgent necessity of switching to an entirely different socioeconomic system.

Değirmencioglu (2022) who reviewed the psychological literature on climate change, similarly concluded that the causes of climate change are rarely covered, with the emphasis instead being persistently placed on its psychological impact. This marked reluctance of psychologists to take on the causes of climate change indicates that the discipline misses the opportunity to align with Roy Bhaskar's (2009) radical vision of the emancipatory social sciences as forms of explanatory critique that seek to eliminate the causes of oppression and the sources of the mystification of reality. According to Bhaskar (2009), explanatory critique is "the kernel of the emancipatory potential of the human sciences" (p. 121). Without the requisite conceptual rigor and theory development that shed light on the extractive logic and oppressive arrangements that caused climate change in the first place, psychologists cannot rise to the occasion.

The report's overall tenor implies that psychology is a benevolent academic discipline and professional practice that, among other things, should "educate the general public" on the psychological aspects of climate change (American Psychological Association, 2022, p. 10) and "help people to adjust to the impacts of climate change" (American Psychological Association, 2022, p. 9). This academic "air of messianism" that reflects the pomposity of scientists and their unwavering belief in the superiority of academic knowledge has been harshly criticized (Freire, 1994, p. 79). The general public is portrayed in the report as passively consuming information about climate change, and the distinction between the active agents (psychologists) and the recipients (the general public) of knowledge is upheld without giving it any serious consideration, as if knowledge and research are the monopolies of academia (Fals-Borda, 1987). Unsurprisingly, this approach is prevalent in mainstream environmental psychology, where "the attention focuses on potential levers to the correction of individuals' errant behaviour by scientists and politicians who believe to have a clear knowledge of how individuals should behave" (Räthzel, & Uzzell, 2019, p. 1386).

These short introductory remarks are meant to convey the main point that conceptual fuzziness has stymied the progressive potential of the shift to more equal and sustainable societies. In light of these developments, it is not an overstatement to suggest that prevalent environmental ideologies have contributed considerably to the obfuscation and mystification of the material reality of climate change. The links between politics, theoretical frameworks, and power asymmetries need to be further explored by psychologists and social scientists. In this regard, I concur with Räthzel and Uzzell (2019), who call for a critical environmental psychology that provides conceptual frameworks for people to attain self-liberation. Rather than conceiving climate change as another area that must be colonized and invaded by traditional social sciences and mainstream psychology, one could regard it as a transformative force that shakes and rocks our theoretical foundations. As time is a terrain of political

struggle and conflict and a site in which power relations arise and emerge (Gokmenoglu, 2022), the remainder of the paper explores how temporal theorizing is a crucial tool for halting this rapidly accelerating depoliticization of climate change.

Temporal and Future Orientations in Contemporary Social Sciences

Despite the fact that "climate change is intrinsically about time and temporality, but in a number of different ways" (Kverndokk & Eriksen, 2021, p. 1), psychologists interested in climate change temporalities confront the unfortunate fact that mainstream psychological approaches have obscured and concealed the temporal, futural, and utopian aspects of human agency. The vast majority of psychological frameworks are marked by a notable lack of temporal conceptualization of psychosocial processes. As a corollary of its excessive reliance on linear epistemologies and the variables approach, "timeless psychology" has been ineffective in explicitly incorporating temporality, the lived experience of time, as a key element of psychosocial phenomena and articulating their futural components (Sools & Mooren, 2012; Tateo & Valsiner, 2015). Although temporality is a key component of psychopathology, contemporary psychiatric approaches, mired in quantifying mental distress, have failed to explain it as a socially grounded, qualitative, and intersubjective phenomenon (Moskalewicz & Schwartz, 2020). In a similar vein, modern theories of cognitive psychology have regarded cognitive processes primarily as spatial phenomena while overlooking their temporal and enduring nature (Vogel et al., 2020), while psychological approaches like those of Bandura and Adler appear to be confined by a Western linear temporality and back the notion that human agency always conforms to prevailing cultural standards (Sools & Mooren, 2012, p. 207). Freudian psychoanalysis has also received criticism for being mired in an archaeology of the subject and obscuring the novel contents of psychological processes (Bloch, 1996; Marvakis, 2007).

The social sciences have a long history of under-investigating temporal and, in particular, future-focused categories; therefore, this issue is neither recent nor unique to psychology. Pink and Salazar (2017), for instance, have put forward a similar argument regarding how anthropologists tend to disregard the future: "Anthropological method itself is embedded with a past orientation, and the theoretical canons of the discipline have not accommodated

a future-focused shift" (p. 6). With a few notable exceptions, the dominant philosophical discourses of modernity and the entire Western philosophical enterprise up until Marx had generated future-focused conceptual tools that were poorly and vaguely developed (Bloch, 1996). The discussion regarding the future has, in general, been dominated to this point by positive psychology-based discourses that place a strong emphasis on the controversial idea of resilience (Kleist & Jansen, 2016, p. 383). Neoclassical economics, which lays a great focus on advanced statistical techniques, prediction, and probabilistic thinking, has likewise dominated mainstream discourses (Appadurai, 2013). In order to

construct energy futures that serve as moral frameworks, financial metrics and conventional economic models are frequently deployed (Field, 2022), and scientists working on the WEF (Water-Energy-Food) environmental approach have blatantly favored quantitative techniques (Albrecht et al., 2018). The point raised here is not anti-quantitative, but as Parker (2007) so aptly remarked, critical psychologists are reasonably skeptical about the stifling quantification of our daily lives.

Utopianism, a potentially fruitful notion that captures agents' aspirations and visions for the future, has likewise been relegated to the margins of social theory. The utopian philosopher Ruth Levitas (2013) has described the persistent hesitancy of social scientists to integrate utopian thought into their research agenda. Levitas has claimed that the sociology of the 20th century was established as a legitimate scientific discipline by excluding utopian thought and perpetuating assumptions that regard science and utopian thinking as two mutually exclusive projects (Levitas, 2013). One major factor contributing to the decline of utopianism has been Karl Popper's criticism. Popper asserted that "utopian engineering" has a highly implausible end result and calls for the complete reconstruction of societal institutions, without anybody being able to guarantee that all these sacrifices and sufferings of the people will not be in vain (Popper, 2003). The concept has been consigned to the periphery of traditional social philosophy despite the emergence of promising reconsiderations of it, such as Wright's Real Utopias (Wright, 2010) and the critical realist notion of Concrete Utopias (Archer, 2019). This is largely owing to the fact that utopias were inextricably linked to the totalitarian regimes and the atrocities of the 20th century (Wegner, 2013).

For psychologists keen on examining future orientations, hope is another promising concept. According to Bryant and Knight (2020), hope is "something that doesn't presently exist but potentially could; hope is based on more than a possibility and less than a probability" (p. 134). "In these unquestionably anti-utopian times," as Rafaella Baccolini (2013, p. 161) has called our era, future orientations like hope are largely confined to the realm of the individual and primarily understood as an atomized and private capacity (Thompson, 2013). We live in critical times, when collective and social hopes that challenge the foundations of our societies are in full retreat. In this context, mainstream psychological approaches, along with market-driven discourses, aggressively infiltrate all of our social relationships and solidify a therapeutic ethos that depoliticizes and privatizes our emotional experiences (Illouz, 2007). Theoretical frameworks, analytical approaches, and methodological designs in mainstream environmental psychology subtly incorporate this prevailing notion of the privatized individual (Räthzel & Uzzell, 2019). Hope has been partially converted to a commercial and consumerist activity restricted to the private sphere, as specific atomistic futural visions become dominant and sideline collective ones; the hope for an ideal body that complies with current beauty standards or for a plastic and flexible brain with unlimited potential, if the person adopts self-enhancement and brain-enhancement practises (Pitts-Taylor, 2010), are relevant examples here.

In the empirical section that ensues, I make an effort to demonstrate that sweeping social processes like the energy transition stimulate temporal thinking. The anthropological literature from South Europe, which demonstrates how the various crises that have wreaked havoc on those countries have spurred temporal thinking, is crucial in this regard (Bryant, 2015; Knight, 2015; Knight & Steward, 2015). Knight and Steward (2017) have summarized this argument by claiming that "crises stimulate temporal thought (temporality), whether tilted in the direction of historicizing, presentifying, futural thought, or some combination of these possibilities" (p.2). The paper is aligned with Kverndokk and Eriksen's call (2021) to investigate not only how climate change temporalities are conceptualized as an abstract geological and historical condition, but also how vernacular discourses and human experiences are attached to these temporal structures. In the final section, I attempt to tie everything together by exploring how and why temporal theorizing can be a strategy we might employ to cease the depoliticization of climate change.

Methodology

The ethnographic data came from participant observation, field notes, casual conversations, and interviews conducted from 2020 to 2023 with local citizens, coal miners, and energy union members who oppose the energy transition in Western Macedonia and Crete (Greece). The study is still in progress. The majority of my conversation partners are middle-aged and come from Greece. Even though I mention several occasions with different informants, my main focus here is on my long-standing friendship with Stefanos and Alexis (pseudonym). Stefanos, a pensioner and a former coal miner, presided over the Labour Solidarity Union of Workers in the lignite mines in Western Macedonia. He is a founding member of the informal collective Energy-Environment SOS Western Macedonia and a regional councilor in Western Macedonia. Alexis, is one of the founding members of the Citizens' Committee of Ierapetra, a group established in 2018 to coordinate local residents' opposition to the installation of wind turbines.

Through the operation of lignite mines and power plants, Western Macedonia served as Greece's energy hub for several decades. Due to the mandate to decarbonize the Greek economy by 2028, the region is at the forefront of discussions concerning ecological and labor transitions. The privatization of the Power Public Company and the precarization of labor relations have raised concerns about the region's future prosperity. The town of Ierapetra is located on the southeast coast of Crete and was chosen as a case study due to the fact that the installation of four 90-meter wind turbines near an archaeological monument has sparked controversies. My research is located at the collaborative intersection between social anthropology and critical psychology, exploring how diverse social groups (miners' trade unions, energy communities, and environmental groups) construct their futures in an interconnected global sector (energy). I am concerned with a better

understanding of human agency, particularly futural anticipation and utopian thinking. In this case, my primary focus is on investigating how energy transitions impact how people experience time.

This study may be referred to as "anthropology at home," as I was raised in Kozani, Western Macedonia, and have since lived in Rethymno, Crete. This phrase has been employed by anthropologists in recent years to indicate the shift in the ethnographic focus from "exotic" and far-off societies to their own communities. Anthropologists confront unique challenges when doing their research at home, since it can be complicated to defamiliarize the familiar and thoroughly interrogate the cultural and linguistic similarities they share with their interlocutors (Jackson, 1987). The research project was approved by The School of Philosophical, Anthropological and Film Studies Ethics Committee (SEC) of the University of Saint Andrews on May 24, 2022 (approval Code: SA16261) and by the Research Ethics Committee of the University of Crete (REC-UOC, A.P.129/22.08.2022).

Energy Future as Perpetuation of an Unjust Past

The notion that Western Macedonia's energy transition reproduces and reinforces the repressiveness and corruption of the country's existing political institutions has been strengthened by the association of the transition with controversies over clientelism, violence, and corruption. An event that was recently revealed and generated heated debates in the local communities is the fact that the three daughters of Vasileios Michelakis, the Secretary-General of the Decentralized Administration of Epirus and Western Macedonia, were partners and managers of the energy firms Kleia Power Energy, Efour Green Power, and MM PV Power in Western Macedonia. A story with the startling headline "The father grants land for his daughters' photovoltaic panels" was published in the local newspaper *Proinos Logos* (Morning Talk) ("Mana Nerou for the three daughters", 2021). Given that the Decentralised Administration of Epirus and Western Macedonia distributes licenses for renewable energy projects, his family members' engagement in energy enterprises has raised ethical concerns. The disputes centered on a location known as Mana Nerou in Messiani Kozani (Western Macedonia). The region had been declared a protected area of "Macedonian oak forest," which barred the installation of solar and photovoltaic panels ("Macedonian oak forest the disputed area", 2021). Licencing these renewable energy projects was viewed as a violation of the prevailing land use system in the area as well as an action that jeopardized the preservation of the surrounding ecosystems. The mayor of Kozani, the capital of Western Macedonia, Lazaros Maloutas, was also involved in this controversy. His nephew, Ioannis Maloutas, is the manager of the private company Coenergy and his daughter, Alexandra Malouta, is a partner in the business ("Mana Nerou and for the daughter", 2021). It has been debated if there are conflicts of interest in this case because of their involvement in this photovoltaic energy company, and it has also been questioned whether the mayor's family members' business ventures are morally

acceptable. The local city council met to debate the issue, and a variety of opinions were voiced regarding the morality and legality of these activities (Conference Hall Coventareio, 2021).

The first to bring up this topic in our conversations and associate it with temporality was Stefanos, a retired coal miner and member of the left-leaning trade union Labour Solidarity. Stefanos has been actively rallying local communities in Western Macedonia against the current energy transition. He is a critical friend and co-researcher who continually ponders how the dominant energy present and future reinforces and perpetuates an unjust past. For instance, when Greek prime minister Kiriakos Mitsotakis recently visited Western Macedonia to inaugurate a new photovoltaic park, there were violent skirmishes between the police and the local social movements that "welcomed" the prime minister. Stefanos was reminded of the 1990–1992 riots, when the father of the current prime minister, Konstantinos Mitsotakis, visited the area and ordered police to beat coal miners. There is a third Mitsotakis family member involved in the energy transition field. The sister of the prime minister, Alexandra Mitsotaki, is in charge of ELPO/ISD and Convergencies' collaborative initiatives to secure public support for renewable energy initiatives and defuse opposition to the transition. The transition, which was associated with familism, did not appear to transform people's values and attitudes; rather, it tended to re-establish the underlying ambiguities of Greek politics.

As Stefanos and I collaborated to write a paper about the environmentalism of the trade union, I realized that the word transition I kept using was perplexing to him. Despite the fact that we chose to keep the phrase "(un)just transitions" in the title of our paper, we both agreed that union members would not use it in other contexts, as they would not conceptualize contemporary transition as a shift or a change, but mainly as a perpetuation of the past (Vavvos & Prassos, 2023). The group Stefanos supports for the regional elections in October 2023 presented its proposals on energy in Western Macedonia in the aftermath of the recent national elections, which yielded a negative outcome for the radical social movements. The notion of an energy transition to renewables was harshly questioned in a handout that contained the group's theses on energy in Western Macedonia: "The so-called transition, contrary to what they claim, is not from lignite to renewable energy but rather from lignite to natural gas, which has since been supplanted by LNG." Green transition is negatively associated with words like *έγκλημα* (crime), *απάτη* (fraud), and *ψέμα* (lie) in the majority of the energy protests and demonstrations in Western Macedonia in which we have taken part with Stefanos. For instance, during a recent demonstration against the installation of renewables in Anatoliko Eordaias (Western Macedonia), which was primarily organized by energy workers and trade unions, workers and locals sang in time to the workers' cries, "Green transition is a fraud, the right of the worker is the law." They regarded the transition towards a greener economy as integral to a long-standing political system that is hostile to the interests of the working class and local communities.

In the paper that Stefanos and I published, we presented the argument that, for his trade union, both the working conditions in the lignite mines and the

deindustrialization process in Western Macedonia are noxious and detrimental to the working class and the local ecosystems. No matter which energy source is used in each context, the prevailing economic system is seen as one that depletes the environment and endangers workers. The transition is viewed as an expansion of the neoliberal policies that have been imposed on the nation over the past several decades, particularly in response to the economic crisis that has only served to deepen citizens' mistrust of the political system as a whole. For some of my interlocutors in Western Macedonia, the region's energy transition is connected to the persistence of neoliberal politics, the maintenance of a corrupt political regime, the long-standing repression of coal miners' protests, and the continuation of politics as a family affair⁴.

Energy Future as Violent Rupture

"One of our aspirations is to create a space where conditions like autism can be treated by people trained in equine-assisted therapy," Alexis remarked as we sipped coffee overlooking the Cretan Sea in Ierapetra. Alexis had worked in a variety of professions while living in other cities; however, the austerity measures and the urban way of life appeared alienating and taxing to him, and he was one of several citizens who decided to return to their villages during the economic crisis. The economic downturn fueled his desire to return to Ierapetra and maintain his familial and cultural legacy. One of the numerous priorities of their local community is the preservation of *georgalidiko alogo*, a horse that has lived on Crete for thousands of years. The next morning, we took a stroll with Alexis to view the monumental ancient olive tree of Kavousi. Although this viewpoint is contentious, many locals consider it to be the most ancient olive tree in the world. As we were circling the tree and admiring its natural splendor, Alexis insisted, "you absolutely must walk the Kavousi Minoan route while you are a resident here."

The following day, Alexis arranged for me to be picked up from Pahia Ammos, a village in Ierapetra, and taken to the Minoan route by one of his friends, Sotiris. Hiking the path instilled in me a profound appreciation for the

⁴ In this section, I only focused on one temporal orientation that is associated with energy transition in Western Macedonia: energy future as a perpetuation of an unjust past. However, further ethnographic inquiry in the region can uncover a wide range of distinct temporal structures and experiences. For instance, several anti-transition discourses in the region portray the transition as a violent rupture with a relatively peaceful past that was mostly characterized by the region's prosperity as the country's energy pillar. A speech delivered at a seminar held on December 14 organized by local officials from the energy municipality of Eordaia (Western Macedonia) offers a pertinent illustration of this temporal orientation. The title of the event was telling: "The future of energy in Western Macedonia." The purpose of the gathering was to debate the hasty decision to phase out lignite by 2028. In his speech, the mayor of the town, Plakentas Panagiotis, portrayed the energy transition as a "violent" process that demonizes the national fuel (lignite) and serves the interests of international natural gas conglomerates. In his portrayal of the upcoming future, Western Macedonia will be turned into an abandoned region, and its economy will be in ruins. Local ecosystems will be degraded since the hasty and premature closing of the mines will prevent the restoration of coal mining regions from being carried out as planned (Dimos Eordaia, 2020).

region's rich history and natural beauty. Sotiris, a middle-aged man who had previously practiced law and served as the community's president in Pahia Ammos, underlined the value of the area's history while giving me a ride with his pickup truck:

Although this should be done over all of Crete, we are documenting the perennial olive trees in our region. We are recording the olive trees, and we are creating six cultural paths that link the olive trees to other monuments. [...] This trail, which you will now stroll down, was originally used by postmen, who were transporting letters with their mules.

The fact that locals in Ierapetra like Alexis and Sotiris opposed industrial renewable energy projects was not irrelevant to their involvement with the aforementioned activities; these RES projects were portrayed as eroding the organic harmony and unity between nature, cultural heritage, and human beings. On these grounds, the transfer of four wind turbines for the erection of a wind farm at the archaeological site of the Isthmus of Ierapetra aroused controversy. Although the Local Council for Monuments in Crete declared that there is no visual contact between the four wind turbines and the ancient sites, the Citizens' Committee of Ierapetra claimed that the installation of wind turbines jeopardized the archaeological site. For its initiatives to preserve this archaeological site, the Committee was awarded the European Archaeological Heritage Prize in 2021. In a fiery press release, the Committee declared that this award was a triumph for all the collectives in the country that oppose industrial RES, and that their efforts had been vindicated on a worldwide level ("To the Citizens' Committee of Ierapetra the award", 2022):

With the announcement of the licensing of a wind farm installation in the sole archaeological site of the Isthmus of Ierapetra in the autumn of 2018, motivated and active residents formed the Citizens' Committee of Ierapetra to conserve our place's legacy. We perceive our history as an inseparable whole that encompasses monuments, perennial olive trees, the natural environment with its flora and fauna, and the products of our forefathers' relationship with nature. These three years of work were surprisingly rewarded when the European Association of Archaeologists (EAA) announced the awarding of the European Archaeological Heritage Prize for 2021 to our group. This is a crucial and international recognition that can only give us and all the collectives in the country strength in our fight against unlawful commercial interests that, in the name of profit, pass like steamrollers and taint forever our region's environment and heritage.

On one of my last days in Ierapetra, over lunch in his stone-built and traditional home, Alexis recounted eloquently how the Cretan traditional way of life (*lyra*, a Cretan traditional instrument, and *raki*, a local distilled alcoholic drink) inspired their opposition to renewables: "The anemological mast was once demolished. They had put up a mast with wind turbines, and those permits are still in place. People said they would pull it down, but not at night like they do everywhere in Crete; they would take it down during the day with *lyres* and *raki*. And yes, that is how it happened; there was a 500-person demonstration." Astonished by his

breathhtaking narration, I responded, "You describe it vividly. I wish I could have been there."

Conclusions and Discussion

By exploring two distinct temporal orientations that are prevalent among trade unions and citizens' initiatives that oppose energy transition, this paper sought to place time and temporality at the forefront of the social sciences and add to the body of knowledge in the field of energy futures. According to one temporal orientation investigated in Western Macedonia, namely that of a bleak energy future that is identical to a stifling past and present, the transition was portrayed as bolstering a long-running neoliberal experiment that is at odds with the interests of the working class and the local communities. Based on this first ethnographic section, I contend that the question at hand is whether the current transition leads to an energy future that is largely experienced as "a repetition, a preordered piece in a circle that is always the same" (Bloch, 1996, p. 143). This argument is in line with studies investigating energy transitions in various locations. For example, Franquesca (2019) has also claimed that for many Southern Catalans, "the arrival of wind energy was not lived as a rupture but as a continuation of old patterns" (p. 118). In a similar vein, Cymene Howe (2019), who has investigated the energy transition in Mexico, wonders whether "renewable energy is really anything "new" at all, especially when seen from the point of view of centuries of domination and militant responses to that domination" (p. 106). The ethnographic study by Spyridakis and Christodoulou (2019) that was carried out in Greece is another pertinent example of similar temporal orientations. Spyridakis and Christodoulou (2019) coined the term "temporality of precariousness" to analyze the life stories of unemployed informants who lived in precarious circumstances in Greece. Two distinct temporal orientations for jobless people were identified by Spyridakis and Christodoulou's (2019) analysis. The first, "I thought that things would always be the same," reflects experiences of being captured in vicious circles and past identities, while the second, "We go step by step," is more closely related to presentist mentalities and worries for the future (p. 68).

In the second ethnographic vignette, the paper interpreted the energy transition in Ierapetra as a sweeping social process that obliges citizens to forfeit their enduring ties to nature and cultural heritage. The argument proposed is that the installation of the four wind turbines was portrayed as a process that disrupts the continuity between the ancient past, the precarious present, and the uncertain future, uprooting locals' cultural roots and eroding their identity. The *georgalidiko alogo*, perennial olive trees, and archaeological remnants from the Neolithic, Minoan, Archaic, Classical, Roman, Byzantine, Venetian, and Ottoman periods— all cultural markers of local identity—were jeopardized by the onslaught of a relentless and profit-oriented socio-economic system. This "avalanche" of industrial renewables in the region brought to the surface the relevance of local history and spurred inhabitants to highlight intangible and

tangible cultural resources. The infestation of renewables imposed by economic interests beyond the local community impeded the envisioning of more just futures; in the midst of an energy transition portrayed as a rupture and as orchestrated by unlawful commercial interests, a long-forgotten past emerged as what Knight (2012) has described as culturally and temporally proximate.

Given that the thriving and flourishing of hypothetical future human and non-human beings, as well as the preservation of their ecosystems, are at the center of environmental policy-making and scientific pursuits and discourses, psychologists are now under pressure to develop conceptual breakthroughs, particularly when it comes to future orientations. Placing temporality at the center of the discipline could be a potential strategy for preventing psychological science from further depoliticizing climate change. Our critical engagement with how climate change temporalities are structured and organized can motivate us to voraciously seek utopian elements in our daily practices as practicing psychologists, mental health professionals, and critical social scientists. For instance, rather than relying on business as usual and framing eco-anxiety as a wholly psychological condition, researchers could investigate how the psychological concerns and complaints of young citizens about the climate hold the potential to propel us out to new societies and a reinvented field of psychology, where human-nature interrelations are positioned at the forefront of our approaches.

Critical environmental psychologists interested in temporal theorizing can draw from several critical psychological and social scientific approaches in order to overcome their problematic view of temporal experiences and, in particular, futural thought. The theoretical framework of *Kritische Psychologie* conceptualizes the "human way of life" as one that is marked by foresight (Räthzel & Uzzell, 2019, p. 1398). The approach attempts to address the transformative potentialities and the dual character (*doppelte Möglichkeit*) of human subjectivity by outlining how "humans can act within the social framework while at the same time, they are able to go beyond this framework and thereby modify it" (Dege, 2019, p. 117). Moreover, a collection of articles in the *Journal of Social and Political Psychology* has investigated the potential contribution of critical psychological knowledge in the field of prefigurative politics. The collection concerns social movements that prefigure radically alternative future societies (Cornish et al., 2016). Prefigurative movements embrace horizontal decision-making processes, imagine feasible futures in the present, and oppose neoliberal hegemony, the market economy, and representative democracy (Maeckelbergh, 2011). This means that engaging with the notion and practice of prefiguration can have profound epistemological implications for psychology. There are also some other future-oriented approaches in psychology, such as the model of prefigurative action research elaborated by critical community psychologists (Kagan & Burton, 2000) and the sophisticated method of Letters from the Future (Sools, 2020). These sporadic and scattered initiatives to explore the future orientations of the human agency may stimulate further inquiry, despite the fact that they do not constitute a comprehensive and well-established approach.

The anthropologist Hirokazu Miyazaki's (2004) study on hope may also serve as an impetus and inspiration. Miyazaki was one of the pioneers in introducing the approach of Ernst Bloch into the social sciences. He investigated how the Suvavou people's continuous attempts to reclaim their ancestral land have been repeatedly unsuccessful. Miyazaki's work has been ground-breaking as it portrays hope as a method, namely as a conceptual tool that reflects the indeterminate nature of the world and the open-ended process of producing anthropological knowledge (Miyazaki, 2004, p. 139). Investigating psychosocial phenomena through Miyazaki's critical lens has the potential to help us consider them as open-ended and transform the way we approach psychology theories and research methodologies.

Paulo Freire's conception of humanity as being in the process of becoming reflects this open-ended nature of social reality as well as the interplay between politics and temporality. In this light, his critique of social research is crucial for critical psychologists seeking to expose the depoliticization of climate change temporalities in mainstream psychology (Freire, 2005, p. 108):

The investigator who, in the name of scientific objectivity, transforms the organic into something inorganic, what is becoming into what is, life into death, is a person who fears change. He or she sees in change (which is not denied, but neither is it desired) not a sign of life, but a sign of death and decay. He or she does want to study change—but in order to stop it, not in order to stimulate or deepen it.

A critical engagement with time and temporality may offer us the opportunity to acquire insight into how social phenomena are in constant flux, how humanity is continuously evolving, and how the present "doesn't have to be like that" (Levitas, 2013, p. 48). Or, to put it another way, another world is possible.

Acknowledgements

I express my gratitude to Thanasis Marvakis for his unwavering support and encouragement while I wrote this chapter. I also thank two of my supervisors, Daniel Knight and Sofia Triliva, for the knowledge I acquired from our discussions on critical psychology, social anthropology, and temporality. I would be remiss in not mentioning that some of the works that I cite in this chapter have been extensively discussed with my critical friend, Hector Trujillo.

phenomenon of opposition to the energy transition. Email: av94@st-andrews.ac.uk

Beyond performance: Psychoanalysis and the politics of sport

Fabio Menezes dos Anjos & Ivan Ramos Estevão

Abstract

Sport is not only an enormous industry that moves billions yearly, but also an integral part of human lives and society, whether we are talking about professional sports or a recreational activity. Thus, it is an area with deep political implications. Some of these are highly visible for the public, and even grow to become important historical moments, such as John Carlos and Tommie Smith's Black Power salute at the 1968 Olympics, or Muhammad Ali's refusal to fight in the Vietnam War. Other aspects of the political nature of sports are subtle and deeply rooted in the very fabric of such practices, having a significant impact in social relations and matters such as gender, race, nationalism, among others. Fields such as anthropology, philosophy and sociology already engage in studies of sports and their political impact. However, psychology seems to take little interest in this aspect. Most of the studies in psychoanalysis focus on group relations with a particular interest in violence, such as hooliganism. Sport psychology, on the other hand, is primarily preoccupied with performance and adaptation, serving as means to obtain better competitive results or athlete mental wellbeing, but within the high performance sport logic. This article proposes to discuss how these approaches serve to maintain the *status quo* and ignore both the political impact of sport. We believe that shining a light on the political aspect and implications of sport is fundamental and can lead to deeper discussions not only in the field of sport, but also in the high-performance logic of society in general.

Keywords

Psychoanalysis, sport, Lacan, performance, athletes

Sport, in its different manifestations, is both a cultural phenomenon and an industry that moves billions annually, being an integral part of the lives of countless people, whether as an occupation, a recreational practice, or as a form of entertainment, since the main sporting events are seen by billions of people across the planet. Such a significant field, with so many effects and ramifications, evidently has relevant political implications which should be discussed. Areas of knowledge such as philosophy, sociology and anthropology have long dedicated themselves to discussing such issues. Psychology, however, seems to seldom show the same level of interest for sport in its political dimension.

Within psychology there is a field dedicated to sport, Sport Psychology, which has as its main focus the development of psychological skills and the treatment of issues related to competitive performance, although it is also dedicated to understanding the effects of sport on development, health and well-being (Weinberg & Gould, 2007; Samulski, 2009). The sport psychologist's work therefore can be applied not only to high-performance sports, but also to school or recreational sports, with a focus on prevention, health and rehabilitation. When working with elite athletes, however, interventions are mostly sought in order to generate an improvement in performance or to reduce symptoms that may affect performance and sports practice. Among such interventions, we can highlight techniques such as mental training, concentration training, biofeedback, and self-motivation, with the aim of improving activation, goal-setting, developing motivation, performance and willpower. The main objectives of psychological training in sport are "developing the psychic capacities of performance, creating a good emotional state during training and competitions and, finally, developing a good quality of life for athletes, coaches and other people involved in sport" (Samulski, 2009, p. 13). Since the focus of this article is not to discuss how sport psychology can intervene with athlete performance, we will not elaborate further on these techniques. What we observe, however, is that there is little space in this field for the analysis of sport as a sociocultural element or the political issues that surround it, especially considering the constant need for results that is prevalent in the logic of elite sports.

In Psychology as a broader field, on the other hand, we can easily find studies, analyses and reflections on various elements of culture, such as literature, cinema, or art, and on social topics such as racism and gender issues, for example, but it is rare to find works that focus on sport. This does not mean, evidently, that such works do not exist. There are authors within Sport Psychology who dedicate themselves to studying issues that transcend aspects of athlete performance, and also within psychology as a broader field we can find studies on topics of sport. For the most part, however, analyses within psychology deal with themes of the psychology of masses, with the theme of violence by football hooligans in particular being one of the most investigated (some examples are Luccas, 1998; Moraes & Moraes, 2012; Santos, 2010). There are few studies that address athletes in their subjectivity and even less on the dynamics of high-performance sport and its effects as a product and reproducer of the logic of capitalist production.

Within psychoanalysis, although they are also rare, we have observed the existence of a few publications on sport. In that regard, the number 101 edition of the *Cliniques Méditerranéennes* magazine, published in France in 2020, represents an important step towards expanding discussions in this field, with the edition having as its declared objective to not merely propagate knowledge about the ideology of sport or to condemn mass ideology, but to identify challenges of the sporting phenomenon from a psychoanalytical point of view, questioning the place that sport occupies in the subject's psychic economy based on psychoanalytical notions and concepts (Petit & Brohm, 2020). The authors also mention the disinterest by psychoanalysts in the sports phenomenon, "except in

an anecdotal or ephemeral way" (Petit & Brohm, 2020, p. 6). As we have stated, such disinterest could be expanded to most psychologists as well. Another relevant publication is the book *Psychanalyse, Sport et Science*, by Marie-Hélène Brousse, Françoise Labridy, André Terrisse and Marie-Jean Sauret, which also discusses elements of sport in society and its impact on subjectivity and on the social bond. Other studies and publications exist in the field (such as Bastidas, 2002; Campos, 2015; Anjos, 2022), but they are rare and discussions about sport in psychoanalytic circles and events are mostly non-existent.

In that context, this article aims to discuss sport in its political dimension, as well as the influence that sport and its discursiveness can have in the social bond. In addition, we intend to touch on the absence of a broader production in this field and what are its effects, and finally point out the importance of a political reading within Psychology to think about sport. Our position is that, by not taking into account the issues of sports in society and its effects, Sport Psychology demonstrates a veiled political dimension, and possibly without realizing it, in the sense that it supports a logic and a discourse that encourage high-performance and the overcoming of limits without question, offering its knowledge and techniques to precipitate such objectives. We defend that Psychology can contribute in other ways to the analysis of the sports field, and our choice is to bring psychoanalysis to the debate as a theoretical reference, starting from Sigmund Freud and Jacques Lacan.

The social place of sport throughout history

We begin our discussion with a brief contextualization of sports practice throughout history, until we reach its place today. As it is not the main focus of this article, the role of sport in different civilizations over time will not be deepened, but we consider its mention relevant to the discussion here. Our proposal at this time is to illustrate the historical process that involved sport over time and how the current model of sport and its social representation was built.

Sport emerged in the prehistoric period and its origin refers to survival, the worship of gods and the practice of rituals. Later, it was organized in Greece as one of the most important events of Ancient History (Rubio, 2001). The political component was already in place early on: the Olympic Games brought together athletes from different city-states, many of which were often at war, and Olympic laws were established to protect competitions from possible political interference. Additionally, athletes occupied a distinct place in society, since participation in the Games was only allowed for citizens, a condition that, at the time, did not include women and slaves, who did not even have the right to watch the competitions. In such a context, the Games represented an important uniting factor that helped create a Hellenic culture (Besnier, Brownell & Carter, 2018).

Later, Macedonian and Roman conquerors assimilated the Olympics into their cultures, as a way of demonstrating their power and also their admiration for Hellenism. During this period, sports were integrated into social, political and economic structures and one of their roles was to reinforce the legitimacy of

leaders and the state (Besnier et al., 2018), an aspect of sport that, in many ways, is still present today. In addition, physical activity was seen as something positive for both individuals and society, since the existence of a large number of citizens in good physical shape represented a greater reserve of soldiers to be used in the event of conflicts with other states.

Over time, different peoples and civilizations throughout history have had their own unique relationships with sport, although the political element was a constant. In the Maya and Aztec Civilizations, ball games were family events, but they also played a role in the establishment of governments at the time. The importance and representativeness of sport in such civilizations is significant:

Sport played a central role in the emergence of complex societies in North America and Mesoamerica, given that these societies all engaged in sport-related spectacles....the sports associated with these spaces demonstrate the same links among spectacle, athleticism, and political power. (Besnier et al, 2018, p. 22)

Over the centuries, there was a homogenization of the concept of sport, especially in the context of Imperialism, which led to the expansion of the main sports modalities that we know and follow today around the world, as well as the suppression of the sports previously practiced in the territories that were colonized. From the middle of the 19th century, sports practice came to be seen as a component of the education of young people from the European middle class, being considered a way to train men for capitalism, colonialism, and militarism (Besnier et al., 2018). The concept of sport that guided this process was developed from an incorporation of the ideal of the male body inspired by Ancient Greece to the emerging ideologies of nationalism. The export of European sports to their colonies had as one of its functions the transmission of the culture, values and ideology of the colonizers. The practice of sports was, then, seen as a way to educate and civilize the colonized “savages” and to demonstrate the behavioral and aesthetic dominance and superiority of the European people. In addition to being a way to propagate European ideals, the practice of sports was seen as a way to dissipate the aggressiveness and sexual energy of the people of the colonies (Besnier et al., 2018). As the colonial hegemony began to break down and colonies became independent, sports clubs continued with the same function within society, but started to serve the new elites. Despite the independence process of nations, tension remained between colonizing and colonized nations in sports, and competitions between them became sites of resistance and national and cultural appreciation, an aspect that remains until today (Coakley, 2015; Besnier et al., 2018). One of many examples of this is Senegal's victory over France in the opening match of the 2002 FIFA World Cup, which was considered an unexpected result by most analysts, and caused widespread celebrations in the streets of Dakar.

Historically, therefore, we observe that sport is closely related to politics, surpassing the place of competition, leisure or an element of health promotion, generally serving the interests of the ruling class. One of the ways by which this logic works is that most national governments finance teams and athletes and offer them training centers. On the other hand, they present these athletes,

especially the winners and most popular ones, as representatives of the nation. This is a way of seeking legitimacy and acceptance from the population, and “this is why so many political leaders present themselves as friends of sport, or even as faithful fans” (Coakley, 2015, p. 441). The emotional bond created by a sport or team can be established to reaffirm the identity that further connects people with the city or nation.

Today's main sports manifestation, the modern Olympic Games have emerged, similarly to the Ancient Games that served as its inspiration, with an organization that excluded several members of society. The first edition took place in 1896 in Athens and, in its origin, the games were restricted to amateur athletes, a definition that favored members of the elites, since it prevented the participation of athletes who used their skills to financially support themselves. Moreover, in the first edition of the games, only men could participate in the competitions. Over time, such restrictions were reviewed and abandoned, in what was a gradual and complex process, especially with regard to female participation. Pierre de Coubertin, founder of the modern Olympic Games, viewed men as the Olympic ideal and, for him, the role of women should be that of spectators of men's achievements. This changed from the following edition, but only in some modalities, such as golf, tennis, archery, and figure skating, as they were seen, at the time, as being more feminine, with an emphasis on coordination and body aesthetics based on grace and beauty. (Coakley, 2015). Over the decades, such restrictions have been reduced, but only in the 1964 Olympics there was a female insertion in a team sport, volleyball, and only in the London Games, in 2012, all sports began to be played by men and women.

Over its history, the modern Olympic Games were the scene of several moments and demonstrations with relevant political implications, such as Jesse Owens winning four gold medals in athletics at the Berlin Olympics in 1936, while Hitler sought to use the games to prove his theory of superiority of the Aryan race. At the time, the Nazi government had dedicated considerable resources to the training of German athletes and Owens' victories challenged the ideology of Aryan supremacy (Besnier et al., 2018). Another famous case was that of athletes Tommie Smith and John Carlos, who held a protest on the podium of the 1968 Olympic Games in Mexico City. After winning the gold and bronze medals in the 200 meters event, they went to the awards ceremony barefoot and raised a fist with a black glove during the execution of the national anthem, a salute associated with the American Black Power movement (Coakley, 2015). Both were expelled from the Olympic village and the American Olympic track and field team and, in addition, suffered death threats, before eventually being recognized by society after many years. In 2005, both were honored with a statue at the University of San José, California, where they had studied (Small, 2008).

Conflicts between nations have also had a political impact on sports. During the Cold War, the United States boycotted the Moscow Olympics, in 1980, and subsequently the Soviet Union boycotted the following games, which were held in Los Angeles in 1984. The Cold War as a whole was a period in which main nations involved in the conflict “used the Olympics and other international sport

competitions to make claims about the superiority of their political and economic systems and ideologies” (Coakley, 2015, p. 440). In this scenario, the use of doping was also constant.

There are also other instances where sporting events feature a prominent political component, such as the aforementioned cases where there is a colonialist history between the nations competing, as is the case of cricket matches between England and its former colonies, or the previously mentioned match between France and Senegal at the World Cup. Another case is that of competitions played between countries in a state of tension with each other, as was the case of the soccer match between Iran and the United States in the 1998 World Cup and the hockey match between the United States and the Soviet Union, at the 1980 Winter Olympics. There is also the case of matches between teams whose origins refer to religions that are in conflict, such as Rangers and Celtic, from Scotland, one of the greatest rivalries in the world of football, in which the teams have Protestant and Catholic origins, respectively. These situations can bring additional tensions both to the public and to the athletes themselves, since there is often an added expectation and pressure to perform and defeat the rival team.

Sport today: culture, justice and meritocracy

Financial investments in the sports environment are increasingly high, with one main objective being the expansion to new and larger markets, especially by the corporations involved with it. Sport has never been as commercialized as it is today, with stadiums, teams and events bearing the names of corporations and being associated with corporate logos. The biggest sporting events in the world, such as the World Cup and the Olympic Games, are watched by billions of people around the world and are spectacles that move a significant amount of financial investment (Campos, 2015; Coakley, 2015). What has been observed in the past decades is a “redimensioning of the importance of the sporting phenomenon by modern society, having the media as its main promoter and ally, which has globalized sport” (Rubio, 2001, p. 101).

Nowadays, sport cannot be thought of as a mere recreational practice or form of entertainment without taking into account its place in capitalist society as a significant part of the global economy. One of the main changes that can be noticed in this new era is a shift in the sporting imagery, as sport “has largely disconnected itself from its popular connotations and has appropriated itself of personal fulfillment through consumption” (Ehrenberg, 2010, p. 14). This is largely due to the way in which sport and athletes are inserted in and perceived by modern society.

Sport is so anchored in everyday life that it is not just a form of leisure or a specific bodily activity designed and organized in terms of performances to be achieved, but the manifestation of a generalized relationship with existence. . . . Sport has left the stadiums and gymnasiums; it has abandoned the restricted context of sporting practices and spectacles: it is a system of conduct in itself that

consists of implicating the individual in the formation of his autonomy and responsibility. (Ehrenberg, 2010, p. 18)

Sport nowadays occupies, therefore, a social place that transcends that of an occupation for athletes or a mode of entertainment for fans. It represents a set of values, a way of life that should be appropriated by everyone, whether they are athletes or not. The spectacularization given by the media contributes to this scenario by reproducing such logic. The role of sport in such an appropriation can be explained by the social view of the sporting practice, especially in terms of elite sports: “sport, as a sign of contemporary society, refers to the image of living well, being well with oneself, being victorious” (Rubio, 2001, p. 103). These ideals are in line with those of capitalist society, but such a perception ignores the discontents in sport, such as personal struggles and mental health issues that athletes face, and which have only recently started becoming more public. What happens instead is the transmission of an idealized and romanticized version of the life and career of an athlete, in a way that is meant to be used as an example of the standards that society expects from individuals.

The reality of sports presents a very different scenario in several aspects. Firstly, an important distinction must be made between regular physical activity and high-performance sports when discussing health and well-being. Although they are socially seen as examples of peak physical and aesthetic fitness, many elite athletes are far from a healthy body, since the training they undergo has negative effects on the body (Besnier et al., 2018). Professional sports aim to show which athletes are the strongest, most prepared and skillful and insert them into training programs that generate discomfort, pain and potentially even injuries in the name of overcoming limits. This element is present in the Olympic motto itself: *citius, altius, fortius*, which can be translated from Latin as “faster, higher, stronger”.

Influenced by social and cultural transformations, sport absorbed characteristics of modern industrial society, which contributed to making performance one of its guiding principles (Rubio, 2001; Quintilio, 2016). Sport is part of capitalist society and reproduces its discursiveness, especially in its professional modality, placing high performance, victory and resilience in the face of obstacles as the main objectives of individuals. Thus, the values that dictate contemporary sport are aligned with those of capitalist society, which also values winners, the best, the strongest and the most skilled. These are used as an example for the “losers” and contribute to the perpetuation of certain types of conduct. The term *loser* itself is seen as a highly depreciative term in society, and one that is used in the various contexts, many of them unrelated to sports (Rubio, 2001). In this context, elite sport leaves little room for playful practice, imposing the speed of a medium where the constant production of results is imperative (Campos, 2015). At the same time, “most people associate sports with play, and they see athletes as having fun rather than working” (Coakley, 2015, p. 377). Many athletes, however, have stated that they do not enjoy their sport, or even outright hate it, such as tennis legend Andre Agassi (Agassi, 2010). Others mention missing a time in their lives where they just played for fun, without the

pressures of professional sport, often referring to childhood, such as Uruguayan footballer Edinson Cavani (Cavani, 2018).

Another aspect that is important to consider is the possibility of inclusion for potential participants. Many sports are considerably exclusive, both with regard to physical conditions for practice and in relation to financial conditions for insertion and maintenance. Currently, in most sports, “playing, watching and achieving excellence in sports depends on resources provided by individuals, families, governments or corporations” (Coakley, 2015, p. 266). This means that opportunities for sports participation are closely linked to social aspects. Even so, the dominant discursiveness in sport states that it is an environment that offers equal opportunities for all and “inequalities related to money, position, and influence have no effect” (Coakley, 2015, p. 267).

Furthermore, a highly present aspect in the discourse of elite sports that can be questioned is related to the notion of justice. Ehrenberg (2010) defines sports competition as the application of identical confrontation rules to everyone “in a stable environment and without temporal unforeseen events” (p. 42). Such a form of competition socially occupies the place of an ideal of meritocratic justice, although it has always been marked by what Ehrenberg defines as *fair inequality*. In this perspective, we argue that sport does not necessarily deal with an absolute concept of justice, but seeks, with its rules, the creation of equal conditions for discovering the best, the most apt or the most prepared *at that moment*. As a whole, competitive sports are organized in ways that inspire stories and narratives that reaffirm dominant ideologies. One of the main discourses that dominate this environment is that “people can achieve anything through hard work and discipline, and that failure is the result of laziness and poor choices” (Coakley, 2015, p. 17). This notion is closely related to such an ideal of meritocratic justice that is customarily attributed to sports competitions. In this context, winning athletes and coaches are seen as models of success, occupying an idealized place in society. Sports competitions and their results are used as evidence that “inequalities are based on merit, that competition identifies winners, and that losers should work harder or change themselves if they want to be winners, or simply get up and try again” (Coakley, 2015, p. 271).

There are, however, other points that are imposed in a sporting competition and that allow us to question the character of justice that is present in the traditional sports discourse. In addition to the physical and technical conditions of the individual athlete, there are great differences between the economic power of different teams, federations and even countries, which means that some athletes have significantly better conditions to train and develop their skills, which tends to translate into better results. Although this is not a guarantee or the only decisive factor, an analysis of the Olympic medal table shows that it generally reproduces the order of the main political and economic powers (Rubio, 2001). In national championships of different modalities, it is also observed that most titles are won by teams that have more economic power and training centers with better structure.

In a culture that values spectacle and heroism, elite sports are an ideal avenue for the manifestation of both, being seen as a technique for producing

autonomy. In this social place occupied by sport, some athletes become celebrities and the narratives of the specialized media reinforce this condition, emphasizing the heroic aspect of the practice (Coakley, 2015). Although the sociopolitical framework that predominates in sport brings into play elements that increase the drama and appeal to the public, a fundamental part of the sport's attractiveness is ultimately related to the individual who is at the center of the sporting scene: the athlete. A mass phenomenon like sport needs "heroes", "stars" or "idols" to maintain its appeal, as it is the existence of such figures that allows people to identify with the event (Helal, 1998). Organizers, sponsors and the media, viewing sport as a consumer product to be sold, need to "create protagonists to sell an expected and desired spectacle" (Rubio, 2001, p. 103). This makes it in the best interest of the media, managers and promoters to develop narratives in order to generate appeal and identification to competitors or teams. One of the main ways by which this happens is through the construction of stories featuring themes such as a redemption arc or the creation of a duality between athletes or teams, placing heroes and villains in the sports scene, creating rivalries. Everything is organized and presented with the aim of entertaining audiences and keeping sponsors happy (Coakley, 2015). The athlete, in this situation, may become identified by the public with a persona which he does not necessarily feel comfortable with, and which may have negative consequences, such as abuse on social media.

The media coverage is focused on the main athletes of the most popular sports, a segment of the athlete population that does not represent the reality experienced by the vast majority of sportspeople. A consequence of this type of approach to the sporting phenomenon is that it leads to a distorted and romanticized view of sport and the lives of athletes. Little space and attention are given to cases found more commonly among athletes – that is, "those who play for one or two seasons before being cut or forced to quit for other reasons, especially injuries" (Coakley, 2015, p. 288). It is common that, in team sports, players sign an initial short-term contract which is then not renewed or even terminated before it is completed: "Much more typical than 30-year-old players contemplating another season are 24-year-olds facing the end of their professional sport careers" (Coakley, 2015, p. 288). Even in cases where athletes succeed, professional sport opportunities are short-term, averaging three to seven years in team sports and three to twelve years in individual sports (Coakley, 2015). Although there is some variation in the duration of the career depending on the sport and the unique conditions of each athlete, it is a brief career, when compared to other areas of work. At the same time, involvement with sport demands full-time dedication, making it difficult to acquire resources such as other academic and professional training, which could facilitate the transition to another occupation after retirement from sport. This contributes to generating a unique mark in the athletes' relationship with their occupation.

The place that elite sports occupy in society and the narratives that are created within that world make it a profitable environment for companies to explore the advertising potential of athletes and competitions. In virtually every advertising campaign by manufacturers of sporting goods, not to mention many

campaigns by companies from other sectors, the image of one or several of the world's leading athletes is often used, followed by a slogan involving some form of imperative, whether in pursuit of glory in sport ("Write the future"), the aesthetic beauty of the game ("Joga bonito", or "Play beautiful") or simply taking action ("Just do it"). Among such advertising campaigns, one that is particularly relevant to our discussion due to its discursive elements is "Impossible is Nothing", by Adidas, released in 2004. This slogan seems to fit the elite sport discourse and reproduce it in an extreme manner, through the notion that every obstacle is merely something to be overcome, and such success is attainable through one's strength and determination. As previously mentioned, the discursiveness and narratives that are formed in sport place the resilience in the face of obstacles as an imperative and high-performance as a continuous goal. Physical pain, limitations and other difficulties, in this logic, occupy the place of obstacles to be overcome. This creates the notion that, in a competition, the winner is the one who was great enough to overcome them and the losers as those who did not have enough dedication, but who can do it if they try harder (Coakley, 2015). The narratives in the media, which portray the main athletes as superhumans and as mythical heroes, contribute to this illusory relationship with impossibility. In this environment where performance reigns supreme and the image of success obtained through a sum of talent and effort is elevated to the level of a goal and of the greater glory for human beings, a discourse is formed that seems to have no holes.

Psychoanalysis and sports politics

Up to this point, we have sought to present some of the political issues surrounding sport, in addition to the dominant discourse in such an environment and some of its effects. We consider this trajectory to be important for the discussion that will follow, about the role of psychology and psychoanalysis in this field. As we pointed out at the beginning of this article, we defend that, by not questioning the political dimension that is inherent to sport, not only sport psychology but the whole field of psychology ends up enabling and favoring the continuity of this whole a series of forms of relationship with the body, with competitiveness, with performance, with the notion of impossibility, among many others, that have effects both on the individuals involved with the sport and on the social bond as a whole.

Nowadays, we are aware, thanks to the numerous cases of athletes that have been publicly manifesting themselves, that this mode of production is increasingly beginning to show signs of its impact on the mental wellbeing of athletes. In recent years, athletes from the various disciplines, levels of competition and experience have spoken about their struggles. The height of such visibility so far was perhaps attained with the case of Simone Biles, at the 2020 Tokyo Olympics (which took place in 2021), when the American gymnast decided to withdraw from the individual all-around competition as well as the women's team competition, with an official statement by the USA gymnastics

mentioning that her decision was in order to focus on her mental health. Biles herself was open about the decision, stating that "*the mental was not there*", and that her goal was to focus on her wellbeing, because "there is more to life than gymnastics" (Ingle, 2021). Her decision was met with widespread support by her teammates, her coaching staff and many fellow athletes that spoke out about her decision and their own struggles with mental health. Even so, there is a part of the public and the media that does not take such demonstrations seriously. In addition, for all the manifestations of support that Biles received, the practical result was that she was replaced by another athlete who started to receive the attention of the public and sponsors and, consequently, the pressure for results. Biles and her decision, on the other hand, started to get less mentions and the discussion as a whole was cast aside, as the focus shifted to the rest of the games. This example demonstrates how the sporting environment, therefore, continues in the same way, only replacing the workforce that will perform in competition.

Faced with such logic, we propose a discussion of the theme using the theoretical framework of psychoanalysis. The interest of psychoanalysis in themes of society and culture dates back to the times of Freud. In his work, the father of psychoanalysis wrote numerous texts analyzing, questioning and developing relevant topics of his time, and his contributions maintain their relevance and power even today. Texts such as *Psychology of the Masses and Analysis of the Self*, from 1921, *Civilization and Its Discontents*, from 1930, among others, are texts that address the social bond, and demonstrate all of Freud's interest in the subjectivity of his time. Jacques Lacan, a French psychoanalyst, was also interested in themes that went beyond the clinic, also dealing with the political dimension of psychoanalysis. One of the main contributions to thinking about politics was his theory of four discourses, which offers possibilities for reading the forms of social ties and the modalities of *jouissance* present in society. For this discussion, Lacan's *discourse of the master* is especially relevant, since it is one of the main forms of subjection in society, for the master "gives a sign, and everybody runs" (Lacan, 1969-70/1992, p. 185). Lacan also makes an association between work and the discourse of the master and, moreover, of work as a proof of the discourse of the master's efficiency:

How is it that this discourse, that one hears so wonderfully well, can have maintained its denomination? This is proven by the fact that, explored or not, workers work.

Never before has worked been so honored, since humanity exists. And furthermore, it is out of the question that one does not work.

This is a success, then, of what I call the discourse of the master. (Lacan, 1969-70/1992, p. 178).

Lacan's theory, therefore, enables us to better understand forms of domination and submission in society. Beyond the discourses, psychoanalysis gives us an important theoretical background to think about society, politics and culture.

their [Freud and Lacan's] combined effort in psychoanalysis, managed to build formidable tools to thought itself and also, to the critical analysis of social

transformations. To a certain extent both thinkers dealt with the political scenario of their historical realities in their theoretical developments and both provided insights to the external political situations. (Gonsalves & Estevão, 2018, p. 170)

Bearing such developments in mind, we argue that sport is a phenomenon that, due to its relevance to the current culture around the world, in addition to the significant portion of the global economy that it moves, can and should be the object of study and analysis by psychoanalysts. This position is corroborated by Petit and Brohm (2020, p. 6), who, expanding this discussion, also address how sport penetrates social and even political discussions:

It is therefore in more ways than one that this phenomenon concerns psychoanalysis. Firstly, because sport can be understood as a cultural object, and we remember Sigmund Freud's interest in culture, a source of inspiration for his clinical and metapsychological reflections. No one can escape the realization that competitive sport rhythms the public life and becomes a priority subject for a large mass of citizens. This can be seen in the general saturation in the media and in political debates where it even becomes a campaign topic, even a 'communication' ground for propagandist slogans, such as 'the France that wins', for example. Sport becomes, moreover, a matter of educational policy and even of public health.

The authors also propose a critique of the naive belief in Olympic sports ideals, and the possibility of psychoanalysis and Freudian theories being used as keys to an understanding of elite sports beyond such illusions. Such arguments converge with the point we defend in this article, namely, that sport cannot be thought of in terms of isolated and self-contained practices and competitions, but inserted in a society with a dominant production logic, values and discourses. Moreover, sport is a medium in which such logics, values and discourses are not only reproduced, but strengthened, insofar as sport is a practice of discourse that

produces a vocabulary, a syntax and a rhetoric and induces a modern and secularized conception of the body, of achievements, of the so-called 'self-realization', which enriches the ideological apparatus of the State of democratic market societies, from the hygienist shift in turn of the 19th and 20th centuries until the dreams of augmented bodies of transhumanism. (Rassial & Salvadere, 2020, p. 39).

Since Freud, psychoanalysts have been concerned, among other things, with the investigation of political discourses and daily life in our culture, seeking to analyze the modalities of social bonding, as well as the political dimension of *jouissance*. Part of the objective of such analysts, in the neoliberal context, is to relocate politics and ethics as inseparable elements, pointing to a politics of resistance to the social instrumentalization of *jouissance* (Rosa et al, 2006). In this sense, understanding the dominant discursivities in the social bond is fundamental, since "discourse is the way in which language rigs *jouissance*, placing it in discursive forms that mark places, positions and functions" (Estevão & Prudente, 2019, p. 124). Currently, we observe, in addition to the discourse of

high-performance through sport, the proliferation of discourses of self-help, motivation and obedience,

deeply associated with aesthetic/moral categories such as willpower, beauty, resilience, good character and physical shape and health. On the other hand, for those who contradict these categories are reserved guilt, laziness, weakness of character, lack of willpower, ugliness, and poor health. (Estevão & Prudente, 2019, p. 132).

Such discursivity is articulated and even confused with the one we observe in elite sports, which is evidently not restricted to the field of sports competitions, penetrating the social bond as a whole (Ehrenberg, 2010). In such a logic, success, autonomy and self-realization become guiding principles, discursively organizing the imaginary of spectacle. This imaginary demarcates identifying positions, two of the main ones being the aforementioned *winners* and *losers*, typically associated with the logic of sports and, just like in sports, they are potentially reversible positions, since, in sports, you are only as good as your last game (Coakley, 2015). Moreover, such discourse names the ways through which individuals can rise above their challenges and become *winners*, placing success as something that is always within reach, if one is determined and works hard enough. Furthermore, success, autonomy and visibility are presented in our society as superegoic imperatives that demand more, whether in sports competitions, in corporate life, in relationships, in our relations with our bodies, and so on.

The imaginary apparatus that provides the mirror images for this is omnipresent in our culture. We refer to the formatting of bodies elected as imagery models such as, for example, the thin body, or the muscular one. There is also the model for proactive, enterprising, aggressive, focused and ambitious behavior directed at winning, so common in corporate language. (Estevão & Prudente, 2019, p. 131)

In such a social context, psychoanalysis emerges as a possibility to question such logics, since, with its ethics, it allows us to position ourselves in the face of such demands for adaptations to reality, which are, in turn, adaptations to discursive demands. Furthermore, the ethics of psychoanalysis imply a discourse, the psychoanalyst's discourse, as developed by Lacan. In his articulations about the four discourses, Jacques Lacan points to psychoanalysis as the opposite of the master's discourse (Lacan, 1969-70/1992). In this sense, psychoanalysis presents itself as a possibility for the subversion of discourses that promise and offer happiness and plenitude through high-performance and success. This does not mean that athletes should necessarily stop competing, but that they should have access to spaces and other forms of discourse that enable them to question aspects of their practice, and allow them to be guided in their practice by desire, interest and personal enjoyment.

In its subversive vocation, psychoanalysis continues to walk on along with humanity, and there is no way to disregard the reflections on the possibilities and

impossibilities that it lays bare, calling us to go further, to advance, influencing and being influenced. (Barbieri, 2017, p. 89)

With its ethics, psychoanalysis allows us to "sustain – and support – that the truth can never be completely told and that, therefore, there are always gaps in knowledge" (Alberti, 2008, p. 10). Here lies a possibility for subverting the politics and discourses of high-performance. Alberti also points out the importance of giving up the requirement of what *should* be different, which would fall on the side of censorship and moralism, to the detriment of one that *could* be different. Sports practice *could* be different. The way we approach competition, high-performance, winning, and losing in society *could* be different. Thus, psychoanalysis, with its ethics and politics, allows us to go beyond an analysis of sport as a pre-defined and immutable phenomenon. It allows us to observe the effects of sports discourse on those who engage in such an environment, beyond demands for adaptation, pointing to the subject of the unconscious.

Before inquiring and intervening on possible sports performance problems, we advocate listening to athletes beyond their performance and competitive demands. We do not believe that, with this, questions will arise that will generate ruptures in the logic of professional sport and major changes, since they are rooted very deeply in the social fabric. Nonetheless, pointing out holes in the high-performance discourse can already have significant effects, especially for athletes, who can, in this way, rethink the places and positions that they occupy and how they want to deal with this. Because they are individuals who often have great social visibility, such effects can reach a greater audience, and could have an influence on future generations, how they deal with pressures to perform and their mental well-being. It is evidently not possible to know what the effects of further questioning of the logic and politics of sport by psychology and, above all, psychoanalysis, will be. Even so, this seems to us to be a debate that deserves to be deepened.

Final considerations

Throughout this article, we sought to bring several dimensions of the relationship between sport and politics, in order to discuss the position that psychology and especially psychoanalysis has historically adopted when dealing with this field. We consider it important to mention that this is not a matter of merely criticizing sport psychology or the logic of high-performance sport, but of pointing out that there are other possibilities for addressing the various issues that sport raises. Within the current production logic in our society, sport psychology has its function and fulfills it well. Evidently, federations, clubs and athletes are interested in increased performance, which in turn will mean better results and, consequently, an increase in income and greater visibility for their brands. Furthermore, it seems unfair to us to make a general statement that sport psychologists are disinterested in issues other than performance. What we

propose here is the possibility for other members of the field of psychology to get involved with sport, as they will be able to insert themselves in the scene from another place, without a commitment to performance. In this sense, it is possible to think of different fields of action, such as clinical work, social work, in addition, of course, politics. In this context, psychoanalysis presents itself as a very interesting alternative, since its discourse has subversive potential, going against adaptive demands and betting on the subject of the unconscious. Therefore, it is fundamental that psychoanalysts insert themselves further into the debate about sports and high-performance.

Finally, we would like to point out that there are numerous topics within the field of elite sports that can and should be studied and discussed by both psychologists and psychoanalysts. We could mention childhood sports to retirement, gender issues, the stigma surrounding mental health, just to name a few topics that are worthy of a deeper look. The high-performance discourse and its impact on the social bond is also a relevant theme that could bring interesting findings. In all of these, opening a dialogue with other sport sciences, such as psychology, sociology and anthropology can also enhance the discussions and analyses. We humbly hope that this article can offer some contributions to this scenario.

Fabio Menezes dos Anjos is a psychoanalyst, with a Masters' degree in clinical psychology from the University of São Paulo. Has authored the book *Psychoanalysis and Sport: professional athletes and their discontents* (Editora CRV, 2022), as well as articles and book chapters on psychoanalysis, with a focus on sports and discourses surrounding performance, mental health and politics.

Ivan Ramos Estevão is a psychoanalyst, with a doctorate in clinical psychology from the University of São Paulo. Professor of the School of Arts, Sciences and Humanities (EACH-USP) and of the Postgraduate Course in Clinical Psychology at the Institute of Psychology of the University of São Paulo (IP-USP). Member of the School of Psychoanalysis of the Forums of the Lacanian Field (EPFCL)

and member of the International Forums of the Lacanian Field (IF-EPFCL). Coordinator of the Psychoanalysis, Politics and Society Laboratory at USP. He has published the books "The Freudian theory of the Oedipus complex" (Escuta, 2017) and "The Oedipus complex" (Aller, 2021), in addition to organising other books. He is the author of several articles published in journals and books on psychoanalysis.

Transforming neoliberal social psychology into an emancipatory science: *A call to abolish the police*¹

Anup Gampa & Jeremy Sawyer

Abstract

Social psychology's response to continued police brutality against Black people and their communities has been to work with police departments to implement interventions and trainings. We first discuss neoliberalism and then show how mainstream social psychology's various forms of interventions underscore it as a neoliberal practice, thus limiting its capacity to fight police violence. Social psychology should, instead, become an emancipatory science by incorporating structural-level and historical analyses in addition to individual- and cultural-level analyses. For us, an emancipatory psychology is an intersectional Marxist psychology and involves the following elements: (1) investigating police brutality from a structural and historical perspective, which most clearly shows that the police are a tool of repression that needs to be abolished; (2) this means being in solidarity with social movements such as Black Lives Matter, and requires radical solutions, i.e., anti-capitalist, against police brutality and racism; (3) the oppressed are seen as the principle agents of change whose experiences and analyses become primary drivers of social psychological research; and finally, (4) following from the prior elements, all resources are democratically controlled and allocated in a manner that respects the movement's call to defund and abolish the police. Armed with that understanding, we critique major social psychological interventions at different levels: implicit bias and procedural justice trainings such as the Behavioral Insight Model targeting situational-level changes, and community policing targeting institutional-level changes. We also discuss the strengths and limitations of cultural psychology's approach to fighting racism. We end with examples of research (studies connecting social movements to aggregate changes in implicit attitudes) and methodologies (critical participatory action research) that incorporate analysis from the levels of the situation to that of the structure, and thus align with an emancipatory psychology.

Keywords

abolition, implicit attitudes, intersectional, Marxist psychology, neoliberalism, police, reform, social psychology

¹ The authors would like to acknowledge Ben Saunders, Sarah Wilhelmy and Luna Bloom for their constructive feedback and support.

Put simply, capitalism requires inequality and racism enshrines it.

Ruth Wilson Gilmore²

Some reforms end up reproducing the system in another form...you put out some kind of a reform, and then that reform becomes institutionalized. Worse than institutionalization, the reform actually creates a new form of consciousness and a new form of “common sense”. That reform itself becomes the new common sense, and that’s so dangerous on so many levels.

We cannot reform police. We cannot reform prisons. We cannot.

Mariame Kaba³

George Floyd was murdered on May 25th, 2020, by a Minneapolis police officer who pressed his knee onto Mr. Floyd’s neck for nine minutes and 29 seconds. David McAtee was killed by the Louisville police on May 31st, 2020, while he was protesting the murder of George Floyd. Another Louisville resident, Breonna Taylor, was fatally shot in her apartment by her city’s police department on May 13th, 2020. The catalogue of police violence will be longer if we include incidents such as the arrest of six-year-old Kaia Rolle, who suffers from pediatric obstructive sleep apnea and thus could be prone to tantrums, for accidentally kicking her teacher. It is a list that ranges from being arrested while waiting for a friend at a local Starbucks to being confronted by the police for playing golf “too slowly”. A list that includes the police killings of Eric Garner, Michael Brown, Tamir Rice, Sandra Bland, and Mya Hall. A list, one that is ever increasing, indicative of a deeply rooted racism within U.S. society and its institutions on all levels—exemplified here by its police departments. These latest atrocities against Black people have resulted in nationwide protests, strikes, and walkouts not just for police reforms, but with the loudest demands being made for the outright defunding and abolishment of the police.

What role should social psychology play in fighting police brutality—a particularly pernicious component of racism? Presently, many social psychologists are actively working *in partnerships with* police officers and departments (Jasperse & Stillerman, 2021). On one side of the spectrum, this takes the form of marshalling evidence *against* racial bias in police shootings (e.g., Cesario, 2021; Johnson et al., 2019 - retracted). In the more liberal mainstream of social psychology, these partnerships with police advocate for reforms meant to address the racism in policing (Fridell, 2008; Goff, 2017; Luscombe, 2020; Russell-Brown, 2018; President’s Task Force, 2015). We pose the question, are these alliances between social psychologists and police adequate means to eliminate pervasive brutality and racism within the institution of

policing, or can we take a more effective emancipatory approach? Our stance is that social psychology has to incorporate structural and historical analyses (i.e., historical-materialism) to understand racism more fully, and it necessarily has to transform itself into an emancipatory science in order to help liberate us from racism. We expand on both these points below, but suffice it to say, “an emancipatory psychological science”, as Ratner (2015) succinctly states, is one that “empowers people to evaluate society and change it”.

What follows, then, is a call to transform current social psychology into a field that actively amplifies the ever-increasing efforts across the globe to reform and revolutionize society (Youngs, 2017). In order to illustrate the reasoning and methodology behind our call, and to address a most pressing issue of our times, i.e., racialized state violence, we will examine social psychology’s interventions (such as implicit bias and procedural justice trainings) in police departments from the perspective of intersectional Marxist social psychology (Gampa & Sawyer, 2021). We list here the elements, adapted from Le Blanc (2016), of such a perspective as it applies to racism and policing, and expand upon them in the rest of the document. The first element is seeing policing as a tool of repression. This can only be done if both the individual police and the individual’s social context are studied from a structural and historical perspective—i.e., analysis extending beyond the immediate situation. Second, it involves a radical anti-capitalist commitment when considering solutions against police brutality and racism. Third, it centers the oppressed and exploited as agents of change. Finally, it demands democratic control of resources such that “the free development of each will be the condition for the free development of all” (Marx & Engels, 1888). Using these elements, we will illustrate how a structural and historical analysis of policing inevitably leads to questioning social psychology’s current practice of addressing police brutality by supporting police reform at the individual or even institutional level. Part of this analysis is to connect social psychology to neoliberalism, which then allows us to implicate capitalism in the persistence of police brutality. This further underscores our call for solidarity with grassroots social movements such as Black Lives Matter (BLM). In other words, we present an intersectional Marxist psychology (IMP)⁴ argument to abolish the police.

We take a small digression here to note that we recognize the heterogeneity of actions, policies, philosophies, locations, and peoples involved in anti-racism work in general, and BLM in particular. As such, we do not claim to be speaking on behalf of any particular group. The range of conversations within the current Movement for Black Lives includes the full spectrum from defending the status quo to revolutionary. Social psychology, however, engages mostly with reformist perspectives, or even with reactionary perspectives (e.g., Cesario, 2021), but never with abolition perspectives (see Table 1).

⁴ The terms “intersectional” and “Marxist”, just like the word “cultural”, also imply “social”, making it redundant. Also, IMP is more fun than IMSP.

Table 1. The number of times the following terms appear within social psychology conference programs: police (or policing)/reform*/defund/abolish.

	Professional Organization							
	<i>Society for the Psychological Study of Social Issues (SPSSI)</i>				<i>Society for Personality and Social Psychology (SPSP)</i>			
Year	Police/ing	Reform	Defund	Abolish	Police/ing	Reform	Defund	Abolish
2013					10	1	0	0
2014					13	4	0	0
2015					38	1	0	0
2016	65	13	0	0	28	1	0	0
2017	42	8	0	0	41	0	0	0
2018	53	5	0	0	20	5	0	0
2019	82	19	0	0	34	1	0	0
2020		No conference.			34	5	0	0
2021	111	25	2	2**	22	2	0	0

Note: SPSSI did not publish full conference programs for years 2013 to 2015.

*reform: could be for anything, not just for policing; doesn't reflect reforms-based research that doesn't use the word reform, for example use of cameras. ** not an explicit call to abolish

Similarly, as shown in Table 2, capitalism, perhaps the single greatest *global* structure dictating our lives, also seldom appears in psychology literature. As we show, the absence of these two topics within social psychology is not accidental. We endeavor to rectify this omission.

Table 2. Number of Articles in Major Social Psychology Journals Whose Text Mention the Word Capitalist/Capitalism/Capitalistic, 2007 to 2022

Social Psychology and Neoliberalism

First, by *social psychology*, we mean *a field whose subject matter is individual-level social cognition* and is almost exclusively grounded in individualistic ontology and positivist epistemology (Arfken, 2015; Dienes, 2008; Flyvbjerg, 2014). This field, housed in psychological social psychology and experimental social psychology (compared to social psychology housed in sociology departments or the psychosocial persuasion within psychoanalysis), is “the dominant or mainstream approach” of studying the individual in the context of a social situation (McDonald et al., 2017, p.364). The space carved out by social psychology is the interaction between the individual and the situation, *where the situation is defined narrowly* to include only the immediate situation, but not necessarily the cultures or institutions, and much less the histories and structures, that make the situation possible (Trawalter et al., 2020). Such a narrow conception of social forces was not always the case in social psychology (Fine, 2012; Gergen, 1973; Lewin, 1939), and those who use a broader conception usually fall under the banner of *critical social psychology* (Reicher, 1997).

Second, we consider the *current mainstream form of social psychology as neoliberal social psychology* (NSP; Adams et al., 2019; Arfken, 2015; Arfken, 2018; Ratner, 2015). For Fine (2012), neoliberalism through social psychology is the reorientation of social psychology away from “macrointerests and shared fates”, thus, an urging to “look away from the 1%” and ignoring the privatization of public life. This turning away from structural politics has been made the “global standard through processes of intellectual and cultural imperialism” (Adams et al., 2019), resulting in social psychology's empirical obsession with

“the individual who is ‘damaged,’ ‘at risk,’ or a ‘potential terror’” (Fine, 2012, p.422). Social psychology, then, not only is shaped in the image of neoliberalism, but furthers neoliberalism in and of itself (Ratner, 2015).

Neoliberal thought is a utopian ideology built on libertarian values in which each entity in society (whether it is an individual or an organization) is treated as an entrepreneurial unit, wherein the success and failure of that unit ought to be attributed to its own efforts and merits, or lack thereof (Foucault et al., 2008; Harvey, 2007). During the postwar era, the growing grassroots movements—labor, civil-rights, and anti-war—in addition to decades of Keynesian economics that promoted a welfare state, had eroded power amongst the economic and political elites (Harvey, 2007). This was tolerable to the ruling classes as long as the economy continued to expand during the postwar boom. The global economic crisis of the 1970s and 1980s, however, resulted in an overall policy shift to neoliberalism, a response by the financial and political elite to reign in the power of labor and to roll back the gains of the civil rights’ and women’s movements in order to restore the elite class’ dominance (Harvey, 2016). Thus, neoliberalism emphasizes individual outcomes as the result of personal responsibility and choice, while purposefully obfuscating and/or minimizing any structural underpinnings of behavior. Neoliberal logic discourages social- or societal-level analysis of behavior and discounts social responsibility for individual outcomes (Ratner, 2015). Simply put, neoliberalization is an “articulation of state, market and citizenship that harnesses the first to impose the stamp of the second onto the third” (Wacquant, 2012).

Psychology has not only been swept along by the shift towards neoliberalism, it has also championed research that pushes the neoliberal agenda. As Adams et al., (2019) argue, the dynamic relationship between neoliberalism and psychology results in the understanding of individual behavior as one with an unfettered but ultimately illusory *sense* of freedom for the individual, afforded by a radical abstraction of experience from material and structural conditions and cultural settings. In the field of personality psychology, Teo (2018) argues that the neoliberal form of subjectivity has influenced topics such as positive psychology, happiness, the self, and agency. This ahistorical and decontextualized neoliberal psychology then results in the centering of the self as an ongoing entrepreneurial development project, in the reconceptualizing of well-being as a constituent of individual growth and personal fulfillment, and in the emphasizing of affect regulation as key to personal success. Perhaps the most direct aspiration of social psychology and neoliberal ideology is in Schwartz’s (2012) suggestion that, “we need psychologists whispering in the president’s other ear” to bring expert advice on human behavior into the highest levels of policy making. Obama’s Executive Order 13707 in 2015, “Using Behavioral Science Insights To Better Serve the American People” (National Archives and Records Administration, n.d.) is one iteration of that aspiration. A growing body of research suggests that the strongest attempt of this marriage between neoliberalism and psychology is in behavioral economics, a field that is deeply rooted in experimental social psychology (Adams et al., 2019; Leggett, 2014; Millward-Hopkins, 2017). Based on this critique of social psychology, and

psychology in general, Clegg and Lansdall-Welfare (2020) conclude that neoliberal theories are being actively transformed into policy through the work of applied social psychology, which “glosses over the social origin of most human difficulties” (pg. 1). They then conclude that mainstream psychology’s “alienated and individualist epistemology makes it a potent neoliberal institution rather than a discipline that can generate alternatives” (pg. 1).

When studying racism, social psychology does not account for structural and historical factors (Trawalter et al., 2020), thus resulting in the field’s study of racism as purely “in the head” (Salter et al., 2018). For instance, social psychology at times has taken the logical step in the neoliberal approach by advocating for racially marginalized people to be less vigilant, like their White counterparts, about perceiving racism (see Adams et al., 2019, pg. 12 for a number of articles). The blame is placed on the oppressed individuals’ tendencies to perceive racism, rather than the perceptibly racist society, for a variety of life outcomes (Adams et al., 2019). Thus, in a society that constantly pushes one to “pick oneself up by the bootstraps”, discrepancies in life outcomes between Black and White people are attributed to individual failings (or a “culture of poverty” among Black people) rather than an actively racist society. Obviously then, the burden of overcoming “underperformance” is placed on the oppressed by demanding they act like the proverbial John Henry to overcome structural constraints via sheer superhuman efforts (Bennett et al., 2004).

Racism’s historical and significant role lies in its destabilization and destruction of working-class solidarity—a role that is also, as was stated earlier, an aim of neoliberalism (Cox, 1948; Fields & Fields, 2014; Roediger, 1999). Social psychology’s limited understanding of racism can further weaken worker solidarity in capitalist society in various ways, if not by commission, then certainly by omission (Arfken, 2015, 2016). For instance, the race-based disparities in income can be explained away by a “culture of poverty” instead of considering how “the white wage” is used by capitalists to drive a wedge between workers of different races (Du Bois, 1935; Roediger, 1999). Further, the institution of policing, as will be detailed below, is a tool of repression of workers, especially those who are Black, Indigenous and people of color (BIPOC).⁵ Social psychology’s work is routinely being applied in police departments across the nation with the goal of reforming the individual police officers and departments, while actively denigrating (Luscombe, 2020) the call of defunding and abolishing the police. Again, by not supporting the calls to abolish the police, social psychologists support a system designed to repress the working class. Unsurprisingly, concerning the role of psychology vis-à-vis neoliberalism, Adams et al., (2019) conclude that, “Rather than a disinterested bystander, hegemonic forms of psychological science are thoroughly implicated in the neoliberal project.”

⁵ Even as we use the language of “BIPOC”, the paper is specifically about anti-blackness due to our research and community-organizing work. If we take struggles against settler-colonialism seriously, then the case against policing only gets vehemently stronger. However, given our lack of expertise and lack of material relations of solidarity with indigenous peoples and their struggles, the two of us cannot do service to the discussion of death and destruction policing has caused to/on Turtle Island and beyond.

Neoliberal Social Psychology Wants to Be Part of the Solution: “Racism Equals Power Plus Prejudice”

Social psychology’s beginnings were meandering, but if one is forced to select a single starting point, then 1908 might do; it was the year that William McDougall’s (1908) ‘An introduction to social psychology’ and Edward Ross’ (1908) ‘Social psychology’—the first two social psychology texts—were published. And if 1908 represents the field’s beginning then it is doubtful—to put it lightly—that social psychology started as an emancipatory field. Both McDougall and Ross were also eugenicists. Consider McDougall’s (1920) statement here,

“Although the greater part of Africa, perhaps the richest continent of the globe, has been in possession of the negro races during all the ages in which the European, Asiatic, and American civilisations were being developed, those races have never founded a nation... We may fairly ascribe the incapacity to form a nation to the lack of men endowed with the qualities of great leaders, even more than to the lower level of average capacity” (pp. 135-136).⁶

Moreover, Ross coined the term ‘race suicide’ (1907), that is, a belief in the threat that people from inferior racial groups will outbreed Whites—this certainly informed and motivated his work on eugenics. He lamented, “The theory that races are virtually equal in capacity leads to such monumental follies as lining the valleys of the South with the bones of half a million picked Whites in order to improve the conditions of four million unpicked Blacks” (Ross, 1907, p. 715).

The field’s more liberal beginnings also converge on a specific date: 1936—the founding of the Society for the Psychological Study of Social Issues (SPSSI). As SPSSI members, social psychologists were committed to examining more liberal concerns (i.e., “racial prejudice, class conflict, and war” [Binning & Sears, 2015], p. 18). It may be worth noting, however, that Gordon Allport—a former SPSSI president—when reviewing McDougall’s words above, remarked that his examination of racial differences was “brilliant” (Allport, 1929, p. 125). Neoliberal social psychology no longer relies on such problematic premises, and many in the field would affirm SPSSI’s call for interventions that address racism.

Unfortunately, even those theories in NSP that purportedly incorporate power dynamics miss the mark. Consider Operario and Fiske’s (1998) argument that “racism equals power plus prejudice”, which seems to obviate the need for our emancipatory psychology project because it seemingly brings in historical and institutional analyses into psychological analyses via the concept of power. In fact, their argument is routinely reflected in works on the social psychology of racism (Richeson & Sommers, 2016; Roberts & Rizzo, 2020), which is why we discuss it here in detail. In line with the neoliberal inner-logic to ultimately blame the individual (Foucault et al., 2008), their argument still treats prejudices as natural, universal and as the result of basic human tendencies (Operario & Fiske, 1998, p. 34 and p.41)—necessarily limiting the potential for radical and emancipatory responsibility, at both the individual and societal level. As Leach

⁶ A recent retracted article, Clark et al. (2020), was not far from this 1920 argument.

(2002) argues, an understanding of racism as a combination of power and prejudice still is unable to fully *disentangle* racism and prejudice because this understanding still views racist activity and all racism as ultimately “a function of weak personality, biased perception or ethnocentric categorization...[therefore placing] prejudice in the individuated person rather than in societal practices and institutions” (Leach, 2002, p. 440). Furthermore, even as Operario and Fiske (1998) foreground power in their equation, it is approached in an abstract and ahistorical manner.

Our current research project, IMP, concretely grounds the creation of American racism in the service of exploitation by settler-colonialism and capitalism. Operario and Fiske’s “power plus prejudice” formulation, on the contrary, downplays the role of power as merely “supplementing” prejudicial biases (p. 34)—in actuality, the term “hijacking” would have been more appropriate. In continuation with their argument of “supplementation”, their paper argues that “societal power...directs” (p. 35) or provides the “impetus” (p.38) or “exert[s] extra energy” (p.50) for the construction of racial categories. As we expand on this throughout the paper, this treatment of racial categorization is ahistorical, abstract, and universalizing—ultimately in line with neoliberalism. We also argue for an alternative language of “creates”, in place of “directs” or “impetus”, because that situates our project in the concrete and directly traceable history of the creation of transatlantic racism and racial categories—and the creation of the police for the enforcing of said racism in the service of capitalism and settler-colonialism (Fields & Fields, 2014).

Analysis such as those by Operario and Fiske (1998) leads social psychologists to routinely “not advise ridding society of the concept of race altogether” (p53; see also Richeson & Sommers, 2016; Roberts & Rizzo, 2020). Which then also explains, in what might be the most telling articulation of NSP, why the recent president of Association for Psychological Science pushes back against the BLM calls for defunding the police (Luscombe, 2020): if races are to continue to exist and race relations are to be managed, then, as we will discuss below, the police, though in much need of reform, cannot be defunded and dismantled. In sum, NSP is incapable of helping to build *emancipatory* solutions because it has yet to incorporate the structural and historical underpinnings of racism. So *how*, and perhaps equally important, *where*, exactly, should social psychologists committed to racial justice intervene?

Social Psychology Must Become an Emancipatory Science

“You can’t be neutral on a moving train... Events are already moving in certain deadly directions, and to be neutral means to accept that.” Zinn (1994, p. 8)

Fully recognizing social psychology’s ideological tendencies (by one estimate the ratio of liberals to conservatives in the field is greater than 10:1 and growing, Duarte et al. (2015)) and decades-long arguments over what role, if any, political values should play in the production of science (Brandt et al., 2014; Sears, 1994),

we nonetheless eschew contemporary calls for value neutrality (Stevens et al., 2018). Such calls are often value-laden themselves (Flyvbjerg, 2014; Petras, 2015), as they prioritize protecting the public image of ideological groups (i.e., conservatives) over solving large-scale social problems (i.e., racism). Consider Tetlock (1994), who claimed that “To label someone a racist, or to label support for a viewpoint as racist, is to pass moral-political judgment on that individual or viewpoint. Standards of evidence need to be exceptionally clear in passing such judgments” (p. 513). To use a current (and rather poignant) example, we think social psychologists would be better off in having the temerity to name President Joe Biden’s solution, for the police to shoot their assailants “in the leg instead of the heart”⁷ as a way to avert the killing of civilians, as racist rather than being timorous about how such labeling would affect his moral status—lest social psychologists recognize their own call for problematic reforms in his solutions.

In a world plagued with oppression, exploitation, and ecological annihilation, there can be no neutral social science, and social psychology is no exception: either we are firmly a “science for the people” (Gampa & Sawyer, 2021) or we, by omission or commission, aid in the continued oppression of the people. An emancipatory science is a dialectic of two contrasting impulses. In one direction, it critiques and deconstructs our ontologies, epistemologies, and applications of our science vis-à-vis forms of oppression and exploitation. In the other direction, as a “science for the people”, it helps to envision and support new capacities for overcoming said forms of oppression and exploitation (Martin-Baro, 1996; Parker, 2007; Watkins & Shulman, 2008). An emancipatory social psychology, to reiterate, is one that “empowers people to evaluate society and change it” (Ratner, 2015). In other words, we propose transforming neoliberal social psychology into an intersectional Marxist psychology, an unambiguously emancipatory project that expands the “social” and the “situation” by integrating historical analyses and incorporating a critical understanding of the structural, i.e., capitalism, racism, and heterocetera-patriarchy⁸. Echoing Marx (1845), expanding this understanding is not only for the purpose of interpreting human behavior but for changing human behavior.

The framework utilized in this paper has affinities with macro-cultural psychology (Ratner, 2011) and other applications of Marxism to psychology—i.e., situating the psychological within the structural (e.g., Arfken, 2017, 2018; Foster, 1999; Vygotsky, 1997). Other intersecting points include Arfken’s (2015) use of a Marxist critique to bring to light the liberal foundations of the cognitive revolution in psychology along with the field’s “commitment to an atomistic and mechanistic view of psychological explanation” (p.26). Foster (1999) argued that the Marxist tradition provides some necessary corrections to the various ways orthodox psychology accounts for and studies racism. Specifically, for Foster, the new understandings of racism in psychology throughout the 20th century, such as racism as prejudice and stereotyping, racism as intergroup relations, and racism

⁷ <https://www.yahoo.com/video/biden-suggests-police-could-shoot-assailants-in-the-leg-instead-of-the-heart-201750470.html>

⁸ Lorde, A. (1984). *Sister outsider: Essays and speeches*. Crossing Press.

as discursive/rhetorical, all potentially further racism by ignoring its structural underpinnings.

Our work complements and extends these prior Marxist psychological works in two specific ways. Firstly, unlike Ratner & Silva (2017), who consider anti-racist demands within capitalism to be a distraction from class struggle, we take for granted that antiracism work is integral to fighting U.S. capitalism (Sawyer & Gampa, 2018). This need for antiracist struggle as central to the fight against capitalism will be made most overt in the connections that we will elaborate between policing and the necessary need for controlling the working class, especially BIPOC, under capitalism. In examining the deep intertwining of racist oppression and capitalist exploitation, our approach is intrinsically intersectional in its Marxism (Combahee River Collective Statement, 1977; Taylor, 2016). Secondly, we center the oppressed as agents of collective liberation, and support social movements, activism, and other efforts to transform our society “from below” (Le Blanc, 2016). Building on prior work on Marxist psychology and our interventions to said work leads us to the earlier discussed elements of our approach, namely: investigating the individual police and their brutality from a structural and historical perspective, which leads one to conclude the police as a tool of repression that needs to be abolished; such a conclusion requires radical anti-capitalist solutions against police brutality and racism; the oppressed and exploited are not just seen as recipients of the solutions designed by social psychologists but are seen as the principle agents of change whose experiences and analyses become primary drivers of social psychological research; and finally, what follows from the prior three elements is that all resources ought to be democratically controlled and allocated in a manner that respects the growing call to defund and abolish the police.

At the core of IMP is the understanding that psychology should be implicated in dismantling oppressive and exploitative societal structures. As opposed to the dominant practice in social psychology of grounding individual psychology in the immediate situational (or even institutional) context, the Marxist approach situates psychology within a dynamic, social structure with a history of development—one that is rife with social contradictions and revolutionary possibilities.

An Intersectional Marxist Psychology – The Case of Police Racism

To better understand the psychology of police brutality and the racism exhibited by police officers, IMP should start with a serious consideration of the social, economic, and political history of the police as an institution—the first element of our approach. By gaining this historical and sociological context, psychology can make better sense of what seems to be systematic racism exhibited by police officers, rather than reformulating the problem into a clinical question of “a few bad apples” or into a set of racial associations that might be easily shifted by implicit bias or procedural justice trainings. Just to illustrate how deeply racism is woven into policing, even the FBI has recognized and warned about systematic

infiltration of police departments by White supremacist networks (Speri, 2020), from a neo-Nazi gang formed by Los Angeles police who targeted Black people and Latinos (Tobar, 1991), to White supremacist officers in Virginia (Jones & Murphy, 2019), to officers and entire agencies with connections to White supremacist groups in Ohio, Illinois, and Texas (Downs, 2016). This requires answering what is it about policing that has made police departments such fertile ground for recruitment by fascist and White supremacist groups, and what makes it an apparently useful tool for the furtherance of their political aims.

The police as an institution came into being relatively recently, making its first historical appearance in England and the U.S. between the 1820s to 1850s, and spreading to a number of urbanizing capitalist societies. As counterintuitive as it may seem today, *there were no standing bodies or social institutions dedicated to the policing of society before the rise of modern capitalism* (Whitehouse, 2014). Crucially, the formation of modern police departments was not undertaken as a response to a rise in crime (Gordon, 2005). Rather, the purpose of police was to control and subdue large, unruly crowds that posed political challenges. In England and the U.S., some of the first goals of policing were to control defiant strikers in England, urban rioters in the Northern U.S., and the imminent threat of enslaved insurrectionists in the U.S. South. By comparison, under feudalism, the ruling rural landholders recruited armed forces on an ad hoc basis to quell revolts or unrest among serfs who were bound to the land and worked in conditions approximating slavery (Whitehouse, 2014).

In the 1700s, as capitalism developed in England, the government forced peasants off the land and into cities to live and work (Fairlie, 2009). Social inequality widened between these new workers and the bosses who employed them in ever-larger workshops. Crowds of workers became rebellious under these conditions, with strikes and demonstrations increasing in size and number from the 1790s to 1820s. The army was sometimes ordered to fire into these crowds, or constables would arrest and hang the leaders of the rebellion, but both of these responses often produced further rebellion in the name of the martyrs who were killed. Constables were different from modern police in that (1) they did not patrol or do detective work, (2) there were typically only small numbers of them on duty, and (3) they acted as emissaries of the court who carried out summonses and arrest warrants (Whitehouse, 2014). The increasingly wealthy capitalists would soon find that the combination of constables and ad hoc use of soldiers was insufficient to retain control as class struggle began to intensify during the industrial revolution.

The London Metropolitan Police was formed in 1829, with the new tactic of inflicting *non-lethal* (for the most part) violence to disperse crowds and avoid creating martyrs. When not massed together to confront crowds, the police were dispatched primarily to poor and working-class neighborhoods to surveil and police the streets and daily life. As Whitehouse (2014) puts it, this dual role is the hallmark of modern police, “There is the dispersed form of surveillance and intimidation that’s done in the name of fighting crime; and then there’s the concentrated form of activity to take on strikes, riots, and major demonstrations.” Importantly, daily patrolling gets the police practiced in the art and mindset of

inflicting non-lethal violence for the “public good” so that they are prepared to do so on a larger scale when a mass social movement or strike arises.

The New York City police department was founded in 1845, on the heels of urban riots throughout the 1820s and 1830s and inspired by the London Metropolitan Police (Brandl, 2019), and constituted an expansion and professionalization of the part-time urban watch that had existed previously. A more centralized military-style chain of command was also instituted to make police more responsive to the needs of the ruling class. Meanwhile, in the U.S. South, the forerunners of the police were slave patrols, composed of White volunteers with their own weapons who roamed the countryside terrorizing and brutalizing slaves into submission (Brown, 2019). When some Black slaves were allowed to “live out” during agricultural off-seasons in towns like Charleston, SC, working and paying dues to their masters, these slaves developed lively communities separate from the plantation control mechanism. In response, during the late 1820s and 1830s these volunteer slave patrols were professionalized, and patrolled the city at all hours, carrying rifles with bayonets, with the specific aim of intimidating the Black community, curtailing their political activity, and harassing their daily life (Whitehouse, 2014). Thus, anti-Black racism was built into Southern police forces from the start (Brown, 2019), just as Northern police forces disproportionately targeted growing urban Black and Irish populations (Whitehouse, 2014).

As we have seen, not only do the police directly repress working class militancy by wielding force against crowds and social movements, but they also use racism to divide workers while carrying out their daily surveillance, intimidation, and arrests chiefly in working-class and poor neighborhoods of color. All of this is carried out in the racially-coded name of “fighting crime” and maintaining “law and order,” obscuring their fundamental purpose. In other words, police institutions are designed to buttress race and class inequalities. Racism has been baked into policing since its beginning, as slave patrols were transformed into Jim Crow policing in the U.S. South, and urban management of the working class and freed slave populations became ghetto policing in the Northern U.S. (Vitale, 2017).

Given the social role that policing has always played in maintaining capitalist order by acting as a coercive and disruptive force against oppressed and exploited communities, it should come as no surprise that police officers have been found to have a greater social dominance orientation than other legal actors, such as public defenders and jurors, as well as university students (Sidanius et al., 1994). In other words, police officers tend to have greater preferences for non-egalitarian (hierarchical) intergroup relations (Gatto et al., 2010). Whether they possessed these attitudes upon joining the force or were socialized into it by repetitive coercive interactions with other officers (Gatto et al., 2010), this ideology facilitates the upholding of relationships that benefit capitalists over workers. A Marxist psychology is well equipped to investigate this connection between the sociohistorical, political, and institutional milieus that exist on a societal level, and the psychology of groups and individuals acting within these milieus.

While the individual police officer may sometimes hold progressive views, or even rarely come to reject the role of policing itself, the police institution has never historically “defected” to take the side of people struggling against oppression and exploitation. Unlike the military, which has often rebelled against its commanding officers’ dictates and taken the side of social movements (e.g., the 1917 Russian Revolution, U.S. soldiers during the war in Vietnam, or the Egyptian military in 2011 and 2013 during the Arab Spring) (Baywood, 2013), the police have always remained loyal to the capitalist class. This may be partly due to the fact that the military typically operates against the enemy “out there” beyond national borders, and thus are less likely to follow orders to use force against fellow citizens. The police, on the other hand, operate *exclusively* against the local population, or the “enemy at home,” and this has a conservatizing effect on their psychology. As James Baldwin (2016) wrote about the policing of Black people in U.S. cities, “The police are the hired enemy of this population. They’re quite stunningly ignorant and since they know they’re hated they’re always afraid. One cannot possibly arrive at a more surefire formula for cruelty.”

Many reforms can and have been demanded of the police, including instituting civilian complaint and oversight mechanisms, community policing, and requiring that police wear body cameras. In total, however, these reforms have done little to diminish the brutality or racial disparities in policing in the United States. Eric Garner was killed by NYC police officer Daniel Pantaleo in 2014 when the officer applied an *illegal* chokehold to Garner’s neck, as he shouted, “I can’t breathe!” *eleven* times. This was captured quite clearly on video and yet it was eventually announced (just before the 5-year deadline) that there will be no federal charges pressed against the officer (Benner, 2019). Most recently, Jayland Walker was shot more than 90 times by eight officers on June 27th, 2022, and there are hours of video recordings of this murder.

Because the police are routinely not charged or indicted, much less convicted, for crimes of police brutality, it is painfully obvious that body cameras will not do enough to check the institutional impunity with which police officers function. Furthermore, despite the fact that Black people have virtually no anti-Black implicit bias compared to White people (Sawyer & Gampa, 2018), police brutality and racism continue even in cities where police forces have substantial numbers of Black officers; for instance, in Baltimore, where Freddie Gray was killed at the hands of police (Taylor, 2016).

All of this suggests that more than an individualistic psychology, or even a social psychology that admits of an immediate social situation and cultural factors, is required to understand and transform the racism and violence intertwined in institutions such as U.S. policing. Again, we submit that IMP would be better equipped to address the challenge of accurately explaining such *social* situations.

Situational, Institutional, And Structural Levels of Analysis

In order to situate social psychology within a structural analysis we integrate the aforementioned Marxism “from below” approach outlined by Le Blanc (2016) with the levels of power metaphor introduced by Alford and Friedland (1985; as cited in Wright, 2015). Thus, when considering racism as “power plus prejudice” (Operario & Fiske, 1998), it is necessary to think of power as operating on different levels: structural power, institutional power, and situational power. Using the metaphor of “playing a game” (Wright, 2015), structural power corresponds to struggles over *what game ought to be played*, institutional power corresponds to struggles over the *rules within a game*, and situational power relates to *possible moves within a game*, given a fixed set of rules.

Table 3. Explanation for Levels of Analysis.

Level of Analysis	Metaphor	Definition
Situational	Possible moves within a game	Concerned with the actions and/or the immediate situation of the individual; interactions between individuals.
Institutional	Rules within a game	Concerned with policies within institutions (e.g., schools, police, housing, etc.) and potential reforms of those institutional policies and actions.
Structural	What game ought to be played	Concerned with society as a systemic whole, transformation of overall political and economic arrangements, and systems (e.g., capitalism, socialism, social-democracy, etc.)

Ascending through the levels, NSP operates primarily on the situational, investigating racism at the level of the individual and the interpersonal—potentially erasing any relationship to institutions, cultures, and structures (Adams et al., 2019; Trawalter et al., 2020). On the institutional level, cultural psychology in particular explores the way that cultures within institutions promote and facilitate racist and racialized behaviors, attitudes, and emotions. Within this framework, individuals are seen as selecting and amplifying cultural resources, artifacts, and contexts that exacerbate racism (Adams et al., 2019). What is missing on the institutional level, i.e., the cultural-psychology approach, is an analysis of the political economy that underlies cultural institutions—the material motivations for creating, nurturing, and perpetuating racist practices and police in the first place (Gordon, 2005). Because of this missing foundation, a structural-level analysis of racism is required to understand and incorporate the economic and political forces that generate racist cultural norms and institutions.

Below, we expand on the concept of levels of analysis by examining widely-considered solutions to police brutality from social psychology. This is

not an exhaustive coverage of solutions being offered to reform policing; they are some of the more visible solutions that help to illustrate our arguments (see Abrams (2020) for more social psychology solutions beyond reforming policing). First, we discuss implicit attitudes and trainings, which are situational-level solutions. We then consider procedural justice and the behavioral insights model, both of which put forth situational-level and institutional-levels solutions to police brutality. We then discuss cultural psychology as another approach providing institutional-level changes and finally we provide our own approach as one that incorporates all the levels of the analyses: situational, institutional, and structural.

Implicit Racial Attitudes and Anti-Bias Interventions in Police Departments: Situational Levels of Analysis

Disproportionate police brutality against minorities (Scott et al., 2017) is of urgent concern, and one that many social psychologists have taken up as a research topic (Correll et al., 2007; Kahn & Davies, 2017). Currently, dozens of police departments across the country are being trained through implicit attitude trainings (Wallace et al., n.d.) to improve relationships between the police and the communities they police (Tyler et al., 2015). We thus center our first analysis of situational-level solutions on implicit racial attitudes and trainings.

Research in implicit racial attitudes has accumulated a convincing amount and variety of evidence to show that racism at an individual and interpersonal level is pervasive throughout our society. Implicit bias⁹ is recognized as a problem in schools, healthcare facilities, corporations, and police departments (Hoffman et al., 2016; Staats et al., 2015). Research and interventions centered around policing include laboratory work on racialized shooter biases (Correll et al., 2007; Cox et al., 2014). A central thrust of these interventions has been institutional, state, and national implementations of implicit bias reduction trainings.

In California, for example, more than 50 law enforcement executives from 28 departments trained with SPARQ (Social Psychological Answers to Real-world Questions, Stanford University's applied social psychology lab) to identify situations in which one is more likely to act on racial bias, in order to exercise greater control over such situations. Although a small sample relying only on self-report and lacking any behavioral measures, participants did report that they developed a better understanding of implicit bias and also believed that the course could help in *decreasing police-community tension* (Wallace et al., n.d). The Las Vegas Police Department (LVPD) worked with the Center for Policing Equity (CPE), a think tank led by a social psychologist that works with police departments to reform biased policing (Goff et al., 2013). They identified that disproportionate minority contact by police in their department occurred as a

⁹ We use the terms "bias" and "prejudice" without the adjective "racial" because that is the standard language in neoliberal social psychology. We, however, are not narrowly concerned with "prejudice" or "bias" in this paper, but racism: behaviors and attitudes against BIPOC by individuals, institutions and structures and created and encouraged by our current socio-economic system to continue to target BIPOC.

result of foot chases in POC communities. CPE helped implement a policy in which officers are not allowed to lay hands on suspects, given officers find it difficult to spot the potential for implicit bias during such chases. Instead, another officer would be required to step in if force was necessary (Richardson, 2015). Finally, the New York City police department, notorious for its punitive “zero tolerance” or “broken windows” policing (Jashnani et al., 2017), signed a \$4.5 million contract with for-profit implicit bias training company Fair and Impartial Policing (Baker, 2018). The focus on implicit attitude trainings is not just at the city and state level but is also one of the recommendations of the President’s Task Force on 21st Century Policing (2015) initiated by Barack Obama.

The growth in the study of implicit attitudes and their application in anti-bias trainings has been a mixed bag for anti-racism efforts. Though it has helped to dispel the pernicious myth that we are now in a post-racial, color-blind society, the evidence for anti-bias trainings improving attitudes and biases is mixed at best (Forscher et al., 2019). Most recently, the NYPD itself reported, “Overall, we found insufficient evidence to conclude that racial and ethnic disparities in police enforcement actions were reduced as a result of the [implicit bias] training” (Worden et al., 2020). In response to “null” results for behavioral changes in the NYPD implementation, social psychologists like Banaji, one of the pioneers of implicit cognition research, argue that trainings should not be mandatory as they could backfire (Kaste, 2020). Given that a disproportionate number of police officers hold racist views (LeCount, 2017), both before and increasingly during their career (Gatto et al., 2010; Sidanius et al., 1994), it is reasonable to assume that actively racist police officers, the very ones in need of training, will opt out of voluntary trainings. It is unclear how social psychologists deal with this impasse. IMP, however, would reveal that such interventions still leave the *purpose* of the police uninterrogated and unchallenged. For instance, an emancipatory approach would start by asking why POC are being chased through their own neighborhoods in the first place (Mooney, 2014), and what the psychological ramifications of these actions are. And, as we discuss later, a Marxist “from below” approach would reorient the social psychologist’s focus away from the efforts to maintaining social order and efficiency of police departments, and towards the benefit and health of communities that are currently being policed—which, we will also argue, necessitates heeding the call of social movements led by Black people and their allies to defund and abolish the police.

Procedural Justice: Situational and Institutional Levels of Analysis

Implicit bias is one significant contributor to what many social psychologists consider to be the central problem with policing: a lack of procedural justice that requires actively making changes on both the situational level and institutional level (Goff, 2017; Goff et al., 2017; Richardson, 2015; Tyler et al., 2015; Wallace et al., n.d; Weir, 2016). On the situational level, procedural justice

entails citizens being treated with respect by the police and experiencing police procedures and decisions as neutral and unbiased. On the institutional level, it entails changing and designing institutional policing policies to support and encourage changes on the situational level. The thrust of “policing for the 21st century,” from the procedural justice perspective, is to transform the police “force” to a police “service” and the culture within the police departments from that of “warriors” to “guardians” (President’s Task Force, 2015).

Some specific implementations of procedural justice are the required use of body cameras by the police and the use of checklists and protocols (e.g., the aforementioned policy change in foot chases) to ensure that every interaction follows the same procedure, regardless of the race of the suspect. Greater transparency and access to police data collected by police departments is another increasingly implemented aspect of procedural justice. Over 100 law enforcement departments have committed to release data on various police actions such as use-of-force, vehicle stops, and searches and arrests. For example, the Austin Police Department (APD) worked with the CPE and the White House’s Police Data Initiative to examine the behavior of their police officers. Data analyses indicated disparities based on race and ethnicity in vehicle-based stops and use of force. As a result, the APD has recently adopted a policy that an officer may be terminated immediately if his or her camera is deactivated without appropriate justification during a deadly force incident (Goff et al., 2017).

This shift towards procedural justice is not meant to replace deterrence and force but is meant to be an *additional motivation for the public* to act in accordance with “social-order maintenance” (Tyler et al., 2015). The deterrence approach focuses narrowly on the rational choice-making of the potential criminal, i.e., by making the costs of illegal behavior higher than any potential benefits. Procedural justice, by contrast, is meant to appeal to people’s belief in a just world and their need for a broader social meaning and sense of belonging. As Tyler et al. (2015) state, “The effects of punishment should be supplemented by building legitimacy and drawing on its motivational power to further enhance efforts at *maintaining social order*” (p. 78, emphasis ours).

Our primary concern here isn’t on the relative effectiveness (or lack thereof) of procedural justice implementations. However, it bears mentioning that a meta-analysis of seventy studies showed body-worn cameras have no statistically significant effect on either officer behavior or *citizens’ view of the police* (Lum et al., 2019), and that the APD program mentioned above now reports a number of compliance issues, including a lack of review of the footage by supervisors— “The audit said of the 151 videos in the audit, they found one that had been reviewed by a supervisor” (Bradshaw & Wilson, 2019).

We are primarily concerned with two assumptions fundamental to social psychologists’ collaborations with police which almost always go unexamined. First assumption, that a society is better off with rather than without police: “It is equally clear that there are problems when there is little or no policing. The impact of police presence is especially striking when compared to zero policing” (Tyler et al., 2015, p. 79). On the contrary, there is evidence suggesting that a

reduction of assertive policing, or even elimination of policing as a whole, would actually *reduce* major crime (Sullivan & O’Keeffe, 2017). For example, when NYC police officers temporarily reduced their “proactive policing” of low-level offenses in 2015 (in protest to their perceived mistreatment by NYC’s mayor over cases of police brutality), reports of major crimes occurring in the city actually *decreased*, based on the NYPD’s own crime statistics (Sullivan & O’Keeffe, 2017). Second assumption, that the maintenance of the social order and status quo is a natural and positive goal to pursue: “The central argument that flows from this research is that the psychological theories underlying legitimacy and procedural justice are a viable basis for constructing models of social-order maintenance” (Tyler et al., 2015, p.87). In other words, social psychologists are working to bolster an explicitly system-justifying psychology when it comes to the role of police in maintaining the social status quo. A Marxist turn in social psychology interrogates the impact of existing social institutions, including the police, on individual attitudes and behaviors and seeks the social and psychological sources to help radically transform them.

Behavioral Insight Model: Situational And Institutional Levels of Analysis

We next discuss the behavioral insight model (BIM; Goff, 2017), for multiple reasons. One, it is also an approach that embraces both the individual- and institutional-level changes. Two, it is being advocated as a corrective for the traditional civil rights model (TCRM) of fighting racism and police brutality—a model that is singular in its push against the status quo. Finally, proponents of BIM, who work with dozens of police departments¹⁰, have a wide audience outside of academia—for instance TED talks¹¹ with more than 2 million times and a presentation at World Economic Forum¹². For Goff (2017), the TCRM supposes the police to be bigoted at worst and ignorant or apathetic at best and thus relies on direct action, protests, and legal battles to fight racism and to respond to police brutality. Goff (2017) contends that these tactics take an “adversarial approach” to police, and this could lead to worse relations between police and “the communities they are sworn to protect”. BIM is meant as a “less antagonistic” model that is based on the fundamental social psychological premise that the situation one is in can have more power than one’s attitude in shaping one’s behavior, including racial discrimination (Goff, 2017). Therefore, it argues, we should focus on identifying which situations improve or worsen interactions between the police and the public. An example of the implementation of BIM is the aforementioned case of scripts for foot chases in the LVPD or the camera use policy by the APD.

¹² Tackling racism in business through data analysis. <https://policingequity.org/newsroom/media-coverage/tackling-racism-business-through-data-analysis>

The BIM goes beyond simply focusing on the situation and makes room for the moral authority of the police. As is explicitly stated, “By working backward from the disparity without an *a priori* theory about police officers’ character, the BIM allows researchers to assume (either strategically or genuinely) that all actors involved intend to do the morally just thing” (Goff, 2017, p.13). This moral assumption is in line with the procedural justice approach, along with its *prima facie* assumption about the police as “sworn to protect” BIPOC communities. Such an assumption, apart from making little room to question policing and police officers as a naturalized requirement of a society, is ahistorical, as discussed earlier, and ignores how the structural priorities/policies and ideology of policing *actively* socialize cops to be racist (Alexander, 2010; Gatto et al., 2010). It also erases how police institutions facilitate the intricate networks of fascists, White supremacists, and other misanthropes within police departments, which have been brought to light under various investigations. In fact, police officers who are the most willing to use force against political demonstrations are routinely promoted, which means callous brutality toward oppressed and working people is directly encouraged within police departments (Williams, 2015). Stated explicitly, “Police violence is very frequently overdetermined—promoted from above and supported from below” (Williams, 2015, p. 30). The only just approach to a repressive force is demanding abolishment, a most antagonistic demand.

If BIM is based on the idea that situations are often more powerful predictors of human behavior than attitudes, why not consider the fact that under racialized capitalism such “situations” that encourage racism and violence on the part of police will constantly recur due to the social and political role that police play? In other words, why is the scope of the situation not allowed to expand beyond the immediate temporal and interpersonal level, or even the cultural level of particular police departments? Because such an expansion would betray the narrow definition of social situations that is a hallmark of NSP. The study of cultural practices, and the socio-economic relations that underpin them, is necessary in order to propose actionable changes that can transform extended, dynamic situations by construing them as outcomes of cultural institutions and not as discrete events.

Cultural Psychology: Institutional Level of Analysis

Not only is the role of the police as a permanent fixture of society not questioned in the work of the social psychologists discussed so far, but there are direct collaborations with police being formed at institutional and cultural levels—e.g., the city level (Goff et al., 2017), state level (Wallace et al., n.d.), and national level (President’s Task Force, 2015). This institutional-cultural connection is the level of analysis and criticism that cultural psychologists argue needs to be considered in order to help dismantle racism. Among efforts to achieve institutional- cultural changes, is the increasing call for community policing that encourages positive and nonenforcement contact between the police and

communities. In one of the few experimental studies on community policing, Peyton et al. (2019) found that even a single instance of 10-minute “positive and nonenforcement” interaction by police officers resulted in improved public attitudes towards the police and willingness to cooperate. Notably, these results persisted after 21 days. Most disconcerting, however, is the finding that after the interaction, participants increased their support of *expanding* the police force by 10%! Precisely due to such system-justifying outcomes, Dixon et al. (2012) are critical of intergroup contact interventions because they can result in the marginalized group reevaluating and downplaying structural problems after the intervention. Additionally, such cultural-level changes limit the understanding of “culture” to the culture of an institution, but do not take into consideration the culture that the structures, such as capitalism and racism, create and perpetuate, and which police institutions uphold.

Taking for granted that the psychological and cultural are “inseparable outgrowths of one another,” Salter et al. (2018) explicitly call for a fight against racism grounded in the cultural, where they define culture on a level that takes into consideration racism, *though not capitalism*. Such critical cultural psychologists, rather than *situating* racism in an individual’s beliefs, attitudes, and behaviors, go further by situating the pervasiveness of racism in a “set of ideas, practices, and materials embedded in the structure of everyday cultural worlds” (Salter et al., 2018). According to this view, culture promotes and facilitates racialized experiences, behaviors, and emotions, while individuals select and shape the context within which racism operates.

One feature of such a cultural psychology is that it incorporates into psychological analyses the fact that the roots of current forms of racism are located in the historical conditions of colonialism and the transatlantic slave trade. For example, in education this relationship is enforced in a manner that constantly privileges the oppressor (Whites) at the expense of the oppressed (BIPOC). Unsurprisingly, White-American students see little to no racism in U.S. society because they are relatively ignorant about any critical knowledge concerning historical racism (Nelson et al., 2013).

Recognizing the limitation of a “Psychology” that has “focused almost exclusively on individual bias” when concerning racism, Trawalter et al. (2020) call for a socioecological psychology of racism, an approach resonant with critical cultural psychology. This approach harks back to Lewin’s (1939) social psychology that included history and structures in the “social”, not just the immediate situation. In the context of policing, Trawalter et al. (2020) suggest that a socioecological approach should take into consideration the history of the modern police force in that it “stems from Slave Patrols and Night Watches in the American South, and constables in New England” (p. 49), and that current policing adheres to a racist ideology that permeates the structures of policing. Ultimately, beyond behavioral changes among police officers, they argue that socioecological psychology might reveal that increasing the trust in police among oppressed communities “will likely require a *reconciliation* process for contending with a history of abuses” (p. 49; emphasis ours).

Both critical cultural psychology and socioecological psychology models of racism suggest that the solutions to racism should ultimately be to destabilize Western colonialism and imperialism. Such an analysis rooted in historical conditions goes far in showing the temporal durability of racism in the US and can lead to concrete reforms that include removing Confederate monuments from public spaces or increasing accessibility to Black studies in universities (Salter et al., 2018). But Salter et al. (2018) state, “Hegemonic commemoration practices...tend to achieve prominence because they resonate with powerful interests,” (p. 153). Although we agree, it is from this premise that we diverge. Their concern is the way ordinary people (i.e., the ones without hegemonic power) “shape collective memory by selecting or reproducing some features of the past while deselecting or omitting others” (p. 153). Our concern is with the political and economic structures and elite class interests that undergird the aforementioned powerful interests and hegemonic practices. In prior work, we have examined the role of social movements in aggregate implicit attitude change (Sawyer & Gampa, 2018; 2022), as such we see considerable promise in examining social movements and other forms of struggle and activism that directly challenge the racist structures that gave rise to police in the first place.

Similarly, Arfken (2015) warns that, while such cultural analyses are intended to critique Western imperialism, they inadvertently make culture an ever-more obscure entity by ignoring the socio-economic relations underlying cultural practices (p. 29). As an illustration, consider Salter et al. (2018) comment, “Europeans constructed their identity as “White” and imagined themselves as more developed and more human in comparison with the darker-skinned “others” (whether African or indigenous) whom they dominated” (p. 151). From our IMP perspective, a more accurate reading of history, one that applies intersectional analysis by incorporating anti-capitalism, is that *some* ruling-class Europeans constructed racism to serve a very particular *purpose*: that of preempting and annihilating growing worker solidarity and resistance to colonialism at the beginning of capitalism (Allen, 1994; Fields & Fields, 2014). Racism today is no longer just about the destruction of working-class solidarity; it has become its own fully-fledged form of oppression. However, it is not irrelevant to the needs of capitalism. Erasing the role of class politics in the roots of racism makes it harder to envision emancipatory practices, which might explain why ultimately Trawalter et al. (2020) limit their vision to a “reconciliation” with police, not policing's abolishment. As Fields and Fields (2018) would argue, even such a historical understanding of racism, “looks like a relation between people or race relations, but it’s really a submerged economic relation”. In other words, even a psychology that takes into consideration a more historical approach to racism but ignores the relationship to capitalism can be one that is in line with neoliberalism to the extent that the role of capitalism is obscured, and consequentially the structures aren’t deemed fundamentally blameworthy.

In the long span of writing this paper, an article explicitly titled, “*Toward a Psychological Science of Abolition Democracy: Insights for Improving Theory and Research on Race and Public Safety*” was published. While it discusses

concerns similar to those raised in this paper, it ultimately falls short of *explicitly* calling for the abolition of the police. Instead, they urge psychologists to “engage seriously with abolition democracy by locating the source of contemporary policing problems in slavery and historical racism” (Najdowski & Goff, 2022, p. 64). Such a framing is seemingly in line with our push for incorporating historical and structural analyses into psychological sciences but again incomplete insofar as it narrowly and exclusively locates the origin of policing in slavery and racism. What is missing is the centrality of capitalism, in addition to racism, which requires the repressive role of policing in order to keep workers’ organizing activity in check against increasing inequalities. Their framing makes the problems in policing appear only as a legacy of slavery rather than seeing policing as an essential, dynamic, and ever-present feature of capitalism (Gilmore, 2007). The paper cites Akbar (2020), Davis (2005), Kaba (2017), and of course Du Bois (1935), who all *explicitly* grounded an abolitionist framework in an *anti-capitalist* framework, yet this line of analysis is missing in the paper. Their cited references might differ in their means but not in their desired end: abolition. There is not even a dismissal, much less discussion, of the anti-capitalist commitment in the references that Najdowski and Goff (2022) cite, leaving the reader to wonder if, in line with Margaret Thatcher, they believe “There is no alternative!”. Our paper, however, furthers an intersectional argument against policing by incorporating both anti-capitalist and anti-racist frameworks—one that can be useful in advocating for police abolition in not just the USA but anywhere policing serves capitalism.

Intersectional Marxist Psychology: Situational, Institutional, and Structural Levels of Analysis

Hamid Khan, an organizer for *Stop LAPD Spying Coalition*, provided a simple litmus test for evaluating reforms: are reforms being put in place to justify oppressive systems *or* are they being put in place to support working-class people and marginalized people? Anti-bias trainings and social psychological interventions of implicit bias that operate on the situational level, and procedural justice interventions that operate on the institutional level, do not align with marginalized people in so far as they are incapable of connecting the blunt end of police brutality with a racist and capitalist society that necessarily requires policing. Tyler et al. (2015) grounds their work in the explicit assumption that there would be major social problems if there were little to no policing, and that the police serve and protect the public under difficult circumstances (p. 77). Similarly, Eberhardt, recent president of Association for Psychological Science, dismisses the call to defund the police as “...a call for defunding that is based on the feeling that the police are bad and that there’s nothing that could be done, no, I don’t support that...There are a lot of levers that we can move to bring about more equitable policing” (Luscombe, 2020).

Neoliberal social psychology’s goal, then, is to improve policing such that the public comes to “...trust in the *benevolence* and *sincerity* of police in their

dealings with the public” (Tyler et al., 2015; p. 76; emphasis ours), by offering interventions to police departments. Thus, one core assumption of NSP is that the overrepresentation of groups like Black people and trans people among those incarcerated in the U.S. is primarily the result of officers’ implicit biases (Spencer et al., 2016). However, regaining “credibility” (Tyler et al., 2015) in the eyes of the public is not a new project, but was in fact propounded in the 19th century by Robert Peel, the founder of the London police department, who referred to this as “policing by consent” (Lentz & Chaires, 2007). Further evidence of supporting the status quo is that CPE researchers signed a memorandum of understanding with police departments to protect police from liability issues and from the requirement to disclose sensitive data after anticipating that police departments might be unwilling to share the data they gather for several reasons, including public relations and potential liability. This agreement also guarantees that police departments have the right to receive the results of any research before the public receives it, to remain anonymous if the results are published, and to be given *reasonable* time to implement solutions or *to do nothing* (Goff et al., 2017; p. 392). The glaring problem is that by not allowing room for questioning the necessity of policing, agreements between police and psychologists ultimately concede power to the oppressor *against the expressed needs of the oppressed*, severely limiting any accountability towards community stakeholders.

Clearly, social psychologists cannot assume that police have benign intentions; furthermore, they cannot accept the maintenance of social order as necessarily being a worthy goal. While socioecological psychology and critical cultural psychology approaches might be amenable to police reforms that are more in line with the explicit demands of BLM and their allies, they do not make such approaches explicit. An emancipatory psychology, in contrast, is fundamentally aligned with efforts made by ordinary citizens to hold the police accountable in meaningful ways—for example, by winning the power to hire and fire them, and to control their budgets, or in completely abolishing them if the community deems it necessary. One starting point for such an emancipatory psychology can be scrutinizing the process by which social psychologists enter into memorandums with the police on behalf (or over the heads) of the public, as well as the results of these agreements.

An IMP is clearly needed to help us discriminate between the deceptive and transformative solutions, between the reforms that support the status quo and the reforms that are in solidarity with, and accountable to, the struggles of marginalized people. Critical participatory action research (CPAR)¹³ is one of the methodologies that are most useful for such a psychology, because it is a framework for conducting research in solidarity with “communities, groups, and individuals living at the margins, that is those with relatively little sociopolitical power” (Fine et al., 2020, pg. 2). Making the oppressed genuine partners, and having their experiences and analyses drive social psychological research, opens

¹³ We are rarely exposed to such methods in a typical social psychology program. As a past participant, I (Anup Gampa) highly recommend attending the Critical PAR Institute (<https://publicscienceproject.org/critical-par-institutes/>)

up the possibility to discuss and decide how to democratically control and allocate resources in a manner that respects the growing call to defund and abolish the police—therefore incorporating multiple elements of IMP.

The Public Science Project at City University of New York, and particularly their Morris Justice Project (Jashnani et al., 2017), is an example of work that understands that oppressors virtually never yield power without the oppressed fighting for it (Davis, 2016). This CPAR project, a collaboration between psychologists, primarily BIPOC residents, and organizers, focused on the neighborhood-level effects of the New York Police Department's "stop and frisk" policy, in which officers stopped, questioned, and searched civilians deemed to be "suspicious", disproportionately targeting people of color. This activism brought public pressure that contributed to the ending of the program. Of course, police resisted this public pressure for as long as they could and warned that crime would skyrocket if the program were ended. Against their claim, crime dropped to record lows following the abandonment of stop and frisk (Equal Justice Initiative, 2019). This instance underscores the need for further, explicit CPAR approaches, as well as approaches that engage with the oppressed outside of formal, psychological-research frameworks. This can include studying and partnering with existing social movements.

Taking a structural-level analysis, i.e., asking "should we be playing this game?", requires us to meaningfully engage with the biggest social movement to fight racism in recent history, and one that explicitly demands the abolishing of police—the BLM movement. As discussed above, there is little evidence for any durable effects of implicit-attitude interventions in changing people's anti-Black attitudes. Even the purported "Obama effect", i.e., the notion that the presidency of Barack Obama should have the power to induce a progressive shift in implicit attitudes at the societal level because he was the perfect instance of a high-status Black exemplar with unprecedented visibility and pervasiveness, has shown to be ineffective (Schmidt & Axt, 2016).

Looking back in our country's history, we know that Americans' explicit (fully consciously endorsed) attitudes toward desegregation and toward Black people in general changed immensely during the Civil Rights and Black Power movements of the 1960s and 1970s despite violent backlash and counter-movements (Bobo et al., 2012). Unsurprisingly, then, there is growing evidence both for the impact of the historical and structural contexts on individual attitudes and the impact of social movements in changing those attitudes. Payne et al. (2019), for instance, show that counties and states with greater dependency on Black slaves before the Civil War had higher levels of anti-Black implicit bias today among White residents. They explain these results partially through measures of structural inequalities, such as poverty, intergenerational mobility among White and Black residents, and housing segregation. The authors concluded that more attention needs to be paid to changing "social environments" rather than individual attitudes to effectively combat implicit bias. Political movements reach far more people for longer periods of time than scattered, short-term trainings. More importantly, they challenge the social

conditions and racial disparities that can breed and reinforce racist attitudes in the first place.

In the most comprehensive study to date of changes in aggregate implicit attitudes from 2007 to 2016, Charlesworth and Banaji (2019) found that implicit attitudes regarding sexual orientation, race, and skin-tone became less biased, while attitudes toward age and disability did not change, and implicit attitudes toward body-weight became more biased. From an IMP perspective, it stands to reason that social issues that are targeted by repeated social movements would have lower overall bias in related attitudes. U.S. history, for example, has witnessed multiple movements against racism and multiple struggles for gay liberation and LGBT rights, with BLM and the struggle for marriage equality being the latest high-profile incarnations. Thus, the finding that changing attitudes around race, skin-tone, and sexuality are related to lower overall bias levels for these attitudes (Charlesworth & Banaji, 2019) may reflect the impact of social movements on these attitudes. This idea is further supported in the negative by evidence that attitudes around age, disability, and body-weight either did not change or became more biased (Charlesworth & Banaji, 2019). None of those issues have been visibly central to mass social movements in recent decades.

In a direct application of testing the impact of social movements on implicit attitudes, Sawyer and Gampa (2018) examined implicit racial attitudes in relation to BLM. Implicit attitudes from 2009 to 2016 were less pro-White during BLM than pre-BLM, became increasingly less pro-White across BLM, and were especially less pro-White during high points of BLM struggle. There are several lines of standard social psychological theories for why social movements should have an impact on implicit attitudes. The associative-propositional evaluation (APE) argues that constant and pervasive exposure to exemplars like Obama may succeed in activating specific preexisting positive associations with Obama (e.g., powerful, accomplished), and as a result influence associative evaluations of Black people in general. However, these activations might be temporary and incapable of fundamentally altering one's association towards Black people in general because Obama, the exemplar, is individually specific. A social movement that repeatedly and literally pairs Black people in general with basic and positive words ("Black Lives Matter"), images, and traits (courageous, agentic) may cause more fundamental and lasting changes on the societal level as a result of systematically changing the underlying valence of associations with Black people (Sawyer & Gampa, 2018; 2022). "Bias in crowds", another line of research in support of the potency of social movements argues that implicit bias is fundamentally a feature of social contexts and not an individual trait. Specifically, implicit attitudes are temporary activations cued by stereotypes and inequalities. Even though implicit bias for any individual might be temporary and idiosyncratic, implicit bias at the aggregate level may mirror the durable inequalities in the social environment (Payne et al., 2017). Thus, BLM might also have changed the social context in which evaluative associations are formed.

Social movements like BLM are also in line with the frameworks outlined by Le Blanc (2016) and Wright (2015). Recall that these frameworks require one

to expand the understanding of the situation to consider the structural-level foundations of society with a historical analysis, with the intention of liberating that society by centering the oppressed and supporting their platforms and movements. Truly transformative demands, such as those from BLM, include ending mass incarceration, disarming the police, ending capital punishment, and establishing community control of local budgets and law enforcement.¹⁴ The website for the Movement for Black Lives also sets out the following radical goal:

Until we achieve a world where cages are no longer used against our people, we demand an immediate change in conditions and an end to all jails, detention centers, youth facilities and prisons as we know them. This includes the end of solitary confinement, the end of shackling of pregnant people, access to quality healthcare, and effective measures to address the needs of our youth, queer, gender nonconforming and trans families.¹⁵

In addition, community control would entail direct democratic control over all levels of law enforcement, “ensuring that communities most harmed by destructive policing have the power to hire and fire officers, determine disciplinary action, control budgets and policies, and subpoena relevant agency information.”¹⁶ Social movements like BLM, therefore, both challenge the structural conditions that breed racism, and provably alter the implicit bias attitudes that help to maintain it.

What if social psychologists took seriously the call to defund and abolish the police? We must resist the temptation of dismissing such an approach on the grounds of objectivity—remember, by working with police departments and supporting the calls to reform *but not* defund, social psychologists have already committed to biased work. Our call, therefore, is to be biased in favor of the oppressed. Methodologically, in order to further socioecological psychology, Trawalter et al. (2020) suggest measuring the impact on psychological outcomes and mechanisms as a result of both (1) exposures to structures and systems of racism, and (2) manipulating salience of historical harms or systems in lab experiments. Additionally, they advocate for leveraging natural experiments and testing associations between racist systems and psychological mechanisms and outcomes. These align well with our own call but are not enough.

Ultimately, an emancipatory psychological science is one that takes account of all three levels: it takes as given that individual-level changes and agency need to be investigated as that is the blunt end where much of police brutality occurs; it expands its scope to better understand how such brutality is perpetuated and supported; and it finally brings into view the forces for whom such police brutality is perpetuated for, which allows one to then understand and navigate the opportunities and limitations of fighting police brutality at the more concrete levels, i.e. the individual- and institutional-levels, with the ultimate aim of abolishing repressive systems.

Conclusion

However, some might be wondering, “Is abolition too drastic? Can We really get rid of prisons and politicking all together?”
The short answer: We can. We must. We are.

Mariame Kaba¹⁷

Neoliberal policies have had devastating effects on Black people, and people of color in general. As a result of austerity policies, funding has been slashed across all social services, which disproportionately hurts marginalized communities. Agencies at all levels of government are disinvesting in housing (Desmond, 2016), education (Hursh, 2016), health services (Labonté & Stuckler, 2016), while unemployment or underemployment is increasing (Nunn et al., 2019). At the same time, homelessness, truancy, and mental health problems have been criminalized (e.g., Leifman, 2019). Evidence suggests that investing in non-carceral alternatives such as mental health resources and job trainings (Heller, 2014) have greater returns on investment for society than policing and incarceration of marginalized people. Yet, these alternatives are rarely well-funded because under the neoliberal regime of austerity and the neoconservative approach of punitiveness, the response to social discord is policing instead of understanding and addressing the underlying problems. The inevitable result is the disproportionate contact of marginalized communities with the police! No amount of tinkering with the dynamics of discrete situations involving police confrontations with citizens will alter this larger political trend. Addressing the root of the issues would require redistribution of wealth beyond trickle-down-economics and scrutinizing the systems responsible for the “need” and role of policing—to repress workers, especially BIPOC (Alexander, 2010; Vitale, 2017).

Black communities and their comrades have again responded to the latest incidents of police brutality with protests and riots across the nation, and across the globe. Louder than ever, they demand defunding, even abolishing, the police. Incredibly, various municipalities answered these demands with commitments to unprecedented reforms: Los Angeles has committed up to a \$150 million decrease in its \$1.8 billion budget; and the city council of Minneapolis, where George Floyd was killed, has committed to abolishing their police department! And, most recently, the police officer directly responsible for killing George Floyd was convicted of the murder.

We have reason to be optimistic, yet we are already seeing ways in which public demands are being routed. For instance, the Minneapolis public-school system severed ties with the police department, only to have the police replaced by former police, security, or correction officers—now called “public safety support specialists” (Cheney-Rice, 2021). Such a corruption of progress *is* American history. The promise of reconstruction was corrupted into the Jim Crow era (Du Bois, 1935). The promise of civil rights was corrupted into the

¹⁷ Kaba, M. (2021). *We do this' til we free us: Abolitionist organizing and transforming justice*. Haymarket Books.

New Jim Crow era (Alexander, 2010). This is what is at stake. A call for defunding or abolishing that is not made with an understanding of capitalism can be corrupted into a New Jim Crow era once again (Davis, 2016; Taylor, 2016). Though racism has been, at least in the Americas, instrumental in the expansion of capitalism, this certainly doesn't mean that it is just about economics anymore. However, if we are to strategize the way forward to fight for a society beyond racism, then we have to target one of the fundamental masters it serves. We have to attack capitalism.

It is with this anti-capitalist and anti-racist (not to mention anti-imperialist and anti-patriarchal) understanding that Angela Davis (2016) called for abolishing the police and warned against deceptive solutions of better prisons and better policing. In spite of her admonishment, and the rallying call for defunding the police and mounting evidence of the ineffectiveness of police trainings, social psychologists continue to push for police reforms that are out-of-step with the demands of the protestors, and even an increasing number of government agencies. In 2021, Los Angeles Review of Books published "Beyond Bias: The Case for an Abolitionist Psychology". This article is a rare exception in that it explicitly calls for police abolition from an intersectional and anti-capitalist perspective. It is entirely in line with the argument we make in this paper, perhaps without laying out the evidence and the arguments as extensively as we do here.

Demands of defunding and abolishing the police are bold and go to the heart of the problems with policing under capitalism, so much so that winning them would threaten the capitalist system itself, if not form a key demand of a revolutionary transformation of capitalism as a whole. In fact, because policing has been so integral to defending the social hierarchy and exploitation that are endemic to capitalism, it is difficult to imagine eliminating police forces without also eliminating capitalist society (Gordon, 2005). Maybe partly for this reason, discussions of policing within social psychology virtually never discuss the reduction or elimination of policing in its modern institutional form.

We are heartened by the exciting new proposals in social psychology that aim to expand the focus of the "social" by incorporating sociological and historical analyses. Most recently, Kraus and Torrez (2020) have argued for a shift in considering power as a trait-based variable to power as a construct embedded in societal hierarchies. Overall, their hope is "to understand power as it is experienced in the world, as a psychological process that is grounded in the institutions, identities, and group dynamics through which much of human behavior is experienced" (p. 88). We also embrace their approach to move social psychology out of the lab and into the field in order to test the limits of generalizability of current research on power. One implication of such a broadening, they argue, will allow us to investigate the impact of collective actions on individual-level power. However, their approach, along with the aforementioned proposals for expanding the concept of the social, such as the socioecological psychology of racism (Trawalter et al., 2020) and "bias of crowds" (Payne et al., 2017) only partially incorporate all of the elements of an IMP. For instance, what is left undefined in these approaches is whether power is

to be treated as a zero-sum game or as gradational. Evidence is starting to build that an explicitly antagonistic approach to class (workers vs. capitalists; i.e., zero-sum) provides a better understanding of worker alienation, in comparison to the socioeconomic status (SES; i.e., gradational) approach of social class (Sawyer & Gampa, 2020). This approach results from a historical understanding of capitalism as one that is at its core an exploitation of the majority of the population by a minority of the population. Such an understanding then also sheds light on the role of the police, as discussed earlier, and provides a roadmap for potential solutions to tackling police brutality. Most importantly, our approach makes it explicit that we eschew any misconceptions of neutrality, and work in solidarity with oppressed communities.

We hope that our framework will help other social psychologists to also envision how an intersectional Marxist psychology can provide structural and historical analyses of the relationship of the individual to the situation, and of the situation to its structural and historical context. We believe it will add to current efforts to incorporate more intersectional analysis in social psychology (Goff & Kahn, 2013), and believe it can help to combat the increasing number of plagues besetting us and looming upon future generations, from racism and exploitation to the climate crisis. Our framework can also bridge social psychologists with other areas of psychology, such as those in community psychology, that are also working on abolition (see Fernández in this issue). Ultimately, we hope abolition theory outlined here can be applied to psychological study of abolition of not just police and prisons, but also to other oppressive institutions such as work (Prole.info, 2014) and family (Lewis, 2019).

Anup Gampa, PhD, is a radical educator-scholar. He lives and teaches as a Marxist-queer-feminist at Harvey Mudd College in Claremont, California. He is obsessively interested in understanding and dismantling systems of oppression through collective organizing and community building.

Jeremy E. Sawyer is Associate Professor of Psychology at CUNY Kingsborough Community College. He studies the psychological impact of collective action and social/labor movements on implicit and explicit attitudes, alienation, and well-being. He examines how children develop cognitively and motivationally through activities like private speech and sociodramatic play, and how adults develop through political activism. He is interested in Marxist approaches to psychology, including Vygotskian and cultural-historical activity theory.

The black failure of psychology – an errant walking away

Hugo ka Canham

Abstract

Since death is both emanant and imminent for black people living in an atmosphere of pervasive global racism, there is some consensus that to be black is to be deathbound.¹ Relatedly, it is a truism that to live close to death is to be in a perpetual dance that necessitates attentiveness to the rhythms of livingness or what keeps us clinging to life. To live close to death is therefore to be in a dance with death. In this paper, I mark the ways in which we die, the systems that kill us, our wrestle with death and oppressive power, and the resistance that is encoded in black dance. I turn to the wilful failure of psychology to apprehend black precarity, ways of dying, and resistance. I suggest that as a discipline, psychology is irredeemably colonial and unable to decolonise itself. Rather than arguing for an inclusive, black or African psychology that brings black death into the purview of the discipline, I succumb to hopelessness and turn to explore what emerges from black unmappability—from the failures of psychological registers of apprehension. Instead, I propose that by giving up on psychology, we might look to the providence of errantry and relation as black genres of seeing and care. These spaces are generative for holding black being and thinking with the black dance with death. The paper provides pathways away from the suffocating lenses of psychology. An errant walk towards black boundlessness.

Keywords

blackness, death, black errantry, livingness, complaint, dance

Since my introduction to psychology approximately 25 years ago, I have been adrift. The discipline has never quite felt right. It has spectacularly failed to explain black life as I know and live it, and it has been wilfully disinterested in theorising blackness. Moving between rural life where colonialism, apartheid, neoliberalism, and modernity have created extreme precarity—and my largely middle-class existence as a marginal body in academia—I have been struck by how the registers of psychological apprehension unsee the lives of so many people. My turn to community psychology and various strands of black and decolonial psychology have not quietened my sense of dis-ease. Approximately

¹ Claudia Rankine (2015) articulates this relationship to death.

five years ago, I began to lean into my alienation and to paddle away from the shore of psychology. Following Mignolo (2009, 172), I have repeatedly asked myself: “Why would someone be interested in advancing the discipline if not for either alienation or self-interest?” The response that I draw out in this paper is that I have resolved not to advance a discipline invested in my alienation. Unmoored, I found unexpected footing on which I currently stand—albeit unsteadily. The ground on which I now stand refuses rootedness and subjects itself to the motion of the tides. It has no allegiance to any discipline. It requires me to read widely and to think with knowledges hitherto understood as disparate. An inadequate name for this is transdisciplinary ground. Errant and seeking relation rather than stasis and replication (Glissant, 1997).

Through the register of black complaint, I next outline the failures of psychology to apprehend and attend to black life and death. I then turn to critique the ways in which black psychology’s embrace of the psy-complex continues a tradition missing the complexity of black life. I suggest that since blackness is the human’s abject other, it is always pathological and delayed when measured against Man. Here, *Man* is Sylvia Wynter’s (2003) monohuman at the top of the Chain of Being. Parker (1994) defines the psy-complex as the sprawling regulative network of theories and practices that make up psychology. To underscore both arguments about the failure of psychology and critiques of the psy-complex, I think with black death, the most overdetermined position of black life. Walcott (2013, p. 143) makes a simple but powerful observation when he notes: “Black people die differently”. Why does psychology misapprehend this difference? I conclude by pointing to the potentialities of refusing psychology in order to experience the providence of being unchained from discipline and therefore to be open to being led by people and communities with whom I co-theorise, resist and co-create.

Black Complaint!

To complain of the failures of Euro-American psychology’s influence and colonisation of the world is unoriginal but necessary to reiterate.² Keguro Macharia (2016) outlined a litany of complaints to register his discontent with how queer studies articulates a universalism that flattens African queer life and experience. Sara Ahmed (2021) similarly illustrated the value of the practice of complaint for unveiling the operation of institutional power at universities. Writing in the *Annual Review of Critical Psychology* in 2018, she observed:

I learnt how difficult it can be to make a complaint, how much work a complaint involves. Making a complaint is not completed by one action alone; you have to keep a complaint going. Students are often warned about making complaints; they are told that making complaints would damage their reputations, relationships, career prospects; lives. If a complaint is made, it tends to be treated as potential

² For local critiques, see Ratele (2019), Nyowe (2015), Baloyi & Ramose (2016), and Canham, Baloyi & Segalo (2021).

damage, as that which could damage the reputation of an individual or an organisation. There is often a concerted effort to stop a complaint from going through the system or to stop a complaint from getting out (2018, p. 15).

I follow these scholars by articulating a litany of black complaint against psychology. I take Ahmed's warning about complaint seriously. To be a dissident is to be marked and further peripheralised. Only, I am already in the periphery—some of it is self-imposed through my refusals and some of it is a consequence of geo and body politics.³ But this is a margin that I am walking away from. I no longer cower from the panopticon of psychology. By accepting a universal psychology through grand theories of the psyche and linear models of development, black and global south people have been written out of full existence. Through my litany of black complaint, I outline four points of objection.

Psychology is a practice that is inextricably tied to English idioms of life

We live lives in local vernaculars and understand our experiences in the contexts where we live. To be a white person who lives in Oxford in the United Kingdom or in Boston, Massachusetts in the United States is to live on a single plane of consciousness. This plane of consciousness is the local vernacular formed within domestic idioms and rhythms of white middle-class life. Since Euro-America has been imagined and deliberately conceived of as the place of enlightenment, theory and reason (Mignolo, 2009), colonial subjects elsewhere in the world have been rendered unreasonable and atheoretical. Euro-American vernaculars or knowledges have been imposed on the black colonial world. Psychology is one of these vernaculars. Beyond psychology, Chimamande Adichie Ngozi (2009) reminds us how British idioms, from the books that she read, applied pressure on her to write stories that were not located in Nigerian idioms and meaning making.

An example of black idioms of death might be found in black death rituals and cosmologies. Unlike Judo-Christian or secular understandings of death, black death vernaculars foreground the ancestral. The dead are therefore revered and understood to co-exist with the living. They give form to how we live here and, in the afterlife (Canham, 2023; Banana, 1991). We consult the dead to make meaning of existential crises. To remain in communion with the ancestral, we visit graves, conduct rituals, and appease them when we have wronged them by walking out of step with cultural dictates. We negotiate with ancestors and find equilibrium between this world and the ancestral realm. With this single example of cosmological rootedness and death vernaculars, I suggest that our idioms are out of synch with white ways of being. However, in white epistemologies and canon-building, black epistemologies are not just different, they are inferior.

³ Walter Mignolo (2009) writes geopolitics attune to the geolocation of power in the knowledge industries where those in the global north determine what counts for truth and knowledge. He reads body-politics as the calculus with which bodies are imbued with credibility to make knowledge claims.

They need remedying, disproving, enhancement, and education. Instead of entering a debate about the value of black epistemologies by insisting that we make room for them at the table of psychology, I choose to strike a different path. To walk away to a place beyond the reach of psychology. In this pathway, I walk towards attending to questions animated by why blackness and death cohabit so intimately, why do we die differently from white others, and where and why do we die?⁴ My own orientation is inflected through what Christina Sharpe (2014) terms a black studies that attends with care to blackness. Care is necessary for death work. For thinking with black life.

Given the existing premises of psychology, unlike the Maori anthropologist about which Mignolo's (2009) writes, I cannot enact geopolitics (thinking from where I am) and body-politics (theorising from my experience) of knowledge in order to place psychology at my service. This is to say, although I embrace the enactment of geopolitics and body-politics, I refuse to make space in psychology, a discipline invested in my annihilation. I refuse dialogue with Euro-American psychology which consigns African experience to the exotic and exceptional. While Ratele (2019) provides a compelling case for African psychology as a situated practice of psychology from Africa, I question the value of psychologising well entrenched practices and vernaculars that readily and competently explain African life worlds. I am weary and do not have the energy to invest in decolonising psychology. I find more productive openings in the modes of thought and practices used by black ancestors. As I will suggest, there are better ways of scripting myself and black life in general beyond the psych-complex and English vernaculars.

Psychology unsees black death

In historicising psychology, Guthrie (2004) famously wrote that “even the rat was white”. What does it mean to be written out of history both in the past and present? To be black is to live in an apocalyptic spacetime saturated in colonial, white supremacist, and neoliberal toxins. In this debris, many of us are mortally wounded. We live with over-determined dying and death. Africans die disproportionately from impoverishment, diseases like the non-ending AIDS pandemic, from the coronavirus, malaria, Ebola, and a range of preventable diseases (Canham, 2021). We have no prospects for a rapaciously greedy pharmaceutical industry. We die from disasters like earthquakes, floods, mine collapses, drownings. In 2021 alone, the United Nations (2022) reports that 3000 migrants drowned in the Mediterranean and the Northwest African maritime route to the Canary Islands while attempting to reach Europe. The rate of death in these oceans doubles year on year. According to the UNHCR, overland routes through the Sahara Desert may lead to even greater numbers of dead Africans in detention centres, remote border areas, or in the course of being held by traffickers or smugglers. Accounting for black death is a risky exercise since black dying is often invisible in fugitive zones where we enact our desires for

⁴ Rinaldo Walcott (2009) draws our attention to the value of doing this death work.

freedom. The arithmetic or mathematics of blackness is often illegible in zones of death (McKittrick, 2016). Psychology journals continue to rewrite the same material in a warped pattern of compulsive repetition. We die unseen.

Source: UNHCR Risk Mitigation Strategy and 2022 Appeal.

In Zimbabwe, conservative estimates place neonatal mortality at 32 deaths per 1000 deaths. This excludes unregistered home births that are administered by midwives (Multiple Indicator Survey, 2019).⁵ Neonatal deaths are those that occur within the first 28 days of birth. Rinaldo Walcott (2013, p. 143) contends that living in the wake of centuries of black devastation that trail the legacy of the slavery, “the question of death should be central to the analysis of black diaspora cultures”. As I suggest in my Africa focused analysis here, the gaze should be bidirectional in spotlighting death, both in Africa and in her diaspora. We too, live in the wake of slavery, its unsettlement, and its maladies of racial capitalism. Having visited several sites of slavery on the Indian Ocean and places of genocidal hauntings on the African continent, I recenter Africa within Katherine McKittrick’s (2006) conception of demonic ground, Édouard Glissant’s (1997) *Gehenna*, literally a hell of fiery torment, and what I have termed black deathscapes. To be African then, is to intimately home with death. It is to live on a deathscape (Canham, 2023).

Psychology’s frames of reference are white—kinship, nuclear family, oriented straight and middle class

Africa is everything that Europe is not—a place of negation. Chinua Achebe captured this deathly sentiment in his remarkable reading of Joseph Conrad’s *Heart of Darkness*. “Quite simply it is the desire—one might indeed say the need—in Western psychology to set Africa up as a foil to Europe, as a place of negations at once remote and vaguely familiar, in comparison with which Europe’s own state of spiritual grace will be manifest” (Achebe, 2016, p. 15). Europe’s state of grace is racialised white, it is constituted by the nuclear family as a natural formation of kinship. It is straight and queer is its aberration. Against this state of grace, Africa is underdeveloped, childlike, and a diseased queer place of excess and unruliness. It fails on every matrix of modernity and it is on the last rung of the psychological timetable. The African is not the runt of Piaget’s litter, it is closer to the animal. Just grunts and frenetic movement.⁶ Europe and the disciplines through which it makes itself can smile in self-satisfied pleasure because Africa reliably casts the shadow of darkness thereby illuminating European grace. Psychology is central to this project.

Psychology is wed to the psy-complex, and except through pathology, refuses to account for the social lives of black people. But if we walk away from

⁵ See “Workers plot stillbirth burials” <https://mg.co.za/africa/2022-08-13-zimbabwe-hospital-workers-plot-stillbirth-burials/>

⁶ Achebe’s (2016) close reading of Conrad’s *Heart of Darkness* is useful here.

psychology, we see openings. Breaks is the fold from which we might leap to a freedom where self-love is possible (Fanon, 2008). Neo S. Musangi (2018) and Savannah Shange (2019) suggest that in the search for liveable lives, black queer relation refashions and reimagines notions of kinship. In this reimagining and practice, Euro-American models of kinship are deformed. For Africans, supposedly healthy models of family and relation that have been placed beyond the reach of blackness, can in fact be zones of danger and be both unworkable and non-desirable. Those of us who live in the wake of enslavement, colonialism, and apartheid—fatal systems of racial capitalism, live lives that psychology can only apprehend as pathological and deviant. I suggest that no matter how we contort the discipline to see ourselves, through the prism of psychology, the view can only yield distortion. To apprehend ourselves in our full complexity, we may have to use black queer tools that embrace blackness as a fugitive freedom bound disposition. Our registers of apprehension should see death as close, hovering, well-worn and material.

Psychology is unrecognisable in black rural communities where modernism has mostly failed. Although indigenous knowledges are not devoid of psychological meaning making, they refuse discipline and errantly move in the service of survivance undergirded by pleasure. Black rural life is queerly aligned to urban white formations that most closely resemble psychological norms. Here, while I register sexuality, I refer more to off centre, strange and wayward forms of living that resonate with black rural existence. As a rural black queer being, I am unreadable and invisible to the psychological canon. Where I vaguely emerge, I am an illegible apparition—my contours are indecipherable in the mirage from which I never rise. Even when Frantz Fanon (2008) first saw me in the 1950s and 1960s, he had to look askance by leaning on black and Caribbean registers of recognition. This is to suggest that to see blackness, Fanon relied on an interdisciplinary method that enabled him to see past the white masks. Fanon's vernacular theorisations began with a commitment to seeing the colonised subject rather than an obligation to disciplinarity. From an Afro-Caribbean situatedness, he was able to provide his devastating account of colonisation, its effects on the colonised, and he imagined post-colonial futures drenched in neo-colonial toxins and pulsating with violence. Fanon saw black life and death not because of psychology but because he used tools of apprehension always already present in the colony and its demonic deathscapes.

Since "black death is constantly framing black peoples' everyday livability" (Walcott, 2013, p. 143), if psychology's frames of reference are oriented away from our ways of dying, how do we do our death work? Black scholarship suggests that an ethics of care is central to tending to the folds, plains and the imminence of death in black being (Macharia, 2019; Sharpe, 2016; McKittrick, 2014; Weheliye, 2014; Walcott, 2013). In the haste to diagnose and to reinscribe normative codes, I do not see the practice of care. With loss writ large in black life, there is an absencing of care work even in extant psychological frames of melancholia. Therefore, if Freudian melancholia is the inability to integrate the lost object (the many dead), black people do not easily fit into this frame since our very cultures have become oriented towards knitting our dead into our

cosmologies and meaning making.⁷ In place of melancholia, we are oriented by a free poetics that is invested in our yearning for survival. Mbembe described this as the perpetual movement of Africans towards the unknown undergirded by the need to repair and create (Goldberg, 2018). However, in our yearning, we hold our dead close and practice a mournful ethic of care—a recognition of our loss through embracing our dead. We do not move away from our dead; we move towards them in a poetics of relation that sutures worlds that become impossible to interdict. This does not make us Freud's melancholic subjects. It makes us boundless beings who thrive in contradiction.

Psychology is tethered to the nation state

In this litany of complaint, I signal the refusal of psychological associations to recognise blackness as a movement formed across nation states and therefore as un beholden to this violent register of being. Psychology's commitment to blanket universals which I read as white normativity, is contradicted by a localising instinct predicated on national boundaries. Therefore, in South Africa, we have the Psychological Association of South Africa founded as an (racially) inclusive association to work against the apartheid legacy of racial segregation and harm caused by white psychology which is also supremacy. Although this organisation is purportedly inclusive, its very existence is premised on South Africanness—a parochial identity subtended by apartheid, colonial and neo-colonial logics of nationalism that unsee black movement. Here black movement points to the constant reinvention that comes with fugitivity, opacity as a collective yearning for expression, and blackness as pan-African and diasporic (Harney & Moten, 2013; Walcott, 2013; Glissant, 1997). Conceived of this way, blackness is uncontainable in nationally oriented conceptions of being that are tethered to the psy-complex. Through its network of regulation, the psy-complex demands coherence, stasis, and pathology. It does not make space for nomadic dreamscapes of blackness.

Even as migrancy may be a concern for psychology, a national psychology is limited by an inability to witness black movement across the region and continent. Movement as legitimate, as life giving, as a tenet of black freedom. Psychology turns away from how Zimbabweans die in transit because of the precarity of narrowly proscribed citizenship. How xenophobia and colonial gatekeeping kills black people and works against our quest for movement, for freedom. How African borders have become zones of black death. Psychology is therefore unable to bring the Mediterranean crossings—empire's insistence on black death and its interdicting of black movement—into its registers of comprehension. Walcott (2013, p. 149) advises that fidelity to tracking black movement enables us to attune to “the ways in which the conditions of black death seem to repeat across space, time, and location”. In walking away from psychology, I aspire to tracking the way black people occupy and move in space, how we dunk and dance, pause and weave, die, and grasp for pleasure in death

⁷ Readers are referred to Freud's (1917) writings on melancholia.

defying ways—if only to defer violent annihilation for a more satisfactory death. Following Édouard Glissant's (1997) theorisation of movement, my interest in black motion is at the level of both physical movement and motion at the level of ideas untethered from the stasis of psychological registers.

Black errantry and freedom bound movements

To choose freedom is also to refuse consignment to the wasteland of psychology and its litany of psychopathology. It is to strike and perhaps to riot by moving away from non-being towards a space of creativity resembling freedom. In her seminal essay, *The race for theory*, Barbara Christian (1987) wrote about her move from philosophy to literature as a passage to possibility. She observes that literature “seemed to have the possibilities of rendering the world as large and as complicated as I experienced it, as sensual as I knew it was. In literature I sensed the possibility of the integration of feeling/knowledge, rather than the split between the abstract and the emotional in which Western philosophy inevitably indulged” (1987, p. 56). To move from one place to another and from discipline to freedom is a political leap. I too seek to move to the prospect of feeling where black being is rendered with complexity and possibility rather than stasis characterised by capture, confinement, and encampment. What would it mean for me to spend time not thinking about my deficiencies in the mirror of psychology? What would a focus on tracking black death and creativity look like? A caring and tending to that embraces movement? For this reason, I turn to black errantry, a feature that is embraced by black studies.

Glissant (1997) pointed to the problems of rootedness or what he termed the totalitarian root. I conceive of psychology this way—attached and stuck to its origins, monolingual and refusing fluency in other tongues, and therefore unable to move and imagine all of us in its ambit of theorisation. Glissant favoured relation and errantry to rootedness. Following Gilles Deleuze and Felix Guattari, he replaced rootedness with the idea of the rhizome, “an enmeshed root system, a network spreading either in the ground or in the air, with no predatory rootstock taking over permanently” thus challenging ideas of a totalitarian root (1997, p. 11). Errantry therefore moves against the root and invokes temptation, curiosity, and openness about the Other. Glissant termed this the poetics of relation where all identities are “extended through a relationship with the Other” (1997, p. 11). Conceived of this way, shared ground and knowledges are central to relation. In relation to errantry, Betsy Wing, Glissant's translator observed: “Directed by Relation, errantry follows neither an arrowlike trajectory nor one that is circular and repetitive, nor is it mere wandering-idle roaming. Wandering, one might become lost, but in errantry one knows at every moment where one is—at every moment in relation to the other” (Glissant, 1997, p. xvi). By forsaking origin stories where worth is determined by root, a poetics of relation deforms hierarchies of being and value. Blackness is not understood in oppositional terms—the foil of whiteness—and as deficit. It is engaged in self-conscious errantry in search of relation.

It is now apparent that I am accusing psychology of being a totalitarian root. In its place, I am invoking walking away as a form of errantry. For Christian (1987), literature was the rhizomatic place that she reached after walking away from the strictures of philosophy. For me, it is black studies, literature, African queer studies and a range of locations that defy a single root. My political commitments are towards theoretical and conceptual tools that allow me to imagine blackness into being. My rhizomatic wanderings find space in the air, in the earth, atop hills, underwater and narrow spaces on surfaces and in folds. All these movements are my desire to go against the root that insists in my interdiction. In walking away, I engage in Glissantian dialectics of rerouting and invest in freedom that honours my location and those with whom I live in relation. I insist in a multiple relationship with the Other—the black queers, women, working classes, rural elderly people, possessed adolescents, the excess bodies of the city, those battling climate disaster in the Caribbeans rising oceans and Haitians fight to live on hostile ground. I seek relation with those drowning in the Mediterranean and those navigating Beitbridge and other borderlands of black annihilation. My desire is to participate in a relation of repair and care that eludes the disciplines of generalising universals. To find care in spaces outside of psychology points to a discipline bereft of care despite its ironic aim of healing.

To walk away from psychology is not to renounce it. It is already imprinted in my thinking, and it forms part of my identity. Glissant is useful once more. He observes that errantry “is not a resolute act of rejection or an uncontrolled impulse of abandonment” (1997, p. 18). He contends that instead, identity is no longer to be found completely within the root but also in relation. Consequently, the ways of thinking to which I move (e.g. black studies, queer African studies etc.) are not devoid of psychology. I hold knowledge relative to all these ways of comprehending. In relation. A position of errantry does not ask what would psychology have to do to see black death and life differently? It relies on multiple ways of seeing that are untethered from the root. If relation is spoken in the poetics of the multilingual, beyond disciplinary boundaries, errantry is to be untethered from the territory of nation state where imagination ends at the borders of the state. It is to be unmoored from the fallacy of South African superiority in relation to her neighbours. It is to call out its myths of exceptionalism. Errantry therefore follows a different rhythm to that of national associations such as the American Psychological Association or the South African Psychological Association. It sees the fate of Zimbabweans and Mozambicans as inextricable from South Africans. It problematises belonging as stasis. It sees our mutual ways of dying and it invests in our creative wanderings in search of black freedom. Its conceptual lens is a form of relation that enlarges instead of territorialising. To consolidate around the nation is to move to monolingual intent and to be immobile—to arrest black mobility. I say this with an awareness of the seminal role of mid-twentieth century nationalist indigenous movements seeking to depose colonial governments and parasitic settler populations.⁸ In the post colony, nationalism has however outlived its usefulness

⁸ Edward Said (2012) and C.L.R. James (2012) are important examples of scholars who advanced nationalism for decolonial struggles in the majority world yoked by colonialism.

and morphed into uncaring boundary maintenance against black Others. It has modelled itself on white modes of statehood.

The internal exile of self-satisfied containment and grids of intelligibility to which psychology has consigned itself mutes it to the thrill of mobility. The mobility to which Glissant refers does not seek to conquer and discover—to pursue an ontological obsession of knowledge—but to foster relation. The alternative to the pleasure of movement is the torment of internal exile that forecloses errantry's imaginary vision. I posit that black creativity thrives in spaces that attend to both repair and imagination. When we do not look for pathology, creative practices of survival are loosed. Even at the risk of breaking the flow of the argument I am advancing, now would be a good time to briefly pause to an illustrative aside. In teaching a critical variant of community psychology, I taught students to read the ways that psychology flattened black working-class people while I also advocated for them to recognise and work with how these communities engaged in creative practices of survival. However, to undo the contradictions that are central to critical community psychology, over time, my colleagues began to agitate for psychological coherence. This coherence is the lifeblood of the psy-complex. This meant that psychotherapeutic and psychopathological concepts had to permeate my teaching practice. Coherence meant that the creative impulse of survival was replaced by domesticating concepts such as depression and attachment in community. This is not the only reason for walking away from psychology, but it is an important consideration. My commitment is towards the creative impulse of black survival, its structures, and economies of desire and how it remakes amid black death. Errantry and relation. I could have stayed at the periphery of the department of psychology and bark at its margins as I have for so long. But one can be a shadowy figure who shrivels in the dark or one might leap out of psychology and break from its sprawling psy-complex. I choose sunlight.

Expanding on the creative impulse to survive, Achille Mbembe contends that intrinsic “to ‘the human’ is something that can never be turned into an object, something ineradicable, and is the desire to be free” (Goldberg, 2018, p. 212). This is the nub of what Walcott (2021) theorises as uninterdictable—audacious eruptions of blackness that exceed limits. It is the thing that racial capitalism cannot break. Since blackness is always mobile and able to occupy multiplicity, its boundlessness allows it to create pleasure amid attempts to capture and restrain it. In walking away from psychology through the studied practice of errantry, I signal my commitment to pleasure, to tracing black multiplicity and its shifting habits and habitations, and to tending to its escape and recreation. To tend to black death and life this way is to surface survivance—survival and endurance that resists nihility and victimry and go beyond reaction (Vizenor, 2008). In McKittrick's (2006) terms, when we see black death, this requires us to ask what else happened here? Therefore, away from the pathologising lenses of psychology, in my new relational and caring theorisation driven by a feminist ethics of care, my desire is to be propelled by this question. What else happened?

Black dance is what else happened amidst death

The question of what else happened rubs against the diagnostic manual's predetermined parameters. It is underpinned by curiosity. Here, curiosity is at once simple and underpinned by political investments against lazy tropes. It is open to surprise and regeneration. A looking ahead that is cognisant of the past but leaps out of its limited parameters. It sees and tends to death but also explores what else occurred at the site of dying. McKittrick (2006) asked this question in relation to the *Zong* slave ship. She was imploring those who study slavery to expand their enquiry to consider the complexity of black livingness even in black vales of dying and abjection. By turning to black dance in this final part of this paper, I heed this important call to attend to how we survive the hold of racial capitalism.⁹

In Africa and her diasporas, black dance is a constant occurrence. It is a form of celebration at festive events like weddings, birthdays, anniversaries, soccer games, cultural events and rituals. It is our motion of mourning when we rhythmically circle the grave during funerals and unveilings. We dance towards death when we protest inequality, oppressive work conditions and state violence. Globally, social media has exploded with black dance. Everywhere we look, black dance is an everyday occurrence. Train surfers dance atop moving trains in a dizzying dance of death.¹⁰ They seek of pleasure at the edges of death. I read black dance as an explosion of freedom. An insistence on motion in confined spaces. Among others, Robin Kelley (2022) and Danielle Goldman (2010) have illustrated how black dance carries black freedom dreams. Black dance captures Glissant's ideas of black errantry as a freedom bound movement. Its occurrence across space is an apt illustration of attending to "what else happened"?

To the non-black observer, black dance is a contradiction since modernity reads dance as a performance of exuberance and joy. To this observer, black dance is not only surprising but inexplicable when it occurs in spaces of abjection. However, if we attend to the long emancipation—an endless push against unending oppression, we know that blackness is necessarily attentive to struggle, death, mourning, joy, survival, and livingness. Any scholarship that unsees this complexity fails blackness. To charge psychology as failing black people is therefore to suggest that it is unable to hold our movement and complexity. The stasis of its diagnostic manuals and foundational theories hobbles the discipline and blinds it to seeing what else happened. My antidote to this failure is errantry—movement towards registers of seeing black motion. Sometimes this requires a location in black studies, queer African genres of attending, cultural studies, and literature. This is not a commitment to discipline or even interdisciplinary but a pledge to attending blackness in its multiplicity. I am not suggesting that this should be everyone's mantle. As a black person who has long been rendered invisible and as pathology when I do show up in the

⁹ Christina Sharpe (2016) theorised the hold of the slave ship.

¹⁰ See this short film on train surfing in Soweto, South Africa: <https://www.youtube.com/watch?v=vAwprnQZJcw>

discipline I was trained in, it is my responsibility to bring black death and life into view. I want to do this in ways that do not capture blackness and render it transparent. As Glissant (1997) cautioned, opacity is an essential attribute of survival. The confounding nature of black dance is illustrative of this insistent move against capture. In walking away, I attend to bursts of freedom which are also a mournful tending to our dead and the deathscapes on which we live.

Conclusion

After years of grappling to see myself and those like me, I write this paper as my breakup with psychology. I have argued for how we might apprehend the black failure of psychology by pointing to the ways in which it refuses to see blackness beyond deficit. But the paper has gone beyond lament and pointed to the productivity of the register of complaint by outlining four black failures of psychology: Psychology is a practice that is inextricably tied to English idioms of life; psychology unsees black death; psychology's frames of reference are white—kinship, nuclear family, oriented straight and middle class; and psychology is tethered to the nation state. In place of psychology, I have proposed a way of attending through Glissant's concepts of errantry and relation. By tending to black motion and our yearnings for freedom, errantry and relation offer us a way out of psychological stasis. Errantry and relation are attentive to death and freedom dreams. This is a crucial antidote to the pervasive unseeingness of psychology. In walking away, I do not seek new disciplinary strictures. I do however find a holding space in between ways of thinking that attend to blackness. These thinking spaces do not demand allegiance. Since my role is to attend to blackness, I cannot commit to inertia when blackness shows up as movement and dance in narrow spaces. To read black death, livingness and survivance, McKittrick insists that I must always be ready to ask what else happened at the sight of death. This is my political commitment against black annihilation.
